Conversion Table for Chinese Units of Measure

Length:

1 kilometre (1,000 m.) = 2 *li* = 0.621 mile
= 0.540 nautical mile
1 metre (m.) = 3 *chi* = 3.281 feet

1 *li* = 0.5 kilometre = 0.311 mile
= 0.270 nautical mile
1 *chi* = 0.333 metre = 1.094 feet

1 mile = 1.609 kilometres = 3.219 *li*
= 0.868 nautical mile
1 foot = 0.305 metre = 0.914 *chi*
1 nautical mile = 1.852 kilometres = 3.704 *li*
= 1.150 miles

Area:

1 hectare = 15 *mu* = 2.47 acres
1 *mu* = 6.667 hectares = 0.164 acre
1 acre = 0.405 hectare = 6.070 *mu*

Weight:

1 kilogramme = 2 *jin* = 2.205 pounds
1 *jin* = 0.5 kilogramme = 1.102 pounds
1 pound = 0.454 kilogramme = 0.907 *jin*

Volume:

1 litre (metric system) = 1 *sheng*
= 0.220 gallon (British)
1 gallon (British) = 4.546 litres = 4.546 *sheng*

FOREWORD

By Xue Muqiao

This work is the first economic almanac of China to be published since the founding of the People's Republic of China. At the beginning of 1980, all units participating in the Economic Research Centre of the State Council decided to edit and publish this *Almanac of China's Economy*. With the support and cooperation of all ministries and commissions of the State Council and of the people's governments at provincial and municipal levels and in all autonomous regions, and thanks to the active efforts of staff members of the Economic Management Magazine, this almanac is at last ready for its readers. With the support of Japanese and American friends, the Japanese and English editions of the book are also being published. Comrades and friends both at home and abroad who are concerned about the development of China's economy should welcome this book.

Under the leadership of the Communist Party of China, the Chinese people overcame many hardships and difficulties, overthrew the three big mountains of imperialism, feudalism and bureaucrat-capitalism, emerged victorious in the revolution and, in 1949, founded the People's Republic of China. During the past 31 years, we have been carrying out socialist revolution and socialist construction in our poor, backward, and overpopulated country and have won unprecedented successes. However, our revolutionary path has not always gone smoothly. It has gone through many twists and turns and we have experienced successes as well as failures along the way.

After the smashing of the counter-revolutionary cliques of Lin Biao and Jiang Qing, the party's correct line was re-established along with the principle of readjustment, restructuring, consolidation and improvement formulated at the Third Plenary Session of the Party's 11th Central Committee. Thus, a new historical period began, emphasizing economic construction. Over the past two years a tremendous amount of work has been done. A series of principles and policies were formulated and experiences and lessons gleaned from economic construction during the past 30 years were summed up. As a result, China's socialist construction has embarked on a new road of seeking truth from facts. So far, it has been advancing steadily.

At this historic turning point, it is of great significance for us to edit and publish the first economic almanac since the founding of the People's Republic.

The party and government have shifted the

emphasis of their work to economic construction. The whole Chinese people are confidently building a modern, powerful socialist country with a higher developed democratic structure and culture. Economic construction is not only a task for those who work in economic departments or who do research in this field. It is a task in which the entire Chinese people are engaged.

China's economic construction is an important component of the world economy. With the growth of its own economy, China will play an increasingly important role in the world's economy. Consequently, more people abroad will be taking an interest in how China's economy is faring.

Thus, in view of both domestic and international requirements, it is necessary to have an *Almanac of China's Economy* so as to systematically and accurately record China's general economic situation. Owing to lack of experience and the pressure of time, the contents of this almanac may not be comprehensive enough and there are bound to be mistakes. For the first time ever, however, this almanac is designed to provide a relatively complete picture of China's general economic situation, including statistical data which will be helpful to comrades and friends at home and abroad who are interested in China's economic development.

As the 1981 *Almanac* is also the first edition, it covers not only the economic situation of China in 1980, but also contains a general introduction to the basic situation during the years since 1949, including statistical information for that period. The *Almanac* will be published annually from now on and will serve as a historical record of the development of our national economy.

Our economy is now undergoing a great reform in its structure, system and organization. Reform must be guided by theory. The leading comrades in the Party Central Committee and in the State Council attach great importance to theoretical research. The Third Plenary Session of Party's 11th Central Committee reaffirmed the principle that practice is the only criterion of truth. It put forward the policy of emancipating our minds and seeking truth from facts. As a result, an unprecedentedly lively atmosphere has emerged in economic circles in which a hundred flowers are in blossom and a hundred schools of thought are contending. This *Almanac* also includes some articles published since the Third Plenary

Session. Owing to time limitations, the selection may not be comprehensive, but these articles do reflect the latest developments in theory during the current period. In this respect, we hope that this *Almanac* will also serve as an "Almanac of Economics."

Everything is difficult at the beginning. We came across a host of difficulties in soliciting contributions and editing and in printing and publishing the 1981 *Almanac*. All those difficulties were overcome with the support and co-operation of all parties concerned. The publication of this book within a few months' time shows that under the socialist system, by relying on cooperation, anything can be done and can be done efficiently.

Owing to our lack of experience and to negligence in our work, this book has many shortcomings, such as in accepting or rejecting materials, in checking and co-ordinating statistical data, as well as in designing the format, collating the book and overseeing its printing quality. All criticisms and suggestions will be appreciated. We hope that as the *Almanac* is published in each successive year our economic construction will forge ahead. With the support and cooperation of our readers, we will make our almanac series richer in content and better in quality with each edition, and in this way contribute to the socialist modernization of our country.

EDITOR'S NOTES

1. The *Almanac of China's Economy* will be published annually. The contents of future issues will not repeat those of previous issues.

2. The 1981 *Almanac*, the first issued, takes 1980 data as the primary focus of its contents. It also gives a brief account of the general situation during the 30 years from 1949 to 1979. Part of the book carries data from the period following the Third Plenary Session of the 11th Party Central Committee held in December 1978.

3. The 1981 *Almanac* consists of eight sections:

- I. General Survey of China
- II. Major Economic Documents, Works of Economic Policy, Laws and Decrees (1978-81)
- III. Monographic Studies on Current Economic Policy
- IV. Survey of China's Economy
- V. Chinese Economic Theory
- VI. Economic Statistics
- VII. Chronology of Major Economic Events in China
- VIII. Appendix

4. Section I, "General Survey of China," provides materials on China's history, geography, party, government and mass organizations.

5. Section II, "Major Economic Documents, Works of Economic Policy, Laws and Decrees," is a chronological compilation of materials for the period dating from the Third Plenary Session of the 11th Party Central Committee up to the end of 1980.

While this book was being prepared, the Sixth Plenary Session of the 11th Central Committee was held and "Resolutions on Certain Historical Problems Within the Party Since the Founding of the People's Republic of China" and the important speech of Comrade Hu Yaobang were published. For chronological purposes, these important documents should have been part of the 1982 *Almanac*; however, because of their relevance, they have been included in this edition and placed at the beginning of Section II.

6. Monographic Studies on Current Economic Policy (Section III) were written especially for the *Almanac* by well-known Chinese economists. They express the personal opinions of

the authors about the main problems facing our national economy.

7. The section on the "Survey of China's Economy" gives a general review of the economic situation in the different sectors and regions of China during the past 31 years, with emphasis on the situation in 1980. This section was prepared by experts who deal mainly with historical events but also express their personal views on current problems and trends. The general economic situation in 1981 will be dealt with in the 1982 edition of the *Almanac*.

8. Section V, "Chinese Economic Theory," broadly outlines our research on economic theory since the Third Plenary Session.

9. Section VI, "Economic Statistics," includes the bulletin of statistics for 1980 as well as principal statistics for the years 1949 to 1979. This data has been approved and verified by the State Statistical Bureau. This is the first occasion that these statistics have been made public.

Readers should note that Section IV, "Survey of China's Economy," includes statistics that may have been compiled through different methods. Thus, there may be discrepancies between these figures and those in Section VI. Readers studying a particular topic should take the statistics reported in Section VI as definitive.

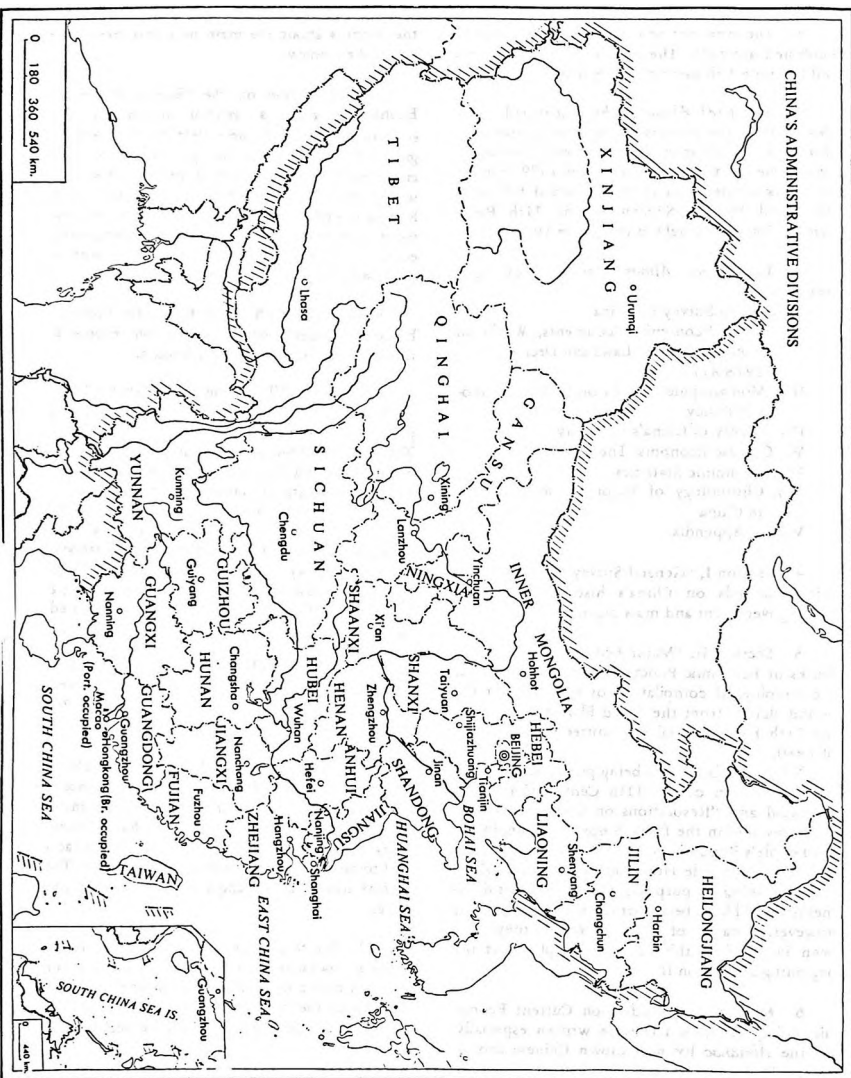

10. Section VII, "Chronology of Major Economic Events in China," consists of events from the Third Plenary Session (December 1978) to the end of 1980.

11. This *Almanac* follows the principle of "letting a hundred flowers blossom and a hundred schools of thought contend." The authors themselves are responsible for what they have written. They were required to base their writing on facts and to be accurate, but their views may differ. The editors have made changes only in wording and style.

12. Due to the complexity of the translation process, occasional discrepancies may occur between data published in the Chinese and English editions of the 1981 *Almanac*. In such cases, the Chinese-language edition should be regarded as definitive.

Editorial Department, *Almanac of China's Economy* July 1982

CHINA'S ADMINISTRATIVE DIVISIONS

SECTION I:

**GENERAL SURVEY
OF CHINA**

1. AN OUTLINE OF CHINESE HISTORY

By Zhu Jiazhen

*Institute of Economics,
Chinese Academy of Social Sciences*

China's Geographical Setting. Our great motherland is one of the largest countries in the world. Stretching from the Pamirs on the west to the Pacific Ocean on the east, from the Heilongjiang River in the north to the Nansha Islands in the south, China covers some 9,600,000 square kilometres in area, nearly equal in size to Europe. Within this vast territory, there are undulating mountains, criss-crossing rivers and expanses of rich land. The varied topography and climate give rise to widely different natural features in various areas as well as to abundant natural resources. Fertile plains produce rice, wheat, millet, corn, sorghum and beans, as well as cash crops, such as cotton, hemp, oilseeds and sugar. Luxuriant forests carpet the mountainous areas. Herds of cattle, sheep, horses, and camels are raised on extensive grasslands. Numerous rivers and lakes yield a variety of fish and aquatic products and are rich in hydroelectric power potential. Coal, iron, oil and other rare mineral resources lie hidden in the earth. From ancient times, the forefathers of the Chinese nation have laboured, lived and multiplied on this rich and beautiful land.

China's People. China's population of one billion includes many nationalities. Over 90% of the population are Hans, who inhabit about 40% of the country; the areas inhabited by the more than 50 minority races account for nearly 60%. Although their cultural development has differed, the nationalities all have long histories of their own. Throughout the long periods of historical development, the different nationalities, through mutual influence, constant intermingling, separation and merging, have together created China's splendid national culture.

Our motherland is also an important site in the development of mankind. The discovery of Peking Man, who lived about 500,000 years ago, and of the even earlier Lantian Man and Yuanmou Man, who lived about 1.7 million years ago, have testified to the presence of human activity in our vast country since remote antiquity.

Early Chinese Societies

Similar to many other nations of the world, the Chinese nation went through a long period as a society of primitive communes. Some 40-50,000

years ago, the primitive society entered a new stage of matrilineal clan communes, as evidenced by the remains of Liujiang Man, found in Guangxi, Ziyang Man, found in Sichuan, Hetao Man, found in Inner Mongolia, and Upper Cave Man, found at Zhoukoudian near Beijing. Evidence that the matrilineal clan communes were still thriving and prosperous about 6-7,000 years ago came to light with the discovery of the Yangshao Culture in the Huanghe River Valley.

Five thousand years ago, matrilineal clan communes gave way to patrilineal clan communes, an example of which was the Longshan Culture in the Huanghe River Valley. But, in ancient China, the pace of development of primitive society was uneven; the clan systems in the area from the middle and lower reaches of the Huanghe (Yellow) River to the Changjiang (Yangtze) River Valley developed more rapidly than those in other areas. Even in the same area, different clans developed in dissimilar ways. The Huangdi clan, which lived in the middle area and the later were revered as the ancestors of the Huaxia clan, was said to have developed more rapidly than all the others. Tang Yao and Yu Shun in ancient China, and the Xia, Shang and Zhou dynasties are all said to be descendants of the Huangdi clan.

Hereditary Kingships. The tradition of the crown being handed over by Yao to Shun and then to Yu reflected the rules and regulations of the primitive commune society. Around the 21st century B.C., Qi, son of Yu, broke with the tradition of handing over the crown and established the Xia Dynasty on a hereditary basis. This marked the collapse of the primitive commune system and the emergence of a society with the earliest slave-owning system. In the 16th century B.C., the Xia Dynasty was overthrown by the Shang clan living in the lower reaches of the Huanghe River. The rise of the Shang further advanced the slave-owning system. Then in the 11th century B.C., the Zhou clan in the middle reaches of the Huanghe River overthrew the Shang Dynasty and founded the Western Zhou Dynasty, with its system of enfeoffment. Later came the Spring and Autumn and Warring States periods, an era in which dukes and princes broke away from the central authorities and exercised their powers locally.

The Feudal Period. In 221 B.C., the Qin

Dynasty succeeded the Zhou Dynasty. After Qin Shihuang, the first Emperor of the Qin Dynasty, unified China, he set up an autocratic government with centralized power. From that time until the beginning of the Opium War in 1840, China remained a feudal society dominated by landlords. China's feudal society lasted more than 3,000 years after the Zhou and Qin dynasties; it was one of the longest periods of feudalism in the history of the world.

The Onset of Imperialism. After the Opium War, the capitalist and imperialist powers launched a series of aggressive wars against China and forced her to sign many unequal treaties, in order to occupy her territories by force, plunder her resources, extort war reparations, dominate her customs and communication lines, open banks, set up enterprises, monopolize her finances, and meddle in her internal affairs. As a result, China was reduced to the status of a semi-colony. At the same time, imperialist aggression wrecked China's self-centred national economy, hastened the disintegration of China's feudal economy, and spurred the development of her national bourgeoisie. But under the oppression of imperialism and feudalism, the development of China's national bourgeoisie was seriously hindered. Moreover, China's feudal forces formed an alliance with the imperialists to become the mainstay of the latter's rule over China. The combination of feudal exploitation and compradore capital — which served as capital for the imperialists as well as the usurers — turned China into a semi-feudal society. Imperialism and feudalism brought great suffering to the Chinese people, who struggled heroically against this two-fold oppression.

The Taiping Rebellion and the Republic of China. In 1851, the Taiping Rebellion led by Hong Xiuquan established the revolutionary power of the peasants. The rebellion lasted for 14 years and its influence spread to 18 provinces; it demonstrated the Chinese people's indomitable spirit of revolt. After the failure of the Taiping movement, the Revolution of 1911 led by Dr. Sun Yat-sen overthrew the ruling Qing Dynasty and established the Republic of China, a bourgeois-democratic republic. However, faced with the opposition of the warlords and their manipulators — the imperialist powers — the democratic revolution of the old type led by Dr. Sun Yat-sen soon failed. China was thrown into long drawn-out wars among warlords.

The Russian Revolution in October 1917 brought Marxism-Leninism to China, and produced great repercussions. In 1919, the May 4th Movement broke out in opposition to imperialism

and feudalism. The movement's thoroughness and lack of compromise demonstrated that the anti-imperialist and anti-feudalist bourgeois-democratic revolution had entered a new stage; it marked the beginning of the new democratic revolution led by the proletariat of China. After the May 4th Movement, came the gradual integration of Marxism-Leninism and the Chinese Workers' Movement. In July 1921, the first group of Marxists in China held the First National Congress of the Chinese Communist Party in Shanghai. The establishment of the Chinese Communist Party brought the disaster-ridden Chinese people their most reliable leadership. Thereafter, the Chinese revolution took on an entirely new look.

Growth of the Revolutionary Movement. In 1924, with the help of the Chinese Communist Party, Dr. Sun Yat-sen reshuffled his party, the Kuomintang, convened its first National Congress, and formulated his three main policies: "Ally with the Russians, with the Chinese Communist Party and help the workers and peasants." The formation of the united front between the Chinese Communist Party and the Kuomintang enabled the revolutionary movements of workers and peasants to make great strides forward.

After Dr. Sun Yat-sen's death in 1925, the Guangdong Revolutionary Government was reorganized to form the National Government. The following year, the National Government, pushed by the Chinese Communist Party, launched the Northern Expedition, aimed at overthrowing imperialists, warlords, and wiping out feudal forces. Warmly welcomed and sincerely supported by workers, peasant and revolutionaries, the revolutionary tide spread to the Changjiang and Huanghe river valleys in less than six months. The successful advance of the Northern Expedition and the rapid development of revolutionary movements seriously undermined the reactionary rule of imperialists and their lackeys.

While restoring directly to armed intervention, the imperialists lured the bourgeoisie into betraying the revolution. In April 1927, Chiang Kai-shek, who usurped the post of commander-in-chief of the national revolutionary forces, staged a counter-revolutionary coup d'état and slaughtered many Communists and revolutionaries. Hence, the First Revolutionary Civil War ended in failure. Later on, the Chinese Workers and Peasants Red Army established a revolutionary base in the Jinggang Mountains near the Hunan-Jiangxi border and its central revolutionary base at Ruijin in Jiangxi Province. There it formulated its strategy of conducting far-reaching agrarian reform in the rural areas and then encircling and capturing the cities.

The Long March. In October 1934, the Central Red Army withdrew from its base in Jiangxi and began its world-famous Long March, which covered 25,000 *li**. In October 1935, the Red Army succeeded in reaching Northern Shaanxi. During the Second Revolutionary Civil War, which lasted from 1927 to 1937, the Chinese people, under the leadership of the Chinese Communist Party, waged an extremely arduous and heroic struggle.

The Lugouqiao Incident, staged by the Japanese imperialists on July 7, 1937, marked the beginning of a nationwide war against Japanese aggression. During the eight-year anti-Japanese war, the Chinese Communist Party beat back three anti-Communist offensives launched by the Kuomintang and exposed their plots to surrender to the Japanese imperialists. In August 1945, with Japan's unconditional surrender, the Chinese people won a great victory. But in 1946, shortly after the victory over Japan, Chiang Kai-shek, backed by the U.S. imperialists, launched an all-out civil war. After three years of people's war, the Chinese people finally wiped out Chiang Kai-shek's armed forces and overthrew his reactionary rule.

Founding of the People's Republic of China

In October 1949, the People's Republic of China was founded and the Chinese people, led by the Chinese Communist Party, marched into a new era of socialism.

Within three years of its founding, New China had healed the wounds of long drawn-out wars, successfully completed the agrarian reform movement and the movement to suppress counter-revolutionaries left over from the democratic revolution, and launched campaigns to eradicate the "three evils" and the "five evils."

During the war to resist U.S. aggression and aid Korea, China's economy was restored to the highest level it had achieved under the old regime. Upon this foundation began the First Five-Year Plan to develop the national economy. In the countryside, the completion of agrarian reform was followed by a series of measures based on the principle of voluntary participation and mutual benefit. With some units setting an example, the transition was made from mutual aid teams to elementary and advanced agricultural producers' cooperatives. Thus the peasants were led smoothly onto the road of agricultural cooperation. In the cities, the socialist transformation of capitalist industry and commerce was carried out as follows: state orders were placed with private enterprises for the processing of materials or the supply of

manufactured goods; a state monopoly was set up for purchase and marketing; products of state-owned enterprises were marked by private shops; and joint state-private ownership of enterprises was started. The historical task of peaceful transformation of the capitalist sector of the economy was thus successfully accomplished.

Socialist Transformation of the Economy. In 1957, following the successful completion of the First Five-Year Plan, China embarked on the socialist transformation of agriculture, handicrafts and capitalist industry and commerce.

In the 31 years since Liberation, China's socialist economy has achieved tremendous successes. Compared with the years immediately after Liberation, production of grain has increased by 2.7 times, cotton by 4.9 times; meanwhile, the iron and steel, power, oil, coal, chemical, engineering, light and textile industries have developed greatly and many new industries have emerged. Especially in the vast inland and minority nationality regions, where there were few industries before Liberation, a great many new industrial bases have been built. Industrial enterprises in China now number 350,000. Fixed assets of state-owned enterprises amount to 320,000 billion yuan, 25 times the total industrial fixed assets accumulated in the last 100 years prior to Liberation. Progress in communications and transportation, as well as posts and telecommunications has opened up many places which were once inaccessible. Domestic and foreign trade are flourishing, and the people's living standard has risen considerably.

With the development of the socialist economy, the ranks of intellectuals are growing steadily. The total number of students in school amounts to 210 million, more than seven times the number in the peak year before Liberation. China's achievements in science and technology are evidenced by the successful tests of the atom bomb, hydrogen bomb and guided missiles, the launching and retrieving of man-made satellites and the production of synthetic bovine insulin, etc. China's system of free medical service and cooperative medical service has virtually eradicated acute infectious diseases; as a result, mortality has dropped greatly while the general health of the population has markedly improved. The tremendous achievements and experiences gained in socialist construction have laid a solid foundation for the realization of the four modernizations, and for the building of a socialist society with high economic and moral standards.

China's Scientific Achievements

The Contributions of Ancient China. China,

*One *li* equals half a kilometre.

one of the world's most ancient countries, has a civilization over 4,000 years old. Early in the Xia Dynasty, about 4,000 years ago, the first astro-nomic calendar, the Lunar Calendar, was invented and the earliest system of characters was formed. In the Shang Dynasty, more than 3,000 years ago, the technology for smelting bronze and then iron was developed. In ceramics, China's white pottery and glazed pottery achieved a quality close to that of primitive chinaware. The flourishing art of silk weaving led to the earliest jacquard weaving in the world. Significant technical achievements were also made in the manufacture of lacquerware, tanning hides, working with wood and bamboo, building vessels and vehicles, architecture, etc. Musical instruments were made of gold, stone, bamboo, wood, leather, silk, pottery and other materials. In the wake of the division of labour and exchange, metal money and copper coins as well as historical documents, ancient books and records in written form came into being. Much knowledge concerning the astronomic calendar, mathematical formulas, medical science and hygiene was contained in oracle instructions.

In the Western Zhou Dynasty, bronze tools were widely employed in farming, and iron-smelting and tile-making became specialized. The technological level of glazed pottery approached that of chinaware. Both the vehicle and ship building industries were further developed, and articles crafted of jade, such as "Guibi," reflected a very high level of technological sophistication. With the development of the exchange economy in this period, markets appeared in big cities.

During the Spring and Autumn Period, steel-making came into existence; mathematics became an independent subject; achievements in geometry were quite successful, while other branches of learning, such as geography, biology, medical science, *materia medica* and veterinary science all developed considerably. Prior to the Warring States Period, great advances were made in mathematics, mechanics, mechanical manufacturing, medical science and astronomy. Among the achievements were: "Ju Gao," an artificial irrigation device operating on the level principle; a crossbow device constructed on the basis of a wheel axle; and the chronograph called the "Dripping-Hourglass" by later generations. The invention of the compass made a particularly brilliant contribution to the civilization of mankind. In astronomy, a tremendous achievement was "Gan Shi Xing Jing," the first list of fixed stars in the world which recorded 800 fixed stars and gave the positions of 120 of them. In medical science, there was "Huang Di Nei Jing," the first medical book in Chinese history. The period also produced

the famous artisan Gong Shuban, and the renowned doctor Bian Que.

Han Dynasty Contributions. During the Han Dynasty, the outstanding astronomist, Zhang Heng, invented the armillary sphere, to study astronomical phenomena, and the seismograph, to detect earthquakes. Cai Lun invented the science of papermaking, which spread from China to Japan via Korea in the 7th Century, to Arabia in the 8th century and to Europe in the 12th century, making a great contribution to culture and science the world over.

In the Eastern Han Dynasty, the famous "Arithmetic of Nine Chapters" was completed, making an important contribution to the history of mathematics in the world while marking the formation of a perfect system in China's ancient mathematics. The first complete work on *materia medica* and botany, "Shen Nong Ben Cao Jing," was also written at this time. It was during the Han Dynasty, the first stable and prosperous period in China's history under centralized rule, that large-scale water-conservation projects were built, opening up and irrigating vast areas of land, and newly developed farming tools and techniques were popularized, thus promoting the advancement of agriculture. Further advances were made in the iron and steel, ceramics, silk weaving and other handicraft industries. For example, the invention of the picture-weaving machine toward the end of the Western Han and the beginning of the Eastern Han Dynasty made it possible to weave truly exquisite silks.

During the Han Dynasty, both domestic and foreign trade flourished, turning many large cities like Luoyang, Handan, Linzi, and Chengdu into commercial centres, while Chang'an became the national centre of domestic and foreign trade. Having defeated the Xiongnu aggressors many times, the Han Dynasty sent large numbers of people to settle in the border areas and open up vast farm lands, thus pacifying the frontiers, promoting the development of economy and culture in border areas, and paving the way for economic and cultural exchange with foreign countries. Zhang Qian travelled to the Western Regions in the Western Han Dynasty, and Ban Chao was sent there as an envoy in the Eastern Han Dynasty. Both rendered memorable service in cementing relations between the Han Empire and the nations of the Western Regions.

Thereafter, various kinds of products, musical instruments and Indian Buddhist philosophy and arts were brought from the West to China, while many aspects of Western Han culture travelled to the West. In return, the transmission of China's advanced production technology to the Western

Regions accelerated the latter's economic and cultural development. The sons of nobles in the Western Regions frequently were sent to Chang'an to study Han culture. China's elegant and gorgeous silk articles, shipped to Europe through Persia, were prized by Europeans, and the road from China to Persia became famous as the "Silk Road," a symbol for the exchange of economy, culture and friendship between the Chinese and Western peoples. China's steel-making technology was also disseminated to the West at that time, promoting the development of Western civilization.

At the time of the Northern and Southern dynasties, the famous scientist Zu Chongzhi was the first to calculate accurately the numerical value of the ratio of the circumference of a circle to its diameter as between 3.1415926 and 3.1415927. He was the first person in the world who arrived at seven figures after the decimal point. The "Da Ming Calendar," also worked out by Zu Chongzhi, determined the exact number of days of one tropical year as 365.24281481, and the period in which the moon circles the earth as 29.21222 days. Compared with the results obtained by using modern means of calculation, his error was merely a few seconds.

In the Northern Wei Dynasty, Li Daoyuan produced the "Shui Jing Zhu," an outstanding work on the history and geography of ancient China, and Jia Sisi completed his "Important Principles for Farmers," China's first comprehensive text about farming. The technique of steel-pouring, developed during the Northern Qi Dynasty, greatly improved steelmaking.

Contributions of the Sui, Tang, Song, Yuan, Ming and Qing. The technology of block printing was developed during the 6th century, under the Sui Dynasty. At the beginning of this dynasty, the artisan Li Chun built the Zhaozhou Bridge, the world's oldest single-arch stone bridge still in existence. Constructed 700 years before the Selie Bridge was built in France in 1312, the Zhaozhou Bridge remained in good condition even after the big earthquake in Xingtai in 1966.

The Tang Dynasty, another great period in Chinese history, was marked by a thriving economy and culture, flourishing agriculture, advanced handicrafts and brisk trade. At that time, weaving, dyeing, ceramics, smelting, metalcasting, printing, papermaking, shipbuilding and other industries all developed considerably. Many large, densely populated cities with a multitude of shops sprang up and a network of land and water communication lines, with over a thousand posts, extended all over the country. Also during the Tang Dynasty, the monk Yixing edited the "Da Yan Calendar" and discovered the phenomenon of the

movement of fixed stars. He was also the first man in the world to survey the meridian line.

As a result of repeated victories in repulsing invasions by the Western and Eastern Tujue, the Tang Dynasty cleared up frontier troubles and extended the land and water routes leading to foreign countries. Among them were the route leading to Central Asia and Europe, the route from Sichuan to Nepal and India and the route from Yunnan to Burma. China's huge ships navigated the turbulent waves of the Persian Gulf. Communications with foreign countries in the Tang Dynasty expanded beyond the "Silk Road." Numerous economic and cultural contacts were established with Korea, Japan, India, Pakistan, Ceylon, Afghanistan, Iran, Arabia, etc. Contacts with Japan were especially profuse; on 13 occasions, Japan sent large numbers of students and Buddhist monks to China to study the Han culture, and the Chinese monk Jian Zhen made several voyages to Japan. The areas influenced by Tang China's politics, economy and culture extended from Japan in the east across Congling in the west to the eastern coast of the Caspian Sea. The Eastern Roman Empire (called Da Qin since the time of the Han Dynasty) frequently sent diplomatic envoys to China. The brilliant culture of the Sui and Tang dynasties profoundly influenced the ancient civilizations of Europe and Asia.

During the Northern Song Dynasty, Bi Sheng invented typography 400 years before the Europeans; Shen Kuo compiled the "Meng Xi Bi Tan," China's first encyclopedia, which covered the development of ancient science and technology; and Wang Weiyi, a medical scientist in acupuncture and moxibustion, devised the "Chart of Acupunctural Curing Points on a Copper Model," a great contribution to this subject.

In the Yuan Dynasty, the methods of tin and wood-block printing were perfected on the basis of Bi Sheng's typography. This achievement soon spread to Iran, then to Europe and all over the world, contributing greatly to the development of the world's culture. In 1280, the scientist Guo Shoujing worked out the "Shou Shi Calendar," which took 365.2425 days as one year, the same as the present-day Gregorian calendar. In 1313, the agronomist Wang Zhen wrote the massive 300,000-word "Book on Agriculture," the most comprehensive encyclopedia on farming after Jia Sisi's "Important Principles for Farmers."

Gunpowder, which was invented long ago in China, was first used for military purposes in the Tang Dynasty. In the Southern Song Dynasty, its use spread to Arabia and then to Europe. But the application of gunpowder and firearms in Europe came at least 300 years later than in China. In the

Yuan Dynasty, cannons cast with copper pipes appeared, a turning point in the world's history of weaponry.

In the Ming Dynasty, China produced a great number of important works in science and technology, including: "The Compendium of Materia Medica" by Li Shizhen; "The Encyclopedia of Agricultural Management" by the agronomist Xu Guangqi; "The Adventure of Xu Xiake" by the geographer Xu Hongzu; and "Tian Gong Kai Wu," a book on agriculture and handicrafts by Song Yingxing.

In the Qing Dynasty, further contributions to the development of modern science and technology were made by the mathematician Wang Xichan, astronomer Mei Wending, botanist Wu Qijun, and especially railway engineer Zhan Tianyou and hydraulic engineer Li Yirang.

Contributions Under the People's Republic. Since the founding of the People's Republic of China, many scientists and technical specialists like Li Siquang have made great contributions on different fronts to China's socialist construction. For thousands of years, the valiant and industrious Chinese people have enriched the treasure-house of science and human civilization with their intelligence and wisdom.

China is a nation which ardently loves liberty and is imbued with revolutionary traditions. During the thousands of years of feudal rule, there were hundreds of peasant uprisings and wars against aggression. Many revolutionary leaders and national heroes, such as Yue Fei, Wen Tianxiang, Qi Jiguang, and Zheng Chenggong have emerged. Their unswerving loyalty to the motherland and dauntless heroism in struggle embodied the great patriotism of the Chinese people. The Chinese nation has always been a nation with glorious revolutionary traditions and patriotic spirit.

The Chinese people have in their long history fashioned a very rich culture and civilization. For thousands of years, China has produced many outstanding thinkers, statesmen, military strategists, writers, historians, and revolutionaries. Among the thinkers are: Lao Dan, Kong Qiu (Confucius), Me Di, Shang Yang, Meng Ke (Mencius), Zhuang Zhou, Xun Kuang, Han Fei, Lu Jia, Ja Yi, Dong Zhongshu, Wang Chong, Ran Ji, Ji Kang, Fan Zhen, Xuan Zhuang, Li Gu, Wang Anshi, Ye Shi, Zhu Xi, Li Zhi, Huang Zongxi, Gu Yanwu, Wang Fuzhi, Dai Zhen, Gong Zizhen, Hong Rengan, Yan Fu, Kang Youwei, Liang Qichao, Tan Sitong, Zhu Zhixin and Zhang Taiyan. Among the writers and historians are: Qu Yuan, Si Maqian, Ban Gu, Zheng Xuan, Tao Qian, Liu Zhiji, Li Bai, Du Fu, Han Yu, Liu Zongyuan, Liu Yuxi, Si Maguang, Ou Yangxiu, Su Shi, Li Qingzhao, Lu You, Xin Qiji,

Wang Shifu, Guan Hanqing, Shi Naian, Luo Guanzhong, Wu Chengen, Pu Songling, Cao Xueqin, Lu Xun, and Guo Moruo. Chinese statesmen include: Ying Zhen, Liu Bang, Cao Cao, Zhu Geliang, Li Shimin, Songzan Ganbu, Zhu Yuanzhang, Aixin Jueluo Xuan Hua. Some military strategists are: Sun Wu, Wu Qi, Sun Bin, Wei Qing, Huo Qubing, Genghis Khan. And famous revolutionaries include: Chen Sheng, Wu Guang, Zhang Jiao, Hunag Chao, Zhong Xiang Li Zicheng, Hong Xiuquan, Sun Yat-sen, Li Dazhao, Qu Qiubai, Mao Zedong, Zhou Enlai, Liu Shaoqi and Zhu De. Their outstanding thoughts and deeds as well as their talented administration and military accomplishments in history have radiated for thousands of years with the brilliance of thought and culture of the great Chinese nation.

Countless Chinese sages had made great contributions to enrich the culture and civilization of mankind. Enslavement and invasion by capitalist powers in the last hundred years seriously hindered the development of China's social economy, science and culture. But the Chinese people fought heroically and, eventually, under the leadership of the Chinese Communist Party, overthrew the three big mountains (imperialism, feudalism, bureaucrat capitalism) and paved the way for the rejuvenation of the Chinese nation. Comrade Mao Zedong said in 1949: "Since they learned Marxism-Leninism, the Chinese people have ceased to be passive in spirit and seized the initiative. That period of modern world history in which the Chinese and Chinese culture were looked down upon should have ended from that moment. The great, victorious Chinese People's War of Liberation and the people's revolution have rejuvenated and are rejuvenating the great culture of the Chinese people."

In the past 31 years, the Chinese people, led by the Chinese Communist Party, have made gratifying achievements in socialist revolution and construction despite twists and turns. While assimilating the advanced science and culture of foreign countries, the Chinese people are determined to uphold the glorious traditions of their own time-honoured culture and to struggle to realize the modernization of socialism as well as the prosperity of the motherland. Comrade Mao Zedong once predicted: "By the year 2001, at the beginning of the 21st century, China will have undergone an even greater change. It will have become a powerful industrial socialist country. And that is as it should be. China is a country with an area of 9,600,000 square kilometres and a population of 600 million, and it ought to make a greater contribution to humanity." The 21st century is bound to be an age in which the Chinese people will write even more brilliant pages in history.

A BRIEF CHRONOLOGY OF CHINESE HISTORY

	Xia Dynasty	circa 2100–1600 B.C.
	Shang Dynasty	circa 1600–1066 B.C.
	Western Zhou Dynasty	circa 1066–771 B.C.

2. AN OUTLINE OF CHINA'S NATURAL GEOGRAPHY

By Niu Wenyan and Zhao Songchiao

*Institute of Geography,
Chinese Academy of Sciences*

I. Territory and Location

China has a territory of 9.6 million square kilometres, which accounts for 6.5% of the total land area on the globe. Next to the Soviet Union and Canada, it is the third largest of the more than 150 countries of the world. Its territory is about the size of Europe, which embraces 32 countries.

The eastern tip of China's territory is located at longitude $135^{\circ}5'E.$, at the confluence of the Ussuri River and the Heilongjiang River to the east of Fuyuan County, in Heilongjiang Province. The western tip is at $73^{\circ}40'E.$, in the Pamirs, west of Wujia County in the Xinjiang Uygur Autonomous Region. From east to west, the country extends for 5,200 kilometres, straddling 62 degrees of longitude, with a time difference of more than four hours. China's territory from north to south measures over 5,500 kilometres, starting in the north from the middle section of the Heilongjiang River north of Mohe in Heilongjiang Province, reaching in the south the Zengmu Reef on the southern tip of the Nansha Islands. The entire land boundary measures 22,800 kilometres.

Territorial Waters and Coastline. In addition to vast land territory, China has immense territorial waters and numerous islands. To the east of China's mainland, from north to south, are the Yellow Sea, the East China Sea and the South China Sea. The Bohai Sea, enclosed by the Shandong Peninsula and the Liaodong Peninsula, is the country's inland sea. The entire coastline from the mouth of the Yalu River in the north to the mouth of the Beilun River in the south extends for more than 18,000 kilometres. If the coastline of the offshore islands is included, the total length of China's boundaries exceeds 32,000 kilometres, one of the longest coastlines in the world.

Islands. China has more than 5,000 islands, big and small, with a total area of some 80,000 square kilometres. Taiwan is the biggest island, with an area of 35,760 square kilometres, followed by Hainan Island, with an area of 32,200 square kilometres.

China occupies a unique position on the globe: (1) Its land area in the Northern Hemisphere totals 9.56×10^7 square kilometres, almost twice as big as the area of 5.32×10^7 square kilometres located in the Southern Hemisphere. The

former is usually regarded as the hemisphere of land and the latter as the hemisphere of water. (2) Two-thirds of China is located in the Eastern Hemisphere, which has a land area of 10.23×10^7 square kilometres, and one-third of it is in the Western Hemisphere, with an area of 4.65×10^7 square kilometres. The former is called the hemisphere of land and the latter the hemisphere of water. (3) The land area located in the eastern half of the Northern Hemisphere measures 7.14×10^7 square kilometres, three times as large as that in the western part, which is 2.42×10^7 square kilometres. From the above, one can see that China is situated in an area of the world where land is most concentrated.

China is situated in the eastern part of Asia, the largest continent on the globe, on the western edge of the world's biggest ocean, the Pacific Ocean, and most of its territory is in the middle latitudes. This location explains the extraordinary features of China's natural geography: the monsoon climate prevails, temperate and subtropical zones together account for 71.7% of the country's total area, and humid (plus semi-humid) areas and arid (plus semi-arid) areas each make up 50% of the country's total land mass.

Korea borders China in the northeast; the Soviet Union in the northeast and southwest; the People's Republic of Mongolia in the north; Afghanistan and Pakistan in the west; India, Nepal, Bhutan and Sikkim in the southwest; and Burma, Laos and Vietnam in the south. To the east and southeast, across the sea, China faces Japan, the Philippines, Malaysia, Indonesia, etc.

II. Contours of the Landform

Generally speaking, China's terrain is high in the west and low in the east, sloping down like a staircase. There are roughly four stairs from west to east: The Qinghai-Tibet Plateau in the southwest forms the highest stair with an average altitude of more than 4,000 metres above sea level; it is known as "the roof of the world." The second stair starts from the outer rim of the Qinghai-Tibet Plateau and extends eastward to the Da Xinggan, Taihang, Wushan and Xuefeng mountains. It includes vast plateaus such as the Inner Mongolia Plateau, the Loess Plateau and the Yunnan-Guizhou Plateau, and broad basins such as the

Tarim Basin, the Junggar Basin and the Sichuan Basin, with an average height of 1,000–2,000 metres. The third stair starts from the line linking the above-mentioned mountains and stretches eastward to the coast. Basically it comprises areas where low mountains, hills and plains alternate with each other, most areas being below 500 metres. At this level are China's biggest plains, such as the Northeast Plain, the North China Plain and the Middle-Lower Changjiang Plain. The fourth stair is an extension of the China mainland into the ocean, or the continental shelf, forming China's inland sea, the Bohai Sea, and the marginal seas — the Yellow, East China and South China seas — with waters generally less than 200 metres deep.

If a line is drawn from the Helan Mountains through the Liupan and Longmen mountains to the Ailao Mountains, dividing China into eastern and western parts, the areas west of this line have huge differences in topographical heights and marked vertical zonality, while the areas east of this line display relatively small differences in topographical heights but great latitudinal zonality.

Mountainous Areas. China has a complex terrain and numerous mountains. Mountains, plateaus and hills together make up 65% of the country's total area. Calculated in terms of their height, the areas less than 500 metres above sea level account for only 16% of the country's total land; areas between 500 and 1,000 metres above sea level make up about 19%; those between 1,000 and 2,000 metres about 28%; those between 2,000 and 5,000 metres about 18%; and those exceeding 5,000 metres 19%. There are 12 peaks in the world surpassing 8,000 metres above sea level and 7 of them are in China. Mount Qomolangma [Mount Everest — *Ed.*], the world's highest peak, is located on the border between China and Nepal. After repeated measuring by various means, Chinese surveyors have established the absolute height of the world's highest peak to be 8,848.13 metres. Between Mount Qomolangma and Lake Aydingkol (a dried up lake at 154 metres below sea level) in the Turpan Depression of Xinjiang, which is the second lowest point on the globe, the difference in topographical height is great than 9,000 metres, a phenomenon unknown in other parts of the world.

According to their arrangement and orientations, China's mountains can be divided into the following systems:

A. East-west ranges: Mainly the Tianshan-Yinshan-Yanshan Mountains, the Kunlun-Qinling-Dabie Mountains, the Nanling Mountains.

B. North-south ranges: Mainly the Helan

Mountains, the Liupan Mountains and the Hengquan Mountains.

C. North-east ranges: Mainly mountains controlled by the Cathysian tectonic system, such as the Changbai, Da Hinggan, Taihang and Wushan mountains.

D. North-west ranges: These include and the Altay Mountains and the Qilian Mountains.

E. Arc-shaped ranges: Chiefly the Himalaya Mountains and the mountains in Taiwan.

The interweaving of different ranges forms a huge network of mountains, which constitutes the basic framework of China's topographical pattern.

In macrostructure, China's terrain can be divided into three zones: (1) The eastern humid monsoon zone, in which running water plays a key role; (2) the northwest arid zone, in which denudation by wind and running water play an equally important role; and (3) the Qinghai-Tibet Plateau zone, where frost plays a major role.

III. China's Coastal Seas

Contiguous to China's mainland are four seas, namely, the Bohai Sea, the Yellow Sea, the East China Sea and the South China Sea. The Bohai is China's only inland sea.

The four seas form an arc running from northeast to southwest, encircling the country's eastern and southeastern coasts. They straddle temperate, subtropical and tropical zones with a total area of over 4.7 million square kilometres. The dividing line between the Bohai Sea and the Yellow Sea runs from the Laotieshan Cape on the southern end of the Liaodong Peninsula through the Miaodao Islands to the Penglai Cape on the northern end of the Shandong Peninsula. The Yellow Sea is divided from the East China Sea by a line running from the northern bank of the mouth of the Changjiang (Yangtze) River to the southwestern corner of Korea's Cheju-do Island. The division between the South China Sea and the East China Sea runs from the southern tip of Dongshan Island in Fujian Province through the southern side of the Taiwan shoals to Eluanbi on the southern tip of Taiwan Island.

Bohai Sea. The Bohai Sea is an almost completely enclosed shallow body of water encircled by the mainland on the west, north and south, and linking up with the Yellow Sea in the east through the Bohai Straits, which are 57 nautical miles wide. With an area of 77,000 square kilometres, the Bohai Sea has an average depth of 18 metres, the deepest place being 70 metres. The three big bays of the Bohai Sea are Liaodong Bay in the north, Bohai Bay in the west and Laizhou Bay in the south.

The Yellow Sea is a half-enclosed shallow sea with an area of some 380,000 square kilometres. Situated entirely on the continental shelf, it has an average depth of 44 metres, the deepest place being about 140 metres. Adjoining the China mainland to the west and facing Haizhou Bay and Jiaozhou Bay, the Yellow Sea touches on the Korean Peninsula in the east and meets the East China Sea in the south.

East China Sea. The East China Sea is an open shallow sea with an area of 770,000 square kilometres and an average depth of 370 metres, the deepest place being 2,719 metres. To the east of the China mainland, it adjoins the Yellow Sea in the north and links up with the South China Sea through the Taiwan Straits in the south.

South China Sea. The South China Sea is a large deep sea basin with an area of 3.5 million square kilometres and an average depth of 1,212 metres, the deepest place being 5,559 metres. Touching the China mainland in the north, it faces the Pacific Ocean beyond the Philippine Islands and the Indian Ocean beyond the Sunda Islands, and borders on the Indo-China Peninsula and the Malay Peninsula in the west. It links up with the East China Sea through the Taiwan Straits, with the Pacific Ocean through the Bashi Channel and Balintang Channel, with the Sulu Sea through the Mindoro Strait and the Balabac Strait, with the Java Sea through the Karimata Strait and the Gelas (Gaspar) Strait, and with the Indian Ocean through the Straits of Malacca and the Singapore Strait.

If a line is drawn from Hainan Island through Taiwan to the Wudao Islands, we find a gentle continental shelf area, or extension of the China mainland northwest of this line; and an area with complex terrain, including continental slopes, sea troughs or deep sea basins southeast of this line. The continental shelf takes up a large proportion of China's offshore seas. It is generally more than 100 nautical miles wide, with a gradient of less than $0^{\circ}02'$ and a depth of around 100 metres.

China's offshore seas are studded with numerous islands, a multitude of harbours, good fishing grounds and wide beaches; they are also rich in oil resources, raw materials for the chemical industry and marine life. All this adds up to excellent potential for the development of China's marine industry.

IV. Monsoonal Climate

China's vast territory embraces a wide variety

of climates. On the basis of temperature, the country can be divided into six temperature zones from south to north: the equatorial zone, tropical zone, subtropical zone, warm-temperate zone, temperate zone and frigid-temperate zone. This division was made by the Natural Regionalization Committee of the Academy of Sciences of China in accordance with the aggregate active temperature of the period in which the average daily temperature equals or exceeds 10°C . The natural features corresponding to each zone are shown in Table 2.

According to moisture conditions, the area from the East China coasts to the northwest hinterlands can be divided into humid, semi-humid, semi-arid and arid regions. If aridity is taken as the main reference index, the country can be divided into: (1) A humid region, accounting for 32.2% of the country's total area, in which aridity is less than 1.0, precipitation exceeds evaporation, and natural vegetation is forest; (2) A semi-humid region, accounting for 14.5% of the country's total area, in which aridity is 1.0–1.5, precipitation roughly equals evaporation, and natural vegetation is forest grassland; (3) A semi-arid region, accounting for 21.7% of the country's total area, in which aridity is 1.5–2.0, evaporation exceeds precipitation, and natural vegetation is dry grassland; and (4) An arid region, accounting for 30.8% of the country's total area, in which aridity is greater than 2.0, evaporation far exceeds precipitation, and natural vegetation is desert grassland and desert.

Monsoonal Characteristics. Owing to differences in the heat-absorbing capacity of the continent and the ocean, the seasonal displacement of the planetary wind belt and other factors, China has a typical monsoonal climate: in winter, north-east and north-west winds prevail; in summer, south-east and south-west winds prevail. Due to the cyclical movement of the monsoons and the terrain, the country has four distinct seasons with rainfall concentrated in the hot season. The cold wave, cyclones, seasonal rains and typhoons are responsible for the types of climate usually seen in China. As southeastern China is close to the ocean, the humid southeast monsoon not only directly affects the southern provinces in summer, causing humid and hot weather, but also penetrates into the hinterland. The increase in precipitation along with the rise in temperature creates the most favourable conditions for agriculture. In most areas, rainfall is concentrated mainly in the six summer months from May to October — particularly July, August and September. From south-east to north-west, precipitation decreases, the rainy season becomes progressively shorter and more concentrated, and precipitation variability

becomes greater. For instance, the isopleth of average annual precipitation of 400 mm between the Songliao Plain in the northeast and the Inner Mongolia Plateau divides the region into two parts: the eastern part belongs to the humid and semi-humid region, while the western part belongs to the semi-arid and arid region.

Continental Factors. Another outstanding feature of China's climate is its strong continental character. This is not only manifested strikingly in the northwest hinterlands which are scarcely affected by the oceanic air stream, but also shows clearly in the eastern and southern humid regions which are close to the ocean. It finds expression mainly in the country's highly variable temperature and precipitation and the great differences between their extremes. Take the mean temperature of January and July, for instance. Winter temperatures in China are much lower than those on other continents at the same latitudes while summer temperatures are much higher. The mean January temperature of Huma in Heilongjiang Province is -27.7°C while that of London, which is on the same latitude, is 4°C , a difference of 31.7°C .

Table 1: China's Climatic Extremes

1. Lowest mean temperature in January	-30.9°C	Mohe, Heilongjiang
2. Absolute lowest temperature	-52.3°C	Mohe, Heilongjiang
3. Extreme highest temperature	48.1°C	Turpan, Xinjiang
4. Maximum annual precipitation	8,408 mm	Huoshaoiao, Taiwan Province
5. Minimum average annual precipitation over the years	3.9 mm (only 0.5 mm in 1968)	Toksun, Xinjiang
6. Maximum rainy days	274 days	Tongzi, Guizhou
7. Maximum foggy days	327 days	Emei, Sichuan
8. Maximum average cloud volume over the years	8.9	Guiyang, Guizhou
9. Maximum strong wind days	217.2 days	Jiuxian Mountain, Qinghua, Fujian
10. Maximum days of fresh gale and above	138.2 days	Magong Island of the Penghu Islands
11. Maximum sunshine hours	3,370 hours	Gar and Tingri, Tibet
12. Maximum sunshine value	1.729 calories/mm ²	Dong Rongbu Glacier, Tibet

The overall picture of China's climate is as follows: the South China Sea islands enjoy summer all year round; Guangdong, Guangxi, Fujian, Taiwan and southern Yunnan have long summers and no winters; Heilongjiang Province and the Inner Mongolia Autonomous Region, the Changbai, Tianshan and Altay mountains and the surrounding areas of the Qinghai-Tibet Plateau have long winters and no summers with spring and autumn linked together; the Qiangtang Plateau in

Tibet has winter all year round; most other areas are cold in winter and hot in summer with four distinct seasons.

V. Land Hydrology

China is rich in surface water. Take rivers for example. The country has more than 50,000 rivers each with a drainage basin of over 100 square kilometres, more than 1,600 rivers each with a drainage basin of over 1,000 square kilometres, 20 rivers each with a length of over 1,000 kilometres. In addition, there are lakes, marshes, glaciers and snowfields as well as subterranean water. The total length of China's rivers is estimated at 226,800 kilometres. The total runoff volume is 260,000 million cubic metres, 6.8% of the total runoff volume of all the rivers on the globe or 20% of the total runoff volume in Asia, ranking third in the world after Brazil and the Soviet Union. With a reserve of 680 million kilowatts, China tops the world in water resources.

Rivers. China's numerous rivers form a host of drainage systems: the Heilongjiang River, Liaohe River, Haihe River, Huanghe (Yellow) River, Huaihe River, Changjiang (Yangtze) River, Jiujiang

(Pearl) River, southeast coastal rivers, island rivers of Taiwan and Hainan Island, southwest rivers, Arctic Ocean rivers, inland rivers of the North Tibet Plateau, inland rivers of Xinjiang, inland rivers of Qaidam in Qinghai, and inland rivers of Gansu and Inner Mongolia. Table 3 lists the drainage areas of China's exterior rivers, i.e., rivers that flow into the sea, and those of enclosed inland rivers.

Most of the trunk streams of China's exterior

river system originate in the three modern geological rising belts: (1) Rising in the eastern part and the southern rim of the Qinghai-Tibet Plateau are such well-known great rivers as the Changjiang, Huanghe, Lancang, Nuijiang and Yarlung Zangbo; (2) rising in the belt linking the Da Xinggan Mountains, the mountains in Hebei and Shanxi, the mountains in western Henan and the Yunnan-Guizhou Plateau are the Heilongjiang, Liaohe, Haihe, Huaihe and Xijiang rivers; (3) rising in the belt joining the Changbai Mountains, the Shandong hills and the southeastern hills are the Tumen, Yalu, Xinmu, Qiantang, Minjiang, Jiulong and Hanjiang rivers as well as the Dongjiang and Beijing tributaries of the Zhujiang River.

As precipitation decreases gradually from the southeast to the northwest, the distribution of

surface runoff also shows obvious signs of zonation. (1) The abundant water region, with a runoff deeper than 900 mm, corresponds to the subtropical and tropical evergreen forest area; (2) the adequate water region, with a runoff depth between 220 and 900 mm corresponds to the deciduous broadleaf and evergreen broadleaf forests area; (3) the transitional region, with a runoff depth between 50 and 200 mm, corresponds to the mixed deciduous broadleaf and evergreen broadleaf forest area; (4) the scarce water region, with a runoff depth between 10 and 50 mm, corresponds to the semi-desert and grassland area; and (5) the arid region, with a runoff depth of less than 10 mm, corresponds to the desert area. The balance of water volume in China is shown in Table 4.

Table 2. China's Temperature Zones

Temperature Zone	Latitude	Aggregate Active Temperature in Period $\geq 10^{\circ}\text{C}$	Major Natural Features
Equatorial zone	South of 15°N	Around $9,500^{\circ}\text{C}$	Sweltering heat all year round; tropical rain forest; latosol.
Tropical zone	$15^{\circ}-23^{\circ}\text{N}$	$8,000^{\circ}-9,000^{\circ}\text{C}$	Average temperature of the coldest month is above 16°C ; tropical monsoon rain forest; three crops of rice a year; latosol.
Subtropical zone	$22^{\circ}-34^{\circ}\text{N}$	$4,500^{\circ}-8,000^{\circ}\text{C}$	Average temperature of the coldest month is $0^{\circ}-16^{\circ}\text{C}$; tropical monsoon rain forest and evergreen broad-leaf forest; two crops of rice a year; red soil and yellow soil.
Warm-temperate zone	$32^{\circ}-43^{\circ}\text{N}$	$3,200^{\circ}-4,500^{\circ}\text{C}$	Average temperature of the coldest month is $-8^{\circ}-0^{\circ}\text{C}$; deciduous broad-leaf forest; three crops in two years; brown soil, cinnamon earth, black earth and brown desert soil.
Temperate zone	$36^{\circ}-52^{\circ}\text{N}$	$1,700^{\circ}-3,200^{\circ}\text{C}$	Average temperature of the coldest month is around -24°C ; mixed coniferous and deciduous broad-leaf forests; one crop a year; podzolized brown soil, chernozem, chestnut soil, greyish-brown desert soil.
Frigid-temperate zone	North of 50°N	Below $1,700^{\circ}\text{C}$	Average temperature of the coldest month is below -24°C ; spring wheat, potatoes, etc., can be grown with effort; taiga; cold, brown soil.

Table 3. Distribution of China's River Drainage Basins

Drainage Basins			Drainage Area (in millions of sq. km.)	Percentage of China's Total Area
Drainage basins of exterior rivers	Flowing into the Pacific Ocean	Sea of Okhotsk	86	8.9
		Sea of Japan	3	0.3
		Yellow Sea, Bohai Sea	167	17.4
		East China Sea	204	21.3
		South China Sea	83	8.7
		Directly flowing into Pacific Ocean	1	0.1
		Sub-total	545	56.7
	Flowing into the Indian Ocean	Andaman Sea, Bay of Bengal	56	5.8
		Arabian Sea	7	0.7
		Sub-total	63	6.5
	Flowing into the Arctic Ocean	Kara Sea	5	0.5
Total			612	63.8
Inland river drainage basins	Inner Mongolia area		33	3.4
	North Tibet and south Tibet areas		73	7.6
	Songhua River inland drainage basin		5	0.5
	Gansu, Xinjiang and Qaidam areas		237	24.7
	Total		348	36.2

Table 4. Balance of Water Volume in China

Drainage Basin		Percentage of China's Total Area	Precipitation		Runoff Volume		Evaporation Volume		Runoff Co-Efficient
			mm	100 million cu. m.	mm	100 million cu. m.	mm	100 million cu. m.	
Drainage basins of exterior rivers	Pacific Ocean	56.8	918	49,926	391	21,347	527	28,579	42.8
	Indian Ocean	6.5	739	4,530	519	3,239	220	1,291	71.5
	Arctic Ocean	0.5	357	144	216	110	141	34	76.3
	Total (average)	63.8	894	54,600	403	24,696	492	29,904	45.2
Drainage basins of interior rivers		36.2	164	5,720	34	1,177	130	4,547	20.6
National total (average)		100	629	60,320	369	25,873	359	34,451	42.9

Lakes. China has a vast number of lakes. It is estimated that the country has more than 2,800 natural lakes larger than one square kilometre each, with a total area of 80,000 square kilometres. Of these lakes, 13 are larger than 1,000 square kilometres. In addition, there are thousands of man-made reservoirs. Most of the lakes are concentrated in five areas, viz., the eastern plain, the Qinghai-Tibet Plateau, the Yunnan-Guizhou Plateau, the Mongolia-Xinjiang area and the North-east area. In accordance with their geographical environment and the conditions of their formation, lakes can also be divided into interior drainage basin lakes and exterior drainage basin lakes.

Most of China's interior drainage basin lakes are saltwater lakes and salt lakes. Lop Nur and the Qinghai Lake are the two largest saltwater lakes. Ebi Nur, Dujiali Lake, and Chaka Salt Lake are salt lakes which produce many important chemical raw materials. Saltwater lakes and salt lakes account for 55% of the total area of the country's lakes. Most of the exterior drainage basin lakes are fresh water lakes such as the Boyang, Dongting, Hongze and Taihu lakes.

Glaciers and Permanent Snow. Glaciers and permanent snow are also component parts of China's surface water. Statistics show that modern glaciers and permanent snow on the high mountains in western China cover an area of 44,000 square kilometres. The total water reserve of the glaciers amounts to 2,300,000 million square metres, almost equivalent to the country's total runoff volume in a year. Distributed over the sources of many rivers, glaciers play an important role in replenishing and regulating the rivers.

VI. Weathering Crust and Soil

Soil formation and evolution in China is closely connected with the country's monsoonal climate, the weathering crust of all types of chemicals, the mountainous terrain, different kinds of vegetation and human activities. Generally speaking, the gradual transition from the arid northwest to the humid southeast determines the geochemical process of China's soil and the weathering crust, which gradually intensifies from the northwest to the southeast.

1. The Qinghai-Tibet Plateau and the high mountains in the northwest are areas which have been violently thrust up since the Quaternary Period; both the weathering process and soil formation process there are in a primary stage. These areas have developed clastic weathering crusts and infant alpine soils such as severe cold

meadow soil, severe cold steppe soil, etc.

2. In the arid region in the northwest hinterland, insufficient water hampers the geochemical process and large quantities of lime, gypsum and other easily soluble salts remain in the soil and the weathering crust. The result is salt-containing weathering crust and desert soil with very high salt content, namely, greyish-brown desert soil, brown desert soil, severe cold desert soil and large areas of saline-alkali soil.

3. In the semi-arid region, where rainfall is greater, most of the easily soluble salts in the soil and the weathering crust are bleached out. But lime, which is hard to dissolve, remains and there is an obvious calcification process in the soil and the weathering crust. Carbonate weathering crust and steppe soil of varying calcification processes, such as chernozem, chestnut soil and sierozem are found in this area.

4. In the eastern humid region, there is abundant rainfall and ample moisture and the geochemical process can be carried out fully. Easily soluble salts are bleached out of the soil and the weathering crust, and varying degrees of migration and accumulation occur in elements which have difficulty migrating, e.g., silicon, aluminium and iron. The process of adhering and allitic weathering dominate, siallitic weathering crust and allitic weathering crust developed. The soil in this region is mainly acid forest soil. Furthermore, because the terrain in the eastern part of China is relatively flat and the zonal character is distinct, the process of adhering and allitic weathering of the soil gradually intensifies with the increase in heat. From north to south one finds brown coniferous forest soil, dark brown soil, brown soil, yellow brown soil, yellow soil, red soil, lateritic red soil and latosol.

Since China has a typical monsoonal climate with a strong continental character, winters are cold and dry; evaporation is rapid, and there is a strong rising water current in the earth. During the hot and rainy summers, there is a stronger permeating water current in the earth and the bleaching of active minerals dominates. As a result, the processes of adhering, desilicification and allitic weathering in the soil prevail. Acid soil predominates: the area of soil with a PH value less than 6-6.5 is greater than that of neutral soil and alkali soil. About one third of the country's farmland is covered with soil that has a PH value less than 5.

In the course of soil formation, from the desert soil in the arid northwest to the forest soil in the humid east, the biological process as well as

the chemical process increases regularly. This finds expression in the constant changes of the quantity and composition of organic matter in the soil. Generally speaking, arid desert soil has a shallow humus layer, only 20–30 mm, and contains 0.15–0.5% of organic matter; in chestnut soil from the grassland, the humus layer is 30–80 mm thick and contains 1.5–3.8% of organic matter; the humus layer of chernozem is generally 30–50 mm thick, with surface organic matter reaching 3–4% and even as much as 6–10%; as for soil formed on forest grassland and black soil, the humus layer can be as thick as 70 mm and sometimes more than one metre, with 3–6% and even as much as 15% of surface organic matter. The accumulation of organic matter in forest soil is also very active, the organic matter content of brown soil being 2–9%, yellow soil 5–10%. Although red soil is exposed to strong bleaching and allitic weathering, its organic matter content still reaches 1–4%; in latosol organic matter, content can be as high as 8–10%.

Thanks to the complex conditions of soil formation, the variety of soil-forming parent material and the regional character of soil formation, China has a rich variety of soil types.

VII. Vegetation and Animal Geography

China has a vast territory, complex natural conditions, a long natural history and was scarcely

covered by continental glaciers in the Quaternary Period. Consequently, China's vegetation has the following four characteristics:

1. *A great variety of plants:* According to the latest statistics, China has 301 families, 2,980 genera and over 24,500 species of seed plants, ranking third in the world after Malaysia (about 45,000 species) and Brazil (about 40,000 species). It has 106 families, 480 genera and 2,100 species of bryophytic plants, which account for 70% of the families, 50% of the genera and 10% of the species of such plants in the world. Among the seed plants, there are 291 families, 2,940 genera and 24,300 species of angiosperm, making up 60% of the total number of the families, and 10% of the species of such plants in the world. With the exception of plants of the araucaria family, 10 of the 11 families of gymnosperm in the world are distributed in China, having 34 genera and over 190 species.

2. *Complex geographical factors:* As China faces Europe and Africa in the west, North America in the east and adjoins the land from India to Malaysia in the south, and since south China used to be an area where Laurasia land plants and Gondwana land plants once abounded, there are very rich geographical elements in China's plant zonation. The known seed plants can be divided into 15 "distribution region types" and 29 variations (Table 5).

Table 5. Distribution of Regional Types of China's Seed Plant Genera

Distribution of Regional Types	Number of Genera	Percentage of the Total Number of Genera
1. Worldwide distribution	108	—
2. Distribution in the tropical zone	372	13
3. Intermittent distribution in tropical America and tropical Asia	89	3.1
4. Distribution in the tropical zone of the old world	163	5.6
5. Distribution in tropical Asia to tropical Oceania	150	5.2
6. Distribution in tropical Asia to tropical Africa	151	5.2
7. Distribution in tropical Asia (India-Malaysia)	542	18.9
8. Distribution in the north temperate zone	296	10.3
9. Intermittent distribution in East Asia and North America	117	4.1
10. Distribution in the temperate zone of the old world	157	5.5
11. Distribution in temperate Asia	63	2.2
12. Distribution in the Mediterranean, West Asia to Central Asia	166	5.8
13. Distribution in Central Asia	112	3.9
14. Distribution in East Asia	298	10.4
15. Distribution special to China	196	6.8
Total	2,980	100.0

3. *Large numbers of plants of monotype and oligotype families and genera and relic plants:* China has many old relic plants and primary or isolated families and genera in evolution. Of the 2,980 genera existing in China, monotype (422) and oligotype (713) total 1,135, accounting for 38% of the total number of genera in the country.

4. *A great variety of plants special to China:* China has 196 genera of plants special to China, accounting for 6.8% of the country's total genera, of which relic plants such as water pine, ginkgo and Chinese tulip tree have become "living fossils" attracting worldwide attention.

China has an agricultural history of several thousand years and many wild plants have become cultivated plants. These plus the rich variety of natural plants make China one of the countries of the world with the richest plant resources. Divided according to their economic use, there are more than 1,000 kinds of timber wood, over 4,000 kinds of medical plants, over 300 kinds of fruit plants, over 500 kinds of fibre plants, over 300 kinds of starch plants, over 600 kinds of oil plants and over 80 kinds of vegetable plants.

The eight main types of vegetation in China are listed below:

1. *Coniferous forest:* From the Da Xinggan Mountains to the Himalaya Mountains, from Taiwan to the Altay Mountains are widely distributed all kinds of coniferous forests and mixed coniferous and broadleaf forests, which have an outstanding place in China's natural vegetation and forest resources. The main community plants belong to the pine, cypress and China fir families.

2. *Broadleaf forest:* Deciduous broadleaf forests are widely distributed on the high mountains and sub-high mountains in the temperate, subtropical and tropical zones. They are regional plants of the temperate zone of north China and belong mainly to the fagaceae, betulaceae, willow, hazel, elm and ulmaceae families. Mixed evergreen and deciduous broadleaf forests are distributed on acid rock and limestone mountains in the north and central subtropical zones. Since this is a transitional-type zone, the composition of the plants is complex and the community plants include all kinds of evergreen and deciduous trees. The evergreen broadleaf forests are regional plants of the subtropical zone of China. Monsoon rain forest and rain forest are distributed in the tropical regions of southwest and south China and Taiwan; they belong mainly to the dipterocarpaceae, mulberry, sterculiaceae and anacardiaceae families.

3. *Bushes:* Severe cold evergreen bushes are

mainly distributed in the Qinghai-Tibet Plateau, the northwest arid area and high mountains and sub-high mountains in the subtropical zone. Deciduous broadleaf bushes are distributed in the forest area of the temperate zone and in the mountains, valleys, plains and sandy land of the northeast arid area. Evergreen broadleaf bushes, most being secondary vegetation, are distributed on low hills and dry valleys in the tropical and subtropical zones as well as along some seashores.

4. *Grassland:* Widely distributed in the western part of China's northeast, the central and eastern part of Inner Mongolia and the central and northern part of the Qinghai-Tibet Plateau, China's grassland is part of the Eurasia grassland.

5. *Desert:* Distributed in the northwest arid zone and the northwestern part of the north Tibet plateau.

6. *Alpine tundra:* Alpine tundra vegetation is seen only in the alpine area of the Changbai Mountains in northeast China, rising over 2,100 metres above sea level, and in alpine areas in the northwestern part of the Altay Mountains, over 3,000 metres above sea level.

7. *Meadows:* Universally distributed on the low flatland, foothills, high mountains and sub-high mountains, from the temperate zone to the subtropical zone.

8. *Marshes:* Universally distributed along lakes and rivers and on low-lying land of big river deltas.

China's Natural Fauna. China is one of the countries of the world with the richest animal life. The country covers 6.5% of the world's land area while its wild animals make up 11.2% of the total number of the world's animals (over 420 kinds); China's birds account for 15.3% of the world's bird species (1,166 species); reptiles and amphibious animals account for 8% of all species in the world (over 510 species). Quite a few rare animals of the world are unique to China, such as the giant panda, the golden-haired monkey, the white-finned dolphin, the white-lipped deer and the Yangtze crocodile.

China's animals can be divided into three ecological geographical animal groups corresponding to three entirely different natural regions: In the eastern monsoon zone is the humidity-resistant animal group; in the northwestern arid zone is the aridity-resistant animal group; and in the Qinghai-Tibet Plateau zone is the cold-resistant animal group.

VIII. Natural Geographic Divisions

In accordance with the differences in temperature, moisture and topographical conditions, China can be divided into three natural geographical zones: the eastern monsoon zone, the northwest arid zone and the Qinghai-Tibet Plateau zone. The three natural geographical zones roughly touch on each other in the Wugiao Ridge area west of Lanzhou in Gansu Province.

1. **Eastern Monsoon Zone:** This region accounts for some 46% of China's total land area and 96% of its population. Markedly affected by the summer monsoon, it has humid and semi-humid climate. It is located on the second and third stairs of China's landform. The region did not rise sharply in the new tectonic movement. It has numerous rivers and the river waters are active in erosion and accumulation. The areas divided according to temperature conditions from north to south are obvious and regular. Deeply and extensively affected by human activity, it is the country's industrial and agricultural centre.

2. **Northwest Arid Zone:** This region accounts for 27.3% of the country's total land and 3% of its population. Scarcely affected by the monsoons, it has arid and semi-arid climate. Most of the region belongs to the hinterland. From east to west, distinctly demarcated according to differences in moisture, are dry grassland, desert grassland and desert. This region constitutes the country's major pastoral area.

3. **Qinghai-Tibet Plateau Zone:** This region accounts for 26.7% of the country's total land area and 1% of its population. Vertical zonality that changes with the altitude is clear. In geological history, the region underwent steep upward movement in modern times. It has high altitude, low temperature, many glaciers and lakes and is little affected by human activity.

On the basis of the regional differences of the three natural zones, the country can be subdivided into 7 "natural regions" and 33 "natural areas" which provide the material basis for the development of China's economy in line with local conditions.

Principal components of China's three natural geographic zones are as follows:

I. Eastern Monsoon Zone

A. *The humid and semi-humid temperate zone region of the northeast*

1. The coniferous forest area in the north-eastern part of the Da Xinggan Mountain.
2. The mixed coniferous and broadleaf forest area in the eastern mountains of the northeast.

3. The forest grassland area on the North-east Plain.

B. *The humid and semi-humid warm to temperate zone region of north China*

4. The deciduous broadleaf forest area on the Liaodong and Shandong peninsulas.
5. The semi-zerophyte deciduous broadleaf forest area on the north China Plain.
6. The semi-zerophyte deciduous broadleaf forest and forest grassland area in the Hebei-Shanxi mountains.
7. The forest grassland and arid grassland area on the Loess Plateau.

C. *The humid subtropical region of central and south-China*

- (a) The north subtropical zone
 8. The mixed deciduous broadleaf and evergreen broadleaf forest area in the middle and lower Changjiang valley.
 9. The mixed deciduous broadleaf and evergreen broadleaf forest area in the Chinling and Daba mountains.
- (b) The central subtropical zone
 10. The evergreen broadleaf forest area in the Zhejiang and Fujian coastal mountains.
 11. The evergreen broadleaf forest area on the Jiangnan Plain and hills.
 12. The Sichuan basin evergreen broadleaf forest area.
 13. The Guizhou Plateau evergreen broadleaf forest area.
 14. The Yunnan Plateau evergreen broadleaf forest area.
- (c) The tropical zone in South Asia
 15. The evergreen broadleaf forest area in the Lingnan Hills.
 16. The evergreen broadleaf forest and monsoon forest area on Taiwan Island.

D. *The humid tropical region of South China*

17. The monsoon forest area of the Leizhou Peninsula and Hainan Island.
18. The monsoon rain forest area in the southern Yunnan valley.
19. The monsoon rain forest and rain forest area of the South China Sea islands.

II. Northwest Arid Zone

E. *The temperate zone grassland region of Inner Mongolia*

20. The dry grassland area of the Xiliao River basin.
21. The dry grassland and desert grassland area on the Inner Mongolia Plateau.
22. The dry grassland and desert grassland area on the Ordos Plateau.

F. *The temperate zone and warm temperate zone desert region of the northwest*

23. The Alxa highlands temperate zone desert

area.

24. The Junggar Basin temperate zone desert area.
25. The Altay Mountains coniferous forest area.
26. The dry grassland and coniferous forest area of the Tianshan Mountains.
27. The warm temperate zone desert area in the Tarim Basin.

on the southern side of the Himalaya Mountains.

29. The coniferous forest and alpine meadow area on the dissected mountains in eastern Tibet.
30. The bushes and grassland area on the south Tibet mountains.
31. The severe cold grassland and mountain grassland area on the Qiangtang Plateau and the Qingnan Mountains.
32. The Qaidam Basin desert area.
33. The alpine desert grassland and desert area on the Ali and Kunlun Mountains.

III. Qinghai-Tibet Severe Cold Zone

G. *The Qinghai-Tibet Plateau region*

28. The tropical and subtropical forest area

3. AN OUTLINE OF CHINA'S ECONOMIC GEOGRAPHY

By Deng Jingzhong and Li Wenyan

Institute of Geology, Chinese Academy of Sciences

I. Natural Conditions and Population

China is situated in the eastern part of Eurasia, on the west coast of the Pacific Ocean. It has an area of 9.60 million square kilometres and a population of one billion (at the end of 1979, the continental provinces and regions had 970,927 million people and Taiwan had 17.47 million). In the last 30 years, the hard-working Chinese people have made use of the country's favourable natural conditions and natural resources to develop the national economy under the socialist system. Building on the basis of the old China, the people have carried out socialist construction on an unprecedented scale and made great advances in agriculture, industry, communications and transportation.

1. Natural Conditions and Natural Resources

Natural resources, such as light, heat, water, earth, living beings, minerals, etc. abound in our country, offering greatly possibilities for the development of various sectors of the national economy. However, the uneven regional distribution of such resources, coupled with insufficient regional coordination, has hampered the development and distribution of industrial and agricultural production. The major characteristics of the natural conditions and resources in our country are as follows:

(1) *Temperate and subtropical zones predominate in China, providing abundant heat and light.* Aside from the 1.2% of the territory that lies in the frigid temperate zone and the 26.7% occupied by the Qinghai-Tibet Plateau, which belongs to the high frigid zone, the remaining 72.1% (divided into temperate zone, 25.9%; warm temperate zone, 18.5%; subtropical zone, 26.1%; and tropical zone, 1.6%) enjoys favourable thermal conditions. Almost all the crops in the world can be cultivated in China. A wide variety of thermophilic plants grow in large parts of the country in the summer half of the year, and double-cropping prevails in the warm temperate zone and its southern regions.

(2) *Water resources are abundant, thanks to the monsoon climate, but the regional distribution is by no means even and the rate of variability very great.* In the humid and sub-humid areas in the southeast part of China, 48% of the whole territory, the total precipitation is in excess of 80%,

and the runoff of rivers over 90%. The correspondence of the high temperature season with the rainy season favours the cultivation of crops. Over 90% of China's farmlands and forests are concentrated in this area, and local rivers provide a rich store of hydroelectric potential. Nevertheless, the wide fluctuation between the seasons and between years of precipitation and runoff, plus their irregularity, lead to frequent periods flood and drought, which seriously affect agricultural production. The arid and semi-arid regions in the northwest of China, covering 52% of the whole territory, are seriously short of water resources, with vast stretches of steppe and desert prohibiting the development of agriculture.

(3) *Mountainous areas occupy two-thirds of the total area of the country, while plains occupy only one-third.* This is disadvantageous to the agricultural utilization of land. The characteristics of the mountain areas are: high altitude, low temperature, and short growing periods. This is especially true of high ranges and plateaus over 3,000 m. in elevation, which cover 25.9% of China's total area. The high altitude and frigid climate discourage the utilization of the land for the development of agriculture, forestry and animal husbandry. Moreover, the steep slopes and the thin soil layer of the mountain areas disturb the ecological balance. Mountains also compound the difficulty of communication and transportation. Owing to the complex natural conditions in the mountain areas, mono-economy is impracticable, and other uses for the land, suitable to local conditions, must be developed.

(4) *The inadequate coordination of the natural resources of light, heat, water, earth, etc., in different localities has resulted in disadvantages as well as local advantages.* Northeastern China has large areas of plains, extremely fertile soil, sub-humid climate and rich forest resources, but the air temperature there is comparatively low, the growing season short and frigid often causes damage. North China is commonly characterized as having broad plains, warm summers and cold winters, insufficient water resources with great variability and large areas of arid, floods and alkaline lands. In Northwestern China, there is plenty of land, strong sunlight and heat, but the land is arid, with deserts, gobies, salinized and alkaline lands scattered here and there. South China has plenty of thermal energy, abundant water, rapid

plant growth and rich biological resources, but hills and uplands predominate, farmland is scarce, precipitation is variable and liability to flood damage is great. The Qinghai-Tibet region, being high, receives the most intense solar radiation in the whole country, but the climate is frigid and the cumulative active temperature very low. Suitable measures must be taken to develop agriculture according to the features of different regions, so as to make full use of their advantages and overcome their defects.

(5) *China's mineral resources are rich and varied with confirmed reserves of 132 kinds of minerals.* The country is especially rich in non-ferrous metals, rare earth metals, coal and some non-metal minerals. China ranks first in the world in reserves of tungsten, antimony, zinc, rare earths, lithium, pyrite, magnesite and borax; second in phosphorus; and third in coal. Deposits of iron, copper and manganese ores are also considerable, but they are mostly lean rather than rich ores. Petroleum prospects are excellent and certain reserves have been verified through prospecting. The distribution of most minerals is by no means even, many are found in combination with other minerals, and some kinds of minerals are deficient.

2. Population, Nationalities and Cities

China has about 23% of the world's population. She is, therefore, very rich in resources of labour for production. On the other hand, the country's requirements for sources of subsistence are very great. Population density averages $103/\text{km}^2$, but the distribution of population is very uneven. If we draw a line from Aihui County through Lanzhou to Tengchong, dividing the country into a southeast part and a northwest part, the southeast part has over 95% of the population with an average density in excess of 200. In the Changjiang Delta, Changdu Plain and Zhujiang Delta, the density exceeds $100/\text{km}^2$. Population density in the North China Plain averages $400\text{--}500/\text{km}^2$, while in the southern and northern mountain areas, it is less than $100/\text{km}^2$. In the northwest part the average population density is less than 10; in some irrigated oases it is $50\text{--}100/\text{km}^2$, while in the extensive gobi, desert and high mountains, it is less than 1.

China is a multinational country, consisting of more than 50 nationalities. The Han are most numerous, making up 94% of the total population in China; the other 50 or more nationalities are less numerous, about 6% of the total. The Zhuang, the Hui, the Uygur and the Yi nationalities each have a population of over three million; the Mongolian, Tibetan, Manchu, Buyi, Korean and Miao, over one million; the Yao, Dong, Tujia,

Kazak, Bai, Dai, over 500,000; the Hani, Li and others, altogether 10 nationalities, over 100,000. Other nationalities besides those mentioned above have smaller populations with the smallest down to hundreds of people. The minority nationalities live predominately in the Southwest, Northwest and Northwest border regions. They generally concentrate in a definite region, although some of them live scattered among other nationalities. In 70% of the counties in China, more than two nationalities live together. Differences in lifestyles, in customs of production, in characteristics of the economy and in the culture of different nationalities are important factors contributing to the differentiation of regional economic features. Communications and living in proximity facilitates close ties among the nationalities and mutual interdependence, as well as the country's economic and cultural development.

The rural population makes up 86.8% of the total population and the urban population the remaining 13.2%. There are more than 3,400 cities and towns, in which the municipalities number more than 200. The urban population exceeds 85 million, 63% of which are concentrated in 43 large and medium-sized cities, each with a population of over 500,000. There are six metropolises, each with a population of more than two million, viz. Shanghai, Beijing, Tianjin, Shenyang, Wuhan, Guangzhou; nine large-sized cities each with a population of one to two million, viz. Chongqing, Harbin, Nanjing, Xi'an, Chengdu, Changchun, Taiyuan, Dalian, Lanzhou; and 28 medium-sized cities with populations between 500,000 and 1,000,000. The large and medium-sized cities are China's chief centres of industry and communication.

II. The Distribution of Agriculture, Industry, Communications and Transportation

1. Agriculture

Agriculture is the basis of the national economy. The rural population accounts for 86.8% of the total population, and cultivated land, forests and grassland account for 70% of the China's territory. To the total output value of agriculture crop cultivation contributes 66.9%, animal husbandry 14%, forestry 2.8%, fishing 1.2% and sideline occupations 15.1%.

Cultivated land contributes only about 10.4% of all land for agricultural use. The proportion of forested land is small compared to China's total land area, with woodlands covering only 12.7%; but land for pastoral use is extensive, including meadows (29.8%) and grassy hills and slopes in the

south prairies (4.6%). Areas suitable for forestry are large, including sparse woodland, 1.6%; shrub land, 3.1%; young forest and woodless land, 9.4%.

The inland water area has a percentage of 2.8%. The distribution of various types of agricultural lands tends to be concentrated in certain parts of the country. Over 95% of the cultivated land in China is distributed in an area to the east of a line drawn from the Da Xinggan Mountains through the Great Wall to the eastern border of the Qinghai-Tibet Plateau. The northwestern part of China is arid, with very little cultivated land scattered around oases; but it has extensive grasslands for pastoral use. Forested land and land suitable for wood-growing predominate in hilly regions in the northwest, southwest and south. Inland water areas prevail in the southeastern part of China, where rainfall is comparatively abundant, and in the western part, where interior lakes are scattered here and there.

Differences between the natural, technical and economic conditions of various regions give rise to great differentiation in productivity. The multiple crop index of the country averages 151%, but the Northeast China and Inner Mongolia regions can only produce one crop a year, the index there being less than 100%. Most of North China can produce three crops in two years, the multiple crop index being 120–150%. The Changjiang Basin and South China can support two to three crops a year, the index increasing to 180–250%. Of all cultivated land, paddy fields make up 25.6% and available irrigated areas 45%. Roughly one-third of all cultivated land is low-yield, either because the soil is thin or because it is sandy, clayey, salinized, alkaline or acidic. About 30% of the cultivated land is distributed on the slopes, liable to loss of water and soil erosion. The best way to develop China's agriculture, in consideration of the deficiency of cultivable waste land, is to improve production conditions and increase the unit-yield. China's monsoon climate, the great variability of precipitation and the constant threat of flood and drought cause great differences in the unit-yields of paddy fields and dry lands, irrigated and non-irrigated lands. Hence, the principal measures for developing agriculture and agricultural investment since the founding of New China have been the building of water-conservation projects, the development of irrigation, the improvement of low-yield fields, the development of farmlands capable of ensuring stable and high yields despite drought or excessive rain. By 1979, farmlands capable of stable and high yields despite drought and excessive rain have been built up to 340 million *mu**, making up 22.8% of all cultivated land.

Grain production is the main part of agriculture, making up 70% of the total output value of

crop cultivation and occupying 80% of all land under cultivation. The main food crops are rice, wheat, maize, kaoliang, millet, potatoes and soya-beans. Rice, wheat and maize are grown most extensively and yield the largest output, making up 80% of China's total food production. China is the world's largest rice producer. The average yield per unit area of rice is the highest of the food crops and the rice output constitutes 43% of total output of food crops. About 94% of China's rice is grown in the regions south of the Huaihe River and the Qinling Mountains. To their north, less rice is cultivated, except in Northeast China. Wheat, which makes up 19% of total food production, is cultivated all over the country, but particularly in the Changjiang Basin and the plains of the Huanghe, Huaihe and Haihe rivers. Cultivation of maize has greatly increased since Liberation, and now comprises 18% of total food production. Predominantly grown in the belt extending from Heilongjiang Province southwestward to Sichuan, Yunnan and Guizhou, kaoliang, millet and soybeans are chiefly grown in northern and northeastern China. The areas under cultivation have been greatly reduced since Liberation, thus reducing their proportion in total food production. Sweet potatoes are grown in the lower reaches of the Huanghe River and the hilly southern regions, while potatoes are the predominant crop in the regions of mild and cool climate north of the Great Wall.

China's food production has greatly increased since Liberation. The total output in 1979 was 332,115 million tons, 2.93 times greater than that in 1949. Food production has increased at an average rate of 3.65% a year in the past three decades, yet because of the large population and the big proportion of rural population, per capita output of grain averages only 344 kg. and commodity grain only amounts to 15% of the total output. Production levels and rates of marketable grain of different regions in China differ enormously. For instance, the Taihu Plain, Zhujiang Delta, Chengdu Plain and Dongting Lake Plain, the regions with the highest yield, have a great amount of surplus grain to sell to the state. The Songliao Plain and Sangjiang Plain, with more land and less people, also have a significant grain surplus. Regions with low levels of production and unstable output, such as the Loess Plateau, the Guizhou and Guangxi mountain areas, as well as regions with large non-rural populations, such as Liaoning Province, are all deficient in food. It is of strategic significance, therefore, to select in a planned way some regions with favourable conditions, solid foundations and great potential to build up as major bases of commodity food crops, as well as to facilitate the overall increase of food

*one *mu* equals 1/15 of a hectare.

production.

China's chief industrial crops include cotton, oil-bearing crops, sugar, tobacco, bast fibre, medicine plants. Other industrial crops include tea, mulberry, fruit, rubber, and various woody plant crops. The area under industrial crops, 8-9% of the total cultivated area, is far smaller than that under food crops, but industrial crops play an important role in increasing the income of the peasants, providing raw material for light industries (60% of the material coming from industrial crops) and supplying commodities for export. Of the industrial crops, cotton and oil-bearing crops occupy the largest cultivated areas, about 80% of the total. Cotton is cultivated most extensively, chiefly in the Changjiang Delta, middle Changjiang Plain, and plains of the Huanghe, Huaihe and Haihe rivers. China is the world's third largest cotton-producing country; its output of ginned cotton was 2,207 million tons in 1979. Many species of oil-bearing crops are widely distributed. Peanuts, for example, in which China ranks as the second largest producer in the world, are grown mainly in the hilly regions of Shandong, the plains of Huanghe, Huaihe and Haihe rivers, Fujian, Guangdong and Guangxi. The rapeseed grown in China is largely winter rapeseed, over 70% of which is cultivated in the regions of the Changjiang Basin. Spring rapeseed is cultivated in Inner Mongolia, Northwest China and Qinghai-Tibet region, where the growth season is relatively short. Sesame mainly grows in the provinces of Henan, Hubei and Anhui. Sugar crops, including sugarcane and beets, occupy cultivated areas of 62% and 38% respectively, but in the country's overall sugar output, cane sugar and beet sugar account for 85% and 15% respectively. Sugarcane grows in Guangdong, Guangxi, Fujian, Sichuan, Yunnan and other subtropical regions, whereas sugar beets grow mainly in Heilongjiang, Jilin, Inner Mongolia, Xinjiang and other temperate regions. China is well-known for her silk and tea. Silk is produced in the Taihu Plain, Sichuan Basin and Zhujiang Delta, and tussah silk largely in Liaoning and Shandong provinces. Tea is commonly planted in the provinces south of the Huaihe River and Qinling Mountains, such as Zhejiang, Hunan, Anhui and Sichuan. Temperate fruits, such as apples, pears, persimmons and Chinese dates, rank first in output of fruits in China; next to them are subtropical fruits, such as oranges and tangerines, and tropical fruits, such as bananas and pineapples. Tropical cash crops, chiefly rubber, are concentrated on Hainan Island and the Leizhou Peninsula, and secondarily, in southern Yunnan Province.

Most of the industrial crops are extensively cultivated in scattered planting areas, so the yield per unit area is not high. However, a small part of

industrial crops are concentrated in cultivation and produce relatively high yields. Production of cotton, plant oil and sugar is still insufficient to meet the needs of the country. The production potentials of tea, silk, fruits, etc. have not been fully tapped. Today, the distribution of the production of industrial crops is being readjusted step by step in line with local conditions and concentrated bases of various industrial crops have increased their output.

Animal husbandry is a weak link in the agricultural economy. The number of livestock is great, but the commodity rate is low, and there are very few meat products per capita. In 1979, China's large and small livestock amounted to 597,438 million head, 15% of the world total but only 7% of the world's output of meat products. China has 319.710 million pigs, about 41% of the pigs in stock in the world, but it produces only 15% of the world's output of pork. Each person in China gets an average 10.95 kg. of meat annually, 2 kg. of eggs, 1 kg. of milk and 0.6 kg. of wool, far lower than the world's average level. The main reasons for the scarcity of livestock products are: the low rate of marketable livestock (the rate for pigs is only 55%, for cattle, 7%); low dressing percentages; and high death rates. The development of animal husbandry depends, on the one hand, upon paying great attention to the eastern agricultural regions which possess 86% of the country's total livestock, upon promoting the rate of marketable livestock and that of meat production, raising larger numbers of cows, sheep, rabbits, geese and other grass-feeding livestock and poultry, as well as upon developing animal husbandry in agricultural areas; and, on the other hand, upon improvement of grasslands in the western pastoral regions, combining animal husbandry with agriculture, depending less on nature and accelerating the distribution of livestock. It is also necessary to build and develop modernized animal husbandry in the suburbs of the cities and in the manufacturing and mining regions in order to increase the production of meat, milk, eggs and poultry.

China is also weak in forestry due to the scarcity of woods, the low rate of forest cover and uneven regional distribution. The average rate of forest cover for the whole country is only 12.7%, that of Heilongjiang and the provinces south of the Changjiang River is over 30%, and that of the northwestern arid areas less than 1%. Timber forest makes up 80% of the existing forest area; economic forest, shelter forest, fuel forest, bamboo forest, etc. make up the rest. Natural forest is largely timber forest. Heilongjiang, Tibet, Sichuan, Yunnan and Jilin provinces possess more than 70% of the timber resources in China. Econo-

mic forest includes mainly oil-bearing trees, such as tea-oil trees, tung-oil trees, walnut and various kinds of fruit trees. Shelter forests are those which are used to check winds and control sand in the northern part of the country as well as those for the conservation of water and soil. To develop our forestry, it is necessary to improve the management and utilization of existing forests, strengthen the work of tending woods, raise the productivity of timber forests, reconstruct the northeast and the southwest forest areas, plant trees on the mountains and wastelands fit for afforestation, build bases for timber forest and oil-bearing trees, intersperse farmlands with trees in North China as well as build shelter forests in the northern arid areas.

Aquatic products have made rapid progress since Liberation. The total amount of aquatic products in 1979 was 4.7 times that in 1950, but the average per capita amount was only 4.5 kg. Aquatic product resources abound in the Bohai Sea, Yellow Sea, East China Sea and South China Sea. Marine products comprise 74% of the country's total output of aquatic products, largely by catching (87%) instead of aquaculture (13%). Fresh-water aquatic products represent 26% of the total, largely by aquaculture (73%) instead of catching (27%). Over 60% of fresh-water aquatic products come from the numerous freshwater lakes and dense waterways in the Changjiang and Huaihe river basins; the rest from the Zhujiang River basin. To further develop aquatic products, it is necessary to protect aquatic product resources and utilize them fully, to limit the catch, to develop aquaculture and build up marine and fresh water aquaculture bases.

2. Industry

Before Liberation, China's industry was relatively undeveloped, contributing only 10% to the combined gross output value of industry and agriculture. The branches of industry were incomplete. Consumer goods industries, mainly the textile and food industries, accounted for 70% of the total value of industrial output. Heavy industry was represented by several coal mines, cement factories, machine-repair factories, and a few medium- and small-sized steel plants and chemical plants. Almost all of the industrial branches were ill-equipped and their range of products limited. The distribution of industry was also very uneven. More than 70% of total industrial output value came from the coastal regions, actually a few cities, including Shanghai, Qingdao, Tianjin, Guangzhou, Shenyang, Anshan, Fushun and Dalian.

Thirty years after the founding of the People's Republic, remarkable growth has been made in

industrial production. The sectoral composition of industry has become more complete, the level of technology higher, and the distribution of industry more rational. In 1979, industry's share of the combined output value of industry and agriculture came to 74%. Industries producing energy, raw materials and various manufactures have developed rapidly. Quite a few branches of industry were built almost from scratch, such as the oil industry, rare metals, organic chemicals, motor vehicles, locomotive and aircraft manufacturing, ship-building, heavy machine-building, precision instruments, electronics, etc., so that China now has a relatively complete industrial system of considerable scale. Meanwhile, the distribution of industry in the whole country has been improved in the following ways:

(1) Three large previously industrialized areas (i.e. Liaoning Province, the lower Changjiang Delta and the Beijing-Tianjin-Tangshan region, as well as other industrial centres along the coast, have been greatly strengthened, so that they have become base areas for the industrialization of China;

(2) Priority was given to the development of a number of new industrial areas and centres in central China and the hinterland of Northeast China. They include Wuhan, central Hunan, central Henan, central Hebei, Taiyuan, Xi'an, Changchun, Jilin, Harbin, etc.

(3) In the inland areas previously almost cut off from the rest of the country, several industrial areas or bases, e.g. Baotou, Lanzhou, Chengdu, Chongqing and Dukou, have been built in a planned way;

(4) In the economically backward border areas and regions mainly inhabited by minority nationalities, large numbers of local industrial enterprises have been developed.

China's abundant and varied energy resources provide ample guarantees that the requirements of industry, other production and the people's standard of living can be met. Verified geological reserves of coal in China total more than 600,000 million tons and total hydroelectrical potential, according to the latest estimate, is 680 million kw., of which 380 million kw. is exploitable. Considerable reserves of oil have been verified. The distribution of these three kinds of energy resources complement and coordinate with each other. Since Liberation, the production of energy has undergone overall growth.

China's coal resources are widely distributed and are particularly abundant in Shaanxi, Inner Mongolia, Hebei, Shaanxi, Henan, Shandong,

Anhui, Heilongjiang, Xinjiang, Guizhou, and Yunnan. Shansi Province alone accounts for one-third of the national total. Annual coal output in the past few years has topped 600 million tons. All of the large economic regions have their own large coal bases: Fushun, Fuxin, Jixi, and Hegang in the Northeast; Datong, Kailuan, Fengfeng and Yangquan in North China; Huainan and Huaibei, Xuzhou and Yanzhou in East China; Pingdingshan in Central-south China; Liuzhi-Panxian-Shuicheng in the Southwest; and Helanshan in the Northwest. If account is taken of the development of medium- and small-sized coal collieries, the Northwest, Southwest and Northeast have, or have virtually, achieved self-sufficiency in coal. Because the largest reserves and the most favourable exploiting conditions are found in North China, this area supplies tens of million of tons of flame coal, coking coal and anthracite every year to East China, Central-south China and Liaoning Province in the Northeast. Shanxi Province, the largest coal-bearing area, alone produces more than 100 million tons annually.

The oil industry, previously with only one small oilfield and a few refineries, has developed rapidly. Since Liberation, a number of large oil (and natural gas) fields have been discovered and opened up in Heilongjiang, Liaoning, Hebei, Shandong, Xinjiang, Qinghai and Sichuan. Among them, the Daqing Oilfield of Heilongjiang is the first and largest oil base, built in the 1960's. Crude oil from Daqing is transported to refineries in the Northeast and to most refineries in the rest of the country and part of it is exported through Dalian. Apart from those refineries attached to oilfields (such as Daqing, Karamay and Yumen), many large refineries were built in Fushun, Jinzhou, Dalian, Beijing, Tianjin, Zibo, Shanghai, Nanjing, Lanzhou, Wuhan, Guangzhou and other places, with convenient transport facilities near oilfields or pipelines and close to the oil-consuming centres.

The large-scale development of the fuel industry has enabled the power industry to develop in step with the wider distribution of industries.

At present, thermal electricity accounts for 82% of China's total annual output of electricity, and hydroelectricity accounts for 18%. Three-fourths of the existing thermal power stations are located at the power-consuming centres and the rest in the fuel (mainly coal) producing regions. The existing large and medium-sized hydropower stations are located on the main tributaries in the upper reaches of the Huanghe and Changjiang rivers, on the Songhua River and some rivers in the southeastern coastal provinces. Nevertheless, the rate of exploitation of hydroelectric potential is still a mere 2.6%. Large regional power grids serving the Northeast, East China, Beijing-Tianjin-

Tangshan, Shaanxi-Gansu-Qinghai, Hubei-Henan, etc. have been built.

The metallurgical industry has undergone large-scale development during the last 30 years. To supply the iron and steel industries with adequate raw materials, more than 40,000 million tons of iron ore reserves have been verified throughout the whole country; these reserves are concentrated in central Liaoning, eastern Hebei and western Sichuan. At present, all of the large economic regions except the Northwest have large iron and steel bases, including Anshan, Benxi, Beijing, Tianjin, Tangshan, Baotou, Taiyuan, Shanghai, Maanshan, Wuhan, Panzhihua, Chongqing, etc. In addition, dozens of medium-sized iron and steel plants and special steel plants have been constructed in most provinces, municipalities and autonomous regions.

The iron and steel industry of the Northeast, developed on the strongest foundation in China, boasts the largest productive capability and the greatest variety of steel products. Iron and steel production in Liaoning Province is particularly concentrated, with the Anshan Iron and Steel Complex alone turning out annually more than 6 million tons of steel. But the Northeast is short of coking coal and must be supplied from Hebei Province.

In North China there are more major iron and steel enterprises in scattered locations. This region has abundant coal and ore reserves for the future growth of iron and steel production.

The annual steel output of East China is second to that of Northeast China. In this vast region, Shanghai has the highest level of technology and the most comprehensive varieties and specifications of rolled steel products. But most provinces in East China (except Shandong and Anhui) are poor in coal and ore reserves and must be supplied from outside.

The major iron and steel base of Central-south China, the Wuhan Iron and Steel Complex, produces mainly steel plates of various types. All of the large and medium-sized iron and steel plants in this region get the coking coal they need from North China. The ore reserves of this region also seem to be insufficient for the future.

In Southwest China, large and medium-sized enterprises, except the old Chongqing Iron and Steel Company, were built during the 1960's and most of them still lack complete production facilities. Although the abundant ore and coal reserves favour the future development of the iron and steel industry in this region, difficulties in transportation and the shortage of flat land constitute major constraints on production and construction.

Finally, in Northwest China, there are only a few newly built medium-sized iron and steel plants

with rather weak foundations for industrial development.

Before Liberation, China had a very elementary chemical industry and only a few small-scale chemical enterprises located in a few cities, such as Tianjin, Dalian, Shanghai, and Nanjing. During the last three decades, production of basic industrial chemicals, chemical fertilizers, pesticides, medicine, rubber, etc. has developed rapidly throughout the country, the few existing acid and soda plants have been greatly expanded and over a dozen large nitrogenous fertilizer plants have been set up. At the same time, the organic chemicals industry, especially the petrochemical industry, was developed from scratch. There are now large petrochemical complexes in Beijing, Shanghai, Tianjin, Daqing, Zibo, Wuhan, Jilin, Liaoyang, Lanzhou, and Luzhou. Production of the three main synthesis chemicals has also increased enormously.

Before Liberation, 70% of China's light industry was concentrated in a few coastal cities, especially Shanghai, Tianjin and Qingdao, far away from raw material sources and inland markets. After Liberation, these cities, Shanghai in particular, have undergone reconstruction and expansion and have become the country's main bases for production of high-grade and middle-grade consumer goods and for the exporting of light industrial goods. They have played an important part in supplying the national market and accumulating capital for construction.

In the same period in the inland regions — rich in raw materials, easily accessible and densely populated — and in the regions inhabited by minority nationalities, large numbers of new textile, foodstuffs, paper-making and other light industrial centres have emerged. On the whole, East China, North China and Central-south China are the most highly developed and diversified in light industry. Paper, sugar, and dairy and meat products are the major branches of light industry in Northeast China. Industries processing livestock products and producing cotton textiles are more important in Northwest China, while various foodstuff industries are more developed in Southwest China. With the readjustment of the national economy in the near future, further development of light industry throughout the country can be expected.

Old China's so-called machine-building industry undertook only repair work and as much as 85% of the plants were concentrated in a few coastal cities. As a result of construction during the last three decades, this backward state has largely changed. China has developed in an all-around way the production of general and special equipment for various industries, power equipment, machine tools, locomotives and carriages, ships, various machinery for agriculture, instru-

ments and meters, communication materials, broadcast and television equipment and household electrical appliances, so that it is now basically self-sufficient in the various kinds of machinery and equipment needed for developing the national economy. Moreover, the geographical distribution of the machine-building industry has been extended throughout the country. Building on their previous industrial foundation, Liaoning Province, the Shanghai-Nanjing region and the Tianjin-Beijing region have developed into the most powerful bases of machine-building industry. At the same time, dozens of machine-building centres focused on different specialities have been built up in most provinces and regions. Taking into account the network of machine-repairing factories scattered in China's medium-sized and small cities, China now boasts a relatively complete machine-building industry.

3. Transport and Communications

To meet the needs for developing industrial and agricultural production and strengthen economic links among provinces and regions, great efforts have been made on to develop the country's transportation system. Whereas previously China had very limited localized lines, a handful of motor vehicles and steamboats and largely inaccessible regions, now she has a nationwide transport system with railways as the framework, connecting highways, inland navigation, marine transport and pipelines.

At present, the total length of railway lines is to 60,000 kilometres. With the exception of Tibet, every province and autonomous region has railway transport. In Southwest and Northwest China, the total length of lines accounts for 25% of the nation's entire network, compared with 5% in 1949. In the eastern part of the country, original trunk lines have undergone the necessary technological improvements and new trunk lines and feeder railways have been built in the last 30 years. Spanning the country are six vertical arteries, i.e. Beijing-Guangzhou, Tianjin-Pukou, Harbin-Dalian, Taiyuan-Jiaozuo-Zhicheng-Liuzhou, Baoji-Chengdu-Kunming and Chengdu-Chongqing-Guiyang; and four lateral arteries, i.e. Manzhouli-Harbin-Suifenhe, Shenyang-Beijing-Baotou-Lanzhou, Lianyungang-Lanzhou-Urumqi and Shanghai-Hangzhou-Zhuzhou-Guiyang-Kunming.

The total length of highways now amounts to 876,000 km., of which 110,000 km. belong to 70 state trunk lines that link up the provincial administrative and economic centres and reach all the important communication hubs and industrial and agricultural bases.

There has been marked growth of navigation — mainly marine, but also on the main course of

the Changjiang River. Some 100,000 km. of rivers are open to navigation, of which more than 20,000 km. are navigable by 100-ton ships. The most important navigable rivers are the Changjiang (more than 9,000 km.), the Zhujiang (more than 2,000 km.) and the Huaihe (more than 2,000 km.). Main inland ports include Nanjing, Wuhan, Chenglingji, Chongqing, Yuxikou, Jiujiang, Yichang, Changsha, and Guangzhou. China's marine navigation, including coastal and ocean transport, has rapidly developed to meet the needs of transporting bulky goods, such as coal and oil from north to south and phosphorites from south to north, and of foreign trade. Dalian, Qinhuangdao, Tianjin, Qingdao, Lianyungang, Shanghai, Huangpu and Zhanjiang have become large modern ports.

The total length of oil pipelines amounts to more than 9,100 km., with the most important pipelines running from Daging Oilfield to Dalian and Beijing, from Renqiu Oilfield to Shandong and Nanjing and from Shengli Oilfield to Qingdao.

Considerable progress has been made in civil aviation. An airline network covering some 16,000 km. is now in service. All provincial capitals are linked with Beijing by direct flights. In addition, China has established business relations with more than 100 foreign aviation companies. Today, 13 international lines connect China with 15 countries. International airports with modern equipment have been built in Beijing, Shanghai, Guangzhou, Urumqi and other cities.

III. A Brief Account of the Regions

1. North China

North China comprises two municipalities (Beijing and Tianjin), two provinces (Hebei and Shanxi) and the western portion of Inner Mongolia Autonomous Region. The Hebei Plain covers the southwestern part of North China, and the Shanxi Plateau and Inner Mongolia Plateau occupy its western and northern parts. The whole region lies slightly northward, but it is the country's communications centre. In this region, industry is more developed than agriculture, and heavy industry more than light industry. It is rich in mineral resources, especially coal, the verified reserves of which make up over 60% of the country's total reserves. It also produces over 25% of the country's raw coal and is the largest industrial fuel and power base. Most of North China's coalfields, represented by such large-scale coal fields as Datong, Kaiquan, Yangquan, etc., are distributed in the Shanxi Plateau, the south and north slopes of the Yenshan Mountains, the face of the Yanshan Mountains, and the eastern base of the Taihang Mountains. The Dagang and Renqiu oilfields are

the major oil-producing areas. North China is the second largest base of the iron and steel industry in China, with Beijing, Baotou, Taiyuan, Tianjin, Tangshan as its centres. Both in reserves of iron ore and in iron and steel output, this region ranks second in the country. The machine-building industries (including heavy machinery, mining machinery, metallurgical equipment, dynamic machinery, agricultural machinery) and the chemical industry (basic chemicals, chemical fertilizers and organic synthesis) are both well developed in this region, with Beijing, Tianjin and Taiyuan as centres. Light and textile industries, represented by the cotton and wool textile industries, have solid bases in Beijing, Tianjin and Hebei Province. Significant quantities of sea salt are produced along the Bohai Gulf, and the processing of livestock products is of considerable importance in Inner Mongolia.

North China's agriculture lags behind its industry. Hebei, Shanxi and the middle and southern parts of Inner Mongolia produce mainly wheat, corn, millet and kaoliang. The low and unstable yields of food crops, a consequence of frequent floods and drought and the high ratio of non-agricultural population to total population (second-highest after the Northeast), make it impossible for this region to become self-sufficient in food. Cotton is a significant industrial crop, distributed largely in the central and southern parts of Hebei and the southern part of the Fen River Valley in Shanxi. Other industrial crops are: peanuts, which grow in the Hebei Plain; oil flax, in Northern Hebei, northern Shanxi and the central and southern parts of Inner Mongolia; and sugar beets, cultivated in Hetao, Inner Mongolia and Yanbei Prefecture, Shanxi. One of the most important pastoral regions in China extends from the Inner Mongolia Plateau to the adjacent regions of northern Hebei and northern Shanxi; this region provides large amounts of meat, milk, hides and fur for the cities and the light and textile industries. However, the extensive management of animal husbandry, and the serious deficiency of fodder in winter and spring, make the improvement of natural pasture imperative.

There are three metropolises in North China: Beijing, Tianjin, and Taiyuan. Beijing is not only China's capital and a political and cultural centre, but also a comprehensive industrial base with an important iron and steel industry, petrochemical industry, machine-building industry and light and textile industries. The urban population is over 4.3 million, second only to Shanghai. Tianjin is an old industrial centre with the largest harbour in the northern coastal region. It has been transformed from a centre for light and textile industries into a comprehensive industrial base focusing mainly on machinery, chemicals, textiles and light

industries and metallurgy. Tianjin's urban population exceeds 3.6 million, making it the third largest metropolis in China. Taiyuan is a centre of heavy industry in the western part of North China. Other important industrial cities are Tangshan, Shijiazhuang and Baotou.

2. Northeast Region

The Northeast region embraces three provinces — Liaoning, Jilin, and Heilongjiang, and the eastern part of the Inner Mongolia Autonomous Region, which consists of a vast fertile plain (with mild and cool temperatures, medium humidity, and rich minerals), surrounded by mountains and rivers on three sides. In this region are abundant forests, large-scale oil fields, and the richest verified iron reserves in China. There are also vast expanses of wasteland suitable for agriculture. In the past hundred years, but especially after Liberation, Northeast China has been transformed into China's most important heavy industrial base, commodity food base, forest-cutting base and modern communication and transportation hub. It forms an integrated economic system under geographical conditions peculiar to northeast China.

Since cultivation in the Songliao Plain and Sanjiang Plain is rather highly mechanized, the rate of marketable agricultural products is also high. Major food crops grown in this region are spring wheat, corn, kaoliang, millet, rice, etc. and industrial crops include soybeans (over one-third of the country's total output) and sugar beets (which is grown predominantly in the northern part). Vast stretches of grassland extend along the two slopes of the Xinggan Mountains, forming an important pastoral region. There is also forestry and hunting in the mountain areas, cultivation of fruit in the southern part of Liaoning Province and fishing along the coast, all of which contribute to the potential development of agriculture in Northeast China.

Northeast China was the first base for heavy industry constructed after Liberation. Now, a fairly complete industrial system has been built up with iron and steel, machinery, oil and chemical industries as its base, and including well-developed coal, electricity, building-materials textile, paper-making and sugar industries. The output of steel in the Northeast accounts for 25% of the country's total output; metallurgical equipment and motor vehicles, 50%; mining and electric installations, 33.5%; oil and timber, over 50%, respectively.

The region's light industry is rather weak. Coal has to be supplied from North China. The region's only outlets for communication and transportation with the rest of China are the Beijing-Shenyang Railway and Dalian Harbour, which are inadequate and in need of improvement.

The heart of this economic region is the industrial area in central Liaoning Province. It is a dense conurbation comprising five cities: Shenyang, Fushun, Anshan, Benxi, Liaoyang and other industrial points in their suburbs. The aggregate population is approximately two-thirds that of the whole province, and its industrial output value 30% that of the Northeast. Shenyang is the biggest city in the region, with an urban population of 2.7 million. Its major industries are machinery and non-ferrous metallurgy. It is also a junction of the railway network in Northeast China, and a political and cultural centre. Anshan is China's "Steel Capital," with an output equal to 20% of the country's total. Fushun is a centre of heavy industries, mainly coal-mining, oil-refining, electric power and machine-building. Benxi is known as a "Steel City" second to Anshan and is famous for its fine-quality pig iron. Liaoyang is a newly developed centre of the petrochemical industry. Harbin is the largest economic centre and communications hub in the northern part of this region, with a population second only to Shenyang's and a developed electrical machine-building industry. Changchun and Jilin are situated in Jilin Province; the former is important for its motor-vehicle industry; the latter for its chemical industry. Dalian lies at the southern end of the region; it is an important industrial port city with relatively developed machine-building chemical, light and textile industries.

3. East China

The East China region includes Shanghai and six provinces: Jiangsu, Zhejiang, Anhui, Jiangxi, Fujian and Shandong. It is situated on the lower reaches of three great rivers: the Changjiang, the Huaihe, and the Huanghe, and faces the sea on its east. East China is home of 30% of China's total population but its area is only 8.2% of the country. It has the largest number of cities, the most developed industries and the most intensive management of agriculture.

The processing industry is most developed in this region, with Shanghai as the most important centre, followed by Jiangsu and Shandong. The region's machine-building, electrical equipment, textile, chemical and light industries are of paramount importance. Due to the solid technical base developed over a long period of history, East China possesses complete branches of industry, capable of producing a multitude of high-quality products. It has become a production base for various kinds of mechanical equipment and high-grade consumer goods. Raw material industries, iron and steel and basic chemical industries have also developed considerably in this region. Except for the coal fields in the southwestern part of

Shandong, the northern parts of Anhui and Jiangsu and the oil field of Shengli, which can supply only part of its needs. East China lacks sufficient resources to meet its huge energy demands, making it indispensable to bring in large amounts of coal and oil from the north.

The vast expanse of fertile plains, crisscrossed with rivers and lakes, the mild and humid climate in large parts of the region, particularly the Changjiang Delta, have long rendered it a region of dense population and intensive agriculture. The yield of crops per unit area is the highest in the country, while the hilly region here is favourable for diversified economy of crops, forestry, fruit and tea. Therefore, the region's annual production of food, cotton, rapeseed, peanuts, tea and silk, marine and fresh-water aquatic products ranks first in China. Rice, cotton, silk, and aquatic products abound in the Changjiang Delta, wheat and peanuts in Shandong Province. Industrial woods flourish in the hilly areas of Zhejiang and Fujian, as well as in the southern part of Anhui and in Jiangxi, alongside the cultivation of rice and rapeseed. However, despite the intensive cultivation of agriculture, the dense population of the region — especially in the cities — and the rapid development of the textile industry together account for the insufficiency of cotton, flax and wool which have to be sent in from other regions; East China is self-sufficient only in foodgrains, while tea and silk are produced in quantities adequate for export.

Communications and transportation are highly developed in East China, as a result of the import of large amounts of raw materials and fuel to Jiangsu, Zhejiang and especially Shanghai, which is the centre of the region, and as a result of the export of industrial products. Railways lead mainly to the harbours, particularly to Shanghai. The bulk of the regional flow of commodities is handled by the Changjiang River, its tributaries and the network of waterways along the Changjiang and the Huaihe, as well as by sea routes. Roughly 70% of the materials enter and leave Shanghai by way of rivers and sea ports.

Shanghai, with its urban population of roughly 6 million, is the biggest metropolis in China, the most solid industrial base, the sea port with the largest handling capacity and the country's most important scientific, technological and cultural centre. It also constitutes the most densely concentrated conurbation, together with Nanjing (population 1,600,000), Zhenjiang, Changzhou, Wuxi and Suzhou along the Shanghai-Nanjing Railway. Other important cities in this region are: Qingdao, a port and industrial city; Jinan, a centre of manufacturing industry; and Hangzhou, the most famous city for tourism.

4. Central-south China

The Central-south region includes Henan, Hubei, Hunan, and Guangdong and the Guangxi Zhuang Autonomous Region. It is situated in the middle of the country, a little to the south of the centre, with adequate land and water communications and relatively developed industry and agriculture. The iron and steel industry centred in the Wuhan Iron and Steel Company and the non-ferrous metallurgical industry (predominantly of antimony, lead and zinc, tungsten, tin) of central Hunan and Nanling region are all significant. Many important machine-building industries such as transportation machines, motor-driven machines, metallurgical and mining equipment, machines, and agricultural machines, are distributed over such cities as Wuhan, Zhengzhou, Luoyang, Xiangtan, Zhuzhou, Guangzhou, Liuzhou. Coal must be supplied from North China, but hydroelectric potential abounds here, and many medium- and small-sized hydroelectric power stations have been built up at Sanmenxia, Danjiangkou, and Xinfengjiang. When the Gezhouba hydroelectric power station is finished it will be the largest in China. Light industries are represented by textiles in Wuhan and Zhengzhou and sugar-refining in Guangdong and Guangxi.

The Central-south region is one of the most developed agriculturally, a multitude of production bases of commodity crops. Except for Henan Province, where wheat predominates, paddy rice is the region's principal food crop. The largest rice-growing area in China lies south of the Huaihe River. The Jiangshan Plain, the Dongting Lake Plain and the Zhujiang Delta are all significant centres of commodity food production. Peanuts are grown in Guangdong, Guangxi and Henan; half of the country's output of sesame, in Henan and Hubei. Hunan and Hubei are important producers of rapeseed. The former is also the largest producer of tung oil in the country. Approximately 60% of the country's sugar cane is grown in Guangdong and Guangxi. Cured tobacco from Hunan, silk from the Zhujiang Delta, tea from Hunan and Hubei, and freshwater aquatic products from the middle Changjiang Plain and Zhujiang Delta are all important commodity crops. Hainan Island and Leizhou Peninsula in the southern part of Guangdong Province are the only tropical areas in China where tropical crops, such as rubber, are cultivated. Forestry is relatively well-developed in this region. The rate of forest cover in Guangdong and Henan exceeds 13%; timber forest and economic forest prevail; and vast expanses of land suitable for afforestation hold promise of future development. Almost all the cities in this region

are key communication centres by virtue of the region's geographical location. Wuhan, situated at the junction of waterways and land routes in central China, is also a comprehensive industrial base, with iron and steel, machinery, textile and chemical industries and well-developed food production. Guangzhou became an economic centre of South China on the basis of foreign trade in predominantly light industrial products. Zhengzhou, Changsha and Nanning are all important industrial cities as well as provincial capitals.

5. Southwest China

The Southwest China region includes three provinces: Sichuan, Guizhou and Yunnan, and also the Tibet Autonomous Region. The topography is complex, with large areas of mountains, hills and plateaus. Natural resources are abundant and diverse. It is the home of many minority nationalities. It is one of the important agricultural regions in China, producing many regionally specialized products in its agriculture, forestry and animal husbandry. Rice, wheat, maize, rapeseed, peanuts, sugar cane, tobacco, silk, tea, tung-oil, raw lacquer, pigs, hide, timber, medicinal materials and fruit are all produced in significant quantities. The extent of agricultural production in various places differs greatly. The Sichuan Basin is dense in population, intensive in agriculture and abundant in food production, various industrial crops, pigs and fruits. In this basin, the Chengdu Plain is an important base of commodity crops for the whole country. On the Yunnan-Guizhou Plateau, where there are more mountains than plains, agricultural production is limited, but the potential in forestry is high. The western part of Sichuan and the Tibet Plateau are mountainous, sparsely populated, and have a severely cold climate; this area is important for its animal husbandry. Natural forest resources abound in large parts of west Sichuan and southeast Tibet; the timber reserves here account for 41% of the country's total.

Industry in Southeast China has mostly grown up since Liberation. Development of heavy industry has been especially rapid. Sichuan Province, which is abundant in energy and mineral resources, is the region's best developed industrial base. Its hydroelectric potential exceeds 70% of China's total, but has so far been little utilized. The region's coal reserves, largely in Guizhou, rank second in China, next to North China, but at present coal-mining is more developed in Sichuan. The Sichuan Basin has plentiful natural gas, an important resource for the chemical industry; thus it leads the country in the production of chemical fertilizers. Deposits of iron ore are distributed from the Anning River in the southwestern part of Sichuan to central Yunnan. At the centre of this area is Dukou, where a large-scale iron and steel

industry is being developed. Large and medium-sized iron and steel plants are also located in Chongqing, Kunming, Shuicheng, etc. Machine-building is the region's major industrial activity; Chongqing and Chengdu are its centres. The chemical industry is fairly well developed in Chongqing, Chengdu, Zigong, Luzhou, etc. Mining and smelting of non-ferrous metals such as tin, copper, lead, zinc, aluminium and mercury are also important. Railway communication has developed rapidly in this region. The construction of Chengdu-Chongqing, Baoji-Chengdu, Guizhou-Guangxi, Sichuan-Guizhou, Guizhou-Kunming, Hunan-Guizhou, Chengdu-Kunming and Xiangyang-Chongqing railways, coupled with the realignment of the upper reaches of the Changjiang, gave rise to an integrated network of all points both inside and outside the region.

Chongqing and Chengdu, as a result of the development of industry and communications, have become particularly large cities, each with a population of over one million. Chongqing, located at the junction of waterways and overland routes on the upper reaches of the Changjiang River, is the largest comprehensive industrial base in the Southwest and has a population of about 1.8 million. Machine-building and light industries have developed fairly well in Chengdu, which is also the largest scientific and cultural centre in the Southwest. Kunming, the largest city on the Yunnan-Guizhou Plateau, is a well-known place for tourism.

6. Northwest China

The Northwest region includes the provinces of Shaanxi, Gansu and Qinghai, and Ningxia Hui and Xinjiang Uygur autonomous regions. With an area equal to 32% of the whole country, but a population less than 7% of the total population, the density of population is only 20% of the national average population density. It is a multi-national region with a low standard of economic development, but great potential. The southern part of this region, south of Wuyao Mountain and east of Riyue Mountain, is the major agricultural area producing wheat and millet. The Guanzhong Plain is an important food and cotton base. But a large part of the farmland here is situated on the Loess Plateau, where steep slopes are under cultivation but where serious loss of water and soil erosion render outputs low and unstable. Large areas west of Wuyao Mountain belong climatically to arid desert, where agriculture depends entirely on irrigation. Farmlands are restricted to small irrigated patches of oases distributed at the foot of mountain ranges. Crops include wheat, cotton, melons and other fruit, well-known for their high yield and superior quality. But the development of agriculture is restricted by the scarcity of water and threatened by salinization, alkalination and sand-

storms. Moreover, deserts and mountain areas prevail over a vast expanse of land. Most of the pastureland is poor and the raising of livestock remains at the mercy of the elements.

Most of the industry in this area developed after Liberation. There are oil fields at Karamay, Yumen and Lenghu; petrochemical industries in Lanzhou and Yumen; coal mining north of the Weihe River valley, in the Helan Mountains, in eastern and central parts of Gansu Province and Urumqi; large hydroelectric power stations in the gorges of the Huanghe River in Qinghai, Gansu and Ningxia; industries in non-ferrous metals (nickel, molybdenum, rare metals), copper, iron and steel,

represented by the Jiuquan Iron and Steel Company; machine-building industries in Xi'an and Lanzhou; and cotton and woolen textile industries. The construction of the Tianshui-Lanzhou, Baoji-Chengdu, Baotou-Lanzhou, Gansu-Xinjiang and Gansu-Qinghai railways considerably improved communications and transportation in the region and facilitated its economic development. Xi'an and Lanzhou each have populations of more than one million and are major industrial centres — the former predominating in cotton textiles and machinery; the latter in petrochemicals, machinery, aluminium smelting and woolen textiles.

4. CHINA'S MINORITY NATIONALITIES

By Hua Juxian

State Nationalities Affairs Commission

China's valiant and industrious minority nationalities are imbued with a glorious revolutionary tradition. Throughout their long historic development, they have joined forces with the Han nationality to open up the border areas and develop a prosperous economy. They have made contributions in creating our country's brilliant culture and in founding the People's Republic of China.

I. General Situation of the Minority Nationalities

China is a unitary multinational state. Apart from the Han nationality, there are 55 minority nationalities. Up to 1978, they accounted for 55.8 million, or 6%, of the total population.

Population. The populations of various minority nationalities differ greatly. The 12 million Zhuangs constitute the largest minority nationality in China while the Hcho and Russian nationalities are the smallest, with populations of less than 1,000 each.

Thirteen nationalities have populations above 1 million: the Mongolians, Hui, Tibetans, Uygurs, Miao, Yi, Zhuang, Buyi, Koreans, Manchu, Dong, Yao and Bai.

Fifteen nationalities have populations above 100,000: the Tujia, Kazak, Hani, Dai, Li, Lisu, Wa, She, Gaoshan, Lahu, Shui, Dongxiang, Naxi, Tu and Luoba.

Eighteen nationalities have a population between 10,000 and 100,000: the Kirgiz, Jingpo, Daur, Mulao, Qiang, Bulang, Sala, Maonan, Gelao, Xibo, Achang, Tajik, Nu, Ewenki, Benglong, Pumi, Monba and Jinuo.

Nine nationalities have a population below 10,000: the Uzbeks, Baoan, Yugur, Jing, Tartars, Dulong, Oroqen, Hezhe and Russians.

In addition, there are groups of people in Yunnan, Tibet and other provinces awaiting conclusive definitions of their nationality origins.

Land Areas. Although relatively small in number, the minority nationalities inhabit large areas, amounting to 50–60% of the total area of China. They are distributed mainly over the Inner Mongolia Autonomous Region, the Xinjiang Uygur Autonomous Region, the Tibet Autonomous Region, the Guangxi Zhuang Autonomous Region,

the Ningxia Hui Autonomous Region and the provinces of Heilongjiang, Jilin, Liaoning, Gansu, Qinghai, Sichuan, Yunnan, Guizhou, Guangdong, Hunan, Hebei, Hubei, Fujian and Taiwan. Over 20 minority nationalities live in Yunnan Province, more than in any other province. The Gaoshan nationality lives in a compact community in Taiwan Province.

In addition to those who live in compact communities, 10 million people of minority nationalities live among other nationalities or are scattered among cities, towns and the countryside throughout the country. At present, minority nationalities live in every province and city and in over 70% of China's counties. In regions where minority nationalities live in compact communities, the Hans reside there together with them. In regions such as Inner Mongolia, Ningxia and Guangxi, the Han are in the majority. The mixing of various nationalities and the living together of various nationalities as ethnic groups with the Han as the core is one of the characteristics of our country's distribution of nationalities.

The principal areas where minority nationalities live are vast and rich in natural resources. This includes cultivated areas of more than 200 million *mu*, while over 700 million *mu* of wasteland are available for development. Some areas, such as the Hetao Plain in Ningxia and Inner Mongolia, are among China's important grain producing regions. As for industrial crops, Xinjiang is the main area for producing long-staple cotton; Guangxi is a sugar-cane growing area; Yunnan and Hainan Island of Guangdong Province produce coffee, rubber and other tropical crops.

Animal husbandry is of national significance in many areas inhabited by people of minority nationalities who live in compact communities. Grasslands, where China's five natural grazing regions are located, cover 29% of the country's territory.

Natural Resources. Areas where minority nationalities live also abound in rare birds and animals, such as pandas, rhinoceros, elephants and peacock; precious traditional medications, such as the bulb of fritillary, Chinese caterpillar fungus, musk, pilose antler of young stags, tubers of elevated gastrodia, fruit of Chinese wolfberry, safflower and snow lotus are also found in these areas. Forests in these regions come to 45 million hectares, accounting for 37% of the country's total

forest area. Timber stands amount to 4,300 million cubic metres, or 49.7% of the national total. Water resources are abundant, with a total hydroelectric potential of 300 million kw. The area of freshwater covers about 46 million *mu*. Within the boundaries of these areas are located several famous lakes, such as Qinghai Lake, Lop Nor, Hulunbuir Lake, Namou Lake and Er Hai Lake. The world-famous Changjiang (Yangtze) River, as well as the Huanghe, Zhujiang, Heilongjiang, Sunghua, Tarim, Yarlung Zangbo and Nujiang rivers rise in and flow through these areas.

Mineral Resources. Rich varieties of mineral resources and abundant mineral deposits include coal, petroleum, ferrous and non-ferrous metals, rare metals and nonmetallic mineral resources. The oil fields of Baise in Guangxi, Majiatan in Ningxia and Qaidam in Qinghai are quite well-known. Abundant geothermal energy resources in Tibet have begun to be exploited. There are rich tin ore deposits in Guangxi, ranking first in China. Bauxite also occupies an important place in Guangxi, Gejiu City, capital of the Han-Yi Autonomous Prefecture on the Honghe River of Yunnan Province, is traditionally known as "the tin capital." Inner Mongolia's mineral resources of aluminium, zinc and copper play an important role in north China. In addition, mica in Xinjiang, gypsum in Ningxia and marble in Yunnan are well-known in China.

All of this wealth belongs to the people of all nationalities of our country. They constitute indispensable material bases on which to build our great motherland into a powerful modernized country.

Language and Culture. Prior to Liberation, only 21 nationalities practiced their own cultures. Fifty minority nationalities have their own languages. The Han spoken language and written characters [i.e., the Chinese language] are commonly used among the Hui, Manchu and She nationalities. Eleven nationalities — the Mongolians, Tibetans, Uygurs, Koreans, Kazaks, Xibo, Dai, Uzbeks, Kirgiz, Tartars and Russians — have their own commonly used written languages; although seven nationalities — the Yi, Naxi, Miao, Jingpo, Lisu, Lahu and Wa — have their own written languages, these languages are not in common use. The remaining 34 nationalities prior to Liberation had no written languages of their own.

After Liberation, the party and state helped ten of these nationalities to create their own written languages, including Zhuang, Buyi, Miao, Dong, Hani, Li; they helped other nationalities such as the Uygurs, Kazaks, Jingpo, Lahu and Dai to reform their written languages.

The languages of 29 nationalities belong to

the Han-Tibetan language family; 18 belong to the Altay language family; 3 belong to the South Asian language family; and 2 to the Indo-European language family. The language of the Gaoshan nationality in Taiwan Province belongs to the Southern Island language family. The language of one nationality has yet to be classified.

Customs and Religion. Throughout their long historical development, the minority nationalities have evolved their own customs and habits in matters of diet, dress and personal adornment, housing, marriage, burial, holidays and celebrations, entertainment, taboos and other aspects. The ten nationalities that adhere to Islam do not eat pork. Every nationality celebrates its own traditional holidays, such as "the water splashing festival" of the Dai, the "torch festival" of the Yi and the "Tibetan New Year's Day" of the Tibetan people. These holidays to varying degrees mirror each nationality's historic traditions and intellectual qualities in realms of morals, arts and religious concepts. Such observances have become an important aspect of the distinguishing features of different nationalities. Religions, including Buddhism and Islam in particular, have a profound influence among minority nationalities. Before Liberation, the ten nationalities of Hui, Uygurs, Kazaks, Kirgiz, Tartars, Uzbeks, Tajiks, Dongxiang, Sala and Baoans took Islam as their faith. The Tibetans, Mongolians, Dai and Yugur professed Buddhism (including Lamaism). Quite a number of Miao, Yao, Yi and other nationalities followed Catholicism and other forms of Christianity. The Oroqen, Ewinki and Daur believed in shamanic religion. It was for that reason that prior to Liberation in China, nationality problems often became intertwined with religious problems.

Social Development. Uneven social development among different nationalities was quite common, even among different areas within one nationality. Generally speaking, the standard of development in Han-inhabited areas was higher. This was due to the fact that before Liberation, there was advanced feudal agricultural economy in the Han-inhabited areas, where modern capitalist industry and commerce had also developed to a considerable extent. Therefore, in areas where the Hans and other minority nationalities lived together, or in those areas of national minority concentration which bordered on or overlapped those areas inhabited by the Han people, the local economy reached or nearly reached the economic levels of Han-inhabited areas.

Conversely, the stages of social development were comparatively backward in places far from areas inhabited by the Han people. Examples of

the backwardness of these minority nationalities is illustrated by the "slash-and-burn" cultivation practiced among the Miao, Yao, Jingpo, Lisu and Wa; the nomadic life of the Mongolians, Tibetans, Kazaks and Yugurs; the simple fishing and hunting life of the Oroqin, Ewenki, Hezhe and Jinuo. Some nationalities have not yet brought about a division of labour between animal husbandry and farming, between agriculture and the handicrafts industry. In other cases, economic division of labour has been carried out not within one nationality but among different nationalities.

To the extent that they are closely linked with stagnant and semi-stagnant production, the cultures of the minority nationalities are generally also backward. Although many minority nationalities possess unique styles in architecture, handicrafts, arts, music and dance, as well as in cultural heritage, and although these traditions have enriched our country's cultural wealth, most minority nationalities either have no intellectuals of their own or have only some intellectuals in the midst of a majority in the nationality who are illiterate. Some nationalities are still in a primitive stage of keeping records — performing these functions by notching wood or tying knots.

In line with economic development at the time, the social structures of the minority nationalities before Liberation were quite complex and represented various stages of historical development. The social and economic structures of 30 minority nationalities, including the Zhuang, Hui, Uyghurs, Koreans, Manchu, Buyi, Bai, Tujia, Dong and Miao; most Mongolians, Yi and Li; and a small portion of Tibetans more or less resembled that of the Han. The feudal serf system existed among the Tibetan, Dai and Hani nationalities; the herding and farming system existed in some pasturelands in Inner Mongolia. The majority of the Yi nationality had long entered into feudal landlord economy, but in Sichuan and the greater and lesser Liangshan Mountain areas of Yunnan, the slave system was still being practiced. Up to Liberation, several minority nationalities preserved systems of primitive communes. These nationalities included the Orogen, Weink, Hezhe, Dulong, Nu, Lisu, Wa, Bulang, Benglong, Jingpo, Jinuo, Monba and Li.

During the long process of historic development, the Han and people of the minority nationalities developed economic ties. The introduction of advanced technologies such as iron-smelting, pottery, wine-making and paper-making from the Han-inhabited central plains promoted economic development in the border areas. At the same time, the Han people imported new varieties of crops, cultivation techniques and livestock products. In turn, the Han gained valuable experiences in animal husbandry from people of minority

nationalities, thus bringing about significant advances in agricultural and livestock production in the central plains. But due to the conditions of national oppression, these ties and exchanges had often to be carried out in the midst of national conflict.

II. Policies Towards Minority Nationalities

Since Liberation, the Communist Party of China and the people's government have formulated and implemented many policies towards nationalities that have taken account of Marxist-Leninist theories on nationality and of the actual conditions of minority nationalities in China. These policies have included:

1. *Adherence to the equality of all nationalities and opposition to national discrimination and oppression.*

The Communist Party of China has consistently stood for the principle that all of the nationalities are equal, be they large or small; the people of minority nationalities and scattered members of minority nationalities, whether living in compact communities or living together with other nationalities, enjoy equal rights. In line with this consistent stand, the party and government drew up a series of policies, decrees and measures on national equality. In the early days of the People's Republic, the Common Programme clearly stipulated that all the nationalities living in the territory of the People's Republic of China are equal. National discrimination, oppression and acts that undermine national unity are strictly forbidden. In the spirit of the provisions of the Common Programme, the State Council of the Central People's Government in 1951 issued its Instructions on Handling Addresses, Names of Places, Steles and Horizontal Inscribed Boards Which Have the Nature of Discriminating Against or Insulting Minority Nationalities; in 1952, it issued the Programme on the Implementation of National Regional Autonomy of the People's Republic of China and the Decision on Guaranteeing to All Scattered Members of the Minority Nationalities the Enjoyment of Equal National Rights. Thereafter, the state constitutions issued by all subsequent National People's Congresses clearly defined that all nationalities enjoy equal rights.

In order to enable the majority nationalities to participate in the management of state affairs on an equal footing with the Han and to guarantee that they enjoy equal rights in organs of state power at all levels, the party and government made special provisions with regard to the number of

deputies to be elected to the National People's Congress and to local people's congresses at each level. Generally speaking, the percentage of deputies of minority nationality surpassed their proportion in the national population. The party and government have seen to it that all minority nationalities including those with populations of less than 1,000 have their own representatives in the congresses. At the same time, in areas where people of the minority nationalities live in compact communities, regional autonomy has been implemented to guarantee that the people of minority nationalities enjoy the right to manage their own national affairs within the unified extended family of the motherland.

In light of the provisions of the Constitution and other statutes, all minority nationalities have the freedom to develop their own oral and written languages. In court, the people of minority nationalities may bring lawsuits and defend cases in their own national oral or written languages. They have the freedom to retain or to reform their own customs and habits and no one has the right to interfere. They have the freedom to participate in people's organizations and in all kinds of professional work and may not be excluded on grounds of nationality. If subjected to nationality discrimination or abuse, the minority nationalities have the freedom to file charges with the people's government. All these measures have enabled dozens of minority nationalities which were not recognized by the Guomindang reactionary government and were in a powerless condition, to appear on our country's political scene and become equal members in the great family of the motherland.

For the sake of implementing the above-mentioned stipulations, the government has taken many concrete measures such as permitting all nationalities to have their days off during their own holidays; not encouraging pig breeding among minority nationalities who do not eat pork; opening up separate dining halls or giving food allowances to the workers and staff of the Hui and Uygur nationalities, so that they may have their meals in neighbourhood Muslim canteens.

During the ten years of turmoil [i.e., the "cultural revolution"] policies regarding the minority nationalities were sabotaged by Lin Biao and the Gang of Four. After restoring order out of the chaos, the Chinese government quickly corrected the errors and restored all effective measures guaranteeing equal national rights. China's criminal law, promulgated in 1979, stipulated that those who have committed serious offences of illegally depriving citizens of their legitimate freedom of religious belief and violating the customs and habits of the minority nationalities will be sen-

tenced to two years' imprisonment or hard-labour detention. This stipulation guarantees by law the implementation of equal national rights.

2. *The implementation of regional national autonomy.*

This is China's basic policy in resolving nationality issues. Regional national autonomy means the setting up within a united motherland under the unified leadership of the party and government and within the areas where people of the minority nationalities live in compact communities, corresponding autonomous local governments in which the minority nationalities are the masters over their own internal affairs.

The autonomous rights and characteristics of the national autonomous local government are:

A. The national autonomous governments are to be mainly formed by members of the nationalities which exercise autonomy.

B. The written languages of the minority nationalities in common use locally are to be used as instruments to exercise functions and powers.

C. In exercising their functions and powers, the autonomous governments are to fully respect national characteristics, customs and habits.

D. Autonomous and special regulations are to be formulated in accord with conditions of autonomous localities.

E. The autonomous governments are to enjoy greater financial privileges than non-autonomous local governments.

In the areas where people of the minority nationalities live in compact communities, over 90% of the population have adopted national regional autonomy. There are five autonomous regions in China: the Inner Mongolia Autonomous Region, the Xinjiang Uygur Autonomous Region, the Ningxia Hui Autonomous Region, the Guangxi Zhuang Autonomous Region and the Tibet Autonomous Region; there are also 29 autonomous prefectures and 75 autonomous counties (i.e., Inner Mongolian "banners").

The policy of national autonomy has strengthened national unity, enhanced unity between the people of all nationalities, aroused the enthusiasm of the minority nationalities, and promoted all levels of development in the national autonomous regions. But this policy had been sabotaged by Lin Biao and the Gang of Four during the ten years of turmoil. After the smashing of the Gang of Four, and especially after the Third Plenary Session of the 11th Central Committee of the Communist Party of China, the government reaffirmed this policy, did a lot of work to correct the wrongs, and adopted many important regulations; for example, the original boundaries of the Inner Mongolia Autonomous Region were restored and the

abnormal situation that existed in some of its autonomous areas — where Han cadres occupied the leading positions — was corrected. At present, the promulgation of laws on national regional autonomy is going on in all parts of the country to strengthen the participation of the nationalities in autonomous organs, and especially to increase the proportion of nationality cadres. These measures will gradually perfect the policy of national autonomy, so that the minority nationalities may fully enjoy their rights as masters of their own affairs.

3. *Devoting major efforts to fostering and training cadres of minority nationalities.*

The party and government have always attached great importance to the work of fostering and training minority nationality cadres. During each stage of development of the revolution, our party trained a large number of cadres of minority nationalities. The Institute for Nationalities, founded in Yanan, was the first school to train national cadres under the leadership of the Communist Party of China. After the founding of New China, the party and government drew up the policy of "training cadres of minority nationalities thoroughly and on large scale." In addition to training them in conventional universities and colleges, ten institutes have been established for the nationalities: Central, Southwest, Northwest, Qinghai, Yunnan, Guizhou, Tibet, Guangdong, Guangxi and South-central Institutes for Nationalities. The provinces and regions run their own national cadres' schools and training centres and train and appoint cadres of minority nationalities through various campaigns and practical work.

According to incomplete data through 1977, there were over 800,000 cadres of minority nationalities throughout the country, an increase of more than 80-fold over 1949. Among them, some were assigned to leading posts in party and government organs; some worked in the departments of economy, culture, science and other special fields; and some were scientific and technical personnel. Cadres of minority nationalities maintain broad contact with the people of their nationalities; they are familiar with local conditions; and they play an important role in the development of the national autonomous areas. Thus, they are valuable assets for the party and the state.

Lin Biao and the Gang of Four wantonly dissolved eight institutes for nationalities; disrupted the work of training national cadres; fabricated a large number of unjust, false and misjudged cases; and ruthlessly persecuted and dealt mercilessly with numerous cadres of minority nationalities. After the downfall of the Gang of Four, the majority of unjust, false and misjudged cases were corrected and many cadres of minority nationalities

were reinstated. In the course of reopening the eight institutes for nationalities, the Nationalities Affairs Commission convened a meeting of presidents of institutes for nationalities. The conference focused its discussions on policies and measures to train cadres and specialists of minority nationalities in the goals of the four modernizations. In order to strengthen the training of cadres of minority nationalities, the Organization Department of the Central Committee of the Communist Party of China and the Nationalities Affairs Commission convened a series of special meetings. Despite these efforts, however, the quantity and calibre of nationalities cadres is as yet unable to meet the needs of revolution and construction in the areas inhabited by national minorities. The population of minority nationalities accounts for 6% of the country's total, while cadres of minority nationalities account for only 4.8% of all cadres. There are few cadres from minority nationalities in leading posts above the county level, and scientific and technical cadres are particularly lacking. These circumstances require further improvement.

4. *Since Liberation, the party and state have undertaken positive and prudent measures to assist minority nationalities achieve democratic reform and socialist transformation.*

In the process of reform, by pursuing all cases from the standpoint of actual conditions in the areas of the minority nationalities, the party and state formulated and adopted a series of correct principles and policies. In light of these principles and policies, the party and state carried out social reforms in stock-raising areas by adopting policies distinct from those in agricultural areas where the government did not distribute cattle and sheep. In the realm of democratic reform, it abolished feudal exploitation and carried out socialization of grazing land. Herdsmen enjoyed freedom to graze sheep and cattle. These policies were beneficial both to herdsmen and to herd owners. Afterwards, with a view to developing production, it carried out transformation among the herd owners and herdsmen through different means, set up socialist collective ownership and ownership by the whole people [i.e., state ownership].

As to those areas inhabited by minority nationalities where class polarization was not clear, where standards of production were very low and where primitive commune systems had survived, the party and state provided energetic assistance by aiding progress in production and culture and by helping them to gradually pass over to socialism by directly taking to the collective road while at the same time undertaking socialist transformation and necessary reforms. For those minority nationalities in the early stage of capitalist development,

the party and state upheld the policy of achieving reform through consultation — exercising the policy of redemption for those upper-class elements who accepted socialist reform. For those regions which had achieved social and economic structures roughly comparable to those of the Han nationality, more moderate policies were adopted.

In this way in less than 20 years the minority nationalities had crossed one or many stages of social development and had passed over to socialism, thus opening up broader prospects for the development of their productive forces.

5. *Constantly readjusting and improving relations between various nationalities and strengthening national unity.*

Since the founding of New China, the party and government have done much to strengthen national unity. On the whole, relations between various nationalities have been good and the unity between various nationalities has stood up to all tests. While guarding against and opposing external sabotage to split national unity, the party and government have paid constant attention to and resolved problems that threatened unity, making steady efforts to overcome the two tendencies of great Han chauvinism and local nationalism — the former tendency in particular. To this end the party, in 1952 and 1953, twice promoted education in nationality policies throughout the party and the country. Along with this educational programme, the party and government carried out general follow-ups on the implementation of policies towards nationalities, resolved a number of problems, improved relations between various nationalities and achieved excellent results.

After 1958, due to the influence of the "Left" ideology — especially during the ten years of turmoil under the reactionary policies of the Gang of Four towards the nationalities — national unity suffered great damage. The reactionary features of these policies were that instead of stressing opposition to great Han chauvinism, they opposed local nationalism. This weakened the cordial links between the party and the minority nationalities and damaged the friendly unity between various nationalities.

After the downfall of the Gang of Four, under the direction of the Party Central Committee and in combination with the condemnation of crimes committed by Lin Biao and the Gang of Four, reeducation and review of policies towards the nationalities were carried out throughout China to eliminate the Gang's negative influence on the work towards nationalities and to correct mistakes of infringing on the right of national equality and violating policies towards nationalities.

In 1980, the Central Committee of the Com-

munist Party of China, in a document prepared for a symposium on Tibetan problems, pointed out: "It is an important task of great historical and strategic significance to cement national unity between the Han, Tibetan, Uyghur and other minority nationalities in the border areas and the hinterland." At present, all areas where people of various nationalities live in compact communities are making great efforts to implement the spirit of this document so as to improve relations between various nationalities and resolve problems.

III. Tremendous Achievements in Economic Construction

Policy Achievements. Our country's fundamental tasks in solving national problems are to earnestly and sincerely help the minority nationalities to develop economically and culturally and to gradually eliminate actual inequalities inherited through historical circumstances. Since the founding of the People's Republic, the party and government have adopted many policies and measures with regard to manpower, material and technical assistance, for example:

1. *In the field of capital construction, the state invested large sums of money in districts inhabited by national minorities.* From 1950 to 1979, investments in capital construction in these areas amounted to 63,400 million yuan.

2. *In the financial field, the state annually provides huge subsidies to minority nationalities areas by granting credits, relief funds and production allowances.*

During the past few years, the total amount of special funds for regional subsidies to underdeveloped areas inhabited by national minorities was 1,000 million yuan. The total included subsidies for the development of border areas; for capital construction in border areas and areas where people of minority nationalities live in compact communities; special funds in support of the developments in underdeveloped areas amounted to 1,000 million yuan. In some areas where production was extremely backward, a policy of reducing or remitting taxes was carried out. In some areas short of production tools, free distribution of farm tools was carried out. Since the early period of Liberation, the party and government have assisted the growth of domestic trade by implementing a policy of rational pricing, price differences between industrial and agricultural products were readjusted so as to increase the income of peoples of minority nationalities and to promote production in areas inhabited by various nationalities.

3. Each year the people's government allocates and transfers large quantities of industrial and agricultural products, raw materials and machinery to areas inhabited by the people of minority nationalities.

It is clearly stipulated that all industrial products required throughout the country should be given priority in distribution to areas inhabited by the people of minority nationalities. These areas are also given special consideration in regard to some commodities.

4. In order to enhance economic and cultural development in areas inhabited by the people of minority nationalities, the party and state have sent large numbers of cadres and technicians to work in these areas. Hinterland workers and youth have been methodically mobilized to help construction in the border areas. Moreover, members of the People's Liberation Army stationed in areas inhabited by the people of minority nationalities also actively participate in local projects.

5. In recent years, the state has made special provision for some provinces and municipalities with relatively advanced development in industry and science and technology to provide direct one-on-one assistance to areas inhabited by the people of minority nationalities. For example: Beijing assists work in Inner Mongolia; Shanghai helps Yunnan and Ningxia; Tianjin helps Gansu; Hebei helps Yunnan and Ningxia; Tianjin helps Gansu; Hebei helps Guizhou; Jiangsu helps Guangxi and Xinjiang; Shandong helps Qinghai; and the whole country helps Tibet. Assistance covers a wide range of activities, including industrial and agricultural production and stock-raising, culture, education, science and public health. According to the specific conditions of the two sides, each relationship has its own emphasis, such as training cadres, disseminating techniques and providing equipment.

Thanks to the assistance from the state and plain living and hard work of the people of minority nationalities, the look of the areas inhabited by the people of minority nationalities have undergone marked changes.

Quantitative Achievements in Minority Nationalities Areas. By 1979, the total value of industry and agriculture in the areas inhabited by minority nationalities had increased by over ten-fold since 1949, reaching 38,000 million yuan.

Agriculture. Since the founding of the People's Republic, strenuous efforts in capital construction on the farms in national autonomous

areas have produced an extensive area of cultivated land with high, stable yields.

Irrigated areas increased by 154.1% between 1949 and 1979. The proportion of cultivated land under irrigation rose from 22.7% in 1949 to 41% in 1979. Primitive farming methods such as the use of bamboo and wooden farm tools and slash-and-burn cultivation have long become things of the past. Animal husbandry continues to be the main element in agricultural production. Nevertheless, several hundred thousand agricultural machines are in place, including tractors, rice transplanters, reapers and lorries. Chemical fertilizers and electricity used in the countryside has increased progressively while great stress has been attached to scientific farming.

In 1979, the total output of agricultural production in the national autonomous areas reached 16,800 million yuan, making up 10.6% of the national total and marking an increase of 279.1% compared with 1949; grain output was 33.17 million tons, making up 10% of the national total and an increase of 186.9% over 1949; cotton output was 56,700 tons, an increase of 455.9% over 1949; and timber output was 15.90 million cubic metres, an increase of 582.4% over 1949. The output of oil-bearing crops, roasted tobacco, tea, sub-tropical industrial crops, local and special products and medicinal herbs has also increased rapidly.

Livestock raising plays an important role in the economic development of areas inhabited by the people of minority nationalities, and occupies a large proportion of the country's animal husbandry output.

By the end of 1979, the total number of head of domestic animals in farming and stockbreeding areas of the autonomous regions reached 171.38 million, amounting to 28.8% of the national total and representing a four-fold increase over 1949; of these, draught animals reached 38.88 million head, making up 41.1% of the national total and an increase of 136.2% as compared with 1949; sheep totalled 98.57 million, accounting for 53.8% of the national total and almost six times greater than 1949; and pigs were 33.93 million, or 10.6% of the national total and four times higher than the total of 1949.

Since the founding of the People's Republic, the minority nationalities have supplied the state with large quantities of farm animals, meat-producing animals, draught animals and livestock products. These have provided significant support to national development. Initial results have been achieved in development of grasslands through the mechanization and quasi-mechanization of stock-raising, as well as through veterinary science and improvements in breeding domestic animals.

Industry. During the old society, the areas of minority nationalities had only small-scale handicrafts industries, or no industries at all. Today, a large number of modern industries have been established, including textiles, steel, coal, electric power, petroleum, machinery, chemicals and building materials industries. The state has constructed world-famous projects in Inner Mongolia, Xinjiang, Gansu and other regions inhabited by the people of minority nationalities; these include the Baotou Iron and Steel Company, the Karamay Oilfield and the Liujiaxia and Quintongxia hydroelectric power stations. In 1979, the total output of industry in the national autonomous areas was 42 times greater than that of 1949. During the three decades from 1950 to 1979, the annual growth-rate for total industrial output in the national autonomous areas was impressively high, averaging 13.3%.

Before Liberation, the people of minority nationalities had no steel industry whatsoever. By 1979, however, iron and steel output in these areas had reached 1.5 million tons. Coal output increased from 1.7 million tons in 1952 to 57.30 million tons in 1979; crude oil from 52,000 tons to 6.2 million tons; electricity from less than 100 million kwh to 18,000 million kwh; and cotton cloth from 35,000 metres to 395 million metres.

Transportation. Transportation has grown rapidly. Except for Tibet, where a railway is now under construction, trains can now travel straight to Inner Mongolia, Ningxia, Guangxi and Xinjiang. By 1979, the total mileage of railroad traffic in the autonomous areas was 3.3 times greater than in 1949. Highway construction in areas inhabited by minority nationalities has been expanding by leaps and bounds. By 1979, the total mileage of highways opened to traffic in autonomous areas was 18.5 times that of 1949. Bus services reach nearly every county town and every commune. Civil air service extends to the capitals of the autonomous regions and to some autonomous prefectures. In short, the underdeveloped conditions in transportation in these areas have been markedly improved.

Commerce. Sectors of national trade that have a direct bearing on production and life among the people of minority nationalities has also made great headway. According to incomplete data, total purchasing value in the autonomous regions in 1979 had increased by 23-fold over 1952; the total value of retail commodities increased 17-fold and the number of workers and staff engaged in national trade increased 5 times, with workers and staff of minority nationalities engaged in this sector having increased by 112 times. At present,

in areas inhabited by the people of minority nationalities, administrative organs for commerce are being set up in stages.

Education. Today, each of the 55 minority nationalities has students in colleges. In 1980, there were 460,000 teachers and 9,700,000 students from minority nationalities enrolled at all levels of education. The number of students has increased by 980% over the early Liberation period; primary-school students increased by 8-fold, middle school students 46-fold and college students 20-fold. In some advanced areas, education developed more rapidly. In the Yanbian Korean Autonomous Prefecture in Jilin Province, primary-school and junior-middle-school education have been widespread for a long time, while senior-middle-school education has become quite well-developed.

Health Care. Medical organizations have for the most part been established in those areas of minority nationalities where doctors and medicines were lacking and where there had been widespread illness and high mortality rates in the past. Nearly all counties (and banners in Inner Mongolia) and most communes have hospitals or commune clinics. According to statistics through 1979, medical and public-health facilities in the autonomous areas totalled 25,027, an increase of 32.6% over 1949. Of the total, 10,254 were hospitals, an increase of 4,458.2% as compared with that of 1949. Along with growth in medical services, endemic or persistent diseases in these areas have been brought under effective prevention and control; these include malaria, snail fever, undulant fever, leprosy, keshan disease and fluorine poisoning.

Obstacles to Rapid Development. Although the people of minority nationalities have gained remarkable achievements in production since the founding of the People's Republic, differences remain vast when compared with areas inhabited by the Han people. Agriculture and stock-breeding have developed slowly; they are low in management levels and weak in their ability to combat natural calamities. Given this production basis, the living standards of peasants and herdsmen cannot be expected to grow rapidly. In some poor mountainous areas, the people's life is yet more difficult, requiring long-term state assistance. In industry and transport, conditions remain relatively backward. School enrollments, the extent of universal education and qualification rates are much lower than in Han-inhabited areas. In some remote mountainous and pastoral areas, the illiteracy rate is about 70–80% among young people.

Moreover, some contradictions exist owing to the fact that the exploitation of natural resources in areas inhabited by minority nationalities has not been linked to the interests of the local minority nationalities. Some of these problems have been handled properly, while others are now being addressed by the departments concerned and are in the process of being settled.

Since the Third Plenary Session of the 11th Central Committee of the Communist Party of China, the party and government have taken many measures in these areas and done much to exploit favourable local conditions, to implement policies, to respect the right of self-management of the

communes and brigades, to promote various systems of responsibility in production and to reduce or waive taxation burdens on the people. All of these measures have been welcomed by the people of minority nationalities and have had the effect of arousing the enthusiasm of the masses. The situation in areas inhabited by people of minority nationalities has changed for the better. So long as we persist in implementing the party's principles and policies and in further strengthening unity between the nationalities, economic development is sure to leap forward in the areas inhabited by the people of minority nationalities.

5. THE CONSTITUTION OF THE COMMUNIST PARTY OF CHINA

(Adopted by the 11th National Congress of the Communist Party of China on August 18, 1977)

GENERAL PROGRAMME

The Communist Party of China is the political party of the proletariat, the highest form of its class organization. It is a vigorous vanguard organization composed of the advanced elements of the proletariat, which leads the proletariat and the revolutionary masses in their fight against the class enemy.

The basic programme of the Communist Party of China for the entire historical period of socialism is to persist in continuing the revolution under the dictatorship of the proletariat, eliminate the bourgeoisie and all other exploiting classes step by step and bring about the triumph of socialism over capitalism. The ultimate aim of the Party is the realization of communism.

Marxism-Leninism-Mao Zedong Thought is the guiding ideology and theoretical basis of the Communist Party of China. The Party persists in combating revisionism, and dogmatism and empiricism. The Party upholds dialectical materialism and historical materialism as its world outlook and opposes the idealist and metaphysical world outlook.

Our great leader and teacher Chairman Mao Zedong was the founder of the Communist Party of China and the greatest Marxist-Leninist of our time. Integrating the universal truth of Marxism-Leninism with the concrete practice of the revolution, Chairman Mao inherited, defended and developed Marxism-Leninism in the struggles against imperialism and the domestic reactionary classes, against Right and "Left" opportunist lines in the Party and against international modern revisionism. He led our Party, our army and our people in winning complete victory in the new-democratic revolution and in founding the People's Republic of China, a state of the dictatorship of the proletariat, through protracted revolutionary struggles and revolutionary wars, and then in achieving tremendous victories in the socialist revolution and socialist construction through fierce and complex struggles between the proletariat and the bourgeoisie, and through the unparalleled Great Proletarian Cultural Revolution. The banner of Chairman Mao is the great banner guiding our Party to victory through united struggle.

Socialist society covers a historical period of considerable length. In this period, classes, class contradictions and class struggle, the struggle be-

tween the socialist road and the capitalist road and the danger of capitalist restoration invariably continue to exist, and there is the threat of subversion and aggression by imperialism and social-imperialism. The resolution of these contradictions depends solely on the theory and practice of continued revolution under the dictatorship of the proletariat.

China's Great Proletarian Cultural Revolution was a political revolution carried out under socialism by the proletariat against the bourgeoisie and all other exploiting classes to consolidate the dictatorship of the proletariat and prevent the restoration of capitalism. Political revolutions of this nature will be carried out many times in the future.

The Communist Party of China adheres to its basic line for the entire historical period of socialism. It must correctly distinguish and handle the contradictions among the people and those between ourselves and the enemy, and consolidate and strengthen the dictatorship of the proletariat. The Party must rely on the working class wholeheartedly and rely on the poor and lower-middle peasants, unite with the vast numbers of intellectuals and other working people, mobilize all positive factors and expand the revolutionary united front led by the working class and based on the worker-peasant alliance. It must uphold the proletarian nationality policy and strengthen the great unity of the people of all nationalities in China. It must carry on the three great revolutionary movements of class struggle, the struggle for production and scientific experiment, it must adhere to the principle of building our country independently, with the initiative in our own hands, and through self-reliance, diligence and thrift, and to the principle of being prepared against war and natural disasters and doing everything for the people, so as to build socialism by going all out, aiming high and achieving greater, faster, better and more economical results. The Party must lead the people of all nationalities in making China a powerful socialist country with a modern agriculture, industry, national defence and science and technology by the end of the century.

The Communist Party of China upholds proletarian internationalism and opposes great-nation chauvinism; it unites firmly with the genuine Marxist-Leninist Parties and organizations the world over; unites with the proletariat, the oppressed people and nations of the whole world and

fighters shoulder to shoulder with them to oppose the hegemonism of the two superpowers, the Soviet Union and the United States, to overthrow imperialism, modern revisionism and all reaction; and to wipe the system of exploitation of man by man off the face of the earth, so that all mankind will be emancipated.

The correctness or incorrectness of the ideological and political line decides everything. All Party comrades must implement Chairman Mao's proletarian revolutionary line comprehensively and correctly and adhere to the three basic principles: Practice Marxism, and not revisionism; unite, and don't split; be open and aboveboard, and don't intrigue and conspire. They must have the revolutionary boldness in daring to go against any tide that runs counter to these three basic principles.

The whole Party must adhere to the organizational principle of democratic centralism and practice centralism on the basis of democracy and democracy under centralized guidance. It must give full scope to inner-Party democracy and encourage the initiative and creativeness of all Party members and Party organizations at all levels, and combat bureaucracy, commandism and warlordism. The whole Party must strictly observe Party discipline, safeguard the Party's centralization, strengthen its unity, oppose all splittist and factional activities, oppose the assertion of independence from the Party and oppose anarchism. In relations among comrades in the Party, all members should apply the principle of "Say all you know and say it without reserve" and "Blame not the speaker but be warned by his words," adopt the dialectical method, start from the desire for unity, distinguish between right and wrong through criticism or struggle and arrive at a new unity. The Party must strive to create a political situation in which there are both centralism and democracy, both discipline and freedom, both unity of will and personal ease of mind and liveliness.

The Party must conscientiously follow the proletarian line on cadres, the line of "appointing people on their merit," and oppose the bourgeois line on cadres, the line of "appointing people by favouritism." It must train and bring up in mass struggles millions of successors in the revolutionary cause of the proletariat in accordance with the five requirements put forward by Chairman Mao. Special vigilance must be exercised against careerists, conspirators and double-dealers so as to prevent such bad types from usurping the leadership of the Party and the state at any level and ensure purity of the leadership at all levels.

The whole Party must keep to and carry forward its fine tradition of following the mass line and seeking truth from facts, keep to and carry

forward the style of work characterized by integration of theory with practice, close ties with the masses and criticism and self-criticism, the style of modesty, prudence and freedom from arrogance and impetuosity, and the style of plain living and hard struggle; and the whole Party must prevent Party members, especially leading Party cadres, from exploiting their position to seek privileges, and wage a resolute struggle against bourgeois ideology and the bourgeois style of work.

A member of the Communist Party of China should at all times and in all circumstances subordinate his personal interests to the interests of the Party and the people; he should fear no difficulties and sacrifices, work actively for the fulfilment of the programme of the Party and devote his whole life to the struggle for communism.

The Communist Party of China is a great, glorious and correct Party, and it is the core of leadership of the whole Chinese people. The whole Party must always hold high and resolutely defend the great banner of Marxism-Leninism-Mao Zedong Thought and ensure that our Party's cause will continue to advance triumphantly along the Marxist line.

Chapter I. Membership

Article 1. Any Chinese worker, poor peasant, lower-middle peasant, revolutionary soldier or any other revolutionary who has reached the age of 18 and who accepts the Constitution of the Party and is willing to join a Party organization and work actively in it, carry out the Party's decisions, observe Party discipline and pay membership dues may become a member of the Communist Party of China.

Article 2. The Communist Party of China demands that its members should:

1. Conscientiously study Marxism-Leninism-Mao Zedong Thought, criticize capitalism and revisionism and strive to remould their world outlook;

2. Serve the people whole-heartedly and pursue no private interests either for themselves or for a small number of people;

3. Unite with all the people who can be united inside and outside the Party, including those who have wrongly opposed them;

4. Maintain close ties with the masses and consult with them when matters arise;

5. Earnestly practice criticism and self-criticism, be bold in correcting their shortcomings and mistakes and dare to struggle against words and deeds that run counter to Party principles;

6. Uphold the Party's unity, refuse to take part in and moreover oppose any factional organization or activity which splits the Party;

7. Be truthful and honest to the Party, observe Party discipline and the laws of the state and strictly guard Party and state secrets; and

8. Actively fulfil the tasks assigned them by the Party and play an exemplary vanguard role in the three great revolutionary movements of class struggle, the struggle for production and scientific experiment.

Article 3. Applicants for Party membership must go through the procedure for admission individually. An applicant must be recommended by two full Party members, fill in an application form for Party membership and be examined by a Party branch, which must seek opinions extensively inside and outside the Party; he or she may become a probationary member after being accepted by the general membership meeting of the Party branch and being approved by the next higher Party committee.

Before approving the admission of an applicant for Party membership, the higher Party committee must appoint someone specially to talk with the applicant and carefully examine his or her case.

Article 4. The probationary period of a probationary member is one year. The Party organization concerned should make further efforts to educate and observe him or her.

When the probationary period has expired, the Party branch to which the probationary member belongs must promptly discuss whether he or she is qualified for full membership. If qualified, he or she should be given full membership as scheduled; if it is necessary to continue to observe him or her, the probationary period may be extended but no more than one year; if he or she is found to be really unfit for Party membership, his or her status as a probationary member should be annulled. Any decision either to transfer a probationary member to full membership, to prolong the probationary period, or to annul his or her status as a probationary member must be adopted by the general membership meeting of the Party branch and approved by the next higher Party committee.

The probationary period of a probationary

member begins from the day when the higher Party committee approves the applicant's admission. The Party standing of a Party member begins from the day when he or she is transferred to full membership.

A probationary member does not have the right to vote and to elect or be elected enjoyed by a full member.

Article 5. When a Party member violates Party discipline, the Party organization concerned should give the member education and, on the merits of the case, may take any of the following disciplinary measures — a warning, a serious warning, removal from his or her post in the Party, being placed on probation within the Party, and expulsion from the Party.

The period for which the Party member concerned is placed on probation should not exceed two years. During this period, he or she does not have the right to vote and to elect or be elected. If the Party member concerned has been through the period of probation and has corrected his or her mistake, these rights should be restored; if the member clings to the mistake instead of correcting it, he or she should be expelled from the Party.

Proven renegades, enemy agents, absolutely unrepentant persons in power taking the capitalist road, alien class elements, degenerates and new bourgeois elements must be expelled from the Party and not be re-admitted.

Article 6. Any disciplinary measure taken against a Party member must be decided on by a general membership meeting of the Party branch to which the member belongs and should be submitted to the next higher Party committee for approval. Under special circumstances, a primary Party committee or a higher Party committee has the power to take disciplinary action against a Party member.

Any decision to remove a member from a local Party committee at any level, to place on probation or to expel the member from the Party must be made by the said Party committee and be submitted to the next higher Party committee for approval.

Corresponding provisions on disciplinary measures against members of the Party committees at all levels in the army units should be laid down by the Military Commission of the Central Committee in accordance with the Party Constitution.

Any decision to take a disciplinary measure against a Member or Alternate Member of the Central Committee must be made by the Central Committee or its Political Bureau.

When a Party organization takes a decision on a disciplinary measure against a member, it must,

barring special circumstances, notify the member that he or she should attend the meeting. If the member disagrees with the decision, he or she may ask for a review of the case and has the right to appeal to higher Party committees, up to and including the Central Committee.

Article 7. A Party member whose revolutionary will has degenerated, who fails to function as a Communist and remains unchanged despite repeated education may be persuaded to withdraw from the Party. The case must be decided by the general membership meeting of the Party branch concerned and submitted to the next higher Party committee for approval.

A Party member who fails to take part in Party life, to do the work assigned by the Party and to pay membership dues over six months and without proper reason is regarded as having given up membership.

When a Party member asks to withdraw from the Party or has given up membership, the Party branch concerned should, with the approval of its general membership meeting, remove his or her name from the Party rolls and report the case to the next higher Party committee for the record.

Chapter II. Organizational System of the Party

Article 8. The Party is organized on the principle of democratic centralism.

The whole Party must observe democratic centralist discipline: The individual is subordinate to the organization, the minority is subordinate to the majority, the lower level is subordinate to the higher level, and the entire Party is subordinate to the Central Committee.

Article 9. Delegates to Party congresses and members of Party committees at all levels should be elected by secret ballot after democratic consultation and in accordance with the five requirements for successors in the revolutionary cause of the proletariat and with the principle of combining the old, the middle-aged and the young.

Article 10. The highest leading body of the Party is the National Congress and, when it is not in session, the Central Committee elected by it. The leading bodies of Party organizations at all levels in the localities and in the army units are the Party congresses or general membership meetings at their respective levels and the Party committees elected by them. Party congresses at all levels are convened by Party committees at their respective levels. The convocation of Party congresses at all

levels in the localities and in the army units and the composition of the Party committees they elect are subject to approval by the next higher Party committee.

Article 11. Party committees at all levels operate on the principle of combining collective leadership with individual responsibility under a division of labour. They should rely on the political experience and wisdom of the collective; all important issues are to be decided collectively, and at the same time each individual is to be enabled to play his or her due part.

Party committees at all levels should set up their working bodies in accordance with the principles of close ties with the masses and of structural simplicity and efficiency. Party committees at the county level and upwards may send out their representative organs when necessary.

Article 12. Party committees at all levels should report regularly on their work to Party congresses or general membership meetings, constantly listen to the opinions of the masses both inside and outside the Party and put themselves under their supervision.

Party members have the right to criticize Party organizations and working personnel in leading posts at all levels and make proposals to them and also the right to bypass the immediate leadership and present their appeals and complaints to higher levels, up to and including the Central Committee and the Chairman of the Central Committee. It is absolutely impermissible for anyone to suppress criticism or to retaliate. Those guilty of doing so should be investigated and punished.

If a Party member holds different views with regard to the decisions or directives of the Party organizations, he or she is allowed to reserve these views and has the right to bring up the matter for discussion at Party meetings and the right to bypass the immediate leadership and report to higher levels, up to and including the Central Committee and the Chairman of the Central Committee, but the member must resolutely carry out these decisions and directives.

Article 13. The Central Committee of the Party, local Party committees at the county level and upwards and Party committees in the army units at the regimental level and upwards should set up commissions for inspecting discipline.

The commissions for inspecting discipline at all levels are to be elected by the Party committees at the respective levels and, under their leadership, should strengthen Party members' education on discipline, be responsible for checking on the observance of discipline by Party members and Party

cadres and struggle against all breaches of Party discipline.

Article 14. State organs, the People's Liberation Army and the militia and revolutionary mass organizations, such as trade unions, the Communist Youth League, poor and lower-middle peasant associations and women's federations, must all accept the absolute leadership of the Party.

Leading Party groups should be set up in state organs and people's organizations. Members of leading Party groups in state organs and people's organizations at the national level are to be appointed by the Central Committee of the Party. Members of leading Party groups in state organs and people's organizations at all levels in the localities are to be appointed by the corresponding Party committees.

Chapter III. Central Organizations of the Party

Article 15. The National Congress of the Party should be convened every five years. Under special circumstances, it may be convened before its due date or postponed.

Article 16. The plenary session of the Central Committee of the Party elects the Political Bureau of the Central Committee, the Standing Committee of the Political Bureau of the Central Committee and the Chairman and Vice-Chairmen of the Central Committee.

The plenary session of the Central Committee of the Party is convened by the Political Bureau of the Central Committee.

When the Central Committee is not in plenary session, the Political Bureau of the Central Committee and its Standing Committee exercise the functions and powers of the Central Committee.

Chapter IV. Party Organizations in the Localities and the Army Units

Article 17. Local Party congresses at the county level and upwards and Party congresses in the army units at the regimental level and upwards should be convened every three years. Under special circumstances, they may be convened before their due date or postponed, subject to approval by the next higher Party committees.

Local Party committees at the county level and upwards and Party committees in the army units at the regimental level and upwards elect their standing committees, secretaries and deputy secretaries.

Chapter V. Primary Organizations of the Party

Article 18. Party branches, general Party branches or primary Party committees should be set up in factories, mines and other enterprises, people's communes, offices, schools, shops, neighbourhoods, companies of the People's Liberation Army and other primary units in accordance with the need of the revolutionary struggle and the size of their Party membership, subject to approval by the next higher Party committees.

Committees of Party branches should be elected annually, committees of general Party branches and primary Party committees should be elected every two years. Under special circumstances, the election may take place before its due date or be postponed, subject to approval by the next higher Party committees.

Article 19. The primary organizations of the Party should play the role of a fighting bastion. Their main tasks are:

1. To lead Party members and people outside the Party in studying Marxism-Leninism-Mao Zedong Thought conscientiously, educate them in the ideological and political line and in the Party's fine tradition and give them basic knowledge about the Party;

2. To lead and unite the broad masses of the people in adhering to the socialist road, in criticizing capitalism and revisionism, in correctly distinguishing and handling the contradictions among the people and those between ourselves and the enemy and in waging a resolute struggle against the class enemy;

3. To propagate and carry out the line, policies and decisions of the Party, and fulfil every task assigned by the Party and the state;

4. To maintain close ties with the masses, constantly listen to their opinions and demands and faithfully report these to higher Party organizations and be concerned about their political, economic and cultural life;

5. To promote inner-Party democracy, practice criticism and self-criticism, expose and get rid of shortcomings and mistakes in work, and wage struggles against violations of the law and breaches of discipline, against corruption and waste, and against bureaucracy and all other undesirable tendencies; and

6. To admit new Party members, enforce

Party discipline, and consolidate the Party organizations, getting rid of the stale and taking in

the fresh, so as to purify the Party's ranks and constantly enhance the Party's fighting power.

6. THE CONSTITUTION OF THE PEOPLE'S REPUBLIC OF CHINA

*(Adopted by the First Session of the Fifth National People's Congress
of the People's Republic of China on March 5, 1978)*

PREAMBLE

After more than a century of heroic struggle the Chinese people, led by the Communist Party of China headed by our great leader and teacher Chairman Mao Zedong, finally overthrew the reactionary rule of imperialism, feudalism and bureaucrat-capitalism by means of people's revolutionary war, winning complete victory in the new-democratic revolution, and in 1949 founded the People's Republic of China.

The founding of the People's Republic of China marked the beginning of the historical period of socialism in our country. Since then, under the leadership of Chairman Mao and the Chinese Communist Party, the people of all our nationalities have carried out Chairman Mao's proletarian revolutionary line in the political, economic, cultural and military fields and in foreign affairs and have won great victories in socialist revolution and socialist construction through repeated struggles against enemies both at home and abroad and through the Great Proletarian Cultural Revolution. The dictatorship of the proletariat in our country has been consolidated and strengthened, and China has become a socialist country with the beginnings of prosperity.

Chairman Mao Zedong was the founder of the People's Republic of China. All our victories in revolution and construction have been won under the guidance of Marxism-Leninism-Mao Zedong Thought. The fundamental guarantee that the people of all our nationalities will struggle in unity and carry the proletarian revolution through to the end is always to hold high and staunchly to defend the great banner of Chairman Mao.

The triumphant conclusion of the first Great Proletarian Cultural Revolution has ushered in a new period of development in China's socialist revolution and socialist construction. In accordance with the basic line of the Chinese Communist Party for the entire historical period of socialism, the general task for the people of the whole country in this new period is: To persevere in continuing the revolution under the dictatorship of the proletariat, carry forward the three great revolutionary movements of class struggle, the struggle for production and scientific experiment, and make China a great and powerful socialist country with modern agriculture, industry, national defence and science and technology by the end of the century.

We must persevere in the struggle of the proletariat against the bourgeoisie and in the struggle for the socialist road against the capitalist road. We must oppose revisionism and prevent the restoration of capitalism. We must be prepared to deal with subversion and aggression against our country by social-imperialism and imperialism.

We should consolidate and expand the revolutionary united front which is led by the working class and based on the worker-peasant alliance, and which unites the large numbers of intellectuals and other working people, patriotic democratic parties, patriotic personages, our compatriots in Taiwan, Hong Kong and Macao, and our countrymen residing abroad. We should enhance the great unity of all the nationalities in our country. We should correctly distinguish and handle the contradictions among the people and those between ourselves and the enemy. We should endeavour to create among the people of the whole country a political situation in which there are both centralism and democracy, both discipline and freedom, both unity of will and personal ease of mind and liveliness, so as to help bring all positive factors into play, overcome all difficulties, better consolidate the proletarian dictatorship and build up our country more rapidly.

Taiwan is China's sacred territory. We are determined to liberate Taiwan and accomplish the great cause of unifying our motherland.

In international affairs, we should establish and develop relations with other countries on the basis of the Five Principles of mutual respect for sovereignty and territorial integrity, mutual non-aggression, non-interference in each other's internal affairs, equality and mutual benefit, and peaceful coexistence. Our country will never seek hegemony, or strive to be a superpower. We should uphold proletarian internationalism. In accordance with the theory of the three worlds, we should strengthen our unity with the proletariat and the oppressed people and nations throughout the world, the socialist countries, and the third world countries, and we should unite with all countries subjected to aggression, subversion, interference, control and bullying by the social-imperialist and imperialist superpowers to form the broadest possible international united front against the hegemonism of the superpowers and against a new world war, and strive for the progress and emancipation of humanity.

Chapter I. General Principles

Article 1. The People's Republic of China is a socialist state of the dictatorship of the proletariat led by the working class and based on the alliance of workers and peasants.

Article 2. The Communist Party of China is the core of leadership of the whole Chinese people. The working class exercises leadership over the state through its vanguard, the Communist Party of China.

The guiding ideology of the People's Republic of China is Marxism-Leninism-Mao Zedong Thought.

Article 3. All power in the People's Republic of China belongs to the people. The organs through which the people exercise state power are the National People's Congress and the local people's congresses at various levels.

The National People's Congress, the local people's congresses at various levels and all other organs of state practice democratic centralism.

Article 4. The People's Republic of China is a unitary multi-national state.

All the nationalities are equal. There should be unity and fraternal love among the nationalities and they should help and learn from each other. Discrimination against, or oppression of, any nationality, and acts which undermine the unity of the nationalities are prohibited. Big-nationality chauvinism and local-nationality chauvinism must be opposed.

All the nationalities have the freedom to use and develop their own spoken and written languages, and to preserve or reform their own customs and ways.

Regional autonomy applies in an area where a minority nationality lives in a compact community. All the national autonomous areas are inalienable parts of the People's Republic of China.

Article 5. There are mainly two kinds of ownership of the means of production in the People's Republic of China at the present stage: socialist ownership by the whole people and socialist collective ownership by the working people.

The state allows non-agricultural individual labourers to engage in individual labour involving no exploitation of others, within the limits permitted by law and under unified arrangement and management by organizations at the basic level in cities and towns or in rural areas. At the same time, it guides these individual labourers step by

step into the road of socialist collectivization.

Article 6. The state sector of the economy, that is, the socialist sector owned by the whole people, is the leading force in the national economy.

Mineral resources, waters and those forests, undeveloped lands and other marine and land resources owned by the state are the property of the whole people.

The state may requisition by purchase, take over for use, or nationalize land under conditions prescribed by law.

Article 7. The rural people's commune sector of the economy is a socialist sector collectively owned by the masses of working people. At present, it generally takes the form of three-level ownership, that is, ownership by the commune, the production brigade and the production team, with the production team as the basic accounting unit. A production brigade may become the basic accounting unit when its conditions are ripe.

Provided that the absolute predominance of the collective economy of the people's commune is ensured, commune members may farm small plots of land for personal needs, engage in limited household side-line production, and in pastoral areas they may also keep a limited number of livestock for personal needs.

Article 8. Socialist public property shall be inviolable. The state ensures the consolidation and development of the socialist sector of the economy owned by the whole people and of the socialist sector collectively owned by the masses of working people.

The state prohibits any person from using any means whatsoever to disrupt the economic order of the society, undermine the economic plans of the state, encroach upon or squander state and collective property, or injure the public interest.

Article 9. The state protects the right of citizens to own lawfully earned income, savings, houses and other means of livelihood.

Article 10. The state applies the socialist principles: "He who does not work, neither shall he eat" and "from each according to his ability, to each according to his work."

Work is an honourable duty for every citizen able to work. The state promotes socialist labour emulation, and, putting proletarian politics in command, it applies the policy of combining moral encouragement with material reward, with the stress on the former, in order to heighten the citizens' socialist enthusiasm and creativeness in work.

Article 11. The state adheres to the general line of going all out, aiming high and achieving greater, faster, better and more economical results in building socialism, it undertakes the planned, proportionate and high-speed development of the national economy, and it continuously develops the productive forces, so as to consolidate the country's independence and security and improve the people's material and cultural life step by step.

In developing the national economy, the state adheres to the principle of building our country independently, with the initiative in our own hands and through self-reliance, hard struggle, diligence and thrift, it adheres to the principle of taking agriculture as the foundation and industry as the leading factor, and it adheres to the principle of bringing the initiative of both the central and local authorities into full play under the unified leadership of the central authorities.

The state protects the environment and natural resources and prevents and eliminates pollution and other hazards to the public.

Article 12. The state devotes major efforts to developing science, expands scientific research, promotes technical innovation and technical revolution and adopts advanced techniques wherever possible in all departments of the national economy. In scientific and technological work we must follow the practice of combining professional contingents with the masses, and combining learning from others with our own creative efforts.

Article 13. The state devotes major efforts to developing education in order to raise the cultural and scientific level of the whole nation. Education must serve proletarian politics and be combined with productive labour and must enable everyone who receives an education to develop morally, intellectually and physically and become a worker with both socialist consciousness and culture.

Article 14. The state upholds the leading position of Marxism-Leninism-Mao Zedong Thought in all spheres of ideology and culture. All cultural undertakings must serve the workers, peasants and soldiers and serve socialism.

The state applies the policy of "letting a hundred flowers blossom and a hundred schools of thought contend" so as to promote the development of the arts and sciences and bring about a flourishing socialist culture.

Article 15. All organs of state must constantly maintain close contact with the masses of the people, rely on them, heed their opinions, be con-

cerned for their weal and woe, streamline administration, practice economy, raise efficiency and combat bureaucracy.

The leading personnel of state organs at all levels must conform to the requirements for successors in the proletarian revolutionary cause and their composition must conform to the principle of the three-in-one combination of the old, the middle-aged and the young.

Article 16. The personnel of organs of state must earnestly study Marxism-Leninism-Mao Zedong Thought, wholeheartedly serve the people, endeavour to perfect their professional competence, take an active part in collective productive labour, accept supervision by the masses, be models in observing the Constitution and the law, correctly implement the policies of the state, seek the truth from facts, and must not have recourse to deception or exploit their position and power to seek personal gain.

Article 17. The state adheres to the principle of socialist democracy, and ensures to the people the right to participate in the management of state affairs and of all economic and cultural undertakings, and the right to supervise the organs of state and their personnel.

Article 18. The state safeguards the socialist system, suppresses all treasonable and counter-revolutionary activities, punishes all traitors and counter-revolutionaries, and punishes new-born bourgeois elements and other bad elements.

The state deprives of political rights, as prescribed by law, those landlords, rich peasants and reactionary capitalists who have not yet been reformed, and at the same time it provides them with the opportunity to earn a living so that they may be reformed through labour and become law-abiding citizens supporting themselves by their own labour.

Article 19. The Chairman of the Central Committee of the Communist Party of China commands the armed forces of the People's Republic of China.

The Chinese People's Liberation Army is the workers' and peasants' own armed force led by the Communist Party of China; it is the pillar of the dictatorship of the proletariat. The state devotes major efforts to the revolutionization and modernization of the Chinese People's Liberation Army, strengthens the building of the militia and adopts a system under which our armed forces are a combination of the field armies, the regional forces and the militia.

The fundamental task of the armed forces of

the People's Republic of China is: To safeguard the socialist revolution and socialist construction, to defend the sovereignty, territorial integrity and security of the state, and to guard against subversion and aggression by social-imperialism, imperialism and their lackeys.

Chapter II. The Structure of the State

Section I

The National People's Congress

Article 20. The National People's Congress is the highest organ of state power.

Article 21. The National People's Congress is composed of deputies elected by the people's congresses of the provinces, autonomous regions, and municipalities directly under the Central Government, and by the People's Liberation Army. The deputies should be elected by secret ballot after democratic consultation.

The National People's Congress is elected for a term of five years. Under special circumstances, its term of office may be extended or the succeeding National People's Congress may be convened before its due date.

The National People's Congress holds one session each year. When necessary, the session may be advanced or postponed.

Article 22. The National People's Congress exercises the following functions and powers:

1. To amend the Constitution;
2. To make laws;
3. To supervise the enforcement of the Constitution and the law;
4. To decide on the choice of the Premier of the State Council upon the recommendation of the Central Committee of the Communist Party of China;
5. To decide on the choice of other members of the State Council upon the recommendation of the Premier of the State Council;
6. To elect the President of the Supreme People's Court and the Chief Procurator of the Supreme People's Procuratorate;
7. To examine and approve the national economic plan, the state budget and the final state accounts;
8. To confirm the following administrative divisions: provinces, autonomous regions, and municipalities directly under the Central Government;
9. To decide on questions of war and peace; and
10. To exercise such other functions and powers as the National People's Congress deems necessary.

Article 23. The National People's Congress has the power to remove from office the members of the State Council, the President of the Supreme People's Court and the Chief Procurator of the Supreme People's Procuratorate.

Article 24. The Standing Committee of the National People's Congress is the permanent organ of the National People's Congress. It is responsible and accountable to the National People's Congress.

The Standing Committee of the National People's Congress is composed of the following members:

- the Chairman;
- the Vice-Chairmen;
- the Secretary-General; and
- other members.

The National People's Congress elects the Standing Committee of the National People's Congress and has the power to recall its members.

Article 25. The Standing Committee of the National People's Congress exercises the following functions and powers:

1. To conduct the election of deputies to the National People's Congress;
2. To convene the sessions of the National People's Congress;
3. To interpret the Constitution and laws and to enact decrees;
4. To supervise the work of the State Council, the Supreme People's Court and the Supreme People's Procuratorate.
5. To change and annul inappropriate decisions adopted by the organs of state power of provinces, autonomous regions, and municipalities directly under the Central Government;
6. To decide on the appointment and removal of individual members of the State Council upon the recommendation of the Premier of the State Council when the National People's Congress is not in session;
7. To appoint and remove Vice-Presidents of the Supreme People's Court and Deputy Chief Procurators of the Supreme People's Procuratorate;
8. To decide on the appointment and removal of plenipotentiary representatives abroad;
9. To decide on the ratification and abrogation of treaties concluded with foreign states;
10. To institute state titles of honour and decide on their conferment;
11. To decide on the granting of pardons;
12. To decide on the proclamation of a state of war in the event of armed attack on the country when the National People's Congress is not in session; and

13. To exercise such other functions and powers as are vested in it by the National People's Congress.

Article 26. The Chairman of the Standing Committee of the National People's Congress presides over the work of the Standing Committee; receives foreign diplomatic envoys; and in accordance with the decisions of the National People's Congress or its Standing Committee promulgates laws and decrees, dispatches and recalls plenipotentiary representatives abroad, ratifies treaties concluded with foreign states and confers state titles of honour.

The Vice-Chairmen of the Standing Committee of the National People's Congress assist the Chairman in his work and may exercise part of the Chairman's functions and powers on his behalf.

Article 27. The National People's Congress and its Standing Committee may establish special committees as deemed necessary.

Article 28. Deputies to the National People's Congress have the right to address inquiries to the State Council, the Supreme People's Court, the Supreme People's Procuratorate, and the ministries and commissions of the State Council, which are all under obligation to answer.

Article 29. Deputies to the National People's Congress are subject to supervision by the units which elect them. These electoral units have the power to replace at any time the deputies they elect, as prescribed by law.

Section II

The State Council

Article 30. The State Council is the Central People's Government and the executive organ of the highest organ of state power; it is the highest organ of state administration.

The State Council is responsible and accountable to the National People's Congress, or, when the National People's Congress is not in session, to its Standing Committee.

Article 31. The State Council is composed of the following members:

- the Premier;
- the Vice-Premiers;
- the ministers; and
- the ministers heading the commissions.

The Premier presides over the work of the State Council and the Vice-Premiers assist the Premier in his work.

Article 32. The State Council exercises the following functions and powers:

1. To formulate administrative measures, issue decisions and orders and verify their execution, in accordance with the Constitution, laws and decrees;
2. To submit proposals on laws and other matters to the National People's Congress or its Standing Committee;
3. To exercise unified leadership over the work of the ministries and commissions and other organizations under it;
4. To exercise unified leadership over the work of local organs of state administration at various levels throughout the country;
5. To draw up and put into effect the national economic plan and the state budget;
6. To protect the interests of the state, maintain public order and safeguard the rights of citizens;
7. To confirm the following administrative divisions: autonomous prefectures, counties, autonomous counties, and cities;
8. To appoint and remove administrative personnel according to the provisions of the law; and
9. To exercise such other functions and powers as are vested in it by the National People's Congress or its Standing Committee.

Section III

The Local People's Congresses and the Local Revolutionary Committees at Various Levels

Article 33. The administrative division of the People's Republic of China is as follows:

1. The country is divided into provinces, autonomous regions, and municipalities directly under the Central Government;
 2. Provinces and autonomous regions are divided into autonomous prefectures, counties, autonomous counties, and cities; and
 3. Counties and autonomous counties are divided into people's communes and towns.
- Municipalities directly under the Central Government and other large cities are divided into districts and counties. Autonomous prefectures are divided into counties, autonomous counties, and cities.

Autonomous regions, autonomous prefectures and autonomous counties are all national autonomous areas.

Article 34. People's congresses and revolu-

tionary committees are established in provinces, municipalities directly under the Central Government, counties, cities, municipal districts, people's communes and towns.

People's congresses and revolutionary committees of the people's communes are organizations of political power at the grass-roots level, and are also leading organs of collective economy.

Revolutionary committees at the provincial level may establish administrative offices as their agencies in prefectures.

Organs of self-government are established in autonomous regions, autonomous prefectures and autonomous counties.

Article 35. Local people's congresses at various levels are local organs of state power.

Deputies to the people's congresses of provinces, municipalities directly under the Central Government, counties, and cities divided into districts are elected by people's congresses at the next lower level by secret ballot after democratic consultation; deputies to the people's congresses of cities not divided into districts, and of municipal districts, people's communes and towns are directly elected by the voters by secret ballot after democratic consultation.

The people's congresses of provinces and municipalities directly under the Central Government are elected for a term of five years. The people's congresses of counties, cities and municipal districts are elected for a term of three years. The people's congresses of people's communes and towns are elected for a term of two years.

Local people's congresses at various levels hold at least one session each year, which is to be convened by revolutionary committees at the corresponding levels.

The units and electorates which elect the deputies to the local people's congresses at various levels have the power to supervise, remove and replace their deputies at any time according to the provisions of the law.

Article 36. Local people's congresses at various levels, in their respective administrative areas, ensure the observance and enforcement of the Constitution, laws and decrees; ensure the implementation of the state plan; make plans for local economic and cultural development and for public utilities; examine and approve local economic plans, budgets and final accounts; protect public property; maintain public order; safeguard the rights of citizens and the equal rights of minority nationalities; and promote the development of socialist revolution and socialist construction.

Local people's congresses may adopt and issue

decisions within the limits of their authority as prescribed by law.

Local people's congresses elect, and have the power to recall, members of revolutionary committees at the corresponding levels. People's congresses at county levels and above elect, and have the power to recall, the presidents of the people's courts and the chief procurators of the people's procuratorates at the corresponding levels.

Deputies to local people's congresses at various levels have the right to address inquiries to the revolutionary committees, people's courts, people's procuratorates and organs under the revolutionary committees at the corresponding levels, which are all under obligation to answer.

Article 37. Local revolutionary committees at various levels, that is, local people's governments, are the executive organs of local people's congresses at the corresponding levels and they are also local organs of state administration.

A local revolutionary committee is composed of a chairman, vice-chairmen and other members.

Local revolutionary committees carry out the decisions of people's congresses at the corresponding levels as well as the decisions and orders of the organs of state administration at higher levels, direct the administrative work of their respective areas, and issue decisions and orders within the limits of their authority as prescribed by law. Revolutionary committees at country levels and above appoint or remove the personnel of organs of state according to the provisions of the law.

Local revolutionary committees are responsible and accountable to people's congresses at the corresponding levels and to the organs of state administration at the next higher level, and work under the unified leadership of the State Council.

Section IV **The Organs of Self-Government of** **National Autonomous Areas**

Article 38. The organs of self-government of autonomous regions, autonomous prefectures and autonomous counties are people's congresses and revolutionary committees.

The election of the people's congresses and revolutionary committees of national autonomous areas, their terms of office, their functions and powers and also the establishment of their agencies should conform to the basic principles governing the organization of local organs of state as specified in Section III, Chapter Two, of the Constitution.

In autonomous areas where a number of nationalities live together, each nationality is

entitled to appropriate representation in the organs of self-government.

Article 39. The organs of self-government of national autonomous areas exercise autonomy within the limits of their authority as prescribed by law, in addition to exercising the functions and powers of local organs of state as specified by the Constitution.

The organs of self-government of national autonomous areas may, in the light of the political, economic and cultural characteristics of the nationality or nationalities in a given area, make regulations on the exercise of autonomy and also specific regulations and submit them to the Standing Committee of the National People's Congress for approval.

In performing their functions, the organs of self-government of national autonomous areas employ the spoken and written language or languages commonly used by the nationality or nationalities in the locality.

Article 40. The higher organs of state shall fully safeguard the exercise of autonomy by the organs of self-government of national autonomous areas, take into full consideration the characteristics and needs of the various minority nationalities, make a major effort to train cadres of the minority nationalities, and actively support and assist all the minority nationalities in their socialist revolution and construction and thus advance their socialist economic and cultural development.

Section V

The People's Courts and the People's Procurators

Article 41. The Supreme People's Court, local people's courts at various levels and special people's courts exercise judicial authority. The people's courts are formed as prescribed by law.

In accordance with law, the people's courts apply the system whereby representatives of the masses participate as assessors in administering justice. With regard to major counter-revolutionary or criminal cases, the masses should be drawn in for discussion and suggestions.

All cases in the people's courts are heard in public except those involving special circumstances as prescribed by law. The accused has the right to defence.

Article 42. The Supreme People's Court is the highest judicial organ.

The Supreme People's Court supervises the administration of justice by local people's courts

at various levels and by special people's courts; people's courts at the higher levels supervise the administration of justice by people's courts at the lower levels.

The Supreme People's Court is responsible and accountable to the National People's Congress and its Standing Committee. Local people's courts at various levels are responsible and accountable to local people's congresses at the corresponding levels.

Article 43. The Supreme People's Procuratorate exercises procuratorial authority to ensure observance of the Constitution and the law by all the departments under the State Council, the local organs of state at various levels, the personnel of organs of state and the citizens. Local people's procuratorates and special people's procuratorates exercise procuratorial authority within the limits prescribed by law. The people's procuratorates are formed as prescribed by law.

The Supreme People's Procuratorate supervises the work of local people's procuratorates at various levels and of special people's procuratorates; people's procuratorates at the higher levels supervise the work of those at the lower levels.

The Supreme People's Procuratorate is responsible and accountable to the National People's Congress and its Standing Committee. Local people's procuratorates at various levels are responsible and accountable to people's congresses at the corresponding levels.

Chapter III. The Fundamental Rights and Duties of Citizens

Article 44. All citizens who have reached the age of 18 have the right to vote and to stand for election, with the exception of persons deprived of these rights by law.

Article 45. Citizens enjoy freedom of speech, correspondence, the press, assembly, association, procession, demonstration and the freedom to strike, and have the right to "speak out freely, air their views fully, hold great debates and write big-character posters."

Article 46. Citizens enjoy freedom to believe in religion and freedom not to believe in religion and to propagate atheism.

Article 47. The citizens' freedom of person and their homes are inviolable.

No citizen may be arrested except by decision of a people's court or with the sanction of a people's procuratorate, and the arrest must be made by a public security organ.

Article 48. Citizens have the right to work. To ensure that citizens enjoy this right, the state provides employment in accordance with the principle of overall consideration, and, on the basis of increased production, the state gradually increases payment for labour, improves working conditions, strengthens labour protection and expands collective welfare.

Article 49. Working people have the right to rest. To ensure that working people enjoy this right, the state prescribes working hours and systems of vacations and gradually expands material facilities for the working people to rest and recuperate.

Article 50. Working people have the right to material assistance in old age, and in case of illness or disability. To ensure that working people enjoy this right, the state gradually expands social insurance, social assistance, public health services, co-operative medical services, and other services.

The state cares for and ensures the livelihood of disabled revolutionary army men and the families of revolutionary martyrs.

Article 51. Citizens have the right to education. To ensure that citizens enjoy this right, the state gradually increases the number of schools of various types and of other cultural and educational institutions and popularizes education.

The state pays special attention to the healthy development of young people and children.

Article 52. Citizens have the freedom to engage in scientific research, literary and artistic creation and other cultural activities. The state encourages and assists the creative endeavours of citizens engaged in science, education, literature, art, journalism, publishing, public health, sports and other cultural work.

Article 53. Women enjoy equal rights with men in all spheres of political, economic, cultural, social and family life. Men and women enjoy equal pay for equal work.

Men and women shall marry of their own free will. The state protects marriage, the family, and the mother and child.

The state advocates and encourages family planning.

Article 54. The state protects the just rights and interests of overseas Chinese and their relatives.

Article 55. Citizens have the right to lodge complaints with organs of state at any level against any person working in an organ of state, enterprise or institution for transgression of law or neglect of duty. Citizens have the right to appeal to organs of state at any level against any infringement of their rights. No one shall suppress such complaints and appeals or retaliate against persons making them.

Article 56. Citizens must support the leadership of the Communist Party of China, support the socialist system, safeguard the unification of the motherland and the unity of all nationalities in our country and abide by the Constitution and the law.

Article 57. Citizens must take care of and protect public property, observe labour discipline, observe public order, respect social ethics and safeguard state secrets.

Article 58. It is the lofty duty of every citizen to defend the motherland and resist aggression.

It is the honourable obligation of citizens to perform military service and to join the militia according to the law.

Article 59. The People's Republic of China grants the right of residence to any foreign national persecuted for supporting a just cause, for taking part in revolutionary movements or for engaging in scientific work.

Chapter IV. The National Flag, The National Emblem and the Capital

Article 60. The national flag of the People's Republic of China has five stars on a field of red.

The national emblem of the People's Republic of China is: Tian An Men in the centre, illuminated by five stars and encircled by ears of grain and a cogwheel.

The capital of the People's Republic of China is Beijing.

7. THE CENTRAL PEOPLE'S GOVERNMENT (THE STATE COUNCIL)

(Compiled by the State Personnel Bureau of the State Council, April 31, 1981)

I. Listing of Premiers, Vice-Premiers, Advisers and the General Secretary of the State Council

Premier: Zhao Ziyang

Vice-Premiers:	Wan Li	Yu Qiuli	Geng Biao
	Fang Yi	Gu Mu	Yao Yilin
	Kang Shien	Chen Muhua (female)	Bo Yibo
	Ji Pengfei	Yang Jingren	Zhang Aiping
	Huang Hua		

Advisors: Qian Zhiguang Liu Linbo Li Qiang Zeng Sheng

General Secretary: Du Xingyuan

II. Listing of Ministers in Charge of Ministries and Commissions of the State Council

Minister of Foreign Affairs:	Huang Hua	(concurrently)
Minister of National Defence:	Geng Biao	(concurrently)
Minister in Charge of the State Planning Commission:	Yao Yilin	(concurrently)
Minister in Charge of the State Agricultural Commission:	Wan Li	(concurrently)
Minister in Charge of the State Economic Commission:	Yuan Baohua	
Minister in Charge of the State Capital Construction Commission:	Han Guang	
Minister in Charge of the State Scientific and Technological Commission:	Fang Yi	(concurrently)
Minister in Charge of the Foreign Investment Commission:	Gu Mu	(concurrently)
Minister in Charge of the Administrative Commission on Import and Export Affairs:	Gu Mu	(concurrently)
Minister in Charge of the Machine-Building Industry Commission of the State Council	Bo Yibo	(concurrently)
Minister in Charge of the State Energy Commission:	Yu Qiuli	(concurrently)
Minister in Charge of the State Nationalities Affairs Commission:	Yang Jingren	(concurrently)
Minister of Public Security:	Zhao Cangbi

	Chen Muhua	(female)

8. ADMINISTRATIVE DIVISIONS OF PROVINCES, AUTONOMOUS REGIONS, MUNICIPALITIES AND COUNTIES OF THE PEOPLE'S REPUBLIC OF CHINA

(1980)

The Municipality of Beijing

Districts under the Jurisdiction of the Municipality:

Dongcheng, Xuanwu, Haidian, Fengtai, Shijingshan, Xicheng, Chongwen, Chaoyang, Mentougou, Yanshan.

Countries:

Changping, Yanqing, Huairou, Miyun, Shunyi, Pinggu, Tongxian, Daxing, Fanshan.

The Municipality of Shanghai

Districts under the Jurisdiction of the Municipality:

Huangpu, Luwan, Changning, Jingan, Yangpu, Wusong, Nanshi, Xuhui, Zhabei, Hongkou, Putou.

Countries:

Shanghai, Jiading, Baoshan, Chusha, Nanhui, Fengxian, Songjiang, Jinshan, Qingpu, Chongming.

The Municipality of Tianjin

Districts under the Jurisdiction of the Municipality:

Heping, Hebei, Hongqiao, Hangu, Nanjiao, Beijiao, Hedong, Nankai, Tanggu, Dongjiao, Xijiao, Dagang, Hexi.

Countries:

Jixian, Baodi, Wuging, Jinghai, Ninghe.

Anhui Province

Hefei City: Changfeng County

Huainan City: Fengtai County

Huaibei City: Suixi County

Bengbu City

Ma'anshan City

Wuhu City: Wuhu County

Anqing City

Tongling City: Tongling County

Suxian Prefecture: The City of Suzhou, Suxian County, Dangshan County, Xiaoxian County, Lingbi County, Sixian County, Wuhe County, Guzhen County, Huaiyuan County.

Chuxian Prefecture: Chuxian County, Jiashan County, Tianchang County, Lai'an County, Quanqiao County, Dingyuan County, Fengyang County.

Chaohu Prefecture: Chaoxian County, Feidong County, Hanshan County, Hexian County, Wuwei County, Lujiang County.

Xuancheng Prefecture: Xuancheng County, Dangtu County, Langxi County, Guangde County, Jingxian County, Nanling County, Fanchang County, Ningguo County, Qingyang County.

Huizhou Prefecture: Tunxi City, Xiuning County, Jingde County, Jixi County, Taiping County, Shexian County, Qimen County, Yixian County, Shitai County.

Anqing Prefecture: Tongcheng County, Zongyang County, Huaining County, Wangjiang County, Dongzhi County, Susong County, Taihu County, Yuexi County, Qianshan County, Guichi County.

Lu'an Prefecture: Lu'an City, Lu'an County, Huoqiu County, Shouxian County, Feixi County, Shucheng County, Huoshan County, Jinzhai County.

Fuyang Prefecture: Fuyang City, Fuyang County, Boxian County, Guoyang County, Mengcheng County, Lixin County, Yingshang County, Funan County, Linquan County, Jieshou County, Taihe County.

Fujian Province

Fuzhou City: Minhou County

Xiamen City: Tong'an County

Jianyang Prefecture: Nanping City, Jianyang County, Jian'ou County, Pucheng County, Shaowu County, Shunchang County, Chongar County, Guangze County, Songxi County, Zhenghe County.

Ningde Prefecture: Ningde County, Fu'an County, Lianjiang County, Fuding County, Xiapu County, Gudian County, Luoyuan County, Shouning County, Zhouning County, Pingna County, Zherong County.

Putian Prefecture: Putian County, Xianyou County, Fuqing County, Changle County, Yongtai County, Pingtan County, Mingqi County.

Jinjiang Prefecture: Quanzhou City, Jinjiang County, Nan'an County, Hui'an County, Anxi County, Yongchun County, Dehua County, Jinmen County.

Longxi Prefecture: Zhangzhou City, Longhai County, Zhangpu County, Zhao'an County, Pinghe County, Yunxiao County, Nanjing County, Changtai County, Dongshan County, Hua'an County.

Longyan Prefecture: Longyan County, Shanghang County, Yongding County, Changting County, Wuping County, Liancheng County, Zhangping County.

Sanming Prefecture: Sanming City, Longxi County, Ninghua County, Dadian County, Yong'an County, Shaxian County, Jiangle County, Qingliu County, Jianning County, Taining County, Mingxi County, Jinmen County to be returned to the motherland.

Gansu Province

Lanzhou City: Yongdeng County, Yuzhong County, Gaolan County.

Jiayuguan City

Dingxi Prefecture: Dingxi County, Huining County, Longxi County, Lintao County, Jingyuan County, Tongwei County, Weiyan County.

Pingliang Prefecture: Pingliang County, Lingtai County, Huating County, Jingning County, Jingchuan County, Chongxin County, Zhuanglang County.

Qingyang Prefecture: Qingyang County, Huachi County, Zhengning County, Zhenyuan County, Huanxian County, Heshui County, Ningxian County.

Tianshui Prefecture: Tianshui City, Changjiachuan Autonomous County for Hui Nationality, Tianshui County, Huixian County, Lixian County, Wushan County, Tai'an County, Qingshui County, Liangdang County, Xihe County, Gangu County, Zhangxian County.

Wudu Prefecture: Wudu County, Dangchang County, Kangxian County, Minxian County, Chengxian County, Wenxian County.

Gannan Autonomous Prefecture for Tibetan Nationality: Lintan County, Zhouqu County, Maqu County, Xiahe County, Jone County, Tawo County, Luqu County.

Linxia Autonomous Prefecture for Hui Nationality: Linxia County, Yongjing County, Hezheng

County, Autonomous County for Dongxiang Nationality, Kangle County, Guanghe County,

Wuwei Prefecture: Wuwei County, Minqiu County, Gulang County, Yongchang County, Jintai County, Tianzhu Autonomous County for Tibetan Nationality, Jishishan Autonomous County for Bao'an, Dongxiang and Sala Nationalities.

Zhangye Prefecture: Zhangye County, Minle County, Linze County, Shandan County, Sunan Autonomous County for Yugur Nationality, Gaotai County.

Jiuquan Prefecture: Yumen City, Jiuquan County, Aksay Kazak Autonomous County, Dunhuang County, Jinta County, Subei Mongolian Autonomous County, Anxi County.

Qinghai Province

Xining City: Datong County

Haidong Prefecture: Ping'an County, Huzhu Autonomous County for Tu Nationality, Huangzhong County, Ledu County, Minhe County, Hualong Autonomous County for Hui Nationality, Xunhua Autonomous County for Sala Nationality, Huangyuan County.

Haibei Autonomous Prefecture For Tibetan Nationality: Menyuan Autonomous County for Hui Nationality, Haiyan County, Gangca County, Qilian County.

Huangnan Autonomous Prefecture For Tibetan Nationality: Tongren County, Jianza County, Zekog County.

Hainan Autonomous Prefecture for Tibetan Nationality: Gonghe County, Guide County, Guinan County, Tongde County, Xinghai County.

Golog Autonomous Prefecture for Tibetan Nationality: Maqen County, Gade County, Jigzhi County, Baima County, Daria County, Madoi County.

Yushu Autonomous Prefecture for Tibetan Nationality: Yushu County, Chindu County, Nangqen County, Zadoi County, Zhidoi County, Qumarleb County.

Haixi Autonomous Prefecture for Mongolian, Tibetan and Kazak Nationalities: Golmud City, Ulan County, Tianjun, Dulan County.

Guangdong Province

Guangzhou City:

Huaxian County, Xinfeng County, Zengcheng County, Conghua County, Longmen County, Panyu County.

Haikou City
Shantou City
Zhanjiang City
Maoming City
Foshan City
Jiangmen City
Shenzhen City
Zhuhai City

Shaoguan City: Qujiang County

Shaoguan Prefecture: Lechang County, Renhua County, Nanxiong County, Sixing County, Wengyuan County, Fogang County, Yingde County, Qingyuan County, Yangshan County, Lianshan Autonomous County for Zhuang and Yao Nationalities, Liannan Autonomous County for Yao Nationality, Lianxian County, Ruyuan Autonomous County for Yao Nationality.

Huiyang Prefecture: Huizhou City, Huiyang County, Bolou County, Heyuan County, Lianping County, Heping County, Longchuan County, Zijin County, Huidong County, Dongguan County.

Meixian Prefecture: Meizhou City, Meixian County, Pingyuan County, Jiaoling County, Dapu County, Fengshun County, Wuhua County, Ningning County.

Shantou Prefecture: Chaozhou City, Chenghai County, Chao'an County, Raoping County, Nan'ao County, Chaoyang County, Huilai County, Lufeng County, Haifeng County, Puning County, Jiexi County, Jieyang County.

Foshan Prefecture: Nanhai County, Sanshui County, Shunde County, Zhongshan County, Doumen County, Xinhui County, Gaohe County, Kaiping County, Taishan County, Enping County.

Administrative Units Directly under the Jurisdiction of Hainan Administrative District: Qionghshan County, Wenchang County, Ding'an County, Qionghai County, Wanning County, Tunchang County, Chengmai County, Danxian County, Lingao County.

Hainan Autonomous Prefecture for Li and Miao Nationalities under the Hainan Administrative District: Baoting County, Baisha County, Qionghong County, Lingshui County, Yaxian County, Ledong County, Dongfang County, Changjiang County.

Zhanjiang Prefecture: Lianjiang County, Huazhou County, Gaozhou County, Xinyi County,

Yangchun County, Yangjiang County, Dianbai County, Wuchuan County, Xuwen County, Haikang County, Suixi County.

Zhaoqing Prefecture: Zhaoqing City, Gaoyao County, Huaiji County, Guangning County, Sihui County, Xinxing County, Yunfu County, Louding County, Yunan County, Deqing County, Fengkai County.

Guizhou Province

Guiyang City

Lupanshui City: Shuicheng Special Region, Luzhi Special Region, Panxian Special Region.

Zunyi Prefecture: Zunyi City, Zunyi County, Suiyang County, Daozhen County, Fenggang County, Yuying County, Chishui County, Tongzi County, Zheng'an County, Wuchuan County, Meitan County, Renhuai County, Xishui County.

Tongren Prefecture: Tongren County, Yuiping County, Sinan County, Dejiang County, Songtao Autonomous County for Miao Nationality, Wanshan Special Region, Jiangkou County, Shiqian County, Yinjiang County, Yanhe County.

Xingyi Prefecture: Xingyi County, Pu'an County, Zhenfeng Autonomous County for Buyi and Miao Nationalities, Wangmo Autonomous County for Buyi and Miao Nationalities, Ceheng Autonomous County for Buyi Nationality, Anlong Autonomous County for Buyi and Miao Nationalities, Xingren County, Qinglong County.

Bijie Prefecture: Bijie County, Qianxi County, Zhijin County, Weining Autonomous County for Yi, Hui and Miao Nationalities, Hezhang County, Dafang County, Jinsha County, Nayong County.

Anshun Prefecture: Anshun City, Anshun County, Xifeng County, Qingzhen County, Puding County, Zhenning Autonomous County for Buyi and Miao Nationalities, Ziyun Autonomous County for Miao and Buyi Nationalities, Kaiyang County, Xiuwen County, Pingba County, Guanling County.

Qiandongnan Autonomous Prefecture for Miao and Dong Nationalities: Kaili County, Shibing County, Zhenyuan County, Tianzhu County, Qianhe County, Liping County, Congjiang County, Majiang County, Huangping County, Sansui County, Cengong County, Jinping County, Taijiang County, Rongjiang County,

Leishan County, Danzhai County.

Qiannan Autonomous Prefecture for Buyi and Miao Nationalities: Duyun City, Duyun County, Guiding County, Weng'an County, Pingtang County, Changshun County, Huishui County, Sandu Autonomous County for Shui Nationality, Lipo County, Fuquan County, Dushan County, Luodian County, Longli County.

Hebei Province

Shijiazhuang City

Tangshan City

Shijiazhuang Prefecture: Xingtang County, Lingshou County, Shulu County, Jinxian County, Gaocheng County, Gaoyi County, Zhaoxian County, Jingxing County, Huolu County, Xinlu County, Zhengding County, Shenze County, Wuji County, Zanhua County, Yuanshi County, Luancheng County, Pingshan County.

Handan Prefecture: Handan City, Yongnian County, Quzhou County, Guantao County, Weixian County, Chengan County, Daming County, Shexian County, Handan County, Jize County, Qiuxian County, Guangping County, Feixiang County, Linzhang County, Cixian County, Wu'an County.

Xingtai Prefecture: Xingtai City, Xingtai County, Baixiang County, Ningjin County, Longyao County, Linxi County, Nangong County, Julu County, Renxian County, Shahe County, Lincheng County, Neiqiu County, Xinhe County, Qinghe County, Weixian County, Guangzong County, Pingxiang County, Nanhe County.

Baoding Prefecture: Baoding City, Laishui County, Zhuoxian County, Dingxing County, Rongcheng County, Anxin County, Lixian County, Yixian County, Xincheng County, Fuping County, Tangxian County, Laiyuan County, Zhuoxian County, Dingxing County, Xiongxin County, Xushui County, Gaoyan County, Anguo County, Qingyuan County, Wangdu County, Quyang County, Wanxian County, Mancheng County.

Zhangjiakou Prefecture: Zhangjiakou City, Kangbao County, Chicheng County, Huailai County, Yuxian County, Xuanhua County, Zhangbei County, Guyuan County, Chongli County, Zhuolu County, Yangyuan County, Huai'an County, Shangyi County, Wanquan County.

Chengde Prefecture: Chengde City, Weichang County, Pingquan County, Kuancheng County, Xinlong County, Luanping County, Longhua County, Qinglong County, Chengde County, Fengning County.

Tangshan Prefecture: Qinhuangdao City, Qianxi County, Qian'an County, Changli County, Lulong County, Luannan County, Yutian County, Zunhua County, Funing County, Leling County, Luanxian County, Fengnan County, Fengrun County.

Langfang Prefecture: Anci County, Sanhe County, Xianghe County, Baxian County, Gu'an County, Dachang Autonomous County for Hui Nationality, Dacheng County, Wenan County, Yongqing County.

Cangzhou Prefecture: Cangzhou City, Cangxian County, Huanghua County, Yanshan County, Wuqiao County, Dongguang County, Suning County, Hejian County, Jiaocheng County, Qingxian County, Haixin County, Mengcun Autonomous County for Hui Nationality, Nanpi County, Renqiu County, Xianxian County.

Hengshui Prefecture: Hengshui County, Raoyang County, Fucheng County, Jingxian County, Zaoqiang County, Shenxian County, Anping County, Wuqiang County, Wuyi County, Gucheng County, Jixian County.

Heilongjiang Province

Harbin City

Qiqihar City

Hegang City

Shuangyashan City

Jixi City

Daqing City

Yichun City: Jiayin County, Tieli County.

Suihua Prefecture: Suihua County, Suileng County, Hailun County, Qing'an County, Lanxi County, Zhaodong County, Zhaozhou County, Zhaoyuan County, Anda County, Mingshui County, Qinggang County, Wangkui County.

Heihe Prefecture: Heihe City, Anhui County, Bei'an County, Dedu County, Sunwu County, Xunke County, Nanjiang County.

Hejiang Prefecture: Jiamusi City, Qitaihe City, Huachuan County, Luobei County, Suibin County, Fujin County, Tongjiang County, Fuyuan County, Raohe County, Baoqing County, Jixian County, Boli County, Huanan County, Yilan County, Tangyuan County.

Mudanjiang Prefecture: Mudanjiang City, Suifenhe City, Linkou County, Jidong County, Mishan County, Hulin County, Dongning County, Muling County, Ningan County, Hailin County.

Songhuajiang Prefecture: Acheng County, Hulan County, Bayan County, Binxian County, Mulan County, Tonghe County, Fengzhang County, Yanshou County, Shangzhi County, Wuchang County, Shuangcheng County.

Nenjiang Prefecture: Fuyu County, Nehe County, Keshan County, Kedong County, Baiquan County, Yi'an County, Lindian County, Dorbod Autonomous County for Mongolian Nationality, Tailai County, Longjiang County, Gannan County.

Da Hinggan Ling Prefecture: Huma County.

Henan Province

Zhengzhou City: Xingyang County

Kaifeng City

Pingdingshan City

Luoyang City

Jiaozuo City

Hebi City

Kaifeng Prefecture: Kaifeng County, Qixian County, Weishi County, Xinzheng County, Dengfeng County, Tongxu County, Zhongmou County, Mixian County, Gongxian County, Lankao County.

Xinxiang Prefecture: Xinxiang City, Xinxiang County, Jixian County, Fengqiu County, Huojia County, Wenxian County, Jiyuan County, Bo'ai County, Huixian County, Yanjin County, Yuanyang County, Wuzhi County, Mengxian County, Qinyang County, Xiuwu County.

Anyang Prefecture: Anyang City, Anyang County, Nanle County, Yuanxian County, Taiqian County, Huaxian County, Xunxian County, Qixian County, Neihuang County, Qingfeng County, Puyang County, Changyuan County, Tangyin County, Linxian County.

Shangqiu Prefecture: Shangqiu City, Shangqiu County, Xiayi County, Zhecheng County, Suixian County, Yucheng County, Yongcheng County, Ningling County, Minquan County.

Zhoukou Prefecture: Zhoukou City, Shangshui County, Fugou County, Luyi County, Huaiyang County, Shenqiu County, Xihua County, Taikang County, Dancheng County, Xiangcheng County.

Xuchang Prefecture: Xuchang City, Luohe City,

Xuchang County, Yanling County, Yancheng County, Xiangcheng County, Lushan County, Jiaxian County, Changge County, Linying County, Wuyang County, Yexian County, Baofeng County, Yuxian County.

Zhumadian Prefecture: Zhumadian City, Queshan County, Xiping County, Runan County, Xincai County, Qinyang County, Suiping County, Shangcai County, Pingyu County, Zhengang County.

Xinyang Prefecture: Xinyang City, Xinyang County, Xixian County, Gushi County, Huangchuan County, Xinxian County, Loushan County, Huabin County, Shangcheng County, Guangshan County.

Nanyang Prefecture: Nanyang City, Nanyang County, Fancheng County, Tanghe County, Xinye County, Dengxian County, Xichuan County, Nanzhao County, Sheqi County, Tongbai County, Zhenping County, Neixiang County, Xixia County.

Luoyang Prefecture: Sanmenxia City, Mengjin County, Linru County, Ruyang County, Songxian County, Luanchuan County, Lingbao County, Mianchi County, Yanshi County, Yichuan County, Yiyang County, Luoning County, Lushi County, Shanxian County, Xin'an County.

Hubei Province

Wuhan City: Wuchang County, Hanyang County

Huangshi City: Daye County

Shiyan City

Shashi City

Yichang City

Xiangfan City

Xiaogan Prefecture: Xiaogan County, Huangpi County, Hanchuan County, Yunmeng County, Yingshan County, Dawu County, Yingcheng County, Anlu County.

Huanggang Prefecture: Echeng City, Huanggang County, Xinzhou County, Hongan County, Macheng County, Loutian County, Echeng County, Xishui County, Qichun County, Huangmei County, Guangji County, Yingshan County.

Xianning Prefecture: Xianning County, Yangxin County, Tongshan County, Tongcheng County, Jiayu County, Chongyang County, Puqi County.

Jingzhou Prefecture: Jingzhou City, Jiangling County, Jingmen County, Zhongxiang County, Jingshan County, Jianli County, Shishou

County, Tianmen County, Qianjiang County, Mianyang County, Honghu County, Gong'an County, Songzi County.

Yichang Prefecture: Yichang County, Yuan'an County, Dangyang County, Yidu County, Zhijiang County, Wufeng County, Changyang County, Zigui County, Xingshan County.

Enshi Prefecture: Enshi County, Jianshi County, Badong County, Hengfeng Autonomous County for Tujia Nationality, Xuan'en County, Laifeng Autonomous County for Tujia Nationality, Xianfeng County, Lichun County.

Yunyang Prefecture: Yunxian County, Fangxian County, Zhuxi County, Junxian County, Zhushan County, Yunxi County, Shennongjia Forest Area.

Xiangyang Prefecture: Suizhou City, Laohekou City, Xiangyang County, Suixian County, Nanzhang County, Gucheng County, Zaoyang County, Yicheng County, Baokang County, Guanghua County.

Hunan Province

Changsha City: Changsha County, Wangcheng County

Zhuzhou City: Zhuzhou County

Xiangtan City

Hengyang City

Shaoyang City

Yueyang Prefecture: Yueyang City, Yueyang County, Linxiang County, Pingjiang County, Miluo County, Xiangyin County, Huarong County.

Xiangtan Prefecture: Xiangtan County, Liuyang County, Liling County, Youxian County, Chaling County, Lingxian County, Xianxiang County.

Chenzhou Prefecture: Chenzhou City, Chenxian County, Anren County, Yongxing County, Zixing County, Guidong County, Rucheng County, Yizhang County, Linwu County, Jiahe County, Guiyang County, Laiyang County.

Hengyang Prefecture: Hengnan County, Hengshan County, Hengdong County, Changning County, Qiyang County, Qidong County, Hengyang County.

Lingling Prefecture: Lingling County, Xintian County, Ningyuan County, Lanshan County, Jianghua Autonomous County for Yao Nationality, Shuangpai County, Jiangyong County, Daoxian County, Dong'an County.

Shaoyang Prefecture: Shaoyang County, Xinning

County, Wugang County, Longhui County, Chengbu Autonomous County for Miao Nationality, Suining County, Dongkou County.

Lianyuan Prefecture: Loudi City, Lengshuijiang City, Lianyuan County, Xinsao County, Shuangfeng County, Shaodong County, Xinhua County.

Qianyang Prefecture: Huaihua City, Hongjiang County, Huaihua County, Qianyang County, Chenxi County, Yuanling County, Xupu County, Huitong County, Jingxian County, Tongdao Autonomous County for Dong Nationality, Xinhua Autonomous County for Dong Nationality, Zhijiang County, Mayang County.

Xiangxi Autonomous Prefecture for Tujia and Miao Nationalities: Jishou County, Yongshun County, Sangzhi County, Dayong County, Guzhang County, Luxi County, Fenghuang County, Huayuan County, Baojing County, Longshan County.

Changde Prefecture: Changde City, Jinshi City, Changde County, Linli County, Lixian County, Anxiang County, Hanshou County, Taoyuan County, Cili County, Shimen County.

Yiyang Prefecture: Yiyang City, Yiyang County, Nanxian County, Yuanjiang County, Ningxiang County, Anhua County, Taojiang County.

Jiangsu Province

Nanjing City: Jiangning County, Liuhe County, Jiangpu County.

Xuzhou City

Lianyungang City

Nantong City

Suzhou City

Wuxi City

Changzhou City

Xuzhou Prefecture: Fengxian County, Peixian County, Ganyu County, Donghai County, Xinyi County, Peixian County, Suining County, Tongshan County.

Huaiyin Prefecture: Qingjiang County, Guanyun County, Guannan County, Shuyang County, Suqian County, Siyang County, Xuyi County, Lianshui County, Huaiyin County, Huai'an County, Hongze County, Sihong County, Jinhu County.

Yancheng Prefecture: Yancheng County, Binhai County, Funing County, Sheyang County, Jianhu County, Xiangshui County, Dafeng County, Dongtai County.

Nantong Prefecture: Hai'an County, Rugao County, Rudong County, Qidong County, Haimen County, Nantong County.

Yangzhou Prefecture: Yangzhou City, Taizhou City, Baoying County, Xinghua County, Gaoyou County, Taixing County, Taixian County, Jingjiang County, Jiangdu County, Hanjiang County, Yizheng County.

Zhenjiang Prefecture: Zhenjiang City, Dantu County, Yangzhong County, Danyang County, Wujin County, Yixing County, Jintan County, Liyang County, Jurong County, Lishui County, Gaochun County.

Suzhou Prefecture: Jiangyin County, Shazhou County, Changshu County, Taicang County, Kunshan County, Wuxian County, Wujiang County, Wuxi County.

Jiangxi Province

Nanchang City: Xinjian County, Nanchang County
Jingdezhen City
Pingxiang City
Jiujiang City

Administrative Unit directly under the Jurisdiction of the Province: Jinggangshan

Jiujiang Prefecture: Jiujiang County, Pengze County, Hukou County, Duchang County, Xingzi County, Yongxiu County, De'an County, Ruichang County, Wuning County, Xiushui County.

Shangrao Prefecture: Shangrao City, Yingtan City, Shangrao County, Wuyuan County, Dexing County, Yushan County, Guangfeng County, Yanshan County, Hengfeng County, Guixi County, Yujiang County, Wannian County, Leping County, Boyang County, Yugan County, Yiyang County.

Yichun Prefecture: Yichun City, Yichun County, Wanzai County, Tonggu County, Yifeng County, Shanggao County, Anyi County, Fengxin County, Gao'an County, Fengcheng County, Qingjiang County, Xinyu County, Fenyi County, Jing'an County.

Fuzhou Prefecture: Fuzhou City, Linchuan County, Jinxi County, Zixi County, Lichuan County, Nanfeng County, Nancheng County, Yihuang County, Chongren County, Le'an County, Dongxiang County, Jinxian County.

Ji'an Prefecture: Ji'an City, Ji'an County, Xingan County, Xiajiang County, Jishui County, Yongfeng County, Taihe County, Wan'an County, Suichuan County, Ninggan County,

Yongxin County, Lianhua County, Anfu County.

Ganzhou Prefecture: Ganzhou City, Guangchang County, Shicheng County, Ningdu County, Xingqiao County, Yudu County, Ruijin County, Huichang County, Anyuan County, Xunwu County, Dingnan County, Longnan County, Quannan County, Xinfeng County, Ganzhou County, Nankang County, Shangyou County, Chongyi County, Dayu County.

Jilin Province

Changchun City: Nongan County, Dehui County, Yushu County, Jiutai County, Shuangyang County.

Jilin City: Yongji County, Shulan County, Jiaohe County, Huadian County, Panshi County.

Yanbian Autonomous Prefecture for Korean Nationality: Yanji City, Tumen City, Yanji County, Wangqing County, Hunchun County, Helong County, Antu County, Dunhua County.

Tonghua Prefecture: Tonghua City, Hunjiang City, Tonghua County, Liuhe County, Hailong County, Huinan County, Jingyu County, Fusong County, Changbai Autonomous County for Korean Nationality, Ji'an County.

Siping Prefecture: Siping City, Liaoyuan City, Lishu County, Huaide County, Yitong County, Dongfeng County, Shuangliao County.

Baicheng Prefecture: Baicheng City, Zhenlai County, Da'an County, Qian Gorlos Mongolian Autonomous County, Fuyu County, Qian'an County, Changling County, Tongyu County, Tao'an County.

Liaoning Province

Shenyang City: Xinmin County, Liaozhong County

Dalian City: Jinxian County, Fuxian County, Xinjin County, Zhuanghe County, Changhai County.

Anshan City: Haicheng County, Tai'an County

Fushun City: Fushun County, Xinbin County, Qingyuan County

Benxi City: Benxi County, Huanren County

Jinzhou City: Jinxian County, Yixian County, Heishan County, Beizhen County, Jinxi County, Xingcheng County, Shuizhong County.

Dangong City: Donggou County, Xiuyan County, Fengcheng County, Kuandian County.

Fuxin City: Mongolian Autonomous County of Fuxin, Zhangwu County.

Yingkou City: Yingkou County, Gaixian County, Panshan County, Dawa County.

Liaoyang City: Liaoyang County, Dengta County.

Tieling Prefecture: Tieling City, Tieling County, Kaiyuan County, Changtu County, Kangping County, Faku County, Xifeng County.

Chaoyang Prefecture: Chaoyang City, Chaoyang County, Jianchang County, Beipiao County, Lingyuan County, Jianping County, Harqin Left Wing Mongolian Autonomous County.

Shaanxi Province

Xi'an City: Chang'an County

Tongchuan City: Yaoxian County

Baoji City: Baoji County, Fengxiang County, Qianyang County, Longxian County, Linyou County, Qishan County, Fufeng County, Wugong County, Meixian County, Taibai County, Fengxian County.

Yulin Prefecture: Yulin County, Shenmu County, Fugu County, Jiaxian County, Mizhi County, Wubu County, Suide County, Qingjian County, Zizhou County, Hengshan County, Jingbian County, Dingbian County.

Yan'an Prefecture: Yan'an City, Ansai County, Zichang County, Yanchuan County, Yanchang County, Yichuan County, Huanglong County, Luochuan County, Yijun County, Huangling County, Fuxian County, Ganquan County, Zhidan County, Wuqi County.

Xianyang Prefecture: Xianyang City, Liquan County, Yongshou County, Binxian County, Changwu County, Xunyi County, Chunhua County, Jingyang County, Sanyuan County, Gaoling County, Huxian County, Zhouzhi County, Xingping County, Qianxian County.

Weinan Prefecture: Weinan County, Pucheng County, Baishui County, Chengcheng County, Hancheng County, Heyang County, Dali County, Tongguan County, Huayin County, Huaxian County, Lantian County, Lintong County, Fuping County.

Shangluo Prefecture: Shangxian County, Luonan County, Danfeng County, Shangnan County,

Shanyang County, Zhen'an County, Zhashui County.

Ankang Prefecture: Ankang County, Xunyang County, Baihe County, Pingli County, Zhenping County, Lan'gao County, Ziyang County, Hanyin County, Shiquan County, Ningshan County.

Hanzhong Prefecture: Hanzhong County, Liuba County, Chenggu County, Yangxian County, Foping County, Xixiang County, Zhenba County, Nanzheng County, Ningjiang County, Mianxian County, Lueyang County.

Shandong Province

Jinan City: Licheng County, Changqing County, Zhangqiu County.

Qingdao City: Laoshan County, Jiaonan County, Jimo County, Jiaoxian County.

Zibo City

Zaozhuang City: Tengxian County.

Dezhou Prefecture: Dezhou City, Ningjin County, Leling County, Shanghe County, Jiyang County, Yucheng County, Xiajin County, Lingxian County, Qingyun County, Linyi County, Qihe County, Pingyuan County, Wucheng County.

Huimin Prefecture: Binxian County, Kenli County, Guangrao County, Huantai County, Zouping County, Yangxin County, Zhanhua County, Lijin County, Boxing County, Gaoqing County, Huimin County, Wudi County.

Changwei Prefecture: Weifang City, Weixian County, Pingdu County, Zhucheng County, Anqiu County, Linqu County, Shouguang County, Changyi County, Gaomi County, Wulian County, Changle County, Yidu County.

Yantai Prefecture: Yantai City, Weihai City, Mouping County, Wendeng County, Haiyang County, Laiyang County, Qixia County, Yexian County, Changdao County, Fushan County, Rongcheng County, Rushan County, Laixi County, Zhaoyuan County, Huangxian County, Penglai County.

Linyi Prefecture: Linyi County, Yishui County, Rizhao County, Lianshu County, Cangshan County, Pingyi County, Yiyuan County, Yinan County, Juxian County, Junan County, Tancheng County, Feixian County, Mengying County.

Tai'an Prefecture: Tai'an County, Laiwu County, Xinwen County, Feicheng County, Pingying

County, Xintai County, Ningyang County, Dongping County.

Jining Prefecture: Jining City, Jining County, Yanzhou County, Sishui County, Yutai County, Jiaxiang County, Wenshang County, Qufu County, Zouxian County, Weishan County, Jinxiang County.

Heze Prefecture: Heze County, Yuncheng County, Juye County, Shanxian County, Caoxian County, Juancheng County, Liangshan County, Chengwu County, Dingtao County, Dongming County.

Liaocheng Prefecture: Liaocheng County, Gaotang County, Dong'e County, Xinxian County, Linqing County, Chiping County, Yanggu County, Guanxian County.

Shanxi Province

Taiyuan City: Yangqu County, Loufan County, Qingxu County.

Datong City

Yangquan City

Changzhi City

Yanbei Prefecture: Datong County, Tanzhen County, Lingqiu County, Huaiaren County, Shanyin County, Pinglu County, Youyu County, Yanggao County, Guangling County, Hunyuan County, Yingxian County, Shuoxian County, Zuoyun County.

Xinxian Prefecture: Xinxian County, Daixian County, Wutai County, Jingle County, Baode County, Hequ County, Shenchi County, Yuanping County, Fanshi County, Dingxiang County, Kelan County, Wuhan County, Pianguan County, Nianwu County.

Jinzhou Prefecture: Yuci City, Yuci County, Yuxian County, Xiyang County, Zuoquan County, Taigu County, Pingyao County, Lingshi County, Shouyang County, Pingding County, Heshun County, Yushe County, Qixian County, Jixiu County.

Luliang Prefecture: Lishi County, Xingxian County, Fanshan County, Lanxian County, Jiaocheng County, Wenshui County, Fenyang County, Xiaoyi County, Jiaokou County, Shilou County, Zhongyang County, Linxian County, Liulin County.

Jindongnan Prefecture: Changzhi County, Xiangyuan County, Licheng County, Huguang County, Gaoping County, Yangcheng County, Zhangzi County, Qinyuan County, Lucheng County, Wuxiang County, Pingshun County, Lingchuan County, Jincheng County, Qinshui County, Tunliu County, Qinxian County.

Linfen Prefecture: Linfen City, Houma City, Linfen County, Fenxi County, Anze County, Guxian County, Yicheng County, Quwo County, Jixian County, Daning County, Xixian County, Yonghe County, Hongdong County, Huoxian County, Fushan County, Xiangfen County, Xiangning County, Puxian County.

Yuncheng Prefecture: Yuncheng County, Wenxi County, Yuanqu County, Ruicheng County, Linyi County, Xinjiang County, Hejin County, Xiaoxian County, Jiangxian County, Pinglu County, Yongji County, Wanrong County, Jishan County.

Sichuan Province

Chengdu City: Jintang County, Shuangliu County

Chongqing City: Changshou County, Baxian County, Qijiang County, Jiangbei County

Zigong City: Rongxian County

Dukou City: Miyi County, Yanbian County

Wenjiang Prefecture: Wenjiang County, Pixian County, Guanxian County, Pengxian County, Shifang County, Guanghan County, Xindu County, Xinjin County, Pujiang County, Qionglai County, Dayi County, Chongqing County.

Mianyang Prefecture: Mianyang City, Jiangyou County, Qingchuan County, Pingwu County, Guangyuan County, Wangcang County, Jian'ge County, Zitong County, Santai County, Yanting County, Shehong County, Suining County, Pengxi County, Zhongjiang County, Deyang County, Mianzhu County, Anxian County, Beichuan County.

Neijiang Prefecture: Neijiang City, Neijiang County, Leizhi County, Anyue County, Weiyuan County, Zizhong County, Ziyang County, Jianyang County, Longchang County.

Yibin Prefecture: Yibin City, Luzhou City, Yibin County, Fushun County, Nanxi County, Jiang'an County, Naxi County, Luxian County, Hejiang County, Gulin County, Xuyong County, Changning County, Xingwen County, Gongxian County, Gaoxian County, Yunlian County, Pingshan County.

Leshan Prefecture: Leshan City, Jiajiang County, Hongya County, Danling County, Qingshen County, Meishan County, Pengshan County, Jingyan County, Renshou County, Jianwei County, Muchuan County, Emei County, Jinkouhe Industrial and Agricultural District, Mabian County, Ebian County.

Jiangjin Prefecture: Yongchuan County, Dazhu County, Tongliang County, Hechuan County, Tongnan County, Bishan County, Jiangjin County, Rongchang County.

Fuling Prefecture: Fuling County, Dianjiang County, Fengdu County, Shizhu County, Xushan County, Youyang County, Qianjiang County, Pengshui County, Wulong County, Nanchuan County.

Wanxian Prefecture: Wanxian City, Wanxian County, Kaixian County, Chengkou County, Wuxi County, Wushan County, Fengjie County, Yunyang County, Zhongxian County, Liangping County.

Nanchong Prefecture: Nanchong City, Nanchong County, Cangxi County, Langzhong County, Yilong County, Nanbu County, Xichong County, Yingshan County, Peng'an County, Guang'an County, Yuechi County, Wusheng County, Huayun Industrial and Agricultural District.

Ili Autonomous Prefecture for Kazak Nationality (Administrative Units under Its Jurisdiction): Yining City, Kuityun City, Yining County, Nilka County, Xinyuan County, Gongliu County, Tekes County, Zhaosu County, Qapqal Autonomous County for Xibo Nationality, Korgas County.

Ili Autonomous Prefecture for Kazak Nationality (Tacheng Prefecture): Tacheng County, Hobksar Autonomous County for Mongolian Nationality, Emin County, Usu County, Toli County, Yumin County, Shawan County.

Ili Autonomous Prefecture for Kazak Nationality (Alta Prefecture): Alta County, Qinghe County, Fuyun County, Jeminay County, Burqin County, Habahe County.

SECTION II:

MAJOR ECONOMIC DOCUMENTS, WORKS OF ECONOMIC POLICY, LAWS AND DECREES (1978-1981)

1. COMMUNIQUE OF THE SIXTH PLENARY SESSION OF THE 11th CENTRAL COMMITTEE OF THE COMMUNIST PARTY OF CHINA

(Adopted on June 29, 1981)

The 11th Central Committee of the Communist Party of China held its Sixth Plenary Session in Beijing from June 27 to 29, 1981. It was attended by 195 members and 114 alternate members of the Central Committee and 53 non-voting participants. Members of the Standing Committee of the Political Bureau of the Central Committee, Comrades Hu Yaobang, Ye Jianying, Deng Xiaoping, Zhao Ziyang, Li Xiannian, Chen Yun and Hua Guofeng, presided at the session.

Items on the agenda of the plenary session were: 1. Discussion and approval of the Resolution on Certain Questions in the History of Our Party Since the Founding of the People's Republic of China; 2. Re-election of principal leading members of the Central Committee and election of new members. The above-mentioned agenda was thoroughly deliberated and conscientiously discussed at a preparatory meeting held before the plenary session. This session is another meeting of great significance in the history of our party following the Third Plenary Session of the 11th Central Committee, a meeting for summing up experience and closing the ranks to press forward. This session will go down in history for fulfilling the historic mission of setting right things which have been thrown into disorder in the guiding ideology of the party.

Applying Marxist dialectical materialism and historical materialism, the Resolution on Certain Questions in the History of Our Party Since the Founding of the People's Republic of China unanimously adopted by the plenary session correctly sums up the major historical events of the party in the 32 years since the founding of the People's Republic of China, particularly the "cultural revolution." The resolution scientifically analyses the rights and wrongs in the party's guiding ideology during these events, analyses the subjective factors and social causes that gave rise to mistakes, realistically evaluates the historical role played by Comrade Mao Zedong, the great leader and teacher, in the Chinese revolution and fully elaborates the great significance of Mao Zedong Thought as the guiding ideology of our party. The resolution affirms the correct path for building a modern and powerful socialist country, a path which has been gradually established since the Third Plenary Session and which conforms to realities in China, and further points out the orientation for the continued advance of our country's socialist cause and the work of our party. The

plenary session believes that the adoption and publication of the resolution will exert great and far-reaching influence on unifying the thinking and understanding of the party, the army and the people of all nationalities throughout the country so that they will strive with one heart and one mind to carry out our new, historical task.

The plenary session unanimously approved Comrade Hua Guofeng's request to resign his posts as Chairman of the Central Committee and Chairman of its Military Commission. The plenary session re-elected the principal leading members of the Central Committee and elected new ones by secret ballot. The results of the elections are:

1. Comrade Hu Yaobang — Chairman of the Central Committee;
2. Comrade Zhao Ziyang — Vice-Chairman of the Central Committee;
3. Comrade Hua Guofeng — Vice-Chairman of the Central Committee;
4. Comrade Deng Xiaoping — Chairman of the Military Commission of the Central Committee;
5. A Standing Committee of the Political Bureau of the Central Committee made up of the Chairman and Vice-Chairman of the Central Committee. They are Hu Yaobang, Ye Jianying, Deng Xiaoping, Zhao Ziyang, Li Xiannian, Chen Yun and Hua Guofeng;
6. Comrade Xi Zhongxun — Member of the Secretariat of the Central Committee.

The plenary session holds that the election and re-election of the principal leading members of the Central Committee will play an important part in strengthening the Central Committee's collective leadership and unity on the basis of Marxism and ensuring the full implementation of the party's correct line and policies formulated since the Third Plenary Session.

The plenary session gave full play to democracy. All comrades present spoke out freely, followed the scientific approach of seeking truth from facts and displayed the spirit of criticism and self-criticism in summing up historical experience and discussing and deciding the choice of persons as leading members of the Central Committee. This restored and carried forward the fine tradition formed by our party during the Yan'an rectification period. The session vividly demonstrates our party's strong unity and fully reflects the growth and flourishing of our cause.

The plenary session believes that, just as the party's correct summing up of historical experi-

ence in the period of the democratic revolution brought great revolutionary victories, the correct summing up of the party's historical experience since the founding of the People's Republic of China will help bring about new great victories in our future socialist construction. The plenary session calls on the party, the army and the people of all nationalities throughout the country to hold high the banner of Marxism-

Leninism and Mao Zedong Thought, to rally more closely around the Party Central Committee, to carry forward the spirit of the legendary Foolish Old Man who removed mountains, to be resolute, to surmount all difficulties and work hard to turn China step by step into a modern and powerful socialist country with a high degree of democracy and civilization.

2. RESOLUTION ON CERTAIN QUESTIONS IN THE HISTORY OF OUR PARTY SINCE THE FOUNDING OF THE PEOPLE'S REPUBLIC OF CHINA

*Adopted by the Sixth Plenary Session of the 11th Central
Committee of the Communist Party of China
(June 27, 1981)*

Review of the History of the 28 Years Before the Founding of the People's Republic

1. The Communist Party of China has traversed 60 years of glorious struggle since its founding in 1921. In order to sum up its experience in the 32 years since the founding of the People's Republic, we must briefly review the previous 28 years in which the party led the people in waging the revolutionary struggle for New Democracy.

2. The Communist Party of China was the product of the integration of Marxism-Leninism with the Chinese workers' movement and was founded under the influence of the October Revolution in Russia and the May 4th Movement in China and with the help of the Communist International led by Lenin. The Revolution of 1911, led by Dr. Sun Yat-sen, the great revolutionary forerunner, overthrew the Qing Dynasty, thus bringing to an end over 2,000 years of feudal monarchical rule. However, the semi-colonial and semi-feudal nature of Chinese society remained unchanged. Neither the Kuomintang nor any of the bourgeois or petty-bourgeois political groupings and factions found any way out for the country and the nation, nor was it possible for them to do so. The Communist Party of China and the Communist Party of China alone was able to show the people that China's salvation lay in overthrowing once and for all the reactionary rule of imperialism and feudalism and then switching over to socialism. When the Communist Party of China was founded, it had less than 60 members. But it initiated the vigorous workers' movement and the people's anti-imperialist and anti-feudal struggle and grew rapidly, soon becoming a leading force such as the Chinese people had never before known.

3. In the course of leading the struggle of the Chinese people with its various nationalities for New Democracy, the Communist Party of China went through four stages: the Northern Expedition (1924-27) conducted with the co-operation of the Kuomintang, the Agrarian Revolutionary War (1927-37), the War of Resistance Against Japan (1937-45) and the nationwide War of Liberation (1946-49). On two occasions, first in 1927 and then in 1934, it endured major setbacks. It was

not until 1949 that it finally triumphed in the revolution, thanks to the long years of armed struggle in conjunction with other forms of struggle in other fields closely coordinated with it.

In 1927, despite the resolute opposition of the left wing of the Kuomintang with Soong Ching Ling as its outstanding representative, the Kuomintang, controlled by Chiang Kai-shek and Wang Jingwei, betrayed the policies of Kuomintang-Communist cooperation and of anti-imperialism and anti-feudalism decided on by Dr. Sun Yat-sen and, in collusion with the imperialists, massacred Communists and other revolutionaries. The Communist Party was still quite inexperienced and, moreover, was dominated by Chen Duxiu's Right capitulationism, so that the revolution suffered a disastrous defeat under the surprise attack of a powerful enemy. The total membership of the party, which had grown to more than 60,000, fell to just over 10,000.

However, our party continued to fight tenaciously. Launched under the leadership of Zhou Enlai and several other comrades, the Nanchang Uprising of 1927 fired the opening shot for armed resistance against the Kuomintang reactionaries. The meeting of the Central Committee of the Party held on August 7, 1927 decided on the policy of carrying out agrarian revolution and organizing armed uprisings.

Shortly afterwards, the Autumn Harvest and Guangzhou uprisings and uprisings in many other areas were organized. Led by Comrade Mao Zedong, the Autumn Harvest Uprising in the Hunan-Jiangxi border area gave birth to the First Division of the Chinese Workers' and Peasants' Revolutionary Army and to the first rural revolutionary base area in the Jinggang Mountains. Before long, the insurgents, led by Comrade Zhu De, arrived at the Jinggang Mountains and joined forces with it. With the progress of the struggle, the party set up the Jiangxi central revolutionary base area and Western Hunan-Hubei, Haifeng-Lufeng, Hubei-Henan-Anhui, Qiongya, Fujian-Zhejiang-Jiangxi, Hunan-Hubei-Jiangxi, Hunan-Jiangxi, Zuojiang-Youjiang, Sichuan-Shaanxi, Shaanxi-Gansu and Hunan-Hubei-Sichuan-Guizhou and other base areas. The First, Second and Fourth Front armies of the Workers' and Peasants' Red Army were also born, as were many other Red Army units. In addition, party organizations and other revolution-

any organizations were established and revolutionary mass struggles unfolded under difficult conditions in the Kuomintang areas.

In the Agrarian Revolutionary War, the First Front Army of the Red Army and the central revolutionary base area under the direct leadership of comrades Mao Zedong and Zhu De played the most important role. The front armies of the Red Army in turn defeated a number of "encirclement and suppression" campaigns launched by Kuomintang troops. But because of Wang Ming's "Left" adventurist leadership, the struggle against the Kuomintang's fifth "encirclement and suppression" campaign ended in failure.

The First Front Army was forced to embark on the 25,000-li Long March and made its way to northern Shaanxi to join forces with units of the Red Army, which had been persevering in struggles there, and with its 25th Army, which had arrived earlier. The Second and Fourth Front Armies also went on their long march, first one and then the other arriving in northern Shaanxi. Guerrilla warfare was carried on under difficult conditions in the base areas in south China from which the main forces of the Red Army had withdrawn. As a result of the defeat caused by Wang Ming's "Left" errors, the revolutionary base areas and the revolutionary forces in the Kuomintang areas sustained enormous losses. The Red Army of 300,000 men was reduced to about 30,000 and the Communist Party of 300,000 members to about 40,000.

In January 1935, the Political Bureau of the Central Committee of the Party convened a meeting in Zunyi during the Long March, which established the leading position of Comrade Mao Zedong in the Red Army and the Central Committee of the Party. This saved the Red Army and the Central Committee of the Party — which were then in critical danger — and subsequently made it possible to defeat Zhang Guotao's splitism, to bring the Long March to a triumphant conclusion and to open up new vistas for the Chinese revolution. It was a vital turning point in the history of the party.

At a time of national crisis of unparalleled gravity when the Japanese imperialists were intensifying their aggression against China, the Central Committee of the Party headed by Comrade Mao Zedong decided on and carried out the correct policy of forming an anti-Japanese national united front. Our party led the students' movement of December 9, 1935 and organized the powerful mass struggle to demand an end to the civil war and to demand resistance against Japan so as to save the nation. The Xi'an Incident, organized by generals Zhang Xueliang and Yang Hucheng on December 12, 1936, and its peaceful settlement

which our party promoted, played a crucial historical role in bringing about renewed cooperation between the Kuomintang and the Communist Party and in achieving national unity for resistance against Japanese aggression.

During the war of resistance, the ruling clique of the Kuomintang continued to oppose the Communist Party and the people and was passive in resisting Japan. As a result, the Kuomintang suffered defeat after defeat in front operations against the Japanese invaders. Our party persevered in the policy of maintaining its independence and initiative within the united front, closely relied on the masses of the people, conducted guerrilla warfare behind enemy lines and set up many anti-Japanese base areas.

The Eighth Route Army and the New Fourth Army — the reorganized Red Army — grew rapidly and became the mainstay in the war of resistance. The Northeast Anti-Japanese United Army sustained its operations amid formidable difficulties. Diverse forms of anti-Japanese struggle were unfolded on a broad scale in areas occupied by Japan or controlled by the Kuomintang. Consequently, the Chinese people were able to hold out in the war for eight long years and win final victory, in cooperation with the people of the Soviet Union and other countries in the anti-fascist war.

During the anti-Japanese war, the party conducted a rectification movement — a movement of Marxist education. Launched in 1942, it was a tremendous success. It was on this basis that the enlarged Seventh Plenary Session of the Sixth Central Committee of the Party in 1945 adopted the Resolution on Certain Questions in the History of Our Party and soon afterwards the party's Seventh National Congress was convened. These meetings summed up our historical experience and laid down our correct line, principles and policies for building a new-democratic New China, enabling the party to attain an unprecedented ideological, political and organizational unity and solidarity.

After the conclusion of the War of Resistance Against Japan, the Chiang Kai-shek government, with the aid of U.S. imperialism, flagrantly launched an all-out civil war, disregarding the just demand of our party and the people of the whole country for peace and democracy. With the wholehearted support of the people in all the Liberated Areas, with the powerful backing of the students' and workers' movements and the struggles of the people of various strata in the Kuomintang areas and with the active cooperation of the democratic parties and non-party democrats, our party led the People's Liberation Army in fighting the three-year War of Liberation and — following the Liaoxi-Shenyang, Beijing-Tianjin and Huai-Hai

campaigns and the successful crossing of the Changjiang (Yangtze) River — in wiping out a total of 8,000,000 Chiang Kai-shek troops. The end result was the overthrow of the reactionary Kuomintang government and the establishment of the great People's Republic of China. The Chinese people had stood up.

4. The victories gained in the 28 years of struggle fully show that:

1) *Victory in the Chinese revolution was won under the guidance of Marxism-Leninism.* Our party had creatively applied the basic principles of Marxism-Leninism and integrated them with the concrete practice of the Chinese revolution. In this way, the great system of Mao Zedong Thought came into being and the correct path to victory for the Chinese revolution was charted. This is a major contribution to the development of Marxism-Leninism.

2) *As the vanguard of the Chinese proletariat, the Communist Party of China is a party serving the people whole-heartedly, with no selfish aim of its own.* It is a party with both the courage and the ability to lead the people in their indomitable struggle against any enemy. Convinced of all this by virtue of their own experience, the Chinese people of every nationality came to rally around the party and to form a broad united front, thus forging a strong political unity unparalleled in Chinese history.

3) *The Chinese revolution was victorious mainly because we relied on a people's army led by the party — an army of a completely new type and one enjoying flesh-and-blood ties with the people — to defeat a formidable enemy through protracted people's war.* Without such an army, it would have been impossible to achieve the liberation of our people and the independence of our country.

4) *The Chinese revolution had the support of the revolutionary forces in other countries at every stage, a fact which the Chinese people will never forget.* Yet, it must be said that, fundamentally, victory in the Chinese revolution was won because the Chinese Communist Party adhered to the principle of independence and self-reliance and depended on the efforts of all of the Chinese people, whatever their nationality, after they underwent untold hardships and surmounted innumerable difficulties and obstacles together.

5) *The victorious Chinese revolution put an end to the rule of a handful of exploiters over the*

masses of the working people and to the enslavement of the multinational Chinese people by the imperialists and colonialists. The working people have become the masters of the new state and the new society. While changing the balance of forces in world politics, the people's victory in so large a country — having nearly one-quarter of the world's population — has inspired the people in countries similarly subjected to imperialist and colonialist exploitation and oppression with heightened confidence in their forward march. The triumph of the Chinese revolution is the most important political event since World War II and has exerted a profound and far-reaching impact on the international situation and the development of the people's struggle throughout the world.

5. Victory in the new-democratic revolution was won through long years of struggle and sacrifice by countless martyrs, party members and people of all nationalities. We should by no means give all the credit to the leaders of the revolution, but at the same time we should not underrate the significant role these leaders have played.

Among the many outstanding leaders of the party, Comrade Mao Zedong was the most prominent. Prior to the failure of the revolution in 1927, he had clearly pointed out the paramount importance of the leadership of the proletariat over the peasants' struggle and the danger of a Right deviation in this regard. After its failure, he was the chief representative of those who succeeded in shifting the emphasis in the party's work from the city to the countryside and in preserving, restoring and promoting the revolutionary forces in the countryside.

In the 22 years from 1927 to 1949, Comrade Mao Zedong and other party leaders managed to overcome innumerable difficulties and gradually worked out an overall strategy and specific policies and directed their implementation, so that the revolution was able to switch from staggering defeats to great victory. Our party and people would have had to grope in the dark much longer had it not been for Comrade Mao Zedong, who more than once rescued the Chinese revolution from grave danger, and for the Central Committee of the Party which was headed by him and which charted the firm, correct political course for the whole party, the whole people and the people's army. Just as the Communist Party of China is recognized as the central force leading the entire people forward, so Comrade Mao Zedong is recognized as the great leader of the Chinese Communist Party and the whole Chinese people, and Mao Zedong Thought, which came into being through the collective struggle of the party and the people, is recognized as the guiding ideology of

the party. This is the inevitable outcome of the 28 years of historical development preceding the founding of the People's Republic of China.

Basic Appraisal of the History of the 32 Years Since the Founding of the People's Republic

6. Generally speaking, the years since the founding of the People's Republic of China are years in which the Chinese Communist Party, guided by Marxism-Leninism and Mao Zedong Thought, has very successfully led the whole people in carrying out socialist revolution and socialist construction. The establishment of the socialist system represents the greatest and most profound social change in Chinese history and is the foundation for the country's future progress and development.

7. Our major achievements in the 32 years since the founding of the People's Republic are the following:

1) *We have established and consolidated the people's democratic dictatorship led by the working class and based on the worker-peasant alliance, namely, the dictatorship of the proletariat.* It is a new type of state power, unknown in Chinese history, in which the people are the masters of their own domain. It constitutes the fundamental guarantee for the building of a modern socialist country, prosperous and powerful, democratic and culturally advanced.

2) *We have achieved and consolidated nationwide unification of the country — with the exception of Taiwan and other islands — and have thus put an end to the state of disunity characteristic of old China.* We have achieved and consolidated the great unity of the people of all nationalities and have forged and expanded a socialist relationship of equality and mutual help among the more than 50 nationalities. And we have achieved and consolidated the great unity of the workers, peasants, intellectuals and people of other strata and have strengthened and expanded the broad united front which is led by the Chinese Communist Party in full cooperation with the patriotic democratic parties and people's organizations, and comprises all socialist working people and all patriots who support socialism and patriots who stand for the unification of the motherland, including our compatriots in Taiwan, Xianggang (Hong Kong) and Aomen (Macao) and Chinese citizens overseas.

3) *We have defeated aggression, sabotage and armed provocations by the imperialists and hege-*

monists, safeguarded our country's security and independence and fought successfully in defence of our border regions.

4. *We have built and developed a socialist economy and have in the main completed the socialist transformation of the private ownership of the means of production into public ownership and put into practice the principle of "to each according to his work."* The system of exploitation of man by man has been eliminated, and exploiters no longer exist as classes since the overwhelming majority have been remoulded and now live by their own labour.

5) *We have scored signal successes in industrial construction and have gradually set up an independent and fairly comprehensive industrial base and economic system.* Compared with 1952 when economic rehabilitation was completed, fixed industrial assets — calculated on the basis of their original price — were more than 27 times greater in 1980, exceeding 410,000 million yuan; the output of cotton yarn was 4.5 times greater, reaching 2,930,000 tons; that of coal, 9.4 times, reaching 620 million tons; that of electricity, 41 times, exceeding 300,000 million kwh.; the output of crude oil exceeded 105,000,000 tons and that of steel, 37 million tons; and the output value of the engineering industry was 54 times greater, exceeding 127,000 million yuan. A number of new industrial bases have been built in our vast hinterland and the regions inhabited by our minority nationalities. National defence industry started from scratch and is gradually being built up. Much has been done in prospecting for natural resources. There has been a tremendous growth in railway, highway, water and air transport and in posts and telecommunications.

6) *The conditions prevailing in agricultural production have experienced remarkable change, giving rise to big increases in production.* The amount of land under irrigation has grown from 300 million *mu* in 1952 to over 670 million *mu*. Flooding by large rivers such as the Changjiang (Yangtze), Huanghe (Yellow River), Huaihe, Haihe, Zhujiang (Pearl River), Liaohe and Songhuajiang has been brought under initial control. In our rural areas, where farm machinery, chemical fertilizers and electricity were practically nonexistent before Liberation, there has now been a big increase in the number of agriculture-related tractors and irrigation and drainage equipment and in the quantity of chemical fertilizers applied, and the amount of electricity consumed is now 7.5 times the amount generated in the whole country in the early years of Liberation. In 1980, the total

of grain was nearly double that in 1952 and that of cotton, more than double. Despite the excessive rate of growth in our population, which is now nearly one billion, we have succeeded by our own efforts in basically meeting the needs of our people in food and clothing.

7) *There has been substantial growth in urban and rural commerce and in foreign trade.* The total value of commodities purchased by enterprises owned by the whole people rose from 17.5 billion yuan in 1952 to 226.3 billion yuan in 1980, registering a nearly 13-fold increase; retail sales rose from 27.7 billion yuan to 214 billion yuan, an increase of 7.7 times. The total value of the state's foreign trade in 1980 was 8.7 times that of 1952. With the growth in industry, agriculture and commerce, the people's livelihood has improved very markedly as compared with pre-Liberation days. In 1980, average consumption per capita in both town and country was nearly twice as much as in 1952, allowing for price changes.

8) *Considerable progress has been made in education, science, culture, public health and physical culture.* In 1980, enrollment in the various kinds of full-time schools totalled 204 million, 3.7 times the number in 1952. In the past 32 years, institutions of higher education and vocational schools have turned out nearly 9 million graduates with specialized knowledge or skills. Our achievements in nuclear technology, man-made satellites, rocketry, etc. represented substantial advances in the field of science and technology. In literature and art, large numbers of fine works have appeared to cater to the needs of the people and of socialism. With the participation of the masses, sports have developed vigorously, and records have been achieved in quite a few events. Epidemic diseases with their high mortality rates have been eliminated or largely eliminated; the health of the rural and urban populations has greatly improved, and average life expectancy is now much longer.

9) *Under the new historical conditions, the People's Liberation Army has grown in strength and in quality.* No longer composed only of ground forces, it has become a composite army, including naval and air forces and various technical branches. Our armed forces, which are a combination of field armies, regional forces and the militia, have been strengthened. Their quality is now much higher and their technical equipment much better. The PLA is serving as the solid pillar of the people's democratic dictatorship in defending and participating in the socialist revolution and socialist construction.

10) *Internationally, we have steadfastly pursued an independent socialist foreign policy, advocated and upheld the Five Principles of Peaceful Coexistence, entered into diplomatic relations with 124 countries and promoted trade and economic and cultural exchanges with still more countries and regions.* Our country's place in the United Nations and the Security Council has been restored to us. Adhering to proletarian internationalism, we are playing an increasingly influential and active role in international affairs by enhancing our friendship with the peoples of other countries; by supporting and assisting the oppressed nations in their cause of liberation, the newly independent countries in their national construction and the people of various countries in their just struggles; and by staunchly opposing imperialism, hegemonism, colonialism and racism in defence of world peace. All of this has served to create favourable international conditions for our socialist construction and contributes to the development of a world situation favourable to people everywhere.

8. New China has not been in existence for very long, and our successes are still preliminary. Our party has made mistakes owing to its meagre experience in leading the cause of socialism and to subjective errors in the party leadership's analysis of the situation and its understanding of Chinese conditions. Before the "cultural revolution" there were mistakes of enlarging the scope of class struggle and of impetuosity and rashness in economic construction. Later, there was the comprehensive, long-drawn-out and grave blunder of the "cultural revolution." All these errors prevented us from scoring the greater achievements of which we should have been capable. It is impermissible to overlook or whitewash mistakes; this in itself would be a mistake and would give rise to more and greater mistakes.

But, after all, our achievements in the past 32 years is the main thing. It would be a no less serious error to overlook or deny our achievements. Our achievements and successful experiences are the products of the creative application of Marxism-Leninism by our party and people. They are the manifestation of the superiority of the socialist system and the base from which the entire party and people will continue to advance. "Uphold truth and rectify errors" — this is the basic stand of dialectical-materialism our party must take. It was by taking this stand that we saved our cause from danger and defeat and won victory in the past. By taking the same stand, we will certainly win still greater victories in the future.

The Seven Years of Basic Completion of the Socialist Transformation

9. From the inception of the People's Republic of China in October 1949 to 1956, our party led the whole people in gradually realizing the transition from new democracy to socialism, in rapidly rehabilitating the country's economy, in undertaking planned economic construction and in the main accomplishing the socialist transformation of private ownership of the means of production in most sectors of the country. The guidelines and basic policies defined by the party in this historical period were correct and have led to brilliant successes.

10. In the first three years of the People's Republic, we cleared the mainland of bandits and the remnant armed forces of the Kuomintang reactionaries; peacefully liberated Tibet; established people's governments at all levels throughout the country; confiscated bureaucrat-capitalist enterprises and transformed them into state-owned socialist enterprises; unified the country's financial and economic work; stabilized commodity prices; carried out agrarian reform in the new liberated areas; suppressed counter-revolutionaries; and unfolded the movements against the "three evils" of corruption, waste and bureaucracy and against the "five evils" of bribery, tax evasion, theft of state property, cheating on government contracts and stealing of economic information — the latter being a movement to beat back the attack mounted by the bourgeoisie. We effectively transformed the educational, scientific and cultural institutions of old China. While successfully carrying out the complex and difficult task of social reform and simultaneously undertaking the great war to resist U.S. aggression and aid Korea, to protect our homes and to defend the country, we rapidly rehabilitated the country's economy which had been devastated in old China. By the end of 1952, the country's industrial and agricultural production had attained record levels.

11. On the proposal of Comrade Mao Zedong in 1952, the Central Committee of the Party advanced the general line for the transition period, which was to realize the country's socialist industrialization and socialist transformation of agriculture, handicrafts and capitalist industry and commerce step by step over a fairly long period of time. This general line was a reflection of historical necessity.

1) *Socialist industrialization is an indispensable prerequisite to the country's independence and prosperity.*

2) *With nationwide victory in the new-democratic revolution and completion of the agrarian reform, the contradiction between the working class and the bourgeoisie and between the socialist road and the capitalist road became the principal internal contradiction. The country needed a certain expansion of capitalist industry and commerce which were beneficial to its economy and to the people's livelihood. But in the course of their expansion, things detrimental to the national economy and the people's livelihood were bound to emerge. Consequently, a struggle between restriction and opposition to restriction was inevitable. The conflict of interests became increasingly apparent between capitalist enterprises on the one hand, and the economic policies of the state, the socialist state-owned economy, the workers and staff in these capitalist enterprises, and the people as a whole, on the other. An integrated series of necessary measures and steps — such as the fight against speculation and profiteering, the readjustment and restructuring of industry and commerce, the movement against the "five evils," workers' supervision of production and state monopoly of the purchase and marketing of grain and cotton — were bound gradually to bring backward, anarchic, lopsided and profit-oriented capitalist industry and commerce into the orbit of socialist transformation.*

3) *Among the individual peasants, and particularly poor and lower-middle peasants who had just acquired land in the agrarian reform but lacked other means of production, there was a genuine desire for mutual aid and cooperation in order to avoid borrowing at usurious rates and even mortgaging or selling their land again with consequent polarization, and in order to expand production, undertake water conservancy projects, ward off natural calamities and make use of farm machinery and new techniques. The progress of industrialization, while demanding agricultural products in ever increasing quantities, would provide increasingly stronger support for the technological transformation of agriculture, and this also would constitute a motive force behind the transformation from individual to cooperative farming.*

As is borne out by history, the general line for the transition period set forth by our party was entirely correct.

12. During the period of transition, our party creatively charted a course for socialist transformation that suited China's specific conditions. In dealing with capitalist industry and commerce, we devised a whole series of transitional forms of state capitalism from lower to higher levels, such as the placing of state orders with private enter-

prises for the processing of materials or the manufacture of goods, state monopoly of the purchase and marketing of the products of private enterprise, the marketing of products of state-owned enterprises by private shops, and joint state-private ownership of individual enterprises or enterprises of a whole trade. Thus, we eventually realized the peaceful redemption of the bourgeoisie, a possibility envisaged by Marx and Lenin. In dealing with individual farming, we devised transitional forms of cooperation, proceeding from temporary or all-year-round mutual-aid teams, to elementary agricultural producers' cooperatives of a semi-socialist nature and then to advanced agricultural producers' cooperatives of a fully socialist nature, always adhering to the principles of voluntariness and mutual benefit, demonstration through advanced examples, the extension of state help. Similar methods were used in transforming individual handicrafts industries. In the course of such transformation, the state-capitalist and cooperative economies displayed their unmistakable superiority over forms of the past. By 1956, the socialist transformation of the private ownership of the means of production had been largely completed in most regions.

But there had been shortcomings and errors. From the summer of 1955 onwards, we were over-hasty in pressing on with agricultural cooperation and the transformation of private handicrafts and commercial establishments; we were far from meticulous, the changes were too fast, and we did our work in a somewhat summary, stereotyped manner, leaving open a number of questions for a long time. Following the basic completion of the transformation of capitalist industry and commerce in 1956, we failed to do a proper job in employing and dealing with some of the former industrialists and businessmen. But, on the whole, it was decidedly a historic victory for us to have effected, and to have effected fairly smoothly, so difficult, complex and profound a social change in so vast a country with its several hundred million people — a change, moreover, which promoted the growth of industry, agriculture and the economy as a whole.

13. In economic construction under the First Five-Year Plan (1953-57), we likewise scored major successes through our own efforts and with the assistance of the Soviet Union and other friendly countries. A number of basic industries, essential for the country's industrialization and yet very weak in the past, were built up. Between 1953 and 1956, the average annual increases in the total value of industrial and agricultural output were 19.6% and 4.8%, respectively. Economic growth was quite rapid, with satisfactory economic results,

and the key economic sectors were well-balanced. The market prospered and prices were stable. The people's livelihood improved perceptibly. In April 1956, Comrade Mao Zedong made his speech *On the Ten Major Relationships*, in which he initially summed up our experiences in socialist construction and set forth the task of exploring a way of building socialism suited to the specific conditions of our country.

14. The First National People's Congress was convened in September 1954, and it enacted the Constitution of the People's Republic of China. In March 1955, a national conference of the party reviewed the major struggle against the plots of the careerists Gao Gang and Rao Shushi to split the party and usurp supreme power in the party and the state; in this way it strengthened party unity. In January 1956, the Central Committee of the Party called a conference on the question of the intellectuals. Subsequently, the policy of "letting a hundred flowers blossom and a hundred schools of thought contend" was advanced. These measures spelled out the correct policy regarding intellectuals and the work in education, science and culture and thus brought about a significant advance in these fields. Owing to the party's correct policies, fine style of work and the consequent high prestige it enjoyed among the people, the vast numbers of cadres, masses, youth and intellectuals earnestly studied Marxism-Leninism and Mao Zedong Thought and participated enthusiastically in revolutionary and construction activities under the leadership of the party, so that a healthy and virile revolutionary morality prevailed throughout the country.

15. The Eighth National Congress of the Party held in September 1956 was very successful. The congress declared that the socialist system had been basically established in China; that while we must strive to liberate Taiwan, thoroughly complete socialist transformation, ultimately eliminate the system of exploitation and continue to wipe out the remnant forces of counter-revolution, the principal contradiction within the country was no longer the contradiction between the working class and the bourgeoisie but between the demand of the people for rapid economic and cultural development and the existing state of our economy and culture, which fell short of the needs of the people; that the chief task confronting the whole nation was to concentrate all efforts on developing productive forces, industrializing the country and gradually meeting the people's incessantly growing material and cultural needs; and that although class struggle still existed and the people's democratic dictator-

ship had to be further strengthened, the basic task of the dictatorship was now to protect and develop the productive forces in the context of the new relations of production. The congress adhered to the principle put forward by the Central Committee of the Party in May 1956, the principle of opposing both conservatism and rash advance in economic construction — that is, of making steady progress by striking an over-all balance. It emphasized the problem of the building of the party in office and the need to uphold democratic centralism and collective leadership, oppose the personality cult, promote democracy within the party and among the people and strengthen the party's ties with the masses. The line laid down by the Eighth National Congress of the Party was correct and it charted the path for the development of the cause of socialism and for party building in the new period.

The Ten Years of Initially Building Socialism in All Spheres

16. After the basic completion of socialist transformation, our party led the entire people in shifting our work to all-round, large-scale socialist construction. In the ten years preceding the "cultural revolution" we achieved very big successes despite serious setbacks. By 1966, the value of fixed industrial assets, calculated on the basis of their original price, was four times greater than in 1956. The output of such major industrial products as cotton yarn, coal, electricity, crude oil, steel and mechanical equipment all recorded impressive increases. Beginning in 1965, China became self-sufficient in petroleum. New industries such as the electronic and petrochemical industries were established one after the other. The distribution of industry over the country became better balanced. Capital construction in agriculture and its technical transformation began on a massive scale and yielded better and better results. Both the number of tractors for farming and the quantity of chemical fertilizers applied increased over 7 times and rural consumption of electricity 71 times. The number of graduates from institutions of higher education was 4.9 times that of the previous seven years. Educational work was improved markedly through consolidation. Scientific research and technological work also produced notable results.

In the ten years from 1956 to 1966, the party accumulated precious experience in leading socialist construction. In the spring of 1957, Comrade Mao Zedong stressed the necessity of correctly handling and distinguishing between the two types of social contradictions differing in nature in a

socialist society, and made the correct handling of contradictions among the people the main content of the country's political life. Later, he called for the creation of "a political situation in which we have both centralism and democracy, both discipline and freedom, both unity of will and personal ease of mind and liveliness." In 1958, he proposed that the focus of party and government work be shifted to technical revolution and socialist construction. All this was the continuation and development of the line adopted by the Eighth National Congress of the Party and was to go on serving as a valuable guide. While leading the work of correcting the errors in the Great Leap Forward and the movement to organize people's communes, Comrade Mao Zedong pointed out that there must be no expropriation of the peasants; that a given stage of social development should not be skipped; that equalitarianism must be opposed; that we must stress commodity production, observe the law of value and strike an over-all balance in economic planning; and that economic plans must be arranged with the priority proceeding from agriculture to light industry and then to heavy industry. Comrade Liu Shaoqi said that a variety of means of production could be put into circulation as commodities and that there should be a double-track system for labour as well as for education* in socialist society. Comrade Zhou Enlai said, among other things, that the overwhelming majority of Chinese intellectuals had become intellectuals belonging to the working people and that science and technology would play a key role in China's modernization. Comrade Chen Yun held that plan targets should be realistic, that the scale of construction should correspond to national capability and considerations should be given to both the people's livelihood and the needs of state construction, and that the material, financial and credit balances should be maintained in drawing up plans. Comrade Deng Xiaoping held that industrial enterprises should be consolidated and their management improved and strengthened, and that the system of workers' conferences should be introduced. Comrade Zhu De stressed the need to pay attention to the development of handicrafts and of diverse undertakings in agriculture. Deng Zihui and other comrades pointed out that a system of production responsibility should be introduced in agriculture. All these views were not only of vital significance then, but have remained so ever since. In the course of economic readjustment, the Central Committee drew up draft rules governing the work of the rural people's communes and work in industry, commerce, education, science and literature and art. These rules which were a more or less systematic summation of our experience in socialist construction and

embodied specific policies suited to the prevailing conditions remain important as a source of reference for us to this very day.

In short, the material and technical basis for modernizing our country was largely established during that period. It was also largely in the same period that the core personnel for our work in the economic, cultural and other spheres were trained and that they gained their experience. This was the principal aspect of the party's work in that period.

17. In the course of this decade, there were serious faults and errors in the guidelines of the party's work which developed through twists and turns.

The year 1957 was one of the years that saw the best results in economic work since the founding of the People's Republic owing to the conscientious implementation of the correct line formulated at the Eighth National Congress of the Party. To start a rectification campaign throughout the party in that year and to urge the masses to offer criticisms and suggestions were normal steps in developing socialist democracy. In the rectification campaign, a handful of bourgeois Rightists seized the opportunity to advocate what they called "speaking out and airing views in a big way" and to mount a wild attack against the party and the nascent socialist system in an attempt to replace the leadership of the Communist Party. It was therefore entirely correct and necessary to launch a resolute counter-attack. But the scope of this struggle was made far too broad and a number of intellectuals, patriotic people and party cadres were unjustifiably labelled "Rightists," with unfortunate consequences.

In 1958, the Second Plenum of the Eighth National Congress of the Party adopted the general line for socialist construction. The line and its fundamental aspects were correct in that it reflected the masses' pressing demand for a change in the economic and cultural backwardness of our country. Its shortcoming was that it overlooked objective economic laws. Both before and after the plenum, all comrades in the party and people of all nationalities displayed high enthusiasm and initiative for socialism and achieved certain results in production and construction. However, "Left" errors, characterized by excessive targets, the issuing of arbitrary directions, boastfulness and the stirring up of a "communist wind," spread unchecked throughout the country. This was due to lack of experience in socialist construction and inadequate understanding of the laws of economic development and of the basic economic conditions in China.

More important, it was due to the fact that Comrade Mao Zedong and many leading comrades,

both at the centre and in the localities, had become smug about their successes, were impatient for quick results and overestimated the role of man's subjective will and efforts. After the general line was formulated, the Great Leap Forward and the movement for rural people's communes were initiated without careful investigation and study and without prior experimentation. From the end of 1958 to the early stage of the Lushan Meeting of the Political Bureau of the Party's Central Committee in July 1959, Comrade Mao Zedong and the Central Committee led the whole party in energetically rectifying the errors which had already been recognized. However, in the later part of the meeting, he erred in initiating criticism of Comrade Peng Dehuai and then in launching a party-wide struggle against "Right opportunism." The resolution passed by the Eighth Plenary Session of the Eighth Central Committee of the Party concerning the so-called anti-party group of Peng Dehuai, Huang Kecheng, Zhang Wentian and Zhou Xiaozhou was entirely wrong. Politically, this struggle gravely undermined inner-party democracy from the central level down to the grass-roots; economically, it cut short the process of the rectification of "Left" errors, thus prolonging their influence. It was mainly due to the errors of the Great Leap Forward and of the struggle against "Right opportunism" — together with a succession of natural calamities and the perfidious scrapping of contracts by the Soviet government — that our economy encountered serious difficulties between 1959 and 1961, causing serious losses to our country and people.

In the winter of 1960, the Central Committee of the Party and Comrade Mao Zedong set about rectifying the "Left" errors in rural work and decided on the principle of "readjustment, consolidation, filling out and raising standards" for the economy as a whole. A number of correct policies and resolute measures were worked out and put into effect with comrades Liu Shaoqi, Zhou Enlai, Chen Yun and Deng Xiaoping in charge. All this constituted a crucial turning point in that historical phase. In January 1962, the enlarged Central Work Conference, attended by 7,000 people, made a preliminary summing-up of the positive and negative experience of the Great Leap Forward and unfolded criticism and self-criticism. A majority of the comrades who had been unjustifiably criticized during the campaign against "Right opportunism" were rehabilitated before or after the conference. In addition, most of the "Rightists" had their label removed. Thanks to these economic and political measures, the national economy recovered and developed fairly smoothly between 1962 and 1966.

Nevertheless, "Left" errors in the principles

guiding economic work were not only not eradicated, but actually grew in the spheres of politics, ideology and culture. At the Tenth Plenary Session of the Party's Eighth Central Committee in September 1962, Comrade Mao Zedong widened and absolutized the class struggle — which exists only within certain limits in socialist society — and carried forward the viewpoint he had advanced after the anti-Rightist struggle in 1957 that the contradiction between the proletariat and the bourgeoisie remained the principal contradiction in our society. He went a step further and asserted that throughout the historical period of socialism, the bourgeoisie would continue to exist and would attempt a comeback and become the source of revisionism inside the party. The socialist education movement that unfolded between 1963 and 1965 in some rural areas and at the grassroots level in a small number of cities did help to some extent to improve the cadres' style of work and economic management. However, in the course of the movement, problems differing in nature were all treated as forms of class struggle or its reflections inside the party. As a result, quite a number of the cadres at the grassroots level were unjustly dealt with in the latter half of 1964, and early in 1965 the erroneous thesis was advanced that the main target of the movement should be "those party persons in power taking the capitalist road."

In the ideological sphere, a number of literary and art works and schools of thought and a number of representative personages in artistic, literary and academic circles were subjected to unwarranted, inordinate political criticism. And there was an increasingly serious "Left" deviation on the question of intellectuals and on the question of education, science and culture. These errors eventually culminated in the "cultural revolution," although they had not yet become dominant.

Thanks to the fact that the entire party and people had concentrated on carrying out the correct principle of economic readjustment since the winter of 1960, socialist construction gradually flourished again. The party and the people were united in sharing weal and woe. They overcame difficulties at home, stood up to the pressure of the Soviet leading clique and repaid all the debts owed to the Soviet Union, which were chiefly incurred through purchasing Soviet arms during the movement to resist U.S. aggression and aid Korea. In addition, they did what they could to support the revolutionary struggles of the people of many countries and assist them in their economic construction. The Third National People's Congress, which met between the end of 1964 and the first days of 1965, announced that the task of national economic readjustment had in the main

been accomplished and that the economy as a whole would soon enter a new stage of development. It called for energetic efforts to build China step by step into a socialist power with modern agriculture, industry, national defence and science and technology. This call was not fulfilled owing to the "cultural revolution."

18. All the successes in these ten years were achieved under the collective leadership of the Central Committee of the Party headed by Comrade Mao Zedong. Likewise, responsibility for the errors committed in the work of this period rested with the same collective leadership. Although Comrade Mao Zedong must be held chiefly responsible, we cannot lay the blame for all those errors on him alone. During this period, his theoretical and practical mistakes concerning class struggle in a socialist society became increasingly serious, his personal arbitrariness gradually undermined democratic centralism in party life and the personality cult grew graver and graver. The Central Committee of the Party failed to rectify these mistakes in good time. Careerists like Lin Biao, Jiang Qing and Kang Sheng, harbouring ulterior motives, took advantage of these errors and inflated them. This led to the inauguration of the "cultural revolution."

The Decade of the "Cultural Revolution"

19. The "cultural revolution," which lasted from May 1966 to October 1976, was responsible for the most severe setbacks and the heaviest losses suffered by the party, the state and the people since the founding of the People's Republic. It was initiated and led by Comrade Mao Zedong. His principal biases were that many representatives of the bourgeoisie and counter-revolutionary revisionists had infiltrated the party, the government, the army and cultural circles, and that the leadership in a fairly large majority of organizations and departments was no longer in the hands of Marxists and the people; that party persons in power taking the capitalist road had formed a bourgeois headquarters inside the Central Committee which pursued a revisionist political and organizational line and had agents in all provinces, municipalities and autonomous regions, as well as in all central departments; that since the forms of struggle adopted in the past had been unable to solve this problem, the power usurped by the capitalist-roaders could be recaptured only by carrying out a great cultural revolution, by openly and fully mobilizing the broad masses from the bottom up to expose these sinister phenomena; and that the cultural revolution was in fact a great political

revolution in which one class would overthrow another, a revolution that would have to be waged time and again. These theses appeared mainly in the May 16 Circular, which served as the programmatic document of the "cultural revolution," as well as in the political report to the Ninth National Congress of the Party of April 1969. They were incorporated into a general theory — the "theory of continued revolution under the dictatorship of the proletariat" — which then took on a specific meaning. These erroneous "Left" theses, upon which Comrade Mao Zedong based himself in initiating the "cultural revolution," were obviously inconsistent with the system of Mao Zedong Thought, which is the integration of the universal principles of Marxism-Leninism with the concrete practice of the Chinese revolution. These theses must be clearly distinguished from Mao Zedong Thought. As for Lin Biao, Jiang Qing and others, who were placed in important positions by Comrade Mao Zedong, the matter is of an entirely different nature. They rigged up two counter-revolutionary cliques in an attempt to seize supreme power and, taking advantage of Comrade Mao Zedong's errors, committed many crimes behind his back, bringing disaster to the country and the people. As their counter-revolutionary crimes have been fully exposed, this resolution will not go into them at great length.

20. The history of the "cultural revolution" has proved that Comrade Mao Zedong's principal theses for initiating this revolution conformed neither to Marxism-Leninism nor China's reality. They represent an entirely erroneous appraisal of the prevailing class relations and political situation in the party and state.

1) *The "cultural revolution" was defined as a struggle against the revisionist line or the capitalist road.* There were no grounds at all for this definition. It led to the confusing of right and wrong on a series of important theories and policies. Many things denounced as revisionist or capitalist during the "cultural revolution" were actually Marxist and socialist principles, many of which had been set forth or supported by Comrade Mao Zedong himself. The "cultural revolution" negated many of the correct principles, policies and achievements of the 17 years after the founding of the People's Republic. In fact, it negated much of the work of the Central Committee of the Party and the People's Government, including Comrade Mao Zedong's own contribution. It negated the arduous struggles the entire people had conducted in socialist construction.

2) *The confusing of right and wrong in-*

evitably led to confusing the people with the enemy. The "capitalist-roaders" overthrown in the "cultural revolution" were leading cadres of party and government organizations at all levels, who formed the core force of the socialist cause. The so-called bourgeois headquarters inside the party headed by Liu Shaoqi and Deng Xiaoping simply did not exist. Irrefutable facts have proved that labelling Comrade Liu Shaoqi a "renegade, disguised traitor and scab" was nothing but a frame-up by Lin Biao, Jiang Qing and their followers. The political conclusion concerning Comrade Liu Shaoqi drawn by the 12th Plenary Session of the Eighth Central Committee of the Party and the disciplinary measures it meted out to him were both utterly wrong. The criticism of the so-called reactionary academic authorities in the "cultural revolution" — during which many capable and accomplished intellectuals were attacked and persecuted — also badly muddled up the distinction between the people and the enemy.

3) *Nominally the "cultural revolution" was conducted by directly relying on the masses. In fact, it was divorced both from the party organizations and from the masses.* After the movement started, party organizations at different levels were attacked and became partially or wholly paralyzed, the party's leading cadres at various levels were subjected to criticism and struggle, inner-party life came to a standstill, and many activists and large numbers of the basic masses upon whom the party has long relied on were rejected. At the beginning of the "cultural revolution," the vast majority of participants in the movement acted out of their faith in Comrade Mao Zedong and the party. Except for a handful of extremists, however, they did not approve of launching ruthless struggles against leading party cadres at all levels. With the lapse of time, following their own circuitous paths, they eventually attained a heightened political consciousness and consequently began to adopt a sceptical or wait-and-see attitude towards the "cultural revolution," or even resisted and opposed it. Many people were assailed more or less severely for this very reason. Such a state of affairs could not but provide openings to be exploited by opportunists, careerists and conspirators, not a few of whom were escalated to high or even key positions.

4) *Practice has shown that the "cultural revolution" did not in fact constitute a revolution or social progress in any sense, nor could it possibly have done so. It was we and not the enemy at all who were thrown into disorder by the "cultural revolution."* Therefore, from beginning to end, it did not turn "great disorder under heaven" into

"great order under heaven," nor could it conceivably have done so. After state power in the form of the people's democratic dictatorship was established in China, and especially after socialist transformation was basically completed and the exploiters were eliminated as classes, the socialist revolution represented a fundamental break with the past in both content and method, even though its tasks remained to be completed. Of course, it was essential to take proper account of certain undesirable phenomena that undoubtedly existed in party and state organs and to remove them by correct measures in conformity with the state Constitution, the laws and the Party Constitution. But on no account should the theories and methods of the "cultural revolution" have been applied. Under socialist conditions, there is no economic or political basis for carrying out a great political revolution in which "one class overthrows another." It decidedly could not come up with any constructive programme, but could only bring grave disorder, damage and retrogression in its wake. History has shown that the "cultural revolution," initiated by a leader labouring under a misapprehension and capitalized on by counter-revolutionary cliques, led to domestic turmoil and brought catastrophe to the party, the state and the whole people.

21. The "cultural revolution" can be divided into three stages:

1) *From the initiation of the "cultural revolution" to the Ninth National Congress of the Party in April 1969.* The convening of the enlarged Political Bureau meeting of the Central Committee of the Party in May 1966 and the 11th Plenary Session of the Eighth Central Committee in August of that year marked the launching of the "cultural revolution" on a full scale. These two meetings adopted the May 16 Circular and the Decision of the Central Committee of the Communist Party of China Concerning the Great Proletarian Cultural Revolution, respectively. They launched an erroneous struggle against the so-called anti-party clique of Peng Zhen, Luo Ruiqing, Lu Dingyi and Yang Shangkun and the so-called headquarters of Liu Shaoqi and Deng Xiaoping. They wrongly reorganized the central leading organs, set up the "Cultural Revolution Group Under the Central Committee of the Chinese Communist Party" and gave it a major part of the power of the Central Committee. In fact, Comrade Mao Zedong's personal leadership characterized by "Left" errors took the place of the collective leadership of the Central Committee, and the cult of Comrade Mao Zedong was frenziedly pushed to an extreme. Lin Biao, Jiang Qing,

Kang Sheng, Zhang Chunqiao and others, acting chiefly in the name of the "Cultural Revolution Group," exploited the situation to incite people to "overthrow everything and to wage full-scale civil war." Around February 1967, at various meetings, Tan Zhenlin, Chen Yi, Ye Jianying, Li Fuchun, Li Xiannian, Xu Xiangqian, Nie Rongzhen and other Political Bureau members and leading comrades of the Military Commission of the Central Committee sharply criticized the mistakes of the "cultural revolution." This was labelled the "February adverse current," and those involved were attacked and repressed. Comrades Zhu De and Chen Yun were also wrongly criticized. Almost all leading party and government departments in the different spheres and localities were stripped of their power or reorganized. The chaos was such that it was necessary to send in the People's Liberation Army to support the Left, the workers and the peasants and to institute military control and military training. This played a positive role in stabilizing the situation, but it also produced some negative consequences. The Ninth Congress of the Party legitimized the erroneous theories and practices of the "cultural revolution," and so reinforced the positions of Lin Biao, Jiang Qing, Kang Sheng and others in the Central Committee of the Party. The guidelines of the Ninth Congress were wrong — ideologically, politically and organizationally.

2) *From the Ninth National Congress of the Party to its Tenth National Congress in August 1973.* In 1970-71, the counter-revolutionary Lin Biao clique plotted to capture supreme power and attempted an armed counter-revolutionary coup d'etat. Such was the outcome of the "cultural revolution" which overturned a series of fundamental party principles. Objectively, it announced the failure of the theories and practices of the "cultural revolution." Comrades Mao Zedong and Zhou Enlai ingeniously thwarted the plotted coup. Supported by Comrade Mao Zedong, Comrade Zhou Enlai took charge of the day-to-day work of the Central Committee and things began to improve in all fields. During the criticism and repudiation of Lin Biao in 1972, he correctly proposed criticism of the ultra-"Left" trend of thought. In fact, this was an extension of the correct proposals put forward around February 1967 by many leading comrades of the Central Committee who had called for the correction of the errors of the "cultural revolution." Comrade Mao Zedong, however, erroneously held that the task was still to oppose the "ultra-Right." The Tenth Congress of the Party perpetuated the "Left" errors of the Ninth Congress and made Wang Hongwen a vice-chairman of the party. Jiang Qing, Zhang Chunqiao, Yao Wenyuan and Wang

Hongwen formed a Gang of Four inside the Political Bureau of the Central Committee, thus strengthening the influence of the counter-revolutionary Jiang Qing clique.

3) *From the Tenth Congress of the Party to October 1976.* Early in 1974, Jiang Qing, Wang Hongwen and others launched a campaign to "criticize Lin Biao and Confucius." Jiang Qing and the others directed the spearhead at Comrade Zhou Enlai, which was different in nature from the campaign conducted in some localities and organizations where individuals involved in and incidents connected with the conspiracies of the counter-revolutionary Lin Biao clique were investigated. Comrade Mao Zedong approved the launching of the movement to "criticize Lin Biao and Confucius." When he found that Jiang Qing and the others were turning it to their advantage in order to seize power, he severely criticized them. He declared that they had formed a "gang of four" and pointed out that Jiang Qing harboured the wild ambition of making herself chairman of the Central Committee and "forming a cabinet" by political manipulation.

In 1975, when Comrade Zhou Enlai was seriously ill, Comrade Deng Xiaoping, with the support of Comrade Mao Zedong, took charge of the day-to-day work of the Central Committee. He convened an enlarged meeting of the Military Commission of the Central Committee and several other important meetings with a view to solving problems in industry, agriculture, transport and science and technology, and began to straighten out the work in many fields so that the situation took an obvious turn for the better.

However, Comrade Mao Zedong could not bear to accept systematic correction of the errors of the "cultural revolution" by Comrade Deng Xiaoping and triggered the movement to "criticize Deng and counter the Right deviationist trend to reverse correct verdicts," once again plunging the nation into turmoil.

In January of 1976, Comrade Zhou Enlai passed away. Comrade Zhou Enlai was utterly devoted to the party and the people and stuck to his post till his dying day. He found himself in an extremely difficult situation throughout the "cultural revolution." He always kept the general interest in mind, bore the heavy burden of office without complaint, racking his brains and untiringly endeavouring to keep the normal work of the party and the state going, to minimize the damage caused by the "cultural revolution" and to protect many party and non-party cadres. He waged all forms of struggle to counter sabotage by the counter-revolutionary Lin Biao and Jiang Qing cliques. His death left the whole party and people in the most profound grief. In April of the same

year, a powerful movement of protest signalled by the Tian An Men Incident swept the whole country, a movement to mourn for the late Premier Zhou Enlai and oppose the Gang of Four. In essence, the movement was a demonstration of support for the party's correct leadership as represented by Comrade Deng Xiaoping. It laid the ground for massive popular support for the subsequent overthrow of the counter-revolutionary Jiang Qing clique. The Political Bureau of the Central Committee and Comrade Mao Zedong wrongly assessed the nature of the Tian An Men Incident and dismissed Comrade Deng Xiaoping from all his posts inside and outside the party. As soon as Comrade Mao Zedong passed away in September 1976, the counter-revolutionary Jiang Qing clique stepped up its plot to seize supreme party and state leadership.

Early in October of the same year, the Political Bureau of the Central Committee, executing the will of the party and the people, resolutely smashed the clique and brought the catastrophic "cultural revolution" to an end. This was a great victory won by the entire party, army and people after prolonged struggle. Hua Guofeng, Ye Jianying, Li Xiannian and other comrades played a vital part in the struggle to crush the clique.

22. Chief responsibility for the grave "Left" error of the "cultural revolution" — an error comprehensive in magnitude and protracted in duration — does indeed lie with Comrade Mao Zedong. But, after all, it was the error of a great proletarian revolutionary. Comrade Mao Zedong paid constant attention to overcoming shortcomings in the life of the party and state. In his later years, however, far from making a correct analysis of many problems, he confused right and wrong and the people with the enemy during the "cultural revolution." While making serious mistakes, he repeatedly urged the whole party to study the works of Marx, Engels and Lenin conscientiously and imagined that his theory and practice were Marxist and that they were essential for the consolidation of the dictatorship of the proletariat. Herein lies his tragedy. While persisting in the comprehensive error of the "cultural revolution," he checked and rectified some of its specific mistakes, protected some leading party cadres and non-party public figures and enabled some leading cadres to return to important leading posts. He led the struggle to smash the counter-revolutionary Lin Biao clique. He made major criticisms and exposures of Jiang Qing, Zhang Chunqiao and others, frustrating their sinister ambition to seize supreme leadership. All this was crucial to the subsequent and relatively painless overthrow of the Gang of Four by our party. In his later years, he still remained alert to

safeguarding the security of our country, stood up to the pressure of the social-imperialists, pursued a correct foreign policy, firmly supported the just struggles of all peoples, outlined the correct strategy of the three worlds and advanced the important principle that China would never seek hegemony. During the "cultural revolution," our party was not destroyed, but maintained its unity. The State Council and the People's Liberation Army were still able to do much of their essential work. The Fourth National People's Congress, which was attended by deputies from all nationalities and all walks of life, was convened and it determined the composition of the State Council with comrades Zhou Enlai and Deng Xiaoping as the core of its leadership. The foundation of China's socialist system remained intact and it was possible to continue socialist economic construction. Our country remained united and exerted a significant influence on international affairs. All these important facts are inseparable from the great role played by Comrade Mao Zedong. For these reasons, and particularly for his vital contributions to the cause of the revolution over the years, the Chinese people have always regarded Comrade Mao Zedong as their respected and beloved great leader and teacher.

23. The struggle waged by the party and the people against "Left" errors and against the counter-revolutionary Lin Biao and Jiang Qing cliques during the "cultural revolution" was arduous and full of twists and turns, and it never ceased. Rigorous tests throughout the "cultural revolution" have proved that standing on the correct side in the struggle were the overwhelming majority of the members of the Eighth Central Committee of the Party and the members it elected to its Political Bureau, Standing Committee and Secretariat. Most of our party cadres, whether they were wrongly dismissed or remained at their posts, whether they were rehabilitated early or late, are loyal to the party and people and steadfast in their belief in the cause of socialism and communism. Most of the intellectuals, model workers, patriotic democrats, patriotic overseas Chinese and cadres and masses of all strata and all nationalities who had been wronged and persecuted did not waver in their love for the motherland and in their support for the party and socialism. Party and state leaders such as comrades Liu Shaoqi, Peng Dehuai, He Long and Tao Zhu and all other party and non-party comrades who were persecuted to death in the "cultural revolution" will live forever in the memories of the Chinese people.

It was through the joint struggles waged by the entire party and the masses of workers, peasants, PLA officers and men, intellectuals, educat-

ed youths and cadres that the havoc wrought by the "cultural revolution" was somewhat mitigated. Some progress was made in our economy despite tremendous losses. Grain output increased rather steadily. Significant achievements were scored in industry, communications and capital construction and in science and technology. New railways were built and the Changjiang River Bridge at Nanjing was completed; a number of large enterprises using advanced technology went into operation; hydrogen bomb tests were successfully undertaken and man-made satellites successfully launched and retrieved; and new hybrid strains of long-grained rice were developed and popularized. Despite the domestic turmoil, the People's Liberation Army bravely defended the security of the motherland. And new prospects were opened up in the sphere of foreign affairs.

Needless to say, none of these successes can be attributed in any way to the "cultural revolution," without which we would have scored far greater achievements for our cause. Although we suffered from sabotage by the counter-revolutionary Lin Biao and Jiang Qing cliques during the "cultural revolution," we won out over them in the end. The party, the people's political power, the people's army and Chinese society on the whole remained unchanged in nature. Once again history has proved that our people are a great people and that our party and socialist system have enormous vitality.

24. In addition to the above-mentioned immediate cause of Comrade Mao Zedong's mistakes in leadership, there are complex social and historical causes underlying the "cultural revolution" which dragged on for as long as a decade. The main causes are as follows:

1) *The history of the socialist movement is not long and that of the socialist countries even shorter.* Some of the laws governing the development of socialist society are relatively clear, but many more remain to be explored. Our party had long existed in circumstances of war and fierce class struggle. It was not fully prepared, either ideologically or in terms of scientific study, for the swift advent of the new-born socialist society and for socialist construction on a national scale. The scientific works of Marx, Engels, Lenin and Stalin are our guide to action, but can in no way provide ready-made answers to the problems we may encounter in our socialist cause. Even after the basic completion of socialist transformation, given the guiding ideology, we were liable, owing to the historical circumstances in which our party grew, to continue to regard issues unrelated to class struggle as its manifestations when observing and

handling new contradictions and problems which cropped up in political, economic, cultural and other spheres in the course of the development of socialist society. And when confronted with actual class struggle under the new conditions, we habitually fell back on the familiar methods and experiences of the large-scale, turbulent mass struggle of the past, which should no longer have been mechanically followed. As a result, we substantially broadened the scope of class struggle.

Moreover, this subjective thinking and practice, divorced from reality, seemed to have a "theoretical basis" in the writings of Marx, Engels, Lenin and Stalin, since certain ideas and arguments set forth in them were misunderstood or dogmatically interpreted. For instance, it was thought that equal right, which reflects the exchange of equal amounts of labour and is applicable to the distribution of the means of consumption in socialist society, or "bourgeois right" as it was designated by Marx, should be restricted and criticized, and thus the principle of "to each according to his work" and that of material interest should be restricted and criticized; that small production would continue to engender capitalism and the bourgeoisie daily and hourly on a large scale, even after the basic completion of socialist transformation, and thus a series of "Left" economic policies and policies on class struggle in urban and rural areas were formulated; and that all ideological differences inside the party were reflections of class struggle in society, and thus frequent and acute inner-party struggles were conducted. All this led us to regard the error in broadening the scope of class struggle as an act in defence of the purity of Marxism. Furthermore, Soviet leaders started a polemic between China and the Soviet Union, and turned the arguments between the two parties on matters of principle into a conflict between the two nations, bringing enormous pressure to bear upon China politically, economically and militarily. So we were forced to wage a just struggle against the big-nation chauvinism of the Soviet Union. In these circumstances, a campaign to prevent and combat revisionism inside the country was launched, which spread the error of broadening the scope of class struggle in the party, so that normal differences among comrades inside the party came to be regarded as manifestations of the revisionist line or of the struggle between the two lines. This resulted in growing tension in inner-party relations. Thus it became difficult for the party to resist certain "Left" views put forward by Comrade Mao Zedong and others, and the development of these views led to the outbreak of the protracted "cultural revolution."

2) Comrade Mao Zedong's prestige reached a

peak and he began to become arrogant at the very time when the party was confronted with the new task of shifting the focus of its work to socialist construction, a task for which the utmost caution was required. He gradually divorced himself from practice and from the masses, acted more and more arbitrarily and subjectively, and increasingly put himself above the Central Committee of the Party. The result was a steady weakening and even undermining of the principle of collective leadership and democratic centralism in the political life of the party and the country. This state of affairs took shape only gradually and the Central Committee of the Party should be held partly responsible. From the Marxist viewpoint, this complex phenomenon was the product of given historical conditions. Blaming this on only one person or on only a handful of people will not provide a deep lesson for the whole party or enable it to find practical ways to change the situation. In the communist movement, leaders play quite an important role. This has been borne out by history time and again and leaves no room for doubt. However, certain grievous deviations, which occurred in the history of the international communist movement owing to the failure to handle the relationship between the party and its leaders correctly, also had an adverse effect on our party. Feudalism in China has had a very long history. Our party fought in the firmest and most thoroughgoing way against it, and particularly against the feudal system of land ownership and the landlords and local tyrants, and it fostered a fine tradition of democracy in the anti-feudal struggle. But it remains difficult to eliminate the evil ideological and political influence of centuries of feudal autocracy. And for various historical reasons, we failed to institutionalize and legalize inner-party democracy and democracy in the political and social life of the country, or else we drew up the relevant laws but without granting them due authority. This meant that conditions were present for the overconcentration of party power in the hands of individuals and for the development of arbitrary individual rule and personality cults in the party. Thus, it was hard for the party and state to prevent the initiation of the "cultural revolution" or to check its development.

A Great Turning Point in History

25. The victory won in overthrowing the counter-revolutionary Jiang Qing clique in October 1976 saved the party and the revolution from disaster and enabled our country to enter a new historical period of development. In the two years from October 1976 to December 1978, when the

Third Plenary Session of the 11th Central Committee of the Party was convened, large numbers of cadres and other people most enthusiastically devoted themselves to all kinds of revolutionary work and the task of construction. Notable results were achieved in exposing and repudiating the crimes of the counter-revolutionary Jiang Qing clique and in uncovering their factional set-up. The consolidation of party and state organizations and the redress of wrongs suffered by those who were unjustly, falsely and wrongly charged began in some places. Industrial and agricultural production was fairly quickly restored. Work in education, science and culture began to return to normal. Comrades inside and outside the party were more and more insistent that the errors of the "cultural revolution" be corrected, but such demands met with serious resistance.

This, of course, was partly due to the fact that the political and ideological confusion created in the decade-long "cultural revolution" could not be eliminated overnight, but it was also due to the "Left" errors in the guiding ideology that Comrade Hua Guofeng continued to commit in his capacity as Chairman of the Central Committee of the Communist Party of China. On the proposal of Comrade Mao Zedong, Comrade Hua Guofeng had become First Vice-Chairman of the Central Committee of the Party and concurrently Premier of the State Council during the "movement to criticize Deng Xiaoping" in 1976. He contributed to the struggle to overthrow the counter-revolutionary Jiang Qing clique and did useful work after that. But he promoted the erroneous "two-whatever's" policy, that is, "we firmly uphold whatever policy decisions Chairman Mao made, and we unwaveringly adhere to whatever instructions Chairman Mao gave," and he took a long time to rectify this error. He tried to suppress the discussions on the criterion of truth that unfolded in the country in 1978, which were very significant in setting things right. He procrastinated and obstructed the work of reinstating veteran cadres in their posts and of redressing the injustices left over from the past (including the case of the "Tian An Men Incident" of 1976). He accepted and fostered the personality cult around himself while continuing the personality cult of the past. The 11th National Congress of the Communist Party of China convened in August 1977 played a positive role in exposing and repudiating the Gang of Four and in mobilizing the whole party for building China into a powerful modern socialist state. However, owing to the limitations imposed by the prevailing historical conditions and the influence of Comrade Hua Guofeng's mistakes, it reaffirmed the erroneous theories, policies and slogans of the "cultural revolution" instead of correcting them.

He also had his share of responsibility for impetuously seeking quick results in economic work and for continuing certain other "Left" policies. Obviously, under his leadership it was impossible to correct "Left" errors within the party, and all the more impossible to restore the party's fine traditions.

26. The Third Plenary Session of the 11th Central Committee in December 1978 marked a crucial turning point of far-reaching significance in the history of our party since the birth of the People's Republic. It put an end to the situation in which the party had been advancing haltingly in its work since October 1976 and began to correct conscientiously and comprehensively the "Left" errors of the "cultural revolution" and earlier. The plenary session resolutely criticized the erroneous "two-whatever's" policy and fully affirmed the need to grasp Mao Zedong Thought comprehensively and accurately as a scientific system. It highly evaluated the forum on the criterion of truth and decided on the guiding principles of emancipating the mind, using our brains, seeking truth from facts and uniting as one in looking forward to the future. It firmly discarded the slogan "Take class struggle as the key link," which had become unsuitable for a socialist society, and made the strategic decision to shift the focus of work to socialist modernization. It declared that attention should be paid to solving the problem of serious imbalances between the major branches of the economy and drafted decisions on the acceleration of agricultural development. It stressed the task of strengthening socialist democracy and the socialist legal system. It examined and redressed a number of major unjust, false and wrong cases in the history of the party and settled the controversy on the merits and demerits, the rights and wrongs, of some prominent leaders. The plenary session also elected additional members to the party's central leading organs.

These momentous changes in the work of leadership signified that the party had re-established the correct line of Marxism ideologically, politically and organizationally. Since then, it has gained the initiative in setting things right and has been able to solve step by step many problems left over since the founding of the People's Republic and the new problems cropping up in the course of practice and to carry out the heavy tasks of construction and reform, so that things are going very well in both the economic and political spheres.

1) *In response to the call of the Third Plenary Session of the 11th Central Committee of the Party for emancipating the mind and seeking truth*

from facts, large numbers of cadres and other people have freed themselves from the spiritual shackles of the personality cult and the dogmatism that prevailed in the past. This has stimulated thinking inside and outside the party, giving rise to a lively situation where people try their best to study new things and to seek solutions to new problems. To carry out the principle of emancipating the mind properly, the party reiterated in good time the four fundamental principles of upholding the socialist road, the people's democratic dictatorship (i.e., the dictatorship of the proletariat), the leadership of the Communist Party, and Marxism-Leninism and Mao Zedong Thought. It reaffirmed the principle that neither democracy nor centralism can be practiced at each other's expense and pointed out the basic fact that, although the exploiters had been eliminated as classes, class struggle continues to exist within certain limits.

In his speech at the meeting in celebration of the 30th anniversary of the founding of the People's Republic of China, which was approved by the Fourth Plenary Session of the 11th Central Committee of the Party, Comrade Ye Jianying fully affirmed the gigantic achievements of the party and people since the inauguration of the People's Republic, while making self-criticism on behalf of the party for errors in its work and outlining our country's bright prospects. This helped to unify the thinking of the whole party and people. At its meeting in August 1980, the Political Bureau of the Central Committee set itself the historic task of combating corrosion by bourgeois ideology and of eradicating the evil influence of feudalism in the political and ideological fields which is still present. A work conference convened by the Central Committee in December of the same year resolved to strengthen the party's ideological and political work, make greater efforts to build a socialist civilization, criticize the erroneous ideological trends running counter to the four fundamental principles and strike at the counter-revolutionary activities disrupting the cause of socialism. This exerted a most salutary country-wide influence in fostering a political situation characterized by stability, unity and liveliness.

2) At a work conference called by the Central Committee in April 1979, the party formulated the principle of "readjusting, restructuring, consolidating and improving" the economy as a whole in a decisive effort to correct the shortcomings and mistakes of the previous two years in our economic work and to eliminate the influence of "Left" errors that had persisted in this field. The party indicated that economic construction must be carried out in the light of China's con-

ditions and in conformity with economic and natural laws; that it must be carried out within the limits of our own resources, step by step, after due deliberation and with emphasis on practical results, so that the development of production will be closely connected with the improvement of the people's livelihood; and that active efforts must be made to promote economic and technical co-operation with other countries on the basis of independence and self-reliance. Guided by these principles, light industry has quickened its rate of growth and the structure of industry is becoming more rational and better coordinated.

Reforms in the system of economic management, including extension of the decision-making powers of enterprises, restoration of the workers' congresses, strengthening of democratic management of enterprises and transference of financial management responsibilities to the various levels, have gradually been carried out in conjunction with economic readjustment. The party has worked conscientiously to remedy the errors in rural work since the latter stage of the movement of agricultural cooperation, with the result that the purchase prices of farm and sideline products have been raised, various forms of production responsibility introduced whereby remuneration is determined by farm output, family plots have been restored and appropriately extended, village fairs have been revived, and sideline occupations and diverse undertakings have been developed. All these have greatly enhanced the peasants' enthusiasm. Grain output in the last two years reached an all-time high, and at the same time industrial crops and other farm and sideline products registered a big increase. Thanks to the development of agriculture and the economy as a whole, the living standards of the people have improved.

3) After detailed and careful investigation and study, measures were taken to clear the name of Comrade Liu Shaoqi, former Vice-Chairman of the Central Committee of the Communist Party of China and Chairman of the People's Republic of China, those of other party and state leaders, national minority leaders and leading figures in different circles who had been wronged, and to affirm their historical contributions to the party and the people in protracted revolutionary struggle.

4) Large numbers of unjust, false and wrong cases were re-examined and their verdicts reversed. Cases in which people had been wrongly labelled bourgeois Rightists were also corrected. Announcements were made to the effect that former businessmen and industrialists, having undergone remoulding, are now working people; that small

tradespeople, peddlers and handicraftsmen who were originally labourers have been differentiated from businessmen and industrialists who were members of the bourgeoisie; and that the status of the vast majority of former landlords and rich peasants, who have become working people through remoulding, has been redefined. These measures have appropriately resolved many contradictions inside the party and among the people.

5) *People's congresses at all levels are doing their work better and those at the provincial and county levels have set up permanent organs of their own.* The system according to which deputies to the people's congresses at and below the county level are directly elected by the voters is now universally practiced. Collective leadership and democratic centralism are being perfected in party and state organizations. The powers of local and primary organizations are steadily being extended. The so-called right to "speak out, air views and hold debates in a big way and write big-character posters," which actually obstructs the promotion of socialist democracy, was deleted from the Constitution. A number of important laws, decrees and regulations have been reinstated, enacted or enforced, including the Criminal Law and the Law of Criminal Procedure — neither of which had been drawn up since the founding of the People's Republic. The work of the judicial, procuratorial and public security departments has improved and telling blows have been dealt to all types of criminals guilty of serious offences. The ten principal members of the counter-revolutionary Lin Biao and Jiang Qing cliques were publicly tried according to law.

6) *The party has striven to readjust and strengthen the leading bodies at all levels.* The Fifth Plenary Session of the 11th Central Committee of the Party, held in February 1980, elected additional members to the Standing Committee of its Political Bureau and re-established the Secretariat of the Central Committee, greatly strengthening the central leadership. Party militancy has been enhanced by the establishing of the Central Commission for Inspecting Discipline and of discipline inspection commissions at the lower levels, by the formulation of the Guiding Principles for Inner-Party Political Life and other related inner-party regulations, and by the effort made by leading party organizations and discipline inspection bodies at the different levels to rectify unhealthy practices. The party's mass media have also contributed immensely in this respect. The party has decided to put an end to the virtually lifelong tenure of leading cadres, change the over-concentration of power and, on the basis of

revolutionization, gradually reduce the average age of the leading cadres at all levels and raise their level of education and professional competence, and has initiated this process. With the reshuffling of the leading personnel of the State Council and the division of labour between party and government organizations, the work of the central and local governments has improved.

In addition, there have been significant successes in the party's efforts to implement our policies in education, science, culture, public health, physical culture, nationality affairs, united front work, Overseas Chinese affairs and military and foreign affairs.

In short, the scientific principles of Mao Zedong Thought and the correct policies of the party have been revived and developed under new conditions and all aspects of party and government work have been flourishing again since the Third Plenary Session of the 11th Central Committee. Our work still suffers from shortcomings and mistakes, and we are still confronted with numerous difficulties. Nevertheless, the road of victorious advance is open, and the party's prestige among the people is rising day by day.

Comrade Mao Zedong's Historical Role and Mao Zedong Thought

27. Comrade Mao Zedong was a great Marxist and a great proletarian revolutionary, strategist and theorist. It is true that he made gross mistakes during the "cultural revolution," but, if we judge his activities as a whole, his contributions to the Chinese revolution far outweigh his mistakes. His merits are primary and his errors secondary. He rendered indelible meritorious service in founding and building up our party and the Chinese People's Liberation Army, in winning victory for the cause of liberation of the Chinese people, in founding the People's Republic of China and in advancing our socialist cause. He made major contributions to the liberation of the oppressed nations of the world and to the progress of mankind.

28. The Chinese Communists, with Comrade Mao Zedong as their chief representative, made a theoretical synthesis of China's unique experience in its protracted revolution in accordance with the basic principles of Marxism-Leninism. This synthesis constituted a scientific system of guidelines befitting China's conditions, and it is this synthesis which is Mao Zedong Thought, the product of the integration of the universal principles of Marxism-Leninism with the concrete practice of the Chinese revolution. Making revolution in a

large Eastern semi-colonial, semi-feudal country is bound to meet with many special, complicated problems which cannot be solved by reciting the general principles of Marxism-Leninism or by copying foreign experience in every detail. The erroneous tendency of making Marxism a dogma and deifying Comintern resolutions and the experience of the Soviet Union prevailed in the international communist movement and in our party mainly in the late 1920's and early 1930's, and this tendency pushed the Chinese revolution to the brink of total failure. It was in the course of combating this erroneous tendency and in making a profound summary of our historical experience in this respect that Mao Zedong Thought took shape and developed. It was systematized and extended in a variety of fields and reached maturity in the latter part of the Agrarian Revolutionary War and the War of Resistance Against Japan, and it was further developed during the War of Liberation and after the founding of the People's Republic of China. Mao Zedong Thought is Marxism-Leninism as applied and developed in China; it constitutes a correct theory, a body of correct principles and a summary of the experiences that have been confirmed in the practice of the Chinese revolution, a crystallization of the collective wisdom of the Chinese Communist Party. Many outstanding leaders of our party made important contributions to the formation and development of Mao Zedong Thought, and their ideas are synthesized in the scientific works of Comrade Mao Zedong.

29. Mao Zedong Thought is wide-ranging in content. It is an original theory which has enriched and developed Marxism-Leninism in the following respects:

1) On the new-democratic revolution.

Proceeding from China's historical and social conditions, Comrade Mao Zedong made a profound study of the characteristics and laws of the Chinese revolution, applied and developed the Marxist-Leninist thesis of the leadership of the proletariat in the democratic revolution, and established the theory of new-democratic revolution — a revolution against imperialism, feudalism and bureaucrat-capitalism waged by the masses of the people on the basis of the worker-peasant alliance under the leadership of the proletariat. His main works on this subject include: *Analysis of the Classes in Chinese Society*; *Report on an Investigation of the Peasant Movement in Hunan*; *A Single Spark Can Start a Prairie Fire*; *Introducing "The Communist"*; *On New Democracy*; *On Coalition Government*; and *The Present Situation and Our Tasks*. The basic points of this theory are:

i) China's bourgeoisie consisted of two sections, the big bourgeoisie (that is, the comprador bourgeoisie, or the bureaucrat-bourgeoisie), which was dependent on imperialism, and the national bourgeoisie, which had revolutionary leanings but wavered. The proletariat should endeavour to get the national bourgeoisie to join in the united front under its leadership and in special circumstances to include even part of the big bourgeoisie in the united front, so as to isolate the main enemy to the greatest possible extent. When forming a united front with the bourgeoisie, the proletariat must preserve its own independence and pursue the policy of "unity, struggle, unity through struggle;" when forced to split with the bourgeoisie, chiefly the big bourgeoisie, the proletariat should have the courage and ability to wage a resolute armed struggle against the big bourgeoisie, while continuing to win the sympathy of the national bourgeoisie or keep it neutral.

ii) Since there was no bourgeois democracy in China and the reactionary ruling classes enforced their terroristic dictatorship over the people by armed force, the revolution could not but essentially take the form of protracted armed struggle. China's armed struggle was a revolutionary war led by the proletariat with the peasants as the principal force. The peasantry was the most reliable ally of the proletariat. Through its vanguard, it was possible and necessary for the proletariat, with its progressive ideology and its sense of organization and discipline, to raise the political consciousness of the peasant masses, to establish rural base areas, to wage a protracted revolutionary war and to build up and expand the revolutionary forces. Comrade Mao Zedong pointed out that "the united front and armed struggle are the two basic weapons for defeating the enemy." Together with party building, they constituted the "three magic weapons" of the revolution. They were the essential basis which enabled the Chinese Communist Party to become the core of leadership for the whole nation and to chart the course of encircling the cities from the countryside and of finally winning countrywide victory.

2) On the socialist revolution and socialist construction.

On the basis of the economic and political conditions for the transition to socialism ensuing from victory in the new-democratic revolution, Comrade Mao Zedong and the Chinese Communist Party followed the path of effecting socialist industrialization simultaneously with socialist transformation and adopted concrete policies for the gradual transformation of the private ownership of the means of production, thereby providing a

theoretical as well as practical solution to the difficult task of building socialism in a large country such as China, a country which was economically and culturally backward, with a population accounting for nearly one-fourth of the world's total. By putting forward the thesis that the combination of democracy for the people and dictatorship over the reactionaries constitutes the people's democratic dictatorship, Comrade Mao Zedong enriched the Marxist-Leninist theory of the dictatorship of the proletariat. After the establishment of the socialist system, Comrade Mao Zedong pointed out that under socialism the people had the same fundamental interests, but that all kinds of contradictions still existed among them, and that contradictions between the enemy and the people and contradictions among the people should be strictly distinguished from each other and correctly handled. He proposed that among the people we should follow a set of correct policies. We should follow the policy of "unity — criticism — unity" in political matters, the policy of "long-term coexistence and mutual supervision" in the party's relations with the democratic parties, the policy of "let a hundred flowers blossom, let a hundred schools of thought contend" in science and culture, and, in the economic sphere, the policy of over-all arrangement with regard to the different strata in town and country and of consideration for the interests of the state, the collective and the individual — all three. He repeatedly stressed that we should not mechanically transplant the experience of foreign countries, but should find our own way to industrialization, a way suited to China's conditions, by proceeding from the fact that China is a large agricultural country, taking agriculture as the foundation of the economy, correctly handling the relationship between heavy industry on the one hand and agriculture and light industry on the other, and attaching due importance to the development of the latter. He stressed that in socialist construction we should properly handle the relationships between economic construction and building up defence, between large-scale enterprises and small and medium-scale enterprises, between the Han nationality and the minority nationalities, between the coastal regions and the interior, between the central and the local authorities, and between self-reliance and learning from foreign countries, and that we should properly handle the relationship between accumulation and consumption and pay attention to over-all balance. Moreover, he stressed that the workers were the masters of their enterprises and that cadres must take part in physical labour and workers in management, that irrational rules and regulations must be reformed and that the three-in-one combination of technical person-

nel, workers and cadres must be effected. And he formulated the strategic idea of bringing all positive factors into play and turning negative factors into positive ones so as to unite the whole Chinese people and build a powerful socialist country.

The important ideas of Comrade Mao Zedong concerning the socialist revolution and socialist construction are mainly contained in such major works as *Report to the Second Plenary Session of the Seventh Central Committee of the Communist Party of China; On the People's Democratic Dictatorship; On the Ten Major Relationships; On the Correct Handling of Contradictions Among the People; and Talk at an Enlarged Work Conference Convened by the Central Committee of the Communist Party of China.*

3) *On the building of the revolutionary army and military strategy.*

Comrade Mao Zedong methodically solved the problem of how to turn a revolutionary army chiefly made up of peasants into a new type of people's army which is proletarian in character, observes strict discipline and forms close ties with the masses. He stressed that the sole purpose of the people's army is to serve the people wholeheartedly; he put forward the principle that the party commands the gun and not the other way around; he advanced the Three Main Rules of Discipline and the Eight Points for Attention and stressed the practice of political, economic and military democracy and the principles of the unity of officers and soldiers, the unity of army and people and the disintegration of the enemy forces, thus formulating by way of summation a set of policies and methods concerning political work in the army. In his military writings such as *On Correcting Mistaken Ideas in the Party; Problems of Strategy in China's Revolutionary War; Problems of Strategy in Guerrilla War Against Japan; On Protracted War; and Problems of War and Strategy*, Comrade Mao Zedong summed up the experience of China's protracted revolutionary wars and advanced the comprehensive concept of building a people's army and of building rural base areas and waging people's war by employing the people's army as the main force and relying on the masses. In raising guerrilla war to the strategic plane, he maintained that guerrilla warfare and mobile warfare of a guerrilla character would for a long time be the main forms of operation in China's revolutionary wars. He explained that it would be necessary to effect an appropriate change in military strategy simultaneously with the changing balance of forces between the enemy and ourselves and with the progress of the war. He worked out a set of strategies and tactics for the revolutionary army to wage people's war in conditions when the

enemy was strong and we were weak. These strategies and tactics include fighting a protracted war strategically and campaigns and battles of quick decision, turning strategic inferiority into superiority in campaigns and battles and concentrating a superior force to destroy the enemy forces one by one. During the War of Liberation, he formulated the celebrated ten major principles of operation.

All these ideas constitute Comrade Mao Zedong's outstanding contribution to the military theory of Marxism-Leninism. After the founding of the People's Republic, he put forward the important guideline that we must strengthen our national defence and build modern revolutionary armed forces (including the navy, the air force and technical branches) and develop modern defence technology (including the making of nuclear weapons for self-defence).

4) On policy and tactics.

Comrade Mao Zedong penetratingly elucidated the vital importance of policy and tactics in revolutionary struggles. He pointed out that policy and tactics were the life of the party, that they were both the starting-point and the end-result of all the practical activities of a revolutionary party and that the party must formulate its policies in the light of the existing political situation, class relations, actual circumstances and the changes in them, combining principle and flexibility. He made many valuable suggestions concerning policy and tactics in the struggle against the enemy, in the united front and other questions. Among other things he pointed out that under changing subjective and objective conditions a weak revolutionary force could ultimately defeat a strong reactionary force; that we should despise the enemy strategically and take him seriously tactically; that we should keep our eyes on the main target of struggle and not strike out in all directions; that we should differentiate among and disintegrate our enemies, and adopt the tactic of making use of contradictions, winning over the many, opposing the few and crushing our enemies one by one; that in areas under reactionary rule, we should combine legal and illegal struggle and, organizationally, adopt the policy of assigning picked cadres to work underground; that, as for members of the defeated reactionary classes and reactionary elements, we should give them a chance to earn a living and to become working people living by their own labour, so long as they do not rebel or create trouble; and that the proletariat and its party must fulfil two conditions in order to exercise leadership over their allies: (a) Lead their followers in waging resolute struggles against the common enemy and achieving victories; (b) Bring material benefits to their followers or at least

avoid damaging their interests and at the same time give them political education.

These ideas of Comrade Mao Zedong's concerning policy and tactics are embodied in many of his writings, particularly in such works as *Current Problems of Tactics in the Anti-Japanese United Front*; *On Policy*; *Conclusions on the Repulse of the Second Anti-Communist Onslaught*; *On Some Important Problems of the Party's Present Policy*; *Don't Hit Out in All Directions*; and *On the Question of Whether Imperialism and All Reactionaries Are Real Tigers*.

5) On ideological and political work and on cultural work.

In his *On New Democracy*, Comrade Mao Zedong stated that any given culture (as an ideological form) is a reflection of the politics and economics of a given society, and the former in turn has a tremendous influence and effect upon the latter; economics is the base and politics the concentrated expression of economics. In accordance with this basic view, he put forward many important ideas of far-reaching and long-term significance. For instance, the thesis that ideological and political work is the life-blood of economic and all other work and that it is necessary to unite politics and economics and to unite politics and professional skills, and to be both red and expert; the policy of developing a national, scientific and mass culture and of letting a hundred flowers blossom, weeding through the old to bring forth the new, and making the past serve the present and foreign things serve China; and the thesis that intellectuals have an important role to play in revolution and construction, that intellectuals should identify themselves with the workers and peasants and that they should acquire the proletarian world outlook by studying Marxism-Leninism, by studying society and through practical work. He pointed out that "this question of 'for whom?' is fundamental; it is a question of principle" and stressed that we should serve the people whole-heartedly, be highly responsible in revolutionary work, wage arduous struggle and fear no sacrifice.

Many notable works written by Comrade Mao Zedong on ideology, politics and culture, such as *The Orientation of the Youth Movement*; *Recruit Large Numbers of Intellectuals*; *Talks at the Yan'an Forum of Literature and Art*; *In Memory of Norman Bethune*; *Serve the People*; and *The Foolish Old Man Who Removed the Mountains*, are of tremendous significance even today.

6) On party building. It was a most difficult task to build a Marxist, proletarian party of a mass character in a country where the peasantry and other sections of the petty bourgeoisie constituted

the majority of the population, while the proletariat was small in number yet strong in combat effectiveness. Comrade Mao Zedong's theory on party building provided a successful solution to this question. His main works in this area include *Combat Liberalism*; *The Role of the Chinese Communist Party in the National War*; *Reform Our Study*; *Rectify the Party's Style of Work*; *Oppose Stereotyped Party Writing*; *Our Study and the Current Situation*; *On Strengthening the Party Committee System*; and *Methods of Work of Party Committees*.

He laid particular stress on building the party ideologically, saying that a party member should join the party not only organizationally but also ideologically and should constantly try to reform his non-proletarian ideas and replace them with proletarian ideas. He indicated that the style of work which entailed integrating theory with practice, forging close links with the masses and practicing self-criticism was the hallmark distinguishing the Chinese Communist Party from all other political parties in China. To counter the erroneous "Left" policy of "ruthless struggle and merciless blows" once followed in inner-party struggle, he proposed the correct policy of "learning from past mistakes to avoid future ones and curing the sickness to save the patient," emphasizing the need to achieve the objective of clarity in ideology and unity among comrades in inner-party struggle. He initiated the rectification campaign as a form of ideological education in Marxism-Leninism throughout the party, which applied the method of criticism and self-criticism. In view of the fact that our party was about to become and then became a party in power leading the entire country, Comrade Mao Zedong urged time and again, first on the eve of the founding of the People's Republic and then later, that we should remain modest and prudent, guard against arrogance and rashness and keep to plain living and hard struggle in our style of work, and that we should be on the lookout against the corrosive influence of bourgeois ideology and should oppose bureaucracy which would alienate us from the masses.

30. The living soul of Mao Zedong Thought is the stand, viewpoint and method embodied in its component parts mentioned above.

This stand, viewpoint and method boil down to three basic points: to seek truth from facts, the mass line, and independence. Comrade Mao Zedong applied dialectical and historical materialism to the entire work of the proletarian party, giving shape to the stand, viewpoint and method so characteristic of Chinese Communists in the course of the Chinese revolution and its arduous, protracted

struggles and thus enriching Marxism-Leninism.

They find expression not only in such important works as *Oppose Book Worship*; *On Practice*; *On Contradiction*; *Preface and Postscript to "Rural Surveys"*; *Some Questions Concerning Methods of Leadership*; and *Where Do Correct Ideas Come From?* — but also in all his scientific writings and in the revolutionary activities of the Chinese Communists.

1) Seeking truth from facts.

This means proceeding from reality and combining theory with practice, that is, integrating the universal principles of Marxism-Leninism with the concrete practice of the Chinese revolution. Comrade Mao Zedong was always against studying Marxism in isolation from the realities of Chinese society and the Chinese revolution. As early as 1930, he opposed blind book worship by emphasizing that investigation and study is the first step in all work and that one has no right to speak without investigation. On the eve of the rectification movement in Yan'an, he affirmed that subjectivism is a formidable enemy of the Communist Party, a manifestation of impurity in party spirit. These brilliant theses helped people break through the shackles of dogmatism and to greatly emancipate their minds. While summarizing the experience and lessons of the Chinese revolution in his philosophical works and many other works rich in philosophical content, Comrade Mao Zedong showed great profundity in expounding and enriching the Marxist theory of knowledge and dialectics. He stressed that the dialectical materialist theory of knowledge is the dynamic, revolutionary theory of reflection and that full scope should be given to man's conscious dynamic role when it is based on and is in conformity with objective reality. Basing himself on social practice, he comprehensively and systematically elaborated the dialectical materialist theory on the sources, the process and the purpose of knowledge and on the criterion of truth. He said that, as a rule, correct knowledge can be arrived at and developed only after many repetitions of the process leading from matter to consciousness and then back to matter; that is, leading from practice to knowledge and then back to practice. He pointed out that truth exists by contrast with falsehood and grows in struggle with it, that truth is inexhaustible and that the truth of any piece of knowledge — namely, whether it corresponds to objective reality — can ultimately be decided only through social practice.

He further elaborated the law of the unity of opposites, the nucleus of Marxist dialectics. He indicated that we should not only study the universality of contradiction in objective exist-

ence, but, more importantly, we should study the particularity of contradiction, and that we should resolve contradictions which are different in nature by different methods. Therefore, dialectics should not be viewed as a formula to be learned by rote and then applied mechanically, but should be closely linked with practice and with investigation and study and should be applied flexibly. He forged philosophy into a sharp weapon in the hands of the proletariat and the people for knowing and changing the world.

His distinguished works on China's revolutionary war, in particular, provide outstandingly shining examples of applying and developing the Marxist theory of knowledge and dialectics in practice. Our party must always adhere to the above ideological line formulated by Comrade Mao Zedong.

2) *The mass line means everything for the masses, reliance on the masses in everything, and "from the masses, to the masses."* The party's mass line in all its work has come into being through the systematic application in all its activities of the Marxist-Leninist principle that the people are the makers of history. It is a summation of our party's invaluable historical experience in conducting revolutionary activities over the years under difficult circumstances in which the enemy's strength far outstripped ours. Comrade Mao Zedong stressed time and again that as long as we rely on the people, believe firmly in the inexhaustible creative power of the masses and hence trust and identify ourselves with them, no enemy can crush us — while we can eventually crush every enemy and overcome every difficulty. He also pointed out that in leading the masses in all practical work, the leadership can form its correct ideas only by adopting the method of "from the masses, to the masses" and by combining the leadership with the masses and the general call with particular guidance. This means concentrating the ideas of the masses and turning them into systematic ideas, then going to the masses so that the ideas are persevered in and carried through, and testing the correctness of these ideas in the practice of the masses. And this process goes on, over and over again, so that the understanding of the leadership becomes more correct, keener and richer each time. This is how Comrade Mao Zedong united the Marxist theory of knowledge with the party's mass line.

As the vanguard of the proletariat, the party exists and fights for the interests of the people. But it always constitutes only a small part of the people, so that isolation from the people will render all the party's struggles and ideals devoid of content as well as impossible of success. To persevere in the revolution and advance the socialist

cause, our party must uphold the mass line.

3) *Independence and self-reliance are the inevitable corollary of carrying out the Chinese revolution and construction by proceeding from Chinese reality and relying on the masses.*

The proletarian revolution is an international cause which calls for the mutual support of the proletariat of different countries. But in order for its cause to triumph, each proletariat should base itself primarily on its own country's realities, rely on the efforts of its own masses and revolutionary forces, integrate the universal principles of Marxism-Leninism with the concrete practice of its own revolution and thus achieve victory. Comrade Mao Zedong always stressed that our policy should rest on our own strength and that we should find our own rate of advance in accordance with our own conditions. In a vast country like China, it is all the more imperative for us to rely mainly on our own efforts to promote the revolution and construction. We must be determined to carry the struggle through to the end and must have faith in the hundreds of millions of Chinese people and rely on their wisdom and strength; otherwise, it will be impossible for our revolution and construction to succeed or to be consolidated even if success is won.

Of course, China's revolution and national construction are not and cannot be carried out in isolation from the rest of the world. It is always necessary for us to try to win foreign aid and, in particular, to learn all that is advanced and beneficial from other countries. The closed-door policy, blind opposition to everything foreign and any theory or practice of great-nation chauvinism are all entirely wrong. At the same time, although China is still comparatively backward economically and culturally, we must maintain our own national dignity and confidence, and there must be no slavishness or submissiveness in any form in dealing with big, powerful or rich countries. Under the leadership of the party and Comrade Mao Zedong, no matter what difficulty we encountered, we never wavered, whether before or after the founding of New China, in our determination to remain independent and self-reliant and we never submitted to any pressure from outside; we showed the dauntless and heroic spirit of the Chinese Communist Party and the Chinese people. We stand for the peaceful co-existence of the people of all countries and their mutual assistance on an equal footing. While upholding our own independence, we respect other people's right to independence. The road of revolution and construction suited to the characteristics of a country has to be explored, decided on and blazed by its own people. No one has the right to impose his views on others. Only

under these conditions can there be genuine internationalism. Otherwise, there can only be hegemonism. We will always adhere to this principled stand in our international relations.

31. Mao Zedong Thought is the valuable spiritual asset of our party. It will be our guide to action for a long time to come. The party leaders and the large group of cadres nurtured by Marxism-Leninism and Mao Zedong Thought were the backbone forces in winning great victories for our cause; they are and will remain our treasured mainstay in the cause of socialist modernization. While many of Comrade Mao Zedong's important works were written during the periods of new-democratic revolution and of socialist transformation, we must still constantly study them. This is not only because one cannot cut the past off from the present and because failure to understand the past will hamper our understanding of present-day problems, but also because many of the basic theories, principles and scientific approaches set forth in these works are of universal significance and provide us with invaluable guidance now and will continue to do so in the future. Therefore, we must continue to uphold Mao Zedong Thought, study it in earnest and apply its stand, viewpoint and method in studying the new situation and solving the new problems arising in the course of practice. Mao Zedong Thought has added much that is new to the treasure-house of Marxist-Leninist theory. We must combine our study of the scientific works of Comrade Mao Zedong with that of the scientific writings of Marx, Engels, Lenin and Stalin.

It is entirely wrong to try to negate the scientific value of Mao Zedong Thought and to deny its guiding role in our revolution and construction just because Comrade Mao Zedong made mistakes in his later years. And it is likewise entirely wrong to adopt a dogmatic attitude towards the sayings of Comrade Mao Zedong, to regard whatever he said as the immutable truth which must be mechanically applied everywhere, and to be unwilling to admit honestly that he made mistakes in his later years, and even try to stick to them in our new activities. Both these attitudes fail to make a distinction between Mao Zedong Thought — a scientific theory formed and tested over a long period of time — and the mistakes Comrade Mao Zedong made in his later years. And it is absolutely necessary that this distinction should be made. We must treasure all the positive experience obtained in the course of integrating the universal principles of Marxism-Leninism with the concrete practice of China's revolution and construction over 50 years or so, apply and carry forward this experience in our new work and enrich and deve-

lop party theory with new principles and new conclusions corresponding to reality, so as to ensure the continued progress of our cause along the scientific course of Marxism-Leninism and Mao Zedong Thought.

Unite and Strive to Build a Powerful, Modern Socialist China

32. The objective of our party's struggle in the new historical period is to turn China step by step into a powerful socialist country, with modern agriculture, industry, national defence and science and technology and with a high level of democracy and culture. We must also accomplish the great cause of reunification of the country by getting Taiwan to return to the embrace of the motherland. The fundamental aim of summing up the historical experience of the 32 years since the founding of the People's Republic is to accomplish the great objective of building a powerful and modern socialist country by further rallying the will and strength of the whole party, the whole army and the whole people on the basis of upholding the four fundamental principles, namely, upholding the socialist road, the people's democratic dictatorship (i.e., the dictatorship of the proletariat), the leadership of the Communist Party, and Marxism-Leninism and Mao Zedong Thought. These four principles constitute the common political basis of the unity of the whole party and the unity of the whole people as well as the basic guarantee for the realization of socialist modernization. Any word or deed which deviates from these four principles is wrong. Any word or deed which denies or undermines these four principles cannot be tolerated.

33. Socialism and socialism alone can save China. This is the unalterable conclusion drawn by all our people from their own experience over the past century or so; it likewise constitutes our fundamental historical experience in the 32 years since the founding of our People's Republic. Although our socialist system is still in its early phase of development, China has undoubtedly established a socialist system and entered the stage of socialist society. Any view denying this basic fact is wrong. Under socialism, we have achieved successes which were absolutely impossible in old China. This is a preliminary but at the same time a compelling manifestation of the superiority of the socialist system. The fact that we have been and are able to overcome all kinds of difficulties through our own efforts testifies to its great vitality. Of course, our system will have to undergo a long process of development before it can be perfected. Given

the premise that we uphold the basic system of socialism, we must therefore strive to reform those specific features which are not in keeping with the expansion of the productive forces and the interests of the people, and to combat staunchly all activities detrimental to socialism. With the development of our cause, the immense superiority of socialism will become more and more apparent.

34. Without the Chinese Communist Party, there would have been no New China. Likewise, without the Chinese Communist Party, there would be no modern socialist China. The Chinese Communist Party is a proletarian party armed with Marxism-Leninism and Mao Zedong Thought and imbued with a strict sense of discipline and the spirit of self-criticism, and its ultimate historical mission is to realize communism. Without the leadership of such a party, without the flesh-and-blood ties it has formed with the masses through protracted struggles and without its painstaking and effective work among the people and the high prestige it consequently enjoys, our country — for a variety of reasons, both internal and external — would inexorably fall apart and the future of our nation and people would inexorably be forfeited. The party leadership cannot be exempt from mistakes, but there is no doubt that it can correct them by relying on the close unity between the party and the people, and in no case should one use the party's mistakes as a pretext for weakening, breaking away from or even sabotaging its leadership. That would only lead to even greater mistakes and court grievous disasters. We must improve party leadership in order to uphold it. We must resolutely overcome the many shortcomings that still exist in our party's style of thinking and work, in its system of organization and leadership and in its contacts with the masses. So long as we earnestly uphold and constantly improve party leadership, our party will assuredly be better able to undertake the tremendous tasks entrusted to it by history.

35. Since the Third Plenary Session of its 11th Central Committee, our party has gradually mapped out the correct path for socialist modernization as suited to China's conditions. In the course of practice, the path will be broadened and become more clearly defined, but, in essence, the key pointers can already be determined on the basis of the summing up of the negative as well as positive experiences since the founding of the People's Republic, and particularly of the lessons of the "cultural revolution."

1) *After socialist transformation was fundamentally completed, the principal contradiction*

our country has had to resolve is that between the growing material and cultural needs of the people and the backwardness of social production.

It was imperative that the focus of party and government work be shifted to socialist modernization centering on economic construction and that the people's material and cultural life be gradually improved by means of an immense expansion of the productive forces. In the final analysis, the mistake we made in the past was that we failed to persevere in making this strategic shift. What is more, the preposterous view opposing the so-called "theory of the unique importance of productive forces" — a view diametrically opposed to historical materialism — was put forward during the "cultural revolution." We must never deviate from this focus, except in the event of large-scale invasion by a foreign enemy (and even then it will still be necessary to carry on such economic construction as wartime conditions require and permit). All party work must be subordinated to and serve this central task — economic construction. All party cadres, and particularly those in economic departments, must diligently study economic theory and economic practice as well as science and technology.

2) *In our socialist economic construction, we must strive to reach the goal of modernization systematically and in stages, according to the conditions and resources of our country.*

The prolonged "Left" mistakes we made in our economic work in the past consisted chiefly in departing from China's realities, in trying to exceed our actual capabilities and in ignoring the economic returns of construction and management as well as the scientific confirmation of our economic plans, policies and measures, with their concomitants of colossal waste and losses. We must adopt a scientific attitude, gain a thorough knowledge of the realities and make a deep analysis of the situation, earnestly listen to the opinions of the cadres, masses and specialists in the various fields and try our best to act in accordance with objective economic and natural laws and bring about a proportionate and harmonious development of the various branches of our economy. We must keep in mind the fundamental fact that China's economy and culture are still relatively backward. At the same time, we must keep in mind such favourable domestic and international conditions as the achievements we have already scored and the experience we have gained in our economic construction and the expansion of economic and technological exchanges with foreign countries, and we must make full use of these favourable conditions. We must oppose both ineptitude and passivity.

3) *The reform and improvement of the socialist relations of production must be in conformity with the level of the productive forces and conducive to the expansion of production.*

The state economy and the collective economy are the basic forms of the Chinese economy. The working people's individual economy within certain prescribed limits is a necessary complement to public economy. It is necessary to establish specific systems of management and distribution suited to the various sectors of the economy. It is necessary to have a planned economy and at the same time give play to the supplementary, regulatory role of the market on the basis of public ownership. We must strive to promote commodity production and exchange on a socialist basis. There is no rigid pattern for the development of the socialist relations of production. At every stage, our task is to create those specific forms of the relations of production that correspond to the needs of the growing productive forces and facilitate their continued advance.

4) *Class struggle no longer constitutes the principal contradiction after the exploiters have been eliminated as classes.*

However, owing to certain domestic factors and influences from abroad, class struggle will continue to exist within certain limits for a long time to come and may even grow acute under certain conditions. It is necessary to oppose both the view that the scope of class struggle must be enlarged and the view that it has died out. It is imperative to maintain a high level of vigilance and conduct effective struggle against all those who are hostile to socialism and try to sabotage it in the political, economic, ideological and cultural fields and in community life. We must correctly understand that there are diverse social contradictions in Chinese society which do not fall within the scope of class struggle and that methods other than class struggle must be used for their appropriate resolution. Otherwise, social stability and unity will be jeopardized. We must unswervingly unite with all forces that can be united and consolidate and expand the patriotic united front.

5) *A fundamental task of the socialist revolution is gradually to establish a highly democratic socialist political system.*

Inadequate attention was paid to this matter after the founding of the People's Republic, and this was one of the major factors contributing to the initiation of the "cultural revolution." Here is a grievous lesson for us to learn. It is necessary to strengthen the building of state organs at all levels in accordance with the principle of democratic centralism, to make the people's congresses at all

levels and their permanent organs authoritative organs of the people's political power, to gradually realize direct popular participation in the democratic process at the grassroots of political power and community life and, in particular, to stress democratic management by the working masses in urban and rural enterprises over the affairs of their establishments. It is essential to consolidate the people's democratic dictatorship, to improve our Constitution and laws and to ensure their strict observance and inviolability. We must turn the socialist legal system into a powerful instrument for protecting the rights of the people, for ensuring order in production, work and other activities and for punishing criminals and cracking down on the disruptive activities of class enemies. The kind of chaotic situation that obtained in the "cultural revolution" must never be allowed to happen again in any sphere.

6) *Life under socialism must attain a high ethical and cultural level.*

We must firmly eradicate such gross fallacies as the denigration of education, science and culture and discrimination against intellectuals — fallacies which had long existed and found extreme expression during the "cultural revolution;" we must strive to raise the status and expand the role of education, science and culture in our drive for modernization. We unequivocally affirm that, together with the workers and peasants, the intellectuals are a force to rely on in the cause of socialism and that it is impossible to carry out socialist construction without culture and the intellectuals. It is imperative for the whole party to engage in a more diligent study of Marxist theories, of the past and present, in China and abroad, and of the different branches of the natural and social sciences. We must strengthen and improve ideological and political work and educate the people and youth in the Marxist world outlook and communist morality. We must persistently carry out the educational policy which calls for all-around development morally, intellectually and physically; for being both red and expert; for integration of the intellectuals with the workers and peasants; and for the combination of mental and physical labour. We must counter the influence of decadent bourgeois ideology and the decadent remnants of feudal ideology, overcome the influence of petty-bourgeois ideology and foster the patriotism which puts the interests of the motherland above everything else and promote the pioneer spirit of selfless devotion to modernization.

7) *The improvement and promotion of socialist relations among our various nationalities and the strengthening of national unity are of*

profound significance to our multinational country.

In the past, particularly during the "cultural revolution," we made a grave mistake on the question of nationalities—the mistake of widening the scope of class struggle; and we wronged a large number of cadres and masses of the minority nationalities. In our work among them, we did not show due respect for their right to autonomy. We must never forget this lesson. We must have a clear understanding that relations among our nationalities today are mainly relations among the working people of the various nationalities. It is necessary to adhere to their regional autonomy and to enact laws and regulations to ensure this autonomy and their decision-making power in applying party and government policies according to the actual conditions in their regions. We must take effective measures to assist economic and cultural development in regions inhabited by minority nationalities, actively train and promote cadres from among them and resolutely oppose all words and deeds undermining national unity and equality. It is imperative to continue to implement the policy of freedom of religious belief. To uphold the four fundamental principles does not mean that religious believers should renounce their faith but that they must not engage in propaganda against Marxism-Leninism and Mao Zedong Thought and that they must not interfere with politics and education in their religious activities.

8) *In the present international situation in which the danger of war still exists, it is necessary to strengthen the modernization of our national defence.*

The building up of national defence must be in keeping with the building up of the economy. The People's Liberation Army should strengthen its military training, political work, logistic service and study of military science and further raise its combat effectiveness so as gradually to become a still more powerful modern revolutionary army. It is necessary to restore and carry forward the fine tradition of unity inside the army, between the army and the government and between the army and the people. The building of the people's militia must also be further strengthened.

9) *In our external relations, we must continue to oppose imperialism, hegemonism, colonialism and racism, and safeguard world peace.*

We must actively promote relations and economic and cultural exchanges with other countries on the basis of the Five Principles of Peaceful Co-existence. We must uphold proletarian internationalism and support the cause of the liberation of oppressed nations, the national construction of

newly independent countries and the just struggles of the peoples everywhere.

10) *In the light of the lessons of the "cultural revolution" and the present situation in the party, it is imperative to build up a sound system of democratic centralism inside the party.*

We must carry out the Marxist principle of the exercise of collective party leadership by leaders who have emerged from mass struggles and who combine political integrity with professional competence, and we must prohibit personality cults in any form. It is imperative to uphold the prestige of party leaders and at the same time to ensure that their activities come under the supervision of the party and the people. We must have a high degree of centralism based on a high degree of democracy and insist that the minority is subordinate to the majority, the individual to the organization, the lower to the higher level and the entire membership to the Central Committee. The style of work of a political party in power is a matter that determines its very existence. Party organizations at all levels and all party cadres must go deep among the masses, plunge themselves into practical struggle, remain modest and prudent, share weal and woe with the masses and firmly overcome bureaucratism. We must properly wield the weapon of criticism and self-criticism, overcome erroneous ideas that deviate from the party's correct principles, uproot factionalism, oppose anarchism and ultra-individualism and eradicate such unhealthy tendencies as the practice of seeking perquisites and privileges. We must consolidate the party organization, purify the party ranks and weed out degenerate elements who oppress and bully the people. In exercising leadership over state affairs and work in the economic and cultural fields as well as in community life, the party must correctly handle its relations with other organizations, ensure by every means the effective functioning of the organs of state power and of administrative, judicial and economic and cultural organizations and see to it that trade unions, the Youth League, the Women's Federation, the Science and Technology Association, the Federation of Literary and Art Circles and other mass organizations carry out their work responsibly and on their own initiative. The party must strengthen its co-operation with public figures outside the party, give full play to the role of the Chinese People's Political Consultative Conference, hold conscientious consultations with democratic parties and personages without party affiliation on major issues of state affairs and respect their opinions and the opinions of specialists in various fields. As with other social organizations, party organizations at all levels must conduct their activities within the limits permitted by

the Constitution and the law.

36. In firmly correcting the mistake of the so-called "continued revolution under the dictatorship of the proletariat" — a slogan which was advanced during the "cultural revolution" and which called for the overthrow of one class by another — we absolutely do not mean that the tasks of the revolution have been accomplished and that there is no need to carry on revolutionary struggles with determination. Socialism aims not just at eliminating all systems of exploitation and all exploiting classes but also at greatly expanding the productive forces, improving and developing the socialist relations of production and the superstructure and, on this basis, gradually eliminating all class differences and all major social distinctions and inequalities — which are chiefly due to the inadequate development of the productive forces — until communism is finally realized. This is a great revolution, unprecedented in human history. Our present endeavour to build a modern socialist China constitutes but one stage of this great revolution. Differing from the revolutions before the overthrow of the system of exploitation, this revolution is carried out not through fierce class confrontation and conflict, but through the strength of the socialist system itself, under leadership, step by step and in an orderly way. This revolution, which has entered the period of peaceful development, is more profound and arduous than any previous revolution and will not only take a very long historical period to accomplish but also demand many generations of unswerving and disciplined hard work and heroic sacrifice. In this historical period of peaceful development, revolution can never be plain sailing. There are still overt and covert enemies who create trouble. We must maintain high revolutionary vigilance and be ready at all times to come out boldly to safeguard the interests of the revolution. In this new historical period, the whole membership of the Chinese Communist Party and the whole people must never cease to cherish lofty revolutionary ideals, maintain a dynamic revolutionary fighting spirit and carry China's great socialist revolution and socialist construction through to the end.

37. Repeated assessment of our successes and failures, of our correct and incorrect practices, of the 32 years since the founding of our People's Republic, and particularly deliberation over and review of the events of the past few years, have helped to raise immensely the political consciousness of all party comrades and of all patriots. Obviously, our party now has a higher level of under-

standing of socialist revolution and construction than at any other period since Liberation. Our party has both the courage to acknowledge and correct its mistakes and the determination and ability to prevent repetition of the serious mistakes of the past. In the last analysis, from a long-term historical point of view, the mistakes and setbacks of our party were only temporary whereas the consequent steeling of our party and people, the greater maturity of the core force formed among our party cadres through protracted struggle, the growing superiority of our socialist system and the increasingly keen and common aspiration of our party, army and people for the prosperity of the motherland will be decisive factors in the long run. A great future is in store for our socialist cause and for the Chinese people in their hundreds of millions.

38. Inner-party unity and unity between the party and the people are the basic guarantee for new victories in our socialist modernization. Whatever the difficulties, as long as the party is closely united and remains closely united with the people, our party and the cause of socialism it leads, will certainly prosper day by day.

The Resolution on Certain Questions in the History of Our Party, unanimously adopted in 1945 by the Enlarged Seventh Plenary Session of the Sixth Central Committee of the Party, unified the thinking of the whole party, consolidated its unity, promoted the rapid advance of the people's revolutionary cause and accelerated its eventual triumph. The Sixth Plenary Session of the 11th Central Committee of the Party believes that the present resolution which it has unanimously adopted will play a similar historical role. This session calls upon the whole party, the whole army and the people of all nationalities to act under the great banner of Marxism-Leninism and Mao Zedong Thought, to closely rally around the Central Committee of the Party, to preserve the spirit of the legendary Foolish Old Man who removed mountains and to work together as one in defiance of all difficulties so as to turn China step by step into a powerful modern socialist country which is highly democratic and highly cultured. Our goal must be attained! Our goal unquestionably can be attained!

*The double-track system for labour refers to a combination of the system of the eight-hour day in factories, rural areas and government offices with a system of part-time work and part-time study in factories and rural areas. The double-track system for education means a system of full-time schooling combined with a system of part-time work and part-time study.

3. SPEECH AT THE MEETING IN CELEBRATION OF THE 60TH ANNIVERSARY OF THE FOUNDING OF THE COMMUNIST PARTY OF CHINA

By Hu Yaobang
(July 1, 1981)

Comrades and Friends:

We are gathered here today to celebrate the 60th anniversary of the founding of the Communist Party of China. At this moment, we are all deeply aware that our party and state find themselves in an important historical period, a period in which we are bringing order out of chaos, carrying on our cause and forging ahead.

To bring order out of chaos, to carry on our cause and to forge ahead, we must undo all the negative consequences of the "cultural revolution," advance the great cause pioneered by the party under the leadership of Comrade Mao Zedong and other proletarian revolutionaries of the older generation, and facilitate the Chinese people's way to socialism and communism.

The Sixth Plenary Session of the 11th Central Committee of the Communist Party of China, which has just ended, adopted the Resolution on Certain Questions in the History of Our Party Since the Founding of the People's Republic of China. The resolution reviews the party's 60 years of struggle, sums up the basic experience it has gained in the 32 years since the founding of the People's Republic; it makes a concrete and realistic evaluation of a whole train of crucial historical events; it analyses what was right and what was wrong in the ideology behind these events and the subjective factors and social roots giving rise to them; it evaluates Comrade Mao Zedong's role in history and expounds Mao Zedong Thought scientifically; and it indicates our way forward more clearly. The plenary session also made decisions on other important matters. History will prove that it too was a meeting of paramount importance for our party — a new milestone for our party and state in the course of bringing order out of chaos, carrying on our cause and forging ahead.

Looking back over the path our party has traversed, we are acutely conscious of the fact that the Chinese revolution has not been smooth sailing. We can say that the 60 years since the founding of the Communist Party of China have been years of unflinching, heroic struggle for the liberation of the Chinese nation and the happiness of the Chinese people, years of ever closer integration, through repeated application, of the universal truth of Marxism-Leninism with the concrete practice of the Chinese revolution, and years when right prevailed over wrong and positive aspects prevailed

over negative aspects in the party. They have been years during which we marched on to a number of victories despite untold hardships and setbacks.

Why do we say that the history of the Chinese Communist Party is one of unflinching, heroic struggle for the liberation of the Chinese nation and the happiness of the Chinese people?

In modern Chinese history, between the Opium War of 1840-42 and the outbreak of the May 4th Movement of 1919, the Chinese people waged protracted, heroic struggles against imperialism and feudalism. The 1911 Revolution led by the great revolutionary Dr. Sun Yatsen overthrew the Qing Dynasty monarchy, thus terminating more than 2,000 years of feudal autocracy. However, the way to China's salvation was not discovered through any of these struggles. It was not until the Communist Party of China was born after the October Socialist Revolution in Russia and the May 4th Movement in China that new vistas were opened up for the Chinese revolution — as a result of the integration of Marxism-Leninism with the rising workers' movement in China, and with the help of the international proletariat.

The enemies of the Chinese revolution were formidable and ferocious. But no hardship could overwhelm the Chinese people and the Communist Party of China. In a dauntless revolutionary spirit, our party led the people in rising up to fight the enemy. We Communists and the people depended on each other for survival; we relied closely on the people, and the people had deep faith in us. Our party steeled itself in grim struggle and became the most advanced and most powerful leading force in the history of the Chinese revolution and built a new and well-trained people's army. After 28 years of arduous struggle in four great people's revolutionary wars (the Northern Expedition, 1924-27; the Agrarian Revolutionary War, 1927-37; the War of Resistance Against Japan, 1937-45; and the War of Liberation, 1946-49), our party led the people of all our nationalities in finally overthrowing the reactionary rule of imperialism, feudalism and bureaucrat-capitalism in 1949 and winning victory in the new-democratic revolution, a tremendous victory which led to the founding of the People's Republic of China, a state of the people's democratic dictatorship.

After the founding of the People's Republic, our party led the entire people in sustained advance. We thwarted the threats, attempts at sub-

version, sabotage and armed provocations of the imperialists and hegemonists, and safeguarded the independence and security of our great motherland. Except for Taiwan Province and a few other islands, we have achieved and consolidated the unification of our country. We have achieved and strengthened the great unity of the Chinese people of all nationalities and of the workers, peasants and intellectuals throughout the country. We have formed and consolidated the broadest possible united front of all socialist workers, all patriots who support socialism and all other patriots who uphold the reunification of the motherland — a united front led by the Chinese Communist Party in full cooperation with all the democratic parties. And we smoothly effected the decisive transition of our society from new democracy to socialism. Thanks to the arduous struggle of the whole party and people, we essentially completed the socialist transformation of the private ownership of the means of production and embarked on large-scale, planned socialist economic construction. Thus, our economy and culture registered an advance unparalleled in Chinese history. However numerous the shortcomings and mistakes in our work and however imperfect certain aspects of our social system, we have eliminated the system of exploitation and the exploiting classes and have established the socialist system. Hence, with nearly a quarter of the world's population, China has entered upon a socialist state of society, a state of society new in the history of mankind. Beyond a shadow of a doubt, this is the most radical social change in Chinese history. It is a leap of the most far-reaching significance in the progress of mankind and an immense victory for and a further development of Marxism.

The change is indeed striking. In the four score years between the Opium War and the birth of the Chinese Communist Party, the ceaseless struggles of the people had all failed despite their heroism, and their hopes and lofty aspirations were sadly frustrated. The picture has been altogether different in the 60 years since the birth of the Chinese Communist Party. A new epoch in Chinese history has been ushered in. The Chinese people have taken their destiny into their own hands; they have stood up in the East. Never again will the Chinese nation be bullied and oppressed.

In celebrating the 60th anniversary of the founding of the Chinese Communist Party, we feel with deep emotion that the splendid fruits of the Chinese people's revolution have been truly hard-won. They have been won by the Chinese people in 60 long years of hard struggle under the leadership of the Chinese Communist Party. They have been nurtured by the blood of millions of Communists and non-party revolutionaries who died

before the firing squad, on the battlefield or at their posts.

Let us rise and pay our sincere tribute to the memory of all the revolutionary martyrs, all the revolutionary leaders and cadres, Communists and Communist Youth League members, veteran revolutionaries and young fighters, non-party comrades-in-arms and foreign friends who laid down their lives for the Chinese people at different stages of the Chinese revolution over the past six decades.

Why do we say that the history of the Chinese Communist Party is one of ever closer integration, through repeated application, of the universal truth of Marxism-Leninism with the concrete practice of the Chinese revolution?

From the moment of its inception, our party adopted Marxism-Leninism as its guiding ideology. However, the general principles of Marxism provide no ready-made recipe for revolution in a particular country, especially a large oriental, semi-feudal and semi-colonial country like China. During its formative years, in the 1920's and 1930's, our party suffered again and again from the "infantile malady" of turning Marxism into a dogma and deifying foreign experience — a malady which could not but leave the Chinese revolution groping in the dark and even lead it into a blind alley. Comrade Mao Zedong's great contribution lies in the fact that, in the course of combating this erroneous tendency and in the struggles waged collectively by the party and the people, he succeeded in integrating the universal truth of Marxism with the concrete practice of the Chinese revolution and in summing up freshly gained experiences. In this way, Mao Zedong Thought took shape as the guiding scientific ideology conforming to Chinese conditions. It is this scientific ideology that has guided the sweeping advance of the Chinese revolution from one triumph to another.

Mao Zedong Thought, coming into being and developing in the course of the Chinese revolution, is the crystallization of the collective wisdom of our party and a summing-up of the victories in the gigantic struggles of the Chinese people. Its theories on the new-democratic revolution, on the socialist revolution and socialist construction, on the strategy and tactics of revolutionary struggle, on the building of a revolutionary army, on military strategy, on ideological and political work, on cultural work, and on the building of the party, as well as its theories concerning scientific modes of thought, work and leadership which will be even more important in guiding all our work in the future, have all added new and original ideas to the treasure-house of Marxism. As a theory and as the summing-up of experiences varied in practice, as the application and development of Marxism in

China, Mao Zedong Thought has been and will remain the guiding ideology of our party.

However, Comrade Mao Zedong had his shortcomings and made mistakes just as many other outstanding figures in the forefront of the march of history. Chiefly in his later years, having been admired and loved for so long by the whole party and people, he became over-confident and more and more divorced from reality and the masses and, in particular, from the party's collective leadership, and often rejected and even suppressed correct opinions that differed from his. Thus, he inevitably made mistakes, including the comprehensive, long-drawn-out and gross blunder of initiating the "cultural revolution." This was a tremendous misfortune for the party and the people. Of course, it must be admitted that, both before the "cultural revolution" and at its inception, the party failed to prevent Comrade Mao Zedong's erroneous tendency from growing more serious but, instead, accepted and approved of some of his wrong theses. We veterans who had been working together with him for a long time as his comrades-in-arms, or who had long been following him in revolutionary struggle as his disciples, are keenly aware of our own responsibility in this matter, and we are determined never to forget this lesson.

Although Comrade Mao Zedong made grave mistakes in his later years, it is clear that if we consider his life work as a whole, his contributions to the Chinese revolution far outweigh his errors. He had dedicated himself to the Chinese revolution since his youth and had fought for it all his life. He was one of the founders of our party and the chief architect of the glorious Chinese People's Liberation Army. At the most trying times in the Chinese revolution, he was the first to discover the correct road for the revolution, to work out a correct over-all strategy and to gradually formulate a whole set of correct theories and tactics, thus guiding the revolution from defeat to victory. After the founding of the People's Republic, under the leadership of the Central Committee of the Party and Comrade Mao Zedong, New China quickly consolidated its position and embarked on the great cause of socialism. Even in the last few years of his life, when his errors had become very serious, Comrade Mao Zedong still remained alert to the nation's independence and security and had a correct grasp of the new developments in the world situation. He led the party and people in standing up to all pressures from hegemonism and instituted a new pattern for our foreign relations. In the long years of struggle, all comrades in our party drew wisdom and strength from Comrade Mao Zedong and Mao Zedong Thought, which nurtured successive generations of

our party's leaders and large numbers of its cadres and educated the whole Chinese people. Comrade Mao Zedong was a great Marxist, a great proletarian revolutionary, theorist and strategist, and the greatest national hero in Chinese history. He made major contributions to the cause of the liberation of the world's oppressed nations and to the cause of human progress. His immense contributions are immortal.

While celebrating the 60th anniversary of the founding of the Communist Party of China, we deeply cherish the memory of Comrade Mao Zedong. We deeply cherish the memory of the great Marxists, comrades Zhou Enlai, Liu Shaoqi and Zhu De, and the memory of comrades Ren Bishi, Dong Biwu, Peng Dehuai, He Long, Chen Yi, Luo Ronghuan, Lin Boqu, Li Fuchun, Wang Jiaxiang, Zhang Wentian, Tao Zhu and others, who were all outstanding leaders of our party and who, together with Comrade Mao Zedong, made important contributions to the victorious Chinese revolution and to the formation and development of Mao Zedong Thought. We deeply cherish the memory of comrades Li Dazhao, Qu Qiubai, Cai Hesen, Xiang Jingyu, Deng Zhongxia, Su Zhaozheng, Peng Pai, Chen Yannian, Yun Daiying, Zhao Shiyan, Zhang Tailei, Li Lisan and other prominent leaders of our party in its formative years. We deeply cherish the memory of comrades Fang Zhimin, Liu Zhidan, Huang Gonglue, Xu Jishen, Wei Baqun, Zhao Bosheng, Dong Zhenzhang, Duan Dechang, Yang Jingyu, Zuo Quan, Ye Ting and other outstanding commanders of the people's army who early laid down their lives for the party and the country. We deeply cherish the memory of Comrade Soong Ching Ling, a great contemporary woman fighter who fought together with us over a long period of time and became a member of the glorious Chinese Communist Party before her death; of Cai Yuanpei, the prominent Chinese intellectual forerunner; and of Lu Xun, the great standard-bearer of our proletarian revolutionary culture. We deeply cherish the memory of Liao Zhongkai, He Xiangning, Deng Yanda, Yang Xingfo, Shen Junru and other close non-party comrades-in-arms of ours who consistently supported our party. We deeply cherish the memory of comrades Zou Taofen, Guo Moruo, Mao Dun and Li Siguang, Mr. Wen Yiduo and other distinguished fighters in the fields of science and culture. We deeply cherish the memory of Yang Hucheng, Tan Kah Kee, Zhang Zhizhong, Fu Zuoyi and other renowned patriots who made significant contributions to the victorious Chinese people's revolution. We deeply cherish the memory of Norman Bethune, Agnes Smedley, Anna Louise Strong, Dwarkanath S. Kotnis, Edgar Snow, Inejiro Asanuma, Kenzo Nakajima and other close friends of the Chinese people and

eminent internationalist fighters.

Why do we say that the history of the Chinese Communist Party is also the history of the triumph of right over wrong and of the triumph of the party's positive over its negative aspects?

The revolutionary cause our party has embarked upon is a sacred cause involving the radical transformation of Chinese society, a completely new cause never undertaken by our forefathers. The enemy of the revolution was formidable and the social conditions under which the revolution took place were extremely complex. Therefore, it was only natural that we should make mistakes of one kind or another, even grievous ones, in the course of our revolutionary struggles. The important thing is to be good at learning through practice once a mistake has been made; to wake up in good time and endeavour to correct it; to strive to avoid a blunder which is long-drawn-out and comprehensive in character; and to avoid repetition of the same grievous blunder.

Our party was born and grew to maturity in the old society. At the high tide of the revolution, large numbers of revolutionaries joined our ranks. This boosted our strength; however, a few careerists and opportunists, too, wormed their way into the party. This could hardly be avoided. The point is that while transforming society, our party must pay attention to remoulding itself, must be good at educating and remoulding those who have diverse non-proletarian ideas when they join our party, and must recognize careerists and conspirators for what they are so as to be able to foil their schemes and conspiracies.

The greatness of the party does not lie in any readiness to guarantee complete freedom from any negative phenomena, but in its ability to overcome shortcomings and rectify errors and to defeat sabotage by all alien forces. Let us look back: Isn't this precisely how our party has fought in the past? Its history contains the blunders of Chen Duxiu's Right capitulationism and Wang Ming's "Left" dogmatism. There were also conspiracies to split the party hatched by Zhang Guotao and by Gao Gang and Rao Shushi. There were even the Lin Biao and Jiang Qing counter-revolutionary cliques. However, none succeeded in destroying our party. The extremely treacherous careerists and conspirators Lin Biao and Jiang Qing exploited the "cultural revolution" to seize supreme power; they committed every conceivable crime against our nation and people, with the gravest consequences. Yet they were finally unmasked and swept into the garbage bin of history by the party and the people. Isn't this an incontrovertible historical fact? Instead of being destroyed by sabotage or crippled by reverses of one kind or another, our party has emerged each time refreshed and reinvigorated

from the struggle to overcome mistakes and prevail over what is negative. It is our party that is invincible.

The past 60 years prove that our party is indeed a proletarian party armed with Marxism-Leninism and Mao Zedong Thought and a party that wholeheartedly serves the people, entirely dedicated to their interests and with no particular interest of its own. It is truly a long-tested party which has acquired rich experience, learned many lessons and is capable of leading the people in braving difficulties to win victory after victory in the revolution. The role of this great party as the force at the core of the Chinese people's revolutionary cause and its leadership in this cause is the dictate of history and of the will and interests of the people of all our nationalities, a dictate which no force on earth can alter or shake.

Comrades and Friends!

With widespread popular support, our party smashed at one stroke the Jiang Qing counter-revolutionary clique in October 1976. This saved the revolution and our socialist state and ushered in a new period of historical development. Two years later, in December, 1978, the Third Plenary Session of the 11th Central Committee marked a decisive turning point in the post-1949 history of our party.

The tremendous significance of this plenary session lies in the fact that it genuinely began to correct matters in an all-around, determined and well-considered way by relying on the masses. Since then, right through the Fourth, Fifth and Sixth Plenary Sessions, our party has been working hard with concentrated energy and attention and under difficult and complex conditions, and has adopted and implemented step by step a series of major policy decisions in ideological, political and organizational matters and all aspects of socialist construction, thus correcting the erroneous "Left" orientation. Moreover, in the light of the new historical conditions, our party has gradually charted a correct course for socialist modernization that is suited to China's conditions.

The most striking change of all is the shift of the focus of work of the whole party and nation after the liquidation and repudiation of the Lin Biao and Jiang Qing counter-revolutionary cliques. Leading organs — from the central down to local levels — are now concentrating their energy and attention on socialist modernization. Now that liquidation of the long prevalent "Left" deviationist guiding ideology is under way, our socialist economic and cultural construction has shifted to a course of development that takes into account the basic conditions of the country and the limits of our ability, that proceeds step by step, and that seeks practical results and steady advance. With

the implementation of the party's policies, the introduction of the system of production responsibilities and the development of a diversified economy, an excellent situation has developed in the vast rural areas in particular — a dynamic and progressive situation seldom seen since the founding of the People's Republic.

In socio-political relations, our party has resolutely and appropriately solved many important issues which had been wrongly handled over a long period of time, eliminated a number of major factors detrimental to stability and unity and put an end to the social unrest and upheaval fomented during the "cultural revolution." We are now striving to foster socialist democracy, to improve the socialist legal system and to reform and perfect the socialist political system. This gives a powerful impetus to the consolidation and development of a political situation of stability, unity and liveliness.

Through organizational consolidation and rectification of the style of work, tangible progress has been made in the normalization of party life, the development of inner-party democracy and the strengthening of the party's ties with the masses. The party's prestige, grievously damaged during the "cultural revolution," is gradually being restored.

To ensure the proper implementation of the principle of emancipating the mind, our party has reiterated that it is necessary to uphold the four fundamental principles of adhering to the socialist road, the people's democratic dictatorship (i.e., the dictatorship of proletariat), the Communist Party's leadership, and Marxism-Leninism and Mao Zedong Thought. These principles constitute the common political basis for the unity of the whole party and the unity of the entire people and provide the fundamental guarantee for the success of socialist modernization.

The great change which began with the Third Plenary Session of the Party's 11th Central Committee and our correct line and policies fulfil the common aspirations of the people and the party. Speaking of the general orientation and major policy decisions taken since the session, many comrades have said, "They suit us fine." These words reflect the thoughts and feelings of the masses and of the majority of cadres. They explain why this change is so dynamic and irresistible.

Needless to say, many difficulties confront us. We have yet to finish the process of correction, and in various fields many problems remain to be solved. Our material resources, expertise and experience are far from adequate for the achievements of the four modernizations. The people's living standards are still very low and many pressing problems demand solution. We have yet to introduce further improvements in the party's leader-

ship and style of work. It is wrong to take these difficulties lightly. Only by taking them into full account will we be invincible. The road before us is still long and tortuous. It is like climbing the Taishan Mountain; when we have reached the Half-Way Gate to Heaven, we find that the Three 18 Flights of Steps lie ahead of us, demanding herculean efforts. Until we have negotiated these Flights of Steps, however, we won't be able to reach the South Gate to Heaven. Still climbing, we will find it relatively easy to mount the Peak of the Jade Emperor, our destination, and only then can we claim to have accomplished the splendid cause of socialist modernization. Once at the South Gate to Heaven, we shall be in a position to appreciate the great Tang Dynasty poet Du Fu's well-known lines, "Viewed from the topmost summit, / All mountains around are dwarfed." The hardships that once towered like "mountains" will then look small and we will be able to negotiate the obstacles on the way to the "topmost summit" more or less easily. In the course of our long journey, we will certainly be able to conquer these Flights of Steps, reach the South Gate to Heaven and then ascend the Peak of the Jade Emperor. Once there, we shall push towards new summits.

Comrades and Friends!

The historical experience of the past 60 years can be summed up in one sentence: there must be a Marxist, revolutionary line and a proletarian party capable of formulating and upholding this line. Faced with the gigantic task of socialist modernization centering around economic construction in the new historical period, we are deeply aware that the key to the fulfilment of this task lies in our party.

Now, the entire people have placed their hopes on our party, and other peoples of the world are closely watching it. Whether or not we can steer the ship of the Chinese revolution onward through storm and stress in the new historical period, whether or not we can modernize our agriculture, industry, national defence and science and technology fairly smoothly, avoid suffering such serious setbacks and paying huge prices as in the past, and achieve results that will satisfy the people and win the praise of posterity — all this depends on the efforts of all comrades in the party in the next decade or two. We must not let our people down.

With higher political awareness, we must make our party a solid core which is more mature politically, more unified ideologically and more consolidated organizationally, and more able to unite with all our nationalities and lead them in socialist modernization.

1. All members of the party must work with

selfless devotion for China's socialist modernization and in the service of the people.

We Chinese Communists must always proceed from our basic standpoint with the objective of wholeheartedly serving the people. Serving the people in essence means that our party must rally the masses round it and — by virtue of its correct guidelines and policies, its close ties with the masses, its members' exemplary role and its propaganda and organizational work — help them to see where their fundamental interests lie and to become united to strive for them.

The people are the makers of history. Both the people's revolution and the construction of socialism led by our party are the people's very own cause. At all times, party members comprise only a small minority of the population; so we must rely on the people in all of our work; have faith in them, draw wisdom from them, set store by their creativeness and subject ourselves to their supervision. Otherwise, we will accomplish nothing; we will fail. Since victory was won in the revolution, the people have become the masters of the country and society. To organize and support them in fulfilling this role and in building a new life under socialism is the quintessence of the party's leadership over the affairs of state.

For us Communists, serving the people means primarily dedication to the cause of communism and readiness to sacrifice ourselves for the interests of the people. In the years of war, many of our party members were the first to charge at the enemy and the last to pull back; they remained staunch and unyielding in captivity, dying as martyrs; and they were invariably the first to bear hardships and the last to enjoy comforts. What an inspiration and encouragement they were to millions upon millions of our people! Today, in peacetime construction, and particularly after the decade of havoc of the "cultural revolution," we need this revolutionary spirit even more. Although our party's fine style of work was corroded by the counter-revolutionary cliques of Lin Biao and Jiang Qing, there are still large numbers of fine party members who have maintained and carried forward this revolutionary spirit characterized by readiness to sacrifice one's individual interests and one's very life for the interests of the people. They have won high praise from the people, and they have earned it. It is utterly wrong to think and act as though the revolutionary spirit may be discarded in peacetime construction and as if party members no longer needed to share weal and woe with the masses whose interests they may subordinate to their own. That would be to debase our party spirit.

The style of work of a party in power vitally affects its very existence. As Comrade Mao Zedong

pointed out in 1942, "Once our party's style of work is put completely right, the people all over the country will learn from our example. Those outside the party who have the same kind of bad style will, if they are good and honest people, learn from our example and correct their mistakes, and thus the whole nation will be influenced. So long as our Communist ranks are in good order and march in step, so long as our troops are picked troops and our weapons are good weapons, any enemy, however powerful, can be overthrown." Let us firmly resolve to strive to our utmost to restore and carry forward the fine style of work which our party and Comrade Mao Zedong cultivated, and to lead the whole Chinese nation in building a high level of socialist civilization.

2. We must be good at carrying forward Marxism-Leninism and Mao Zedong Thought in the light of the new historical conditions.

We have obtained great success in revolution and construction in the past under the guidance of Marxism-Leninism and Mao Zedong Thought. We will obtain new and greater success in our long march into the future by relying on Marxism-Leninism and Mao Zedong Thought for guidance. If we Communists have any family heirlooms to speak of, by far the most important one is Marxism-Leninism and Mao Zedong Thought. It has always been our basic and unshakable principle to uphold Marxism-Leninism and Mao Zedong Thought and to persist in taking the tenets of Marxism as our guideline.

Marxism is the crystallization of scientific thinking on proletarian revolution; it is our most powerful weapon for understanding and transforming the objective world. Its tenets are truths that have been repeatedly verified in practice. However, it does not exhaust all the truths of human history in its unending course, nor can it possibly do so. For us revolutionaries, the theory of Marxism is a guide to action and by no means a rigid dogma to be followed unthinkingly. All revolutionaries true to Marxism have the responsibility to ensure that it does not become divorced from social life and does not stagnate, wither or ossify; they must enrich it with fresh revolutionary experiences so that it will remain full of vitality. Therefore, our fundamental approach to Marxism is that we should apply and advance Marxism-Leninism and Mao Zedong Thought; such is our unshirkable historical duty as Chinese Communists. This is not easy of course. It requires us to make strenuous, lifelong efforts to achieve a better integration of the tenets of Marxism with the concrete practice of China's socialist modernization.

We must continue to apply ourselves to the

study and investigation of the history of the Chinese revolution. For the China of today has grown out of the China of yesterday, a China of which we know not too much, but too little. We should especially study present-day China because our efforts to create a radiant future must first of all be based on a comparatively correct understanding of the present. And the trouble is that we don't know much — in fact, we still know very little about Chinese realities today and the objective laws governing the building of socialism.

Our cause is an integral whole and has a single goal. Yet, ours is a vast country with extremely diverse conditions. Therefore, our study and understanding of the over-all situation and of the situation in different regions must be closely coordinated. If we overlook the whole and disregard uniformity, we shall make the mistake of acting blindly and thoughtlessly and with no consideration for the whole in directing the work in specific regions. If we ignore the regions' specific conditions in directing the work of the whole country, we shall make the mistake of being guided by our own conjectures and fancies which may have no bearing in reality. We Chinese Communists should be revolutionaries who are at once far-sighted and realistic in our approach.

We lay stress on self-reliance and strive to solve our problems by our own efforts and treasure our own experience. But we must never be conceited and underrate the experience of others. We should through analysis absorb whatever is useful in others' experience and lessons. We must therefore earnestly study and analyse the experience of other countries, other regions and other people while studying and summing up our own.

The integration of the universal truth of Marxism with Chinese reality is a long process of repeated cycles of practice, knowledge, again practice and again knowledge. In the new historical period, we should emancipate our minds and constantly identify and grapple with the new conditions and problems in our practice and thus equip ourselves with rich, varied, living, perceptual knowledge. At the same time, we must set our minds to work and learn more social and natural science and their methods in order to raise perceptual knowledge to the plane of rational knowledge, logical knowledge that is more or less systematic, and verify it again and again in practice. We must therefore study diligently, learn from specialists and heed differing views and opinions and, at the same time, delve deep into reality and carry out thorough, systematic investigations and study so as to successfully synthesize our direct and indirect experience.

So long as we proceed in study and work in accordance with this stand, viewpoint and method,

we shall be able to put all our party work on a scientific foundation, make discoveries and function creatively for socialist modernization, thus ensuring the triumphant advance of our great cause.

3. We must put democratic life in the party on a sounder basis and strengthen party organization and discipline.

One of the fundamental reasons why the grievous errors of the "cultural revolution" remained unrectified for so long was that the regular political life of our party, inner-party democratic centralism and the collective leadership of the Central Committee in particular, had been disrupted. As a result, personality cults, anarchism and ultra-individualism all prevailed. This afforded the Lin Biao and Jiang Qing counter-revolutionary cliques and other scoundrels an opportunity they exploited to the full. No comrade in the party must ever forget this bitter lesson and we must all take a warning from it.

We are historical materialists. We do not deny the significant role that outstanding individuals play in history or the significant role of outstanding leaders in a proletarian party. But at the same time, we maintain that our party must be placed under collective leadership exercised by those who combine ability with political integrity and who have emerged in the course of mass struggle, and that we must ban all forms of personality cults. Party organizations should commend all comrades, irrespective of their rank or position, who have made special contributions and achieved outstanding results in their work, so as to encourage other party members and people to learn from their example. But such public commendation must be truthful and unvarnished.

Appropriate relationships should be established between the leaders and the led in our party organizations at all levels. Comrades at a lower level must respect and obey the leadership of comrades at a higher level. They must not feign compliance while actually violating or resisting instructions from the higher level. On the other hand, comrades at a higher level must heed the opinions of their subordinates, respect their functions and powers and accept their supervision. Leaders should take part in inner-party activities just like ordinary party members, abide by party rules and discipline and the law of the state, and maintain their ties with the rank-and-file and the masses in general; they must not put themselves in a special category just because they are in leading positions.

Decisions concerning important matters must be made after collective discussions by the appropriate party committee, and no one individual is allowed to have the final say. All members of a

party committee must abide by its decisions. Party committees at all levels must practice a division of labour and responsibilities to be discharged under the collective leadership of the party committee, with each member doing his share conscientiously and responsibly and in the best and most efficient way possible.

All party members are entitled to criticize, at party meetings, any individuals within the party, including leading members of the Central Committee; retaliation is impermissible. Party organizations at all levels and all party members should give full play to their initiative and dare to work independently and conscientiously in a spirit characterized by boldness in thinking and action. But no party member is allowed to impair the party's interests and the common goal by turning the department or unit entrusted to him by the party into his own independent kingdom.

Our party's fighting strength lies in its vitality and strict discipline. Now that we are committed to the socialist modernization of the country and our tasks are so challenging and difficult, we have still greater need to promote this fine party tradition.

4. We must be good at keeping ourselves politically pure and healthy and under all circumstances maintain our revolutionary vigour as members of a party in power.

Ours is a large party with a membership of 39 million and it is a party in power. This can easily make some of our comrades feel conceited and succumb to bureaucratic practices. Confronted as we are with so many new things and new problems, we can hardly avoid making mistakes. Besides, class struggle continues to exist to a certain extent in our society, and the ideological influences of the exploiting and other non-proletarian classes still survive. These facts, combined as they are with the complexities of contemporary international relations, put us in daily contact with the undesirable phenomena of capitalism, feudalism and small-scale production. The contradictions between proletarian and non-proletarian ideology and between correct and erroneous thinking within our party demand that we make more effective use of the best weapon Communists have for remoulding themselves, namely, the practice of criticism and self-criticism.

Communists should take a clear-cut stand on questions of principle and should uphold truth. Every party member should uphold the party spirit and be unequivocal in his position on questions of right and wrong which involve the interests of the party and the people and should show clearly what he is for and what he is against. The vile and vulgar practice of trying to be on

good terms with everybody at the expense of principle is incompatible with the proletarian character of our party.

Our party's fine tradition of criticism and self-criticism, gravely undermined in previous years, is now being revived and carried forward, and new and useful experience has been gained in this respect. In making either criticism or self-criticism, one should base oneself on facts and should rectify existing mistakes without trying to hide or magnify them. Criticism should be offered in a well-reasoned way and should be instructive so that it can help the comrades concerned raise their level of political consciousness; it must not be based on speculation or aimed at intimidating others. We should induce the comrades concerned voluntarily to examine themselves and to correct their mistakes. In our criticisms, we must not make far-fetched interpretations and unduly involve other comrades at a higher or lower level. So long as the comrades concerned have recognized their mistakes and are willing to correct them, we should encourage them to go on working boldly. Our main mistake in the past was to engage in excessive struggle which yielded results contrary to our expectations; people became reluctant to make self-criticism and were afraid to criticize others. We must change this unhealthy tendency.

We Communists need to practice criticism and self-criticism so that our party will become more, not less, united and militant. Provided we fully revive and carry forward this fine tradition, our party will undoubtedly continue to show endless vitality and will never show signs of decay.

5. We must select more cadres who combine ability and political integrity and who are in the prime of life, and appoint them to leading posts at all levels.

Insofar as experience in struggle is concerned, it may be said that our party's cadres belong to three or four generations, which shows that ours is a long-standing and well-established cause. It is indeed fortunate that our leading cadres at all fronts are largely veterans who have been tempered in prolonged revolutionary struggle. If cadres can be called valuable party assets, then these numerous senior comrades are indeed most valuable.

But the laws of nature cannot be changed and, after all, most of our senior comrades are physically not as strong and active as before. In order to make sure that there is an adequate number of successors to carry on our cause and guarantee continuity in our party's guidelines and policies, we must devote much of our energy from now on to the selection and training of thousands upon thousands of cadres who combine ability and poli-

tical integrity and who are in their prime, and give these comrades the opportunity to take part in leadership in various fields so that they may be better and more effectively tempered through practice. It is now a pressing strategic task facing the whole party to build up a large contingent of revolutionary, well-educated, professionally competent and younger cadres.

Older comrades have an especially significant role to play in fulfilling this strategic task. Comrades Ye Jianying, Deng Xiaoping, Chen Yun and Li Xiannian have said more than once that although old comrades may be pardoned for other mistakes, they would be committing an unforgivable historical error if they did not redouble their efforts to train younger successors. The old comrades should work personally with the organizational departments of the party and the masses in the selection and training of younger cadres and should eagerly and enthusiastically guide them to frontline posts of leadership. At the same time, they should free themselves from the onerous pressure of day-to-day work and advance their views and judgments on key and long-range problems. The Central Committee of the Party earnestly hopes that all veteran party comrades will have the vision to discharge this crucial historic responsibility to the best of their ability. Meanwhile, it hopes that party organizations at all levels and all comrades in their prime who have been selected for higher posts will respect and take good care of our veterans and learn as much as possible from them.

At present, we are facing the major task of learning anew. It is the hope of the Central Committee of the Party that all party comrades, and the younger comrades in particular, will brace up, strengthen their party spirit, enhance their political consciousness, set stricter demands on themselves, diligently study Marxist-Leninist works and works by Mao Zedong and the history of the party, our nation and the world, acquire more theoretical and practical knowledge, and learn more about management and technology as required by their own occupations and specific jobs. The results of our study will determine the quality of our leadership and work and will have a direct bearing on the progress of the socialist modernization of our country. Since we have successfully learned to destroy the old world, we can surely learn even more successfully how to build a new one.

6. *We must forever uphold internationalism and cast in our lot with the proletariat and the people of the whole world.*

We Chinese Communists have always integrated patriotism with internationalism.

We are patriots. We have invariably fought

might and main for our national liberation, for the well-being of our people and for the unification and prosperity of our motherland. We have never knuckled under to any pressure from any foreign power. We have never flinched in our determination to be independent and to rely on ourselves, no matter how formidable the difficulties we have faced. Our country is still relatively backwards economically and culturally; but we have always maintained our national self-respect in the face of hegemonist threats of force and in our relations with all stronger and richer countries, and we will not tolerate any servility in thought or deed. We are resolved to strive together with the people of the whole country, not least including those in Taiwan, for its return and for the sacred cause of the complete reunification of our motherland.

At the same time, we are proletarian internationalists. We have always cast in our lot with other peoples of the world in their just struggles and with the cause of human progress. Throughout, our struggles have enjoyed the support of the other peoples of the world, and we on our part have always supported the struggles of the world's oppressed nations and peoples for emancipation, the cause of world peace and the cause of human progress, and we have consistently opposed imperialism, hegemonism, colonialism and racism. Our cause of socialist modernization is at once patriotic and internationalist. Its success will be a tremendous contribution to the cause of world peace and human progress. We hereby wish solemnly to proclaim once again that the Communist Party of China will always live in friendship and cooperation and on an equal footing with all the political parties and organizations in the world which are dedicated to human progress and to national liberation and will learn from their useful experience, and that we will never interfere in the internal affairs of any foreign political party. Even when it becomes stronger and more prosperous, socialist China will belong to the third world and will forever stand by the other peoples of the world, will strive for world peace and friendly intercourse among peoples, will abide faithfully by the Five Principles of Peaceful Co-existence, and will continue to promote increased economic, cultural, scientific and technological exchange and cooperation with other nations; it will never seek advantage at the expense of others or bully weaker nations and will never under any circumstances seek hegemony.

Comrades and Friends!

The decisions of the Sixth Plenary Session of the 11th Central Committee of the Party were adopted after ample and extensive exchanges of views and discussions both prior to and during the session. Its outcome fully testifies to our party's

ability to safeguard and strengthen its unity on the basis of Marxist principles and to the fact that the political life of our party has now become much healthier.

Some well-intentioned friends at home and abroad have been worried about our party's ability to achieve complete unity, while a handful of people harbouring evil designs placed their hopes on successfully sowing dissension so as to undermine the unity of our party. Now reality has given them a clear answer: No force on earth can break the Chinese Communist Party's strong unity based on Marxist principles.

Comrades and Friends!

We, the proletariat, are the class which commands the future, and our party has lofty ideals and aspirations. The best way for us to celebrate our party's birthday and to celebrate this grand festival is to learn from historical experience and thus unite and look to the future, focusing our attention on problems awaiting solution.

Socialist modernization is a great revolution. We are undertaking this great revolution in a huge oriental nation left economically and culturally backward by ruthless imperialist oppression and plunder. The fact that China embarked upon socialism before developed capitalist countries is due to China's specific historical conditions, to the correct leadership exercised by our party and to the arduous struggles of the entire people. It represents a development of scientific socialism and is a credit to our party and the Chinese people. On the other hand, our socialist cause is bound to meet many difficulties arising from our economic and cultural backwardness. This in turn calls for more strenuous and protracted struggle. We are still living under the threat of aggression and sabotage from outside. Therefore, our whole party, our whole army and our whole people must more actively apply their revolutionary spirit, heighten their revolutionary vigilance and steel their revolutionary will so as to win victory in this great revolution.

We have suffered severe setbacks in our advance to socialism and have paid heavily for our errors. However, these errors and setbacks have made us more resolute, more experienced, more sensitive to our actual conditions, more sober and more powerful. We have learned much from our reverses and mistakes and shall go on learning. In this sense, our grievous errors and reverses are but

fleeting phenomena. We must not overlook the fact that we have a vast contingent of cadres steeled in struggle, that we have built up a substantial material base, that the whole party, army and people fervently desire a prosperous motherland, and that we enjoy the superiority of our socialist system. All of these things, together with the fact that we now have correct ideological, political and organizational lines, constitute the decisive factors that will apply for a long time to come. There is no doubt whatsoever that our socialist cause and the hundreds of millions of Chinese people have a bright future.

The internal unity of the party and the party's unity with the people are the essential condition for the triumph of our cause. While celebrating the 60th anniversary of the founding of the Communist Party of China, we wish to pay our sincere respects to the workers, peasants and intellectuals who are fighting valiantly on the different fronts, to the glorious People's Liberation Army, the Great Wall of steel that defends our motherland, to the vast numbers of hard-working cadres, to our Party's close aides — the Communist Youth League members who are full of vigour and vitality, and to our fellow-countrymen in Taiwan, Hong Kong and Macao and to Chinese citizens overseas! We wish to extend our heartfelt thanks to all the democratic parties and non-party personages and friends of all circles who have cooperated with our party and rendered invaluable support to the people's revolution and to construction.

The unity of the Chinese people with the other peoples of the world is another essential condition for the triumph of our cause. In celebrating the 60th anniversary of the founding of the Communist Party of China, we wish to express our deep gratitude to all friendly countries which have entered into relations of equality and mutual assistance with us, and to all our foreign friends and comrades who have rendered invaluable assistance to our party and people.

Let all comrades in the party and the people of all nationalities in our country unite as one under the great banner of Marxism-Leninism and Mao Zedong Thought and work hard to make China a modern and powerful socialist country, a country which is prosperous, highly democratic and culturally advanced! Let us all strive for the supreme ideal of communism!

4. OPENING SPEECH
(At the Third Session of the Fifth National
People's Congress of the People's Republic of China on
August 30, 1980)

By Ye Jianying

Fellow Deputies,

Since the conclusion of the Second Session of the Fifth National People's Congress, there has been tremendous progress in all spheres of our work, thanks to the concerted efforts of the people of all nationalities in the country. The readjustment of the national economy has achieved marked success; socialist democracy and the legal system have been strengthened; and political stability and unity have been further consolidated. The great undertaking of the four modernizations in socialist construction is making steady progress. The people of the whole country are happy about these changes as we advance triumphantly in the first year of the 1980's.

Fellow Deputies,

At this session we will examine and approve the Report of the State Council on the Arrangements for the National Economic Plans for 1980 and 1981 and the Report of the State Council on the Final State Accounts for 1979, the Draft State Budget for 1980 and the Financial Estimates for 1981.

The present session will deliberate on the Proposal for an Amendment to Article 45 of the Constitution of the People's Republic of China, put forward by the Standing Committee of the National People's Congress on the recommendation of the Central Committee of the Communist Party of China, and the drafts of the Nationality Law of the People's Republic of China, the revised Marriage Law of the People's Republic of China, the Income Tax Law of the People's Republic of China Concerning Joint Ventures with Chinese and Foreign Investment, and the Individual Income Tax Law of the People's Republic of China.

The present session will hear and deliberate on the Report on the Work of the Standing Committee of the National People's Congress and deliberate on the Report on the Work of the Supreme People's Court and the Report on the Work of the Supreme People's Procuratorate.

Another important item on the agenda of the session is to hear a speech by Hua Guofeng, Premier of the State Council, and to decide on the

appointment of the Premier of the State Council on the proposal of the Central Committee of the Communist Party of China, as well as decide on or elect some other leading state personnel. The session will also examine and discuss another important proposal of the Central Committee of the Communist Party of China for the revision of the Constitution of the People's Republic of China and the setting up of the Committee for the Revision of the Constitution.

Fellow Deputies,

In order to meet the requirements of socialist modernization, we must further promote socialist democracy and improve our socialist legal system. We must institute necessary laws one after another, and in particular, speed up the work of legislation concerning the economy and the nationalities. In order to strengthen and improve the leadership of our party and government, perfect our state apparatus and raise our efficiency, we must take effective measures to change the state of affairs wherein leading personnel hold too many posts with the consequence that power becomes too concentrated, and we must select and appoint to leading posts those cadres who have distinguished themselves in practical work, who enjoy popular support and who are in the prime of life. This session will discuss the proposal of the Central Committee of the Communist Party of China with regard to the change of a number of leading personnel of the Standing Committee of the National People's Congress and the State Council.

This session is of great significance as it will discuss and make decisions on matters of major import to our country. I am convinced that at this session the deputies will fully reflect and sum up the opinions of the workers, peasants, soldiers, intellectuals and all other patriots of the country, offer criticisms and suggestions with regard to the work of the government in every field, and, after thorough deliberations, make proper decisions on the proposals submitted to the session. Let us work together to accomplish the various tasks facing this session and make it a success.

5. REPORT ON THE ARRANGEMENTS FOR THE NATIONAL ECONOMIC PLANS FOR 1980 AND 1981

(Delivered at the Third Session of the Fifth National
People's Congress on August 30, 1980)

By Yao Yilin

*Vice-Premier of the State Council and Concurrently
Minister in Charge of the State
Planning Commission*

Fellow Deputies,

I have been entrusted by the State Council to submit a report on the arrangements for the national economic plans for 1980 and 1981 to this congress for deliberation and approval.

In regard to the arrangements for the national economic plan for 1980, Comrade Li Renjun, Vice-Minister in Charge of the State Planning Commission, was entrusted by the State Council to report to the 14th Session of the Standing Committee of the National People's Congress, which he did on April 8 this year. The plan is being smoothly implemented, and it is expected that the targets set in the plan for the gross output value of both agriculture and industry will be overfulfilled. Copies of the report have been distributed for your deliberation, so I will not elaborate here. In view of the fact that previous annual plans were adopted rather late and this inconvenienced the various localities and government departments in their efforts to make timely arrangements, the State Council decided that the national economic plan for 1981 should be drawn up in advance and submitted to this congress for deliberation and approval this year. The localities and government departments will then be called on to compile their specific plans.

I will now focus on the implementation of the policy of the readjustment, restructuring, consolidation and improvement of the economy since 1979 and on the arrangements for the 1981 national economic plan.

I. Progress Made in the Readjustment, Restructuring, Consolidation and Improvement of the Economy

The Second Session of the Fifth National People's Congress called upon the people of all nationalities in China, under the leadership of the party and the government, resolutely to effect the great strategic shift of the focus of our work to modernization and to carry out the policy of the

readjustment, restructuring, consolidation and improvement of the economy. Through well over a year of arduous and concerted effort, the people of all nationalities have made marked progress in all aspects of economic readjustment.

1. *The relationships between the major sectors of the economy are moving towards balance, and there is sustained economic growth.*

The pace of development of agriculture and light industry has quickened, while the relationship between agriculture, light industry and heavy industry has improved. Since the Third Plenary Session of the Party's 11th Central Committee, a series of rural policies have been put into effect and the state has given greater financial and material support to agriculture, considerably raised the purchase price of a number of major farm products, and reduced or remitted the grain purchase quotas for poorer communes, production brigades and production teams. All this has greatly fired the enthusiasm of vast numbers of peasants for production, triggering a faster growth in agricultural production. In 1979, gross agricultural output value registered an increase of 8.6% over 1978. The total grain output was 332.12 million tons, 27.37 million tons more than the bumper harvest of 1978. The increase in grain output in 1978 and 1979 totalled over 49 million tons — an increase unparalleled since the founding of the People's Republic. In 1979, the output of oil-bearing crops was 6.44 million tons, 1.22 million tons more than in 1978; the output of meat was 10.62 million tons, 2.06 million tons more than in 1978. These are both substantial increases. The output of cotton, hemp, silk, tea and other cash crops has also increased in varying degrees. The sluggish growth in agricultural production which prevailed for many years has begun to change.

Thanks to the priority given to light industry in the supply of raw materials, fuel and power, its gross output value increased by 9.6% in 1979 over 1978 and by 24.2% in the first half of this year over the same period last year. Both increases eclipsed

those in heavy industry. Major light industry items such as cotton yarn and cloth, synthetic fibres, paper, detergents, bicycles, sewing machines and wrist-watches all recorded comparatively big increases in output, and many have been improved markedly in both quality and variety. In the first half of this year, the output value of collectively owned industrial enterprises increased by 23.6% over the same period last year.

In heavy industry, continued advance has been made in the course of the readjustment. The production of goods which were in excessive supply was curtailed and that of readily marketable items boosted, while a number of enterprises which had turned out high-cost, low-quality, unwanted goods or had long operated at a loss were shut down or suspended operations or were amalgamated or switched to the manufacture of other products. The gross output value of heavy industry in 1979 showed a 7.7% increase over the previous year and another 6% increase in the first half of this year as compared with the same period last year. The rate of growth of production in the coal and oil industries has been slowed down as a result of readjusting the relationship between extraction and tunnelling and between extraction and reserves. While increasing generating capacity, we have improved management in the power industry, thus putting an end to the serious frequency fluctuation and low voltage operation which have persisted for years. In the iron and steel industry, steel output in 1979 increased by 2.7 million tons over 1978, while total energy consumption (taking the standard of one kilogramme of coal producing 7,000 kilocalories of heat) dropped by one million tons. At the same time, overall energy consumption per ton of steel fell from 2.51 tons of coal to 2.28 tons. In machine-building we have done much in adjusting service orientation and in changing the product lineup. The enterprises under the First Ministry of Machine-Building alone successfully trial-produced 945 major new products, a single-year record unmatched in the last decade. In the chemical and building materials industries, the output of many major items such as chemical fertilizers, plastics, cement and plate glass has risen considerably. The defence industry has succeeded in raising the quality of military supplies. In addition, it turned out more products for civilian use, which accounted for about 20% of its total output value in 1979. We have also scored new successes in transport, posts and telecommunications and in geological prospecting.

The ratio between accumulation and consumption has improved. The national income in 1979 was 7% higher than that of the preceding year. Of the national income of 333.1 billion yuan,

221.1 billion yuan went to consumption and 112 billion yuan to accumulation. Thus the rate of accumulation dropped from 36.5% in 1978 to 33.6% and, under the 1980 plan, it may drop further to around 30%. This lower rate of accumulation is mainly the result of an increase in the consumption fund for the rural and urban population, of limiting the scope of capital construction and of economizing on the circulating fund. It has played a positive role in the correct handling of the relationship between national construction and the people's livelihood and in the promotion of the planned, proportionate growth of the economy.

We have achieved initial successes in curtailing capital construction and getting better results from investment. In 1979, the total investment in capital construction within and outside the state budget was held at 50 billion yuan and 295 large and medium-sized projects were suspended or deferred. The plan called for the commissioning of 118 large and medium-sized projects but 128 projects were actually completed. This has changed the situation in which the number of completed projects fell short of the plan year after year. The planned total investment in capital construction for 1980 is to be limited to 50 billion yuan, and a further 238 large or medium-sized projects are to be suspended or deferred. Of the total investment in capital construction, the portion allocated for housing for workers and staff, science, culture, education, public health and city construction is to be increased. It was 17.4% in 1978 and 27% in 1979 and will reach 29% in 1980.

2. We have introduced a number of new economic policies and initiated certain measures to reform economic management; the economy as a whole is thus living up.

In the rural areas, new trails have been blazed in introducing more flexible policies and in exploiting favourable local conditions. In accordance with the Decisions of the Central Committee of the Communist Party of China on Some Questions Concerning the Acceleration of Agricultural Development, the localities have adopted measures to ensure the right of the communes, production brigades and production teams to make their own decisions, striven to carry out the policy of distribution according to work, implemented various systems of responsibility in production, developed diversified production and household sideline occupations and encouraged village fairs, thus greatly reinvigorating the rural economy. In accordance with the principle of adapting measures to local conditions, many localities have begun to make adjustments both in

the internal structure of agriculture and in the overall crop pattern. While raising the production of food grains, they have given attention to the development of forestry, animal husbandry, sideline occupations and fisheries. As for crop pattern, the acreage devoted to cash crops has increased both in 1979 and in 1980. The structure of agriculture and the patterning of crops which have been irrational for a long time have begun to show some change.

Industry has made a good start in establishing various forms of association and producing for demand. Under the precondition that ownership and affiliation are not altered, different forms of association which take into account the economic interests of all the parties concerned have been established on a trial basis in various localities. We now have specialized associations, joint investment ventures breaking through the conventional confines of different trades, joint undertakings embracing processing factories in one region and raw material producers in another, and so on. Through associated operation, the enterprises involved have been able to tap their potentials better, create new productive forces, open up new sources of raw material supply and achieve better results. Many local administrations and enterprises have tried to become more familiar with the market, and have organized sales exhibitions or sales through their own channels or on a commission basis. This has promoted the integration of industry and commerce and the linking of production with demand, and as a result readily marketable commodities have gradually increased. To meet market demand, the iron and steel industry has increased production and turned out more than 2 million tons of rolled steel products in short supply, such as small-sized steel products, wire, sheet steel and welded pipe. With under-capacity production quotas in 1979, the machine-building industry started to produce according to demand and sought and found more markets. Its gross output for the year registered an increase of 81.1% over the preceding year, while export volume rose by 30.8%.

We have actively yet prudently initiated experiments in restructuring economic management in selected enterprises on the basis of prior investigation. In the first half of this year, about 6,600 industrial enterprises experimented with added decision-making powers, their total output value accounting for some 45% of the gross output value of all state-run industrial enterprises. These experiments have done much to arouse the enthusiasm of the enterprises and their workers and staff, making them more mindful of management, markets, services and competition, and thus improving operational management, expanding

production, improving quality and increasing profit. The rates of increase in output, output value and profits turned in by such enterprises generally surpassed their earlier levels and also those of other enterprises in the same trades which have yet to engage in such experiments. According to data from 84 local enterprises in Sichuan Province where experiments are being carried out, in 1979 average output value showed an increase of 14.9%, profits 33% and profits turned in to the state 24.2% over 1978. This year all of Shanghai's textile enterprises are experimenting with retention of a portion of profits. Output value for the first half of the year was 14.1% higher than that for the same period last year and the profits turned in to the state increased by 16.3%, both increases being higher than the average increases for the city as a whole. In the rural areas, more than 100 state farms and a number of counties have formed associations on a trial basis embracing agricultural, industrial and commercial enterprises; the results have been generally good. In the financial sector, we have introduced the practice under which the central and local authorities "each apportion its revenues and expenditures and fixes its responsibilities," which has strengthened the motivation of the localities to boost receipts and cut down expenditures. In the foreign trade sector we have begun a number of experimental reforms, appropriately increasing the power of the localities and certain industrial departments to engage in import and export trade, and introducing the practice of allowing the retention of a share of the foreign currency earned. All such experiments give expression to the principle of combining regulation through planning with regulation by the market, the principle of taking into account the interests of the central and local authorities, the enterprises and the individual workers and the principle of closely linking the material interests of the workers with their enterprise's success, so as to stimulate the enthusiasm and initiative of the enterprises and workers in improving management, increasing production and practicing economy. Generally speaking, the results of these experiments are good, though quite a few new problems have cropped up in the process, and these will have to be solved in future.

3. *We have achieved better economic results in various sectors with the progress in adjusting the relationships between the sectors of the economy, in introducing reforms in management and in consolidating enterprises.*

In agricultural production and capital construction, fewer arbitrary orders are issued, and there is less inefficient use of labour and more

regard for production costs. Production expenses took up a smaller share of the total proceeds of agriculture in 1979. State farms, some of which had long been running at a loss, showed over 300 million yuan profit last year as against a loss of 90 million yuan in 1978. In industrial production, measures for economizing on energy consumption have begun to take effect. Last year, with an increase in energy of less than 3%, gross industrial output value rose 8.5%. With only a slight increase in the supply of energy it was 13.6% higher in the first half of this year than in the same period last year. 62% of the increased output value of state-run industrial enterprises is due to higher labour productivity. Every 100 yuan of net fixed assets produced 31.5 yuan in taxes and profits for the state in 1977, 35.5 yuan in 1978 and 36.3 yuan in 1979. The turnover of circulating funds has been speeded up. The amount of such circulating funds used by state-run industrial and commercial enterprises in 1979 fell by 6.4 billion yuan as compared with 1978. In the first half of 1980, it was another 16 billion yuan less than in the same period last year. In the field of capital construction, the ratio of operational fixed assets to total investment increased from 74.3% in 1978 to 83.7% in 1979.

4. The party and government have made strenuous efforts to increase the income of the urban and rural population and to improve living standards.

With growing agricultural production and higher state purchase prices for major farm products, peasant income increased 10.8 billion yuan in 1979. The peasants have benefited to the extent of 2 billion yuan from the reduction or remission of agricultural tax and taxes paid by enterprises run by the communes, production brigades and production teams. Their per capita income from the collective economy averaged 83.4 yuan in 1979, up 9.4 yuan over 1978, as against a total increase of only 10.5 yuan over the entire 11 years between 1965 and 1976 (these figures do not include their income from household sideline occupations). In 1979, a total of 9,030,000 people were provided with jobs in cities and towns, and we raised the wage-scales of 40% of the workers and staff and readjusted wage classifications for some regions. Moreover, all workers and staff now receive a monthly subsidy to cover the price increases in non-staple food, and the system of rewards was universally introduced in enterprises. Last year's total outlay on wages (bonuses included) for workers and staff in state-run enterprises and establishments was 6 billion yuan more than in the preceding year, with annual per capita wages averaging 705 yuan, 61 yuan above the 1978 figure. 1979 witnessed the biggest addition

to housing for workers and staff since the founding of the People's Republic, totalling 62,560,000 square metres of floor space (a 66% increase over 1978). Construction of another 73,710,000 square metres of housing began in January-June this year, again more than in the same period in 1979.

5. We have enjoyed steady increases in purchases and sales, a brisk retail trade in urban and rural areas and a fairly big increase in foreign trade.

The total value of commodities purchased by commercial departments in 1979 was 199.2 billion yuan, or 14.5% more than in 1978. It rose again by 17.9% in the first six months of this year as against the same period last year. Thanks to the higher income of the majority of workers and staff as well as of peasants, the people's purchasing power has grown substantially. With retail sales totalling 175.3 billion yuan, 22.5 billion yuan or 14.7% more than in 1978, 1979 witnessed the biggest increase in such sales in many years. In the first half of this year there was another 18.5% increase above the corresponding period last year. Since 1979, urban and rural consumption of major consumer items has been rising. Pork, long in short supply, can now be bought without any restriction. There has also been a substantial increase in the sales of knitted and cotton goods, bicycles, sewing machines, radio sets, wrist-watches, TV sets, tape recorders, etc.

The total value of imports and exports rose by 28% in 1979 and by another 20.2% in the first half of 1980 as against the same period last year. Foreign exchange earnings from non-trade channels such as tourism, remittances by overseas Chinese and harbour services have also recorded a fairly rapid increase.

6. Science, culture, education and public health have made further progress.

Altogether 103 inventions were approved by the state in 1979, and good results were obtained in more than 3,000 major scientific and technological research projects. New successes were scored in the popularization of hybrid paddy-rice over large areas, in the extensive use of methane gas, and in surveying China's agricultural resources, regional planning for agricultural growth, etc. The industrial departments have succeeded in trial-manufacturing some 1,000 important products, and heartening progress has been reported in scientific research into the multipurpose use of associated ores in the three big mines at Panzhihua, Baotou and Jinchuan. In the field of scientific research for national defence, new advances have been made in the development and manufacture of carrier rockets, nuclear weapons,

man-made satellites, and so on. China's successful launching of a carrier rocket over the Pacific Ocean in the first half of this year signifies that our scientific and technological development has reached a new level. A lively atmosphere now prevails in the realm of social science, and many useful ideas have been put forth in studies of the theory and practice of socialist economy.

In 1979, the number of students in the colleges and universities reached 1,020,000, an all-time high. There were 1,200,000 students in secondary technical schools and 59,050,000 in ordinary middle schools. Another 860,000 students were enrolled in various kinds of adult institutions of higher learning. New achievements have been registered in the fields of culture, art, broadcasting, television, the press, publishing, public health and physical culture. We have made some headway in family planning, with the natural growth rate of our population dropping from 1.2% in 1978 to 1.17% in 1979.

Things have been going fairly well in the implementation of this year's national economic plan. Owing to severe natural calamities in many areas the output of summer crops dropped by over 10%, but the autumn crops are now at the height of their growth and if there are no more severe natural calamities they will probably approach the 1979 output. It is expected that cotton and sugar crops will be bigger than in 1979 and that the output of oil-bearing crops, meat and aquatic products will reach state quotas. In industry, it is estimated that the output of major products such as coal, crude oil, electricity, steel, cement, chemical fertilizer, cotton yarn, synthetic fibres, paper, sugar, bicycles and TV sets will reach or exceed state quotas and that the planned 6% increase in gross industrial output value for the year will be exceeded.

Practice has proved that the economic policies adopted by the party and government in the past year or more are correct and have the support of the people. The readjustment of the national economy has been carried out smoothly and the people are pleased with what has been achieved. Nevertheless, we still face a lot of problems in our march forward. The living standards of the majority of peasants and workers have improved, but for people living in the outlying regions and in the minority nationality areas, where the pace of economic development has been slow over the years, or for people living in disaster-stricken areas, life is still very hard. For those scientific research workers, teachers, and medical and government workers who receive little or no bonus, income has increased very little or not at all, and for some of them living standards have actually declined. With the purchasing power of the people rising in both

town and country, some commodities are in short supply because time is required for the reform of the industrial structure. The problems accumulated over the years in housing, health facilities, public utilities and environmental protection can only be solved step by step through sustained efforts. Generally speaking, capital construction is still over-extended. On the one hand, some major projects have not been cut back as they should have been. On the other hand, in areas such as energy, transport, building materials and science and education where spending should be increased, the demands cannot be met owing to shortage of funds. In the process of readjustment, certain heavy industrial enterprises, especially in the machine-building industry, are now operating under capacity. The problem of stockpiling is quite serious within some categories of means of production. Financially, we are still operating and in the red. The readjustment of the national economy is a highly complex and difficult task and some contradictions and difficulties are bound to appear. So long as we earnestly implement the various policies laid down by the Central Committee of the Party and the State Council and work hard to increase production and practice economy, these problems can be solved step by step.

II. The Task and Main Targets for the National Economic Plan for 1981

The main task in developing the economy in 1981 is to carry on with the policy of readjustment, restructuring, consolidation and improvement so as to bring about the co-ordinated development of industrial and agricultural production and all other undertakings. Specifically, we should strive to speed up the growth of agriculture and light industry so that the supply of consumer goods will be in general balance with the rise in the people's purchasing power and that commodity prices will remain stable on the whole. We should strive to develop and conserve energy, to promote communications services and the building industry, to speed up the reorganization and technical transformation of the machine-building industry, to rationally readjust production in the metallurgical, chemical and other heavy industries, to increase the production of raw and semi-finished materials in short supply and of new types of such materials, so as to do a better job in serving agriculture, the people's livelihood, export, national defence and the economy as a whole. We should continue to exercise strict control over the scale of capital construction and strive to shorten the building cycle so as to get more projects

completed and into operation. We should develop foreign trade and expand international economic exchange. We should step up our efforts in science and technology, education and public health, urban construction, environmental preservation and labour protection. We should give overall consideration to economic results, do our best to find new financial resources, increase revenues and reduce expenditures. We should further adjust the ratio between accumulation and consumption, so that a further improvement in the people's standards of living will be possible with increased production.

In accordance with the above requirements, the main targets for the national economic plan for 1981 are as follows:

The total output value of industry and agriculture is expected to increase by 5.5% as compared with 1980, with that of agriculture increasing by 4% and that of industry by 6%.

Agriculture: The output of grain will be 342.5 million tons, with an estimated increase of 10 million tons over 1980; cotton output will be 2.55 million tons, with an estimated increase of 250,000 tons over 1980. The output of other cash crops, meat and aquatic products and the acreage for afforestation will also register new increases.

Light Industry: It is estimated that total output value will increase by 8%, with light industry continuing to maintain a higher rate of growth than heavy industry. The output of cotton yarn will be 2.865 million tons, an estimated increase of 90,000 tons over 1980; that of paper, 5.2 million tons, an increase of 200,000 tons; sugar 2.6 million tons, an increase of 100,000 tons; bicycles, 14.84 million, an increase of 2.24 million; sewing machines, 8.6 million, up 1.4 million; wrist-watches, 23.6 million, an increase of 2.6 million; and detergents, 480,000 tons, an increase of 50,000 tons. The output of other light industrial products will all be increased to varying degrees.

Energy Industry: The output of coal will be 620 million tons, an estimated increase of 10 million tons over 1980; that of petroleum, 106 million tons, maintaining the same level as 1978 and 1979; and that of electricity, 312 billion kwh, an estimated increase of 12 billion kwh over 1980.

Raw and Semi-Finished Materials Industry: The output of steel will be 35 million tons; 10 nonferrous metals, 1.08 million tons; cement, 78 million tons; chemical fertilizer, 12.3 million tons; and timber, 49.1 million cubic metres.

Machine-Building Industry: It will produce 97,500 tractors, internal-combustion engines with 20 million hp. and 160,000 automobiles. These figures are fixed in accordance with need and the likely available fuel supplies.

Transport and Communications: The volume of rail freight will be 1,060 million tons; that of ship and barge freight, 390 million tons; and that of truck freight, 540 million tons. The total volumes of civilian passenger and freight transport by air and of postal and telecommunication services will also be increased.

Capital Construction: Total investment will be held at 55 billion yuan, including direct investments under the state budget plus those made by the departments and localities, loans from Chinese banks and construction projects utilizing foreign capital.

Foreign Trade: The total volume of imports and exports will be 55.9 billion yuan, an estimated rise of 4.2 billion yuan over 1980.

Home Market: The total volume of retail sales will be 220 billion yuan, an estimated increase of 15 billion yuan over 1980.

Science and Technology: Over 400 items have been listed in the national scientific and technological plan. These include trial-manufacture of new products, intermediate tests and major scientific research projects.

Education: As students admitted into institutions of higher learning in 1977 began the academic year later than usual and will not graduate and make room for new students until the winter vacation of 1981, the enrollment of new students in 1981 will be 270,000, or the same as in 1978 and 1979.

Employment: 6 million people will be given jobs in cities and towns.

Family Planning: The natural population growth rate will be 1%.

People's Livelihood: The income of communes, production brigades, production teams and individual peasants will increase by approximately 10 billion yuan. The urban population's income will increase by more than 4 billion yuan, and urban housing and collective welfare and everyday services will continue to be improved. Beginning from 1981, we shall gradually and suitably raise the income of people engaged in

scientific research, teaching, medicine and office work who receive small bonuses or none at all.

In making plans for 1981, we should pay attention to the solution of the following questions:

The growth of light industry has been hampered by the slow increase in cash crops in recent years. Therefore, in agriculture, we must do a better job in surveying resources and in regional planning, suiting measures to local conditions in order to achieve all-around progress. In regions suitable for growing cash crops, we must develop them in a planned way, giving top priority to the production of cotton and sugar. Simultaneously, we must strive to increase the output of grain wherever conditions are suitable. In the grain-producing regions of Heilongjiang, Jilin and other provinces, we must expand commodity grain-producing bases in a planned way to provide the state with more marketable grain. We must actively promote growth in forestry, animal husbandry, sideline production and fisheries. In light industry, we must strive to expand the sources of raw materials and processing capacity since growth lags behind the increase in the people's purchasing power. We must also increase variety in product design, size and colour and raise the proportion of medium- and high-grade goods.

The planned increase in the production of energy for next year is 0.9%, whereas the planned increase for industrial production as a whole is 6%. We must try hard to save energy and, at the same time, ship out more quickly the coal stockpiled at a number of coal mines. In the rural areas, we must actively promote the utilization of methane gas and the planting of forests for fuel.

In the field of transport and communications, we must step up our efforts to renovate and expand the major harbours and wharves and those railway sections which are unable to handle large traffic volumes.

We must continue to do a good job of tapping the potential of existing enterprises and of renovating and transforming them with the emphasis on saving energy and raw and semi-finished materials, on producing raw and semi-finished materials in short supply and those which are needed but have not yet been produced as well as new types of materials.

There are numerous demands from every quarter for capital construction funds, but as our financial and material resources are limited, we must act according to our capabilities and rationalize the use of the construction funds from various channels through planning and guidance so that the needs of key projects are fully met.

Both in industry and agriculture, we must attach importance to popularizing the achieve-

ments of scientific research and energetically apply new technology. We should make overall arrangements for the introduction of key technology urgently needed in our economic construction and for scientific research projects aimed at meeting the needs of long-term development.

In the field of education, we must open up new avenues of schooling, reinforce higher education, reform the system of secondary education and promote vocational and technical education. We must continue to universalize elementary school education and improve our work in child-care and preschool education.

In health work, we must continue to unfold patriotic sanitation campaigns so as to improve sanitary conditions in both town and country and reduce the incidence of disease, thus raising the people's level of health.

With respect to the questions of employment, we must modify the current labour administrative system step by step, adopt more flexible policies and open up new avenues of employment. We must combine employment on the recommendation of state labour departments with employment through voluntary self-organization and the individual search for jobs. We must vigorously develop the economy of collective ownership in which enterprises assume sole responsibility for their profits and losses, and must appropriately develop individual economy involving no exploitation of others.

We should promote labour protection. All production and construction units, enterprises and establishments should conscientiously draw on the profound lessons to be learned from the capsizing of the oil rig *Bohai No. 2* and should perfect and strictly abide by the rules for safety in production and the various systems of job responsibilities, respect science, improve their technical knowledge, modestly heed the opinions of the workers and technicians, submit themselves to supervision by the masses and guarantee the workers' safety of person.

As for family planning, we must regard it as a task of strategic importance and allow of no relaxation of effort. We should conduct intensive and meticulous publicity work and forbid any resort to compulsion. We should constantly improve birth control techniques and take the utmost care to prevent accidents resulting in injury or disablement.

III. Take Vigorous Measures to Ensure the Fulfilment of the Plans for 1980 and 1981

To fulfil the national economic plans for 1980 and 1981 successfully, it is necessary to proceed

from the actual conditions and adopt effective and vigorous measures. In agriculture, all local authorities should conscientiously carry out the policies laid down by the Central Committee of the Party, energetically promote and popularize science and technology, increase their aid to agriculture so as to ensure the continued all-round development of agricultural production. The whole nation should continue to pay attention to light industry and boost its production by every possible means, so that its prospects will become ever broader.

I would now like to explain the principal measures that are needed in four areas: the exploitation and conserving of energy; the readjustment of heavy industry, especially the readjustment and transformation of the machine-building industry; the strengthening of the raw and semi-finished materials industry; and the restructuring of economic management.

1. *We should lay equal stress on exploiting energy and practicing economy in its consumption. In the near future, however, it is imperative to give priority to saving energy and make every endeavour to carry out technical transformation and structural reform to this end. The first steps should be taken next year.*

We shall adopt the following measures to exploit energy and increase its production:

In the coal mining industry, we should strive, through state investments in capital construction, bank credits and associations of various forms, to engage in the construction of new collieries having a total capacity of 120 million tons next year, with those put into operation having a capacity of 10 million tons. Simultaneously, beginning next year we shall appropriately increase expenditures on maintaining simple reproduction so as to better tap the potential of existing coal mines and bring about their renovation. We shall also take necessary measures to improve the work system and ensure the safety of the coal miners.

In the petroleum industry, agreements on marine prospecting have been signed with a number of foreign oil companies, and geophysical surveys have been conducted over an area of 410,000 square kilometres in China's Nanhai Sea (South China Sea) and southern Huanghai Sea (Yellow Sea). On this basis we will begin issuing successive calls for tenders on joint exploration and exploitation. Moreover, we have signed contracts with foreign oil companies to carry out joint exploration and exploitation of oil and gas in parts of the Bohai Sea and Beibu Gulf. With regard to onshore oil prospecting, while work continues in the eastern part of the country, progress is being made in the continental sedimentary basins of

Jungar, Qaidam, Tarim, Shaanxi-Gansu-Ningxia and Sichuan.

In the power industry, we shall strive to install new generating sets with a total capacity of over 3 million kw next year. This will be done through state investment in capital construction and by attracting funds from the localities and getting more bank credits. In the meantime, we shall speed up surveying and designing and other preparatory work for the construction of a number of big hydropower stations.

We shall continue to step up research and experiments in nuclear power, solar energy and other new sources of energy:

And we shall take the following measures to conserve energy:

We shall continue to improve energy management. Quota management will be strengthened and a balance between power and heat loss will be struck next year for those enterprises with an annual comprehensive consumption of over 50,000 tons of standard coal. Economic methods will also be utilized to impel the enterprises to further reduce their energy consumption. We must do all this well and strive to save 7 to 8 million tons of standard coal next year.

We shall alter the structure of industry and the product mix step by step. The plan calls for an increase in the proportion of the output value of light industry to the total output value of industry from an estimated 44% this year to 45% next year. By an increase of 1%, we can save 6 million tons of standard coal. The planned ratio of the amount of pig iron to the output of steel will fall from 1.03:1 this year to 1:1 next year, which will mean a further saving of 2 million tons of standard coal. Every locality and government department must adopt effective ways and means to change the structure of industry and the product mix in order to save as much energy as possible.

We shall endeavour to carry out technical transformation with the focus on energy saving. This will be an avenue for conserving energy for a long time to come and an important step towards modernizing our industry. Preparations will be made next year to renovate medium and low voltage generating units which are characterized by high coal consumption and to introduce the centralized supply of heating and integrated power generation and heat supply, so as gradually to replace small boiler units. Other measures will also be enforced that will yield prompt and effective results in energy conservation in the metallurgical, chemical, building material, petroleum, communications and transport and other major departments.

We shall update motorized machines and tools with high energy consumption. Experiments will

start with trucks next year. Some will be replaced, others put into storage and still others eliminated in order to save oil.

We shall keep on trying to convert oil consumers into coal consumers. The focus will be on those power stations and factory boilers which were originally designed to use coal but were later changed over to oil consumption. Plans call for the conversion of power stations and factory boilers with a total consumption of 2.5 million tons of oil next year.

We shall institute laws and regulations setting standards for energy consumption together with relevant regulations for rewards and penalties.

2. We shall further readjust the structure of heavy industry, especially the machine-building industry, so as better to serve economic development.

With the readjustment of the ratio between accumulation and consumption, the scope of capital construction is being brought under control and the demand for some kinds of means of production is on the decline; the income of the urban and rural population is steadily rising and so is their demand for consumer goods. These are new conditions to which the present structure of industry finds it hard to adapt itself. Part of the machine-building industry now has idle capacity, whereas supplies of some consumer goods are inadequate; this has an adverse effect on the harmonious development of the entire economy. The key to settling this problem is for us to actively undertake a substantial readjustment in heavy industry, and especially the machine-building sector, as far as its service orientation is concerned.

The machine-building industry, including the electrical engineering and electronics industries, supplies all branches of the economy with technical equipment and carries a heavy burden in the four modernizations programme. In order to utilize its capacity to the full and raise its level of production and skills, we must undertake comprehensive planning, gradually break down all sorts of barriers between different departments and regions and accelerate the readjustment and transformation of the industry in accordance with the principles of coordination among specialized departments, standardization, serialization and interchangeability. We must step up scientific research and the import of technology in order increasingly to master the world's advanced production technology and product designing. We must make great efforts to improve the quality of basic parts and raise the level of basic process technology. We should work hard to trial-produce and manufacture new-type machines and elec-

tronic products and optical instruments including lasers, which are urgently needed, highly efficient, of good quality, and low in consumption of energy and cost of production, for light and heavy industries and other departments. We should strive to increase the production of consumer goods. We must make ever wider use of such new technology as integrated circuits and electronic computers, and particularly small and medium-sized computers and microprocessors, in industrial and agricultural production and in producing articles for daily use. We must get large-scale integrated circuits into mass production. In the machine-building industry, we must energetically raise our ability to supply complete sets of machinery and improve technical services. All departments and all the people should show concern for our machine-building industry and should be keen on using Chinese products. Administrative and economic measures should be taken to promote the growth of our machine-building industry, at the same time reducing its dependence on imports and increasing its exports.

In line with technical transformation centred on energy conservation, the machine-building industry should develop energy-saving mechanical and electrical products and quicken the pace of replacement of those with high rates of energy consumption. Particularly with respect to those motorized machines and tools which consume large amounts of energy, such as factory boilers, internal-combustion engines, automobiles, pneumatic machines, pumps, and motors, we should actively study, design and manufacture new types that meet energy-saving targets.

We should transfer, in a planned way, a part of the productive capacity and technical forces of the heavy and defence industries to the production of consumer goods and other urgently needed merchandise. We hope that the localities and departments will make solid market investigations and forecasts and, basing themselves on economic rationality and allowing for technical suitability and supplies of raw materials, concretely carry out these transfers.

3. We must strengthen the materials industry, increase variety and improve quality and make every effort to promote comprehensive utilization.

Materials are vital to the economy, defence and the development of science and technology. The levels achieved in their variety, quality and output are major indicators of the degree of development of our economy and science and technology. Technical transformation, with its focus on energy saving, the growth of industrial and agricultural production and science and tech-

nology, the modernization of national defence and the gradual improvement in living standards — all this will make more and new demands on the materials industry. Therefore, we must pay adequate attention to its development.

We should produce more varieties of better metallic materials and gradually raise the share of alloy steel in steel production to meet our social needs. At the same time, given China's wealth of polymetallic associated ores, we should exploit and utilize such ores in a planned and comprehensive way. Our rich deposits of vanadium, titanium, nickel, cobalt, niobium and rare-earth metals should be exploited so as to increase the varieties of iron, steel and nonferrous metals.

We should systematically put such nonferrous metals as tungsten, molybdenum, tin, aluminium and copper to multipurpose use and improve the quality of their products. We should step by step turn from the export of nonferrous metals themselves to the export of their products.

Wherever possible, we should energetically develop the manufacture of plastics, synthetic fibres and synthetic rubber and gradually increase their level in the raw material mix used by industry, and by light industry in particular.

New construction materials are important for shortening construction cycles in the building industry, lessening the structural weight of buildings, cutting costs, utilizing industrial residues and saving energy. We should give special help to their development.

Our country abounds in non-metallic mineral deposits such as graphite, asbestos, gypsum and kaolin. We should gradually modernize the existing technology in prospecting for, extracting and processing these minerals, which is still backward.

We should continue to develop new materials. As the cause of modernization progresses, there will be an increasing demand for more new materials of better quality, more variety and improved properties. This work will be most challenging. We must consider it an important task and render all necessary financial and material assistance to the development of new materials to which we must give special help in matters of pricing and taxation.

4. We must expedite our experiments in restructuring the economic managerial system, give full play to favourable conditions, ensure competition, promote integration and mobilize the initiative of all concerned.

We should try to enlarge the decision-making power of all enterprises in state-owned industry. Under the guidance of the state plan, enterprises should enjoy greater power than they do today to decide matters concerning personnel, financial and

material resources, production, supply and marketing. On condition that it ensures the supply of goods as required by the state, an enterprise may fix production plans according to market demand or undertake tasks in co-operation with other units. Aside from materials provided under the state plan, an enterprise may also purchase what it needs according to its own choosing. Contracts and agreements signed between enterprises should be protected by law. Any rules and regulations now in force which are incompatible with the principle of enlarging the decision-making power of enterprises should be gradually revised. Congresses or conferences of representatives of workers and staff should be instituted in every enterprise or establishment. They have the right to discuss and take decisions on important matters concerning their unit. They have the right to submit to the higher authorities proposals for the removal of any leading member of the administration who is not equal to his duty, and they can gradually undertake the election of leading personnel at appropriate levels.

We should actively develop various types of economic integration. All localities, departments and enterprises should give full scope to their respective specialities and strong points and, taking the road of integration, develop economic co-operation, complement each other, fostering strengths and circumventing weaknesses so that they may obtain the maximum economic results at minimum costs. Organizational linkups should be arranged on the principles of equality, mutual benefit and due consideration of the economic interests of all parties concerned. Though such linkups need not be limited to the same trade, region, sphere of ownership, or affiliation, the ownership, affiliation and financial relations of the participants must not be changed at will. Each enterprise within an association should keep its separate accounts, which means no "sharing of food from the same big pot." The association is entitled to market those goods produced over and above its plan quota. A joint committee consisting of representatives of all parties concerned should be set up to act as the overall authority.

Extensive competition is to be encouraged under the guidance of the state plan. Given adherence to the socialist planned economy, competition between enterprises will spur them to improve management, strengthen cost accounting and raise economic efficiency and quality. To unfold competition, it is necessary to do away with regional blockades and interdepartmental barriers and combat monopoly so as to allow goods to flow freely in all directions. It is wrong to shield backwardness, blockade the market and impede the normal circulation of merchandise by

administrative means, and this should be stopped. While competing, we should encourage the socialist spirit of co-operation and the exchange of technical know-how. As for important new technology, a scheme of royalties should be worked out.

Banks are to be run independently. Under the guidance of the state plan we should promote to the full their role in economic development. We should enlarge their decision-making power step by step, so that they are entitled to decide on the extension and supervision of loans in accordance with credit policies, loan ceilings and lending priorities stipulated by the state. All banks should improve their work, make full use of interest rates as leverage, broaden the sources of credit funds, support the expansion of production, assist enterprises in making careful plans and economize in the use of capital funds by speeding up their turnover.

We should gradually reform the system of taxation. In accordance with the laws to be adopted at the present session, we shall impose an income tax on ventures involving joint Chinese and foreign investment and an individual income tax, and we must do a good job of taxation where foreigners are involved. In the machine-building and farm machinery industries, we shall experiment with a tax on added value so as to solve the problem of double taxation on some industrial products. We shall revise the laws concerning taxes on income of collectively owned urban enterprises and appropriately adjust their taxes so as to facilitate the development of the collective economy. Beginning from 1981, we shall try out collecting fees from state-owned enterprises for the use of fixed funds so as to promote the rational use of state assets. We shall extend to more state-owned enterprises the experimental changeover from the transfer of profits to the state to a tax on income, and we shall also impose regulatory taxes and taxes on natural resources. In capital construction, investment by the state should be replaced by bank loans wherever repayment is possible.

We should encourage market regulation under the guidance of the state plan. The state plan should bring about overall balance. Some of the targets assigned to the enterprises are of a mandatory nature and must be fulfilled; there will be a gradual reduction in targets of this kind. Others perform the function of guidance or forecasting. Through its economic policies and decrees and the use of certain economic levers, the state gives guidance to the enterprises regarding production and expansion so as to stimulate their initiative. There will be more and more targets of this kind. Except for those materials which are very important and in short supply and must be

distributed in a planned way and those which are subject to priority purchase by supplies departments, the means of production can be put on the market for free circulation. Except for those consumer goods which are subject to unified purchase and marketing or unified purchase and distribution, the state monopoly over the selling of consumer goods will be replaced by planned purchases, by placing orders or by exercising choice. It is necessary to reduce the number of links in the chain of circulation and open up more channels of circulation. It is necessary to break down the barriers separating different administrative departments and divisions and to organize rational circulation of the means of production and consumer goods within the economic zones. We should sum up experience concerning the existing forms of distribution used by various regions and departments, such as commodity fairs, wholesale markets, trade centres, trade warehouses, enterprise-operated street outlets and combined exhibition and sales departments. Those forms of circulation must continue to be run well so as to promote industrial and agricultural production and improve the people's living standards.

We should continue with the restructuring of the management of foreign trade. We should entrust all areas and departments engaged in foreign trade with greater operational powers. We should effectively strengthen economic accounting. At the same time, certain large enterprises and associations can begin, upon approval, to experiment with direct foreign trade. It is imperative to formulate necessary decrees, rules and regulations in accordance with the principle of unified policies, unified planning and unified international stance and the principle of expanding the power of departments at all levels to make decisions with respect to foreign trade. Goods will be imported or exported under license, and exchange controls will be tightened.

We should strengthen legislation and the administration of justice in the economic field. With the gradual restructuring of our economic management and with the increasing application of economical methods in managing our economy, there is an urgent need for reinforcing both economic legislation and its administration. It is imperative to conscientiously study and sum up experience in economic construction at home and abroad, gradually to formulate laws and rules governing the planning and management of our socialist economy in the light of our party's lines, principles and policies, and actively to train legal personnel. It is imperative to reinforce economic arbitration, and we suggest that an economic tribunal be quickly set up with adequate personnel.

All the economic reform measures mentioned

above are aimed at promoting the readjustment of the economy, arousing general enthusiasm, using our economic potential, increasing production and practicing economy. But these measures are only of a preliminary nature. The overall restructuring of management of our economy calls for further investigation and study, the summing-up of experience, deeper theoretical exploration and the absorption of the strong points of other countries which are relevant and useful. It will take a period of deliberation and preparation before it can be unfolded.

Fellow Deputies! Thanks to our conscientious implementation of the policy of readjustment, restructuring, consolidation and improvement for well over a year, our economy has made major

progress. Practice proves that it can advance steadily in the process of readjustment. We are convinced that our national construction will continue to advance triumphantly and the prospects for realizing socialist modernization by the turn of the century are very good, so long as, under the leadership of the Central Committee of the Party, we continue to carry out this policy, give more scope to the people's wisdom and talent and earnestly solve new problems as they crop up in our advance. We must emancipate our minds, seek truth from facts, work with one heart, study diligently, go all out to make the country strong, enthusiastically and steadily make a success of our work and strive to fulfil and overfulfil our national economic plans for 1980 and 1981!

6. REPORT ON THE FINAL STATE ACCOUNTS FOR 1979, THE DRAFT STATE BUDGET FOR 1980 AND FINANCIAL ESTIMATES FOR 1981

(Delivered at the Third Session of the Fifth
National People's Congress on August 30, 1980)

By Wang Bingqian
Minister of Finance.

Fellow Deputies,

I have been entrusted by the State Council with making the report on the final state accounts for 1979, the draft state budget for 1980 and the financial estimates for 1981 which I now submit for your examination.

I. The Final State Accounts for 1979

In 1979, the people of all our nationalities, led by the Chinese Communist Party, strove conscientiously to implement the policy decisions of the Third Plenary Session of the 11th Central Committee of the Party and the decisions of the Second Session of the Fifth National People's Congress; they brought about a great shift of emphasis in the work of the whole nation and began the task of readjusting, restructuring, consolidating and improving the economy. The serious disproportions in our economy were somewhat corrected, and new advances were made in production and construction. In state finances, a series of important measures were adopted last year that led to notable results in readjusting the ratio between accumulation and consumption, promoting industrial and agricultural production and bettering the livelihood of the people, and also in reforming the financial system, increasing the financial powers of the local authorities and enterprises, and encouraging initiative in all quarters. While doing all this we paid a certain price in terms of state expenditure in order to correct the serious disproportions in our economy caused by the sabotage of Lin Biao and the Gang of Four, and gradually to solve the problems in production and in the people's livelihood left outstanding over the years.

In the state budget for 1979 adopted by the Second Session of the Fifth National People's Congress last year, revenues and expenditures were balanced at 112 billion yuan. The final state accounts for 1979 as prepared on the basis of the actual implementation of the budget break down essentially as follows:

Revenues totalled 110.33 billion yuan. Deducting the 3.53 billion yuan of foreign loans not

originally included in the budget, domestic revenues amounted to 106.8 billion yuan, or 95.4% of the budgeted figure. Of this, revenues from industrial enterprises totalled 49.29 billion yuan, or 88.6% of the budgeted figure; taxes totalled 53.78 billion yuan, or 99.7%; other revenues totalled 650 million yuan, or 272.5%, while 2.46 billion yuan, or 112%, consisted of depreciation funds turned in to the central financial authorities by the various enterprises.

Expenditures totalled 127.39 billion yuan. Deducting the 7.09 billion yuan not originally included in the budget but appropriated out of foreign loans, for capital construction and other purposes, domestic expenditures amounted to 120.3 billion yuan, or 107.4% of the budgeted figure. This included 44.38 billion yuan, or 113.8%, for domestic capital construction; 7.2 billion yuan, or 128.6%, for tapping the potential of existing enterprises, and for subsidizing their transformation and the trial-manufacture of new products; 5.2 billion yuan, or 106.2%, for additional allocations of circulating funds to enterprises, and of credit funds to banks; 9.01 billion yuan, or 127.8%, for financing rural people's communes and other agricultural undertakings; 13.21 billion yuan, or 109.4%, for culture, education, health work and science; 22.27 billion yuan, or 110.1%, for national defence and preparations against war; and 5.69 billion yuan, or 124.2%, for administrative expenses.

In the final state accounts for 1979, expenditures exceeded income by 17.06 billion yuan. To make up the difference, we drew on the surplus of the past years to the sum of 8.04 billion yuan, and took out an overdraft of 9.02 billion yuan from the People's Bank of China.

This deficit is mainly the result of the measures taken for economic readjustment. These measures, which led to reduced revenues and increased expenditures, were indispensable for helping to lay the foundation for sustained economic growth in the future. They have already achieved obvious and heartening results and contributed to the consolidation and improvement of the political situation in which unity and stability go hand in hand with liveliness and vitality.

1. *The purchase prices of farm and sideline products were increased by a fairly big margin and some taxes in the rural areas were reduced or remitted.*

This helped bring about recovery in the rural areas in a relatively short time and contributed to the strengthening of agriculture which is the foundation of the economy. Beginning from the summer harvest of last year, the state raised the purchase prices of 18 major farm and sideline products, including grain, cotton, edible oils, hemp, sugar cane, beets, pigs, cattle, sheep, fish, eggs and cocoons, and instituted the policy of offering higher prices for grain, cotton and edible oils sold over and above quota. The state subsidy for such purposes amounted to 7.8 billion yuan in the year, or 1.3 billion yuan over the budgeted figure. For low-yielding, grain-deficient areas, the state set a level below which agricultural tax was to be remitted. As a result, the total amount of agricultural tax collected in 1979 was reduced by 4.7 billion *jin* (2.35 million tons) of grain. Moreover, the minimum taxable income level was appropriately raised for industrial and commercial income tax to be paid by enterprises run by communes, production brigades and production teams; the time limit for the reduction or remission of taxes to be paid by the newly established enterprises in the same category was appropriately extended; and it was stipulated that such enterprises located in minority nationality autonomous counties (or banners) and border counties should be exempted from industrial and commercial income tax for a period of five years. The total amount of taxes thus reduced and remitted came to 2 billion yuan in 1979, exceeding the budgeted figure by 300 million yuan. Thanks to the expansion of agricultural production and the rise in the price paid by the state for farm and sideline products, the peasants' per capita income from the collective economy averaged 83.4 yuan in 1979, an increase of 9.4 yuan over the previous year. Naturally, the situation differed from locality to locality. The above measures, nevertheless, were some of the most important ones taken in any year since the founding of the People's Republic to readjust the relationship between industry and agriculture, and to readjust the distribution of the national income and state finances. This is of positive, far-reaching significance for the development of the economy.

2. *Great efforts were made to increase employment, and steps were taken to increase the wages and salaries of a proportion of the workers and staff and introduce the system of rewards.*

As a result, their income rose to some extent. In 1979, jobs were provided through various channels for a total of 9,030,000 people in cities

and towns, including students who, graduating during the year from colleges and secondary vocational schools, were given jobs under a unified state plan. Altogether 40% of workers and staff got pay rises, and wage scales were readjusted in certain regions. A system of rewards was introduced in all state enterprises, and a monthly subsidy to offset the increased prices of non-staple food-stuffs given to all workers and staff. The average annual per capita wage of workers and staff in all state-run enterprises and establishments rose to 705 yuan, an increase of 61 yuan over 1978. State expenditures on all these items totalled 7.5 billion yuan, or 2.5 billion yuan more than the budgeted figure. In addition, the state allocated special funds out of capital construction investment which were combined with the reserve funds of local authorities and enterprises to build housing for workers and staff. By the end of last year, a total floor space of 62,560,000 square metres had been completed in cities, towns and mining areas. This figure shows a 66% increase over 1978, making 1979 the year which saw the greatest amount of housing built since the birth of the People's Republic. It should be noted that the state made strenuous efforts to provide this considerable sum in a year in which certain proportions in the economy were being readjusted and the state was in financial difficulty. However, there are a number of people in urban areas who are yet to be provided with jobs; earnings in some scientific, educational and public health establishments and administrative organs where no bonuses are given have increased only a little, or not at all, and the actual living standards of some have even fallen to a certain extent; moreover, housing is still a headache in urban, industrial and mining areas. We must make further efforts to solve all these problems.

3. *The financial powers and reserve funds of the local authorities and enterprises were increased.*

This is conducive to reinvigorating the national economy, promoting production and increasing revenue, and gradually correcting the serious disproportion between the productive and non-productive sectors. In 1979, the state specified that the authorities of 49 big and medium-sized cities could draw 5% from their industrial and commercial profits for urban construction, and that all other local authorities could utilize a certain portion of the earnings of their county-run industrial enterprises. As a result, the reserve funds of the local authorities were increased by 2 billion yuan. Meanwhile, a system was introduced whereby all state enterprises may set up enterprise funds, and in over 4,000 industrial and commercial

enterprises the policy of allowing the enterprise to keep a portion of its profits was tried out. As a result, these enterprises obtained 4 billion yuan as reserve funds. The state earmarked more than 6 billion yuan for the above purposes, which involved 2 billion yuan in excess of the budgeted figure.

4. Funds devoted to developing agriculture and light industry were increased by a fairly big margin.

This helped to readjust the proportions between agriculture, light industry and heavy industry, enliven the market and meet the people's rising purchasing power. In 1979, the state used 9.01 billion yuan, or 1.96 billion yuan more than the budgeted figure, to aid the communes and finance various agricultural undertakings. At the same time, apart from the 2.3 billion yuan set aside as investment in capital construction for the textile and other light industries, the state appropriated an additional 1.5 billion yuan for them as funds for tapping their potential and carrying out their transformation, or as special-purpose loans. To boost production, the state adopted the policy of giving them priority as regards supplies of fuel, power and raw and semi-finished materials. Last year saw a growth rate of 9.6% in the textile and other light industries, as against 7.7% in the case of heavy industry. There was a significant increase, seldom seen in past years, in the production of such manufactured consumer goods as cotton cloth, synthetic-fibre knitwear, paper, bicycles, sewing machines, wrist-watches, TV sets and synthetic detergents, all of which were in great demand.

5. There were increased expenditures on national defence and preparations against war.

In 1979, spending for such purposes reached 22.27 billion yuan, or 2.04 billion yuan in excess of the budgeted figure. In order to oppose hegemonism and ensure a peaceful environment for the realization of our socialist modernization, it was absolutely necessary that we increase our defence spending to some extent in 1979.

6. It should also be mentioned that since the Third Plenary Session of the 11th Central Committee of the Party, we have, in line with the principle of seeking truth from facts, redressed on a nationwide scale the wrongs done to many people who were unjustly, falsely or wrongfully accused.

This is of great significance in consolidating a political situation of stability and unity. It will also help to mobilize our whole people to work for

the four modernizations with one heart and one mind. In accordance with regulations laid down, the state has given the back pay due to rehabilitated cadres, workers and staff, and given subsidies to those in special difficulties. According to incomplete statistics, state expenditures in this regard have amounted to well over 1 billion yuan.

State expenditures in the six above-mentioned categories exceeded the budgeted figure by more than 11 billion yuan. These major measures taken by the state are very significant and have yielded remarkable results. That in a single year we did so much that had to be done is something unheard of for many years. The state spent more than the sum budgeted for improving the people's livelihood by readjusting prices, increasing wages and expanding employment. Moreover, despite reductions in spending on domestic capital construction, the necessary readjustment in expenditures could not be completed all at once and the scope of such construction is still too big. For these reasons state expenditures exceeded the budgeted figure by 5.3 billion yuan, and there is a deficit in the final state accounts for 1979. This is the price we have had to pay for the measures adopted. But people have already seen that with these measures, the relationships between the major sectors in our economy have begun to move towards better co-ordination, an excellent situation of all-round increase has been brought about in industrial and agricultural production and in commodity circulation, and a relatively big increase has been achieved in the purchasing power of both the urban and the rural population together with an improvement in living standards. In a word, things are thriving in all fields. Of course, our work is not free from shortcomings and mistakes, for in the implementation of the 1979 budget, we underestimated the serious consequences of the sabotage by Lin Biao and the Gang of Four. To cite some examples: there was a dislocation between the import of capital construction projects and budgetary arrangements; we failed to give top priority to the plan to lower costs in enterprises and to help those running at a loss to change for the better and make a profit; our financial management was not strict enough so that some profits and taxes were not turned in to the state as they should have been, and economy was not practised as it could have been with regard to some items of expenditure; our financial discipline was lax, and there were fairly serious cases of losses and waste with which we did not deal effectively. We have to improve our work and remedy the shortcomings in all these respects.

It should also be explained that a considerable part of last year's deficit was covered by drawing on the accumulated surpluses, and partly by a bank overdraft. However this did not lead to any

big increase in the issue of paper money, because, first, the total value of agricultural output last year was 8.6% higher than in the previous year, the total value of the output of light industry increased by 9.6%, and the total volume of retail sales rose by 14.7%. For many years past such big increases have been rare. Thanks to the good harvests and the increased output of the textile and other light industries, generally speaking, supplies of food, clothing and articles of daily use, with a few exceptions, were quite sufficient. Therefore, people felt reassured, and the market was virtually stable and also healthy.

Second, the savings deposits of the urban and rural population rose by 9.7 billion yuan during the year, and this is also a big increase, unheard of for many years. On the one hand, it shows that the masses are industrious and thrifty and are eager to support national construction; on the other, it also indicates that the people's currency, the Renminbi, enjoys high prestige.

Third, as a consequence of the restructuring of the financial system, part of the state's financial resources was converted into reserve funds of various local authorities and enterprises. The unspent part of these funds in turn became bank deposits. By the end of 1979, the deposits originally earmarked for specific uses by enterprises, the extra-budgetary deposits of local authorities, and the deposits of capital construction units, government departments, mass organizations and army units were some 6.7 billion yuan larger than at the beginning of the year. These funds helped to reduce the effects of the state financial deficit. The three aforesaid factors played an important role in forestalling any grave consequences that last year's financial deficit might have had on the economic life of the nation. There may well be repercussions sooner or later. The rise in the prices of certain commodities in recent years is a symptom of this. We must never treat this matter casually, but should pay great attention to and really solve it.

In our financial work, our policy has all along been one of ensuring a balance of revenue and expenditure with a slight surplus, and of striving to avoid deficit financing. In the final analysis, our financial deficit last year resulted from the severe damage done to the economy by Lin Biao and the Gang of Four over the ten catastrophic years and from the many problems ensuing therefrom. Experience has made us keenly aware that these problems which have accumulated over the years are much more serious than we first estimated and cannot be solved once and for all within a short period. Furthermore, our shortcomings and mistakes in construction will also take their toll by adding to the price we will have to pay. None of the major measures for economic readjustment we

adopted last year, including price readjustment, wage increases, bonus payments and the provision of employment, are temporary measures which are to be completed in a single year. They must be pursued and will inevitably impede our efforts to balance state revenue and expenditure for the next year or two. We must continue to do well in agricultural and light industrial production, keep prices basically stable and, in the course of implementing the budget, take vigorous measures to tap potential, increase revenues and economize on expenditures. While solving the problem of the unified collection of revenue and unified spending, we must further improve our financial system to meet the needs of the structural reform of the economy. Success in these respects will enable us gradually to reduce, and finally do away with, financial deficits and to strike a balance between revenue and expenditure. We believe that by following this economic readjustment and with advances in production and construction, we shall definitely be able to achieve our goal.

II. The Draft State Budget for 1980

In 1980, our financial work faces most serious tasks. We must continue to implement the policy of readjustment, restructuring, consolidation and improvement and further correct the serious disproportions in our economy. At the same time, we must conscientiously give full play to favourable conditions, ensure competition and promote integration so as to invigorate the economy. We must do what we can to accelerate the development of production, tap potential, explore more sources of revenue and increase receipts. We must firmly control investment in capital construction, reduce the rate of accumulation step by step and in a planned way, and gradually improve the people's livelihood on the basis of increased production and productivity. We must give more and more assistance to agriculture and light industry, strengthen such weak links as the coal, power, petroleum and building-materials industries and the transport services, and aid progress in the fields of culture, education, public health and science. We must, actively but prudently, continue to keep tight control over the restructuring of the financial system and the reform of the financial management of enterprises and the taxation system in order to improve our financial work.

To meet the above requirements, the 1980 budget sets state revenues at 106.29 billion yuan and expenditures at 114.29 billion yuan, the latter exceeding the former by 8 billion yuan. It should be possible to reduce this gap somewhat in the course of implementing the budget by increasing

production and practicing economy. The remainder of the deficit we plan to make up by obtaining loans at interest from the People's Bank of China.

At the 14th Session of the Standing Committee of the National People's Congress in April this year, the State Council submitted the Report on the Implementation of the 1979 National Economic Plan and the Arrangements for the 1980 National Economic Plan, in which it estimated that state revenues in 1980 would be 98.2 billion yuan and expenditures 102.2 billion yuan, the difference being 4 billion yuan. A new estimate has now been made in the light of the implementation of the 1980 budget during the first half of this year, and the fresh problems that have cropped up. Moreover, new items have been included: for instance, revenue in the form of foreign loans and allocations for capital construction out of foreign loans, outlay for repaying principal and interest within the current year, additional allocations for investment in the power industry and for combating unusually serious floods and droughts, necessary expenditures for the increase of personnel in the public security, procuratorial and judicial organs, and subsidies for the reduction in the price of pork. Therefore, there has been an increase in both revenues and expenditures, with a bigger gap between them.

Of the total budgetary revenues for 1980, receipts from enterprises amount to 46.06 billion yuan, taxes 54.4 billion yuan, receipts from other sources 240 million yuan, depreciation funds turned in by enterprises to the central financial departments 2.2 billion yuan, and receipts in the form of foreign loans 3.39 billion yuan.

Compared with the previous year, total revenues for 1980 are 4.04 billion yuan lower. This is because the higher prices paid for farm and sideline products, the wage increases, the expansion of employment, etc., which were successively introduced in the middle of last year had an impact on revenues for only a few months in 1979, but this effect will continue to be seen throughout the year of 1980. Furthermore, the year 1980 will also see the prices of cotton, medicines, pig iron, coke, etc., readjusted and the depreciation rate raised for the railways as well as for those enterprises which are experimenting with profit sharing. Calculated in terms of comparable items, revenues in 1980 will increase by 6.4 billion yuan, or 6% over last year. This target is basically in keeping with the 5.5% increase in the gross value of industrial and agricultural output. It is ambitious yet realizable.

It is necessary to add that at present there is a wide variety of state subsidies to offset price increases, and these subsidies will exceed 20 billion yuan in 1980. Some totalling about 12 billion

yuan cover such basic consumer commodities as grain, cotton, edible oils, meat, eggs, vegetables and coal for household use; others, which are for the increased purchase prices of agricultural products sold above quota, amount to over 5 billion yuan; still others costing 3 billion yuan or so are for ensuring preferential prices of the means of agricultural production and of industrial products which aid agriculture. The total figure will be much bigger, if subsidies for house rent, transport and other items are included. All these price subsidies eat up part of the state's revenue and will naturally affect its increase adversely. Nonetheless, it must be affirmed that, in the conditions prevailing in our country, such subsidies are essential for ensuring a secure and better life for the people and for promoting national stability and unity. We must do an even better job in this regard.

Total budgetary expenditures for 1980 were cut by 13.1 billion yuan as compared with last year. The breakdown is essentially as follows:

1. Appropriations for capital construction total 37.35 billion yuan, 14.1 billion yuan less than last year.

Of this sum, capital construction investment directly provided for in the state budget comprises 24.15 billion yuan; capital construction investment provided by stand-by financial resources in the localities plus the investments placed at the disposal of Tangshan comprise 2.13 billion yuan; outlays such as reserve funds for capital construction comprise 4.74 billion yuan; and appropriations for capital construction derived from foreign loans comprise 6.33 billion yuan. Here some explanations are in order. Investment in capital construction arranged by the state has been reduced, while construction outlays from extra-budgetary funds raised by the localities and enterprises themselves, as well as various loans earmarked for capital construction, have increased. Therefore, the projected scope of capital construction still remains at the level of 50 billion yuan. This requires an overall arrangement which takes account of both budgetary and extra-budgetary investments, both financial resources and credit, and both domestic funds and foreign loans, which can channel scattered funds into the production and construction projects most vital to the state, and which can exercise a strict control over the scope of capital construction. From now on it is necessary to draw up a comprehensive financial plan and improve the overall balance of our financial and material resources.

2. Funds allocated for tapping the potential of enterprises or for transforming enterprises, plus those for subsidizing the trial-manufacture of new

products, amount to 6.98 billion yuan, 220 million yuan less than last year.

Apart from these funds which fall within the category of direct state appropriations, the depreciation funds collected by the state-owned enterprises according to the relevant stipulations plus profits kept by the enterprises for expanding production amount to 16 billion yuan. Added together, all these funds amount to a considerable sum. If they are put to rational use through an overall arrangement, they can yield substantial results.

3. *Additional allocations of circulating funds to enterprises and of credit funds to banks account for 3.72 billion yuan, 1.48 billion yuan less than last year.*

They are intended mainly to meet the needs of newly commissioned enterprises and certain special reserves. Considering that overstocking of materials is a common problem in enterprises so that too large a percentage of their funds is lying idle, the funds needed for expanding production in the existing enterprises should be obtained mainly through improving management, reducing stocks and exploiting financial potential.

4. *Expenditures for aiding the communes and other operating expenses for agriculture total 7.74 billion yuan, 1.27 billion yuan less than that for last year.*

If we add to this the 6.66 billion yuan that will flow to the countryside from the investments in capital construction, circulating funds and rural relief funds, and another 2.4 billion yuan in agricultural loans, the amount earmarked for agriculture in 1980 comes to 16.8 billion yuan, which represents a considerable sum.

5. *Allocations for culture, education, health work and science amount to 14.83 billion yuan, an increase of 1.62 billion yuan over 1979.*

Speeding up the development of education and science is the key to the realization of the four modernizations. Since these two fields have been starved of funds for a number of years, outlay ought to be increased. Therefore the funds allocated have been increased as much as the country's financial resources will allow. Owing to our present limited financial and material resources, some problems in science and education will have to be solved step by step.

6. *Expenditures on national defence and preparations against war account for 19.33 billion yuan, 2.94 billion yuan less than last year.*

7. *Expenditures on administration and*

management amount to 5.78 billion yuan, an increase of 90 million yuan over 1979.

8. *Development funds in aid to economically underdeveloped areas take 500 million yuan.*

These funds have been established for the first time in this year's budget for the purpose of boosting production mainly in the old revolutionary base areas, remote border areas, autonomous localities inhabited by minority nationalities and places with a relatively poor economic base.

9. *The general reserve funds account for 1.88 billion yuan.*

10. *Payments on the principal and interest of foreign loans take 2.17 billion yuan.*

They cover mainly the proportion borrowed and to be repaid by the state for financing contracts signed during the last few years to import equipment and technology with foreign funds, and payments of principal and interest starting as from this year.

As for foreign debts, it is estimated that up to the end of 1980, the total amount borrowed by the state will be U.S.\$3.4 billion after deducting the matured principal that will be paid off. In order to bring about the quickest possible economic results from foreign loans, we must conscientiously strengthen our planning and management in the import of advanced technology and equipment. Especially in the coming years this work must be linked with the readjustment of the economy and with the elimination of some of its weak links. At the same time, full consideration must be given to the terms and conditions of loans, to our ability to manufacture the necessary accessories in China and our ability to repay. From now on the proportion of loans to be repaid from the state coffers must be borrowed by the state financial institutions and included in the national plan. A system of clearly defined job responsibility should be set up, and management must be properly strengthened so that the present state of lax management and poor co-ordination can be firmly dealt with.

Fellow Deputies, more than seven months of the year 1980 have elapsed. During this period, the national economic plan has been implemented very satisfactorily. Industrial production has surpassed the planned rate of growth; the textile and other light industries, in particular, have increased output by a big margin as compared with the same period of last year. In commerce, both sales and purchases have been brisk and the market is active. With the gradual raising of the people's income, urban savings deposits have shown an increase of 4.7 billion yuan compared with the end of last

year. The situation as regards revenues and expenditures from January to July was also fairly good. Revenues were 57.7 billion yuan, or 54.3% of the sum budgeted for the whole year, while expenditures were 58.26 billion yuan, or 51% of the sum budgeted for the whole year; thus expenditures exceeded revenues by 560 million yuan.

According to the pattern prevailing over the years, the greater part of expenditures is incurred in the second half of the year, especially in the last quarter. Furthermore, the impact of most of the factors that will result in a reduction in revenue this year, such as enterprises retaining part of their profits, wage increases, and price adjustment for cotton and so on, will only be felt in the last few months of the year. So we must not relax in the coming months just because the situation as regards revenues and expenditures in the first seven months is not bad. In order to fulfil the budgetary plan for the whole year, we should exert still greater efforts to increase revenues and cut expenditures and narrow the gap between the two.

III. Financial Estimates for 1981

Nineteen eighty-one will be the first year of the Sixth Five-Year Plan. According to the guiding principles and policies laid down by the state and the requirements of the national economic plan for 1981, the state financial departments must, on the basis of the continued readjustment of the economy and growth of production, rationally arrange the various revenues and expenditures so as to promote the co-ordinated development of various undertakings and to improve the people's livelihood. Our efforts to narrow the gap between revenue and expenditure in 1980 should be carried on through 1981 so as to lay the foundation for sound and balanced finances. We should continue to reform financial administration, the system of taxation and the management of finance in enterprises, thus improving financial work, and co-ordinate all this with the restructuring of the economic system so as to meet the needs of the four modernizations.

The projected state financial estimates for 1981 are as follows: State revenues are put at 115.46 billion yuan and state expenditures at 120.46 billion yuan, with a deficit of 5 billion yuan. These estimates take into account the money to be borrowed from abroad, the appropriations for capital construction provided by foreign loans and payments on principal and interest for the year.

Estimated state revenues for 1981 show an increase of 9.17 billion yuan compared with 1980. This is calculated in terms of the rate of growth of

industrial and agricultural production after the increase in revenue resultant from reducing costs and tapping the potential of the enterprises has been taken into account. Of the total revenues, 49.62 billion yuan is to come from the enterprises, 59 billion yuan from taxation and 240 million yuan from other sources, while the depreciation funds of enterprises to be turned in to the central financial authorities will amount to 2.1 billion yuan.

Estimated state expenditures for 1981 are 6.17 billion yuan more than in 1980. This is in line with the need to continue the readjustment of the national economy. The breakdown of the total is as follows: appropriations for capital construction, 37.58 billion yuan; additional allocations of circulating funds to enterprises, 2 billion yuan; funds to be allocated for tapping the potential of enterprises, for transforming them and for subsidizing the trial-manufacture of new products, 6.7 billion yuan; aid to the communes and other operating expenses for agriculture, 8.8 billion yuan; allocations for culture, education, health work and science, 16.95 billion yuan; national defence and preparations against war, 20.17 billion yuan; administrative expenses, 6.06 billion yuan and general reserve funds, 2.6 billion yuan.

According to these estimates, the increase in revenues in 1981 will be greater than in expenditures, and thus the difference between them will be smaller than in 1980. During 1981, the state will gradually provide for appropriate increases in the incomes of staff members in scientific research, educational and health institutions as well as in government departments where very small or no bonuses are given, and will find work for several million more people who are waiting for jobs. The living standards of both the urban and rural population will be further raised.

Since the plan for the development of the economy in the period of the Sixth Five-Year Plan is still being worked out, necessary readjustments will be made in the state financial estimates for 1981 in accordance with the finalized plan. If there are major changes, these estimates will be submitted to the Standing Committee of the National People's Congress for re-examination.

I would now like to go into the question of reforming the system of financial administration. The concentration and distribution of financial resources must be suited to the restructuring of the economic system. At present, we are carrying out a step-by-step restructuring of the economic system in accordance with the principle of combining regulation by planning with regulation by the market. We will give the enterprises greater power to make decisions, organize various forms of economic integration and encourage competition guided by planning. The reform of the

financial administration system began in 1978. In the latter half of that year, the systems of establishing enterprise funds and giving awards to workers and staff were put into effect in state-owned enterprises. In 1979, we tried out three systems under which some state-owned enterprises retained a share of their profits, loans replaced appropriations in some capital construction projects, and some administrative establishments took responsibility for their surpluses or deficits; we instituted a system of holding agricultural reclamation enterprises responsible for their own finances; and we adjusted and improved the tax system relating to agriculture as well as to industry and commerce. In 1980, we have undertaken the reform of the financial structure and also launched some experiments in the reform of the taxation system. In general, these reforms have aroused the initiative of the parties concerned and have achieved good results. However, they are only preliminary reforms. We should continue to carry out reforms in the next few years and co-ordinate the reform of the financial administration system with that of the economic system. For the next year and a half we will concentrate our efforts on the following reforms:

1. The Restructuring of the Financial System. Starting this year, we have instituted a special system for the two provinces of Guangdong and Fujian under which the provincial authorities are to be held responsible for their own finances after handing in a fixed sum to the state. For the other provinces, municipalities and autonomous regions we are trying out a system of "apportioning revenues and expenditures between the central and local authorities, while holding the latter responsible for their own profit and loss." That is to say, whereas in the past "everybody shared food from the same big pot," now each will "eat from his own pot." The localities will be able to spend more when their revenues rise but should spend less when they fall. They must balance their own revenues and expenditures. For the five minority nationality autonomous regions, Xinjiang, Ningxia, Inner Mongolia, Tibet and Guangxi, and the three provinces, Yunnan, Guizhou and Qinghai, the preferential treatment they have enjoyed will remain unchanged and the subsidies provided by the central authorities will be increased progressively at a rate of 10% a year. In 1981, we should sum up the experience gained in experimenting with these new systems and improve them.

2. Reform of the System of Enterprise Finance Management. The system of letting enterprises keep part of their profits is being tried out

this year in 6,600 state-owned industrial and transport and communications enterprises. It will be extended to all state-owned enterprises in 1981. In order to make rational use of state assets, the state financial departments will charge state-owned enterprises for the use of circulating funds allocated to them beginning from the latter half of this year, and starting in 1981 will charge them for the use of the fixed assets on a trial basis. As for investments in capital construction, from 1981 we will implement a system of bank loans instead of appropriations from the state coffers for all units except administrative establishments and a few projects. We shall have to see how integrated complexes develop and operate before we can work out a system for their financial management.

3. Reform of the Taxation System. In 1980, we shall pass legislation and begin to collect an income tax from joint ventures involving Chinese and foreign investment and an income tax from individuals. We should do a good job in collecting taxes concerning foreign nationals. In order to solve the problem of double taxation on some industrial products, we shall try out a value-added tax in the machinery and farm machinery industries. We shall also amend the income tax law on urban collectively owned enterprises so as to appropriately reduce their tax burden in an equitable manner and promote the development of the collective economy. Starting from 1981, we shall experiment with having state-owned enterprises pay a business tax instead of turning their profits over to the state, and accordingly begin to levy the regulatory business tax and resources tax.

The above reforms, particularly the reform of the tax system, will inevitably affect the distribution of revenue and other aspects of the economy. They are therefore important policy issues and involve a wide range of problems. They require thorough investigation and study, experimentation, and co-ordination with the reform of the economic system as a whole. We must vigorously but prudently push ahead with these reforms in order to meet the requirements of economic development.

IV. Go All Out to Increase Production and Practice Economy, Combat Extravagance and Waste, and Improve Economic Performance, in Order to Carry Out Our Financial Tasks for This Year and the Next

The political and economic situation in our whole country today is very satisfactory. After

more than a year of strenuous effort, the ideological, political and organizational lines adopted at the Third Plenary Session of the 11th Central Committee of the Party are being conscientiously put into effect. The readjustment and restructuring of the national economy are making good progress and notable results have been achieved. However, there are still some weak links in the chain of our financial and economic work, and losses and waste are not uncommon. Consequently, there is an enormous potential to tap with respect to increasing production and practicing economy. In order to fulfil the financial tasks for this year and the next, we must inspire and organize the cadres and the people to work even harder to increase production and practice economy, combat extravagance and waste and vastly improve economic performance so that the national economy may develop steadily and harmoniously.

Production is the foundation of finance. The active promotion of production together with increases in tax revenues and in profits will provide important guarantees for the fulfilment of the financial tasks for 1980 and 1981. In many enterprises at present the rate of consumption of energy and raw materials is high, waste great, the rate of profit low and losses are heavy. Every one hundred yuan's worth of products sold by state-run enterprises yielded 25 yuan in tax revenue and profit in 1979 which is 5 yuan, or 16% less than in 1965. The total losses incurred by industrial enterprises in the first six months of this year were still as high as 1.4 billion yuan. Such losses must be eliminated as quickly as possible. The success or failure of industrial as well as agricultural undertakings in future should be judged by their economic performance. Every undertaking must take the actual conditions into full account, make the best possible use of favourable conditions and avoid the unfavourable and must use the available manpower, material, and financial resources where they can yield the maximum results. Each enterprise must tap its own potential to the maximum and increase the variety of its products and expand their sales to make sure that the increase in production and in tax revenue and profit required by the state plan is attained. Priority in the supply of raw and semi-finished materials, fuel and power must be given to the textile and other light industries to ensure more and better products for the market, and to keep prices basically stable. Measures must be taken to cut down the consumption of energy, and to reach the targets set by the state for the economical use of energy. Energetic efforts must be made to develop foreign trade, tourism and the service trades, and a conscientious job must be done with regard to remittances from

Chinese nationals residing abroad. The masses of workers and staff must be aroused to improve management and business accounting in their enterprises so as to lower costs and increase profits and thus contribute more to the state.

Increasing the returns on investment while strictly controlling the magnitude of capital construction is of first-rate importance to the more rapid growth of production and construction. During the First Five-Year Plan, it generally took four or five years to build a large or medium-sized project. Now, it averages a dozen years. During the First Five-Year Plan it took an average of three to four years to recoup the sum invested in some industries, and now, it averages more than eight years. Some completed projects were not commissioned for a long period of time. Others have operated at a loss year after year ever since they were commissioned. How much can we accomplish in the 20 years before the end of this century if it takes ten years to build a large or medium-sized project and more than eight years to recoup the sum invested and if, still worse, some of the projects continue to depend on state subsidies for their operations? And where can we acquire all the funds needed for our modernization programme? We must conscientiously draw lessons from such undeniable historical facts as are presented by instances of excess in capital construction, huge waste and unsatisfactory economic results, and resolutely cut out projects which are unrealistic in terms of construction possibilities or which are not badly needed, and use our limited financial and material resources for those projects which will yield the best economic results. We very much need to frame legislation to check the results of investment in capital construction and to apply strict discipline to capital construction. It should be stipulated, among other things, that no project can be undertaken before its feasibility has been studied, before the advisability of importing advanced technology and equipment financed by foreign funds has been considered, before alternative construction plans are drawn up and compared and the best is chosen. The projects chosen should be undertaken strictly according to the procedure for capital construction. Those who act irresponsibly, make the investment inefficient, or cause heavy losses or waste in construction, shall be held economically responsible, and disciplinary actions shall be taken against them or, where warranted, they shall be punished according to law. They must not be allowed to get away unpunished.

Enterprises must use their circulating funds with meticulous care so as to achieve the best possible economic results. The turnover of enterprise circulating funds was speeded up last year

and in the first half of this year, thus saving a considerable sum. But generally speaking, there are still large sums lying idle, serious overstocking of materials and huge losses and waste. For every hundred yuan's worth of manufactured goods sold, 33 yuan of circulating funds was needed in 1979, eight yuan more than in 1965. Despite constant appeals, the stockpile of rolled steel and mechanical and electrical engineering products has swollen year after year. The country's stockpile of mechanical and electrical engineering products has now reached 60 billion yuan in value and that of rolled steel has now increased to nearly 20 million tons. Business establishments also have a considerable quantity of unsalable or slow-selling goods on hand, which are tying down large funds. In coordination with the general checkup on enterprise assets now under way, it is necessary to give scope to the regulatory role of the market by various means so as to dispose of these overstocked materials and bring about a quicker turnover of materials and funds. Commercial enterprises should organize the circulation of commodities according to the economic regions of the country, cut down the number of intermediate links, reduce circulation expenses and speed up the turnover of funds.

In the non-productive sectors we must continue to practice strict economy and combat waste. Since the beginning of the year, local authorities, departments and units have put into effect the "Circular on Reducing Non-Productive Spending and Combating Waste" issued by the Central Committee of the Party and the State Council; good results have already begun to be seen, and many models have emerged. However, extravagance and waste still exist in a number of enterprises and establishments as well as in government departments, mass organizations and army units. The squandering of state funds on the purchase of luxury goods by some units which take advantage of their dealings with foreign personnel and foreign visitors is still rather serious. The unhealthy tendency of some leading cadres to use their positions to pursue personal perquisites and privileges has not yet been completely brought in check. We must continue to take vigorous action in the spirit of the circular and give fuller play to the fine tradition of building the country through diligence, thrift and hard work. We must streamline our administration step by step and in a planned way, exercise strict control over institutional purchases, drastically reduce various kinds of non-productive spending and make earnest efforts to solve the problems of overstaffing and inefficiency.

To increase production and practice economy, combat extravagance and waste and achieve better economic results, it is necessary to strengthen financial control and enforce strict financial and

economic discipline. In April and May this year, a general countrywide checkup on the enforcement of financial and economic discipline was carried out. This yielded good results, and we found that certain local authorities, departments and enterprises had arbitrarily held back state revenues, had reduced or remitted taxes without authorization, had taken it upon themselves to raise prices, extend the scope of cost outlays and raise the ceilings on their spending, or had handed out bonuses without regard to merit and subsidies without regard to need. Some of the offences were quite serious. While it is true that the root of these problems lies in lax party discipline and a weak sense of legality resulting from the long interference and sabotage perpetrated by Lin Biao and the Gang of Four, the tendency among some leading cadres to attempt the impossible, seek quick results and only concern themselves with a part to the neglect of the whole must also be considered an important cause. In order to strengthen financial and economic discipline, we must first see to it that leading cadres at various levels are guided by the principles of attempting only what is possible and taking the whole country and the overall situation into account. Leading cadres at all levels must draw the lessons from the capsizing of the oil rig *Bohai No. 2* and improve their work. They must set an example in abiding by the law and in having a scientific approach and take the lead in enforcing all financial and economic rules and regulations. To ensure that laws are observed, their enforcement must be strict and law-breakers must be punished; violations of financial and economic discipline must be investigated and sternly dealt with. No violation should be tolerated, not even with the excuse that it "will not serve as a precedent," for such an excuse actually means a precedent is being set which can pave the way for more and more violations of law and discipline. Financial personnel, tax collectors and accountants must be supported in performing their duties and encouraged to go about their work boldly. We must back up those comrades who are subjected to retaliation for upholding principles or for reporting matters truthfully and severely punish those who seek revenge so as to promote healthy tendencies and combat unhealthy ones.

Fellow Deputies,

The current political and economic situation in our country provides very favourable conditions for the fulfilment of the national economic plans and the state budgets for 1980 and 1981. Although we will encounter all manner of difficulties as we advance, the prospects for development are good and it is entirely possible to bring about a steady growth of the economy and gradually strike a balance between revenue and expenditure. Led

by the Chinese Communist Party and relying closely on the workers, peasants and intellectuals of all nationalities as well as all the democratic parties, patriotic personages and patriotic overseas

Chinese, let us emancipate our minds, seek truth from facts, unite and work as one and strive for the successful fulfilment of the financial tasks set for 1980 and 1981.

**7. RESOLUTION OF THE THIRD SESSION OF THE FIFTH NATIONAL
PEOPLE'S CONGRESS OF THE PEOPLE'S REPUBLIC OF CHINA
ON THE ARRANGEMENTS FOR THE NATIONAL ECONOMIC PLANS
FOR 1980 AND 1981, THE FINAL STATE ACCOUNTS FOR 1979,
THE STATE BUDGET FOR 1980 AND THE FINANCIAL ESTIMATES FOR 1981**
(Adopted on September 10, 1980)

The Third Session of the Fifth National People's Congress of the People's Republic of China, after deliberation and examination, approves the arrangements for the national economic plans for 1980 and 1981 and the Report on the Arrangements for the National Economic Plans for 1980 and 1981 delivered by Yao Yilin, Vice-Premier of the State Council and concurrently Minister in charge of the State Planning Commission. The session, in accordance with the Examination Report submitted by the Budget Committee, approves the final state accounts for 1979, the state budget for 1980 and the financial estimates for 1981, and approves the Report on the Final State Accounts for 1979, the Draft State Budget for 1980 and the Financial Estimates for 1981 delivered by Wang Bingqian, Minister of Finance.

The session holds that the National Economic Plan for 1979 was implemented satisfactorily in the main and the economy as a whole made steady advances in the course of readjustment. The state financial departments did a lot of work to support the readjustment of the economy and did much that had to be done to correct the serious disproportions in our economy caused by the sabotage of Lin Biao and the Gang of Four and gradually to solve the problems in production and in the people's livelihood left outstanding over the years, thus promoting the stability and unity of the whole country and the growth of the national economy and resulting in some improvement in the lives of the majority of the urban and rural population.

The successes scored in our national economy prove that the policies of shifting the focus of the work of the whole country and of readjusting, restructuring, consolidating and improving the national economy, which were put forward by the Central Committee of the Communist Party of China and the State Council and adopted at the

Second Session of the Fifth National People's Congress, and a series of new policies are correct and that our economic work in various aspects are fruitful.

On the other hand, the session, having conscientiously studied the problem of deficits in the final state accounts for 1979, points out certain shortcomings and mistakes that occurred in the performance of work. The session enjoins the relevant departments under the State Council to make further efforts to implement the guiding principle of proceeding from reality, acting according to our capabilities and paying attention to economic results; to adopt effective measures to increase production, practice economy, combat waste, curtail capital construction, strengthen financial control; and to enforce strict financial and economic discipline so as gradually to reduce our financial deficit and achieve a balance between revenues and expenditures.

The session holds that the arrangements for the national economic plans for 1980 and 1981, the state budget and financial estimates embody the requirements of the continued readjustment of the national economy and the betterment of the people's lives; that the main targets are ambitious yet prudent and the measures are efficient. The fulfilment of the plans, budget and financial estimates will certainly lead to new advances in our socialist construction and create favourable conditions for the continued restructuring of our economic management and for the sustained growth of the national economy in the future.

The session calls on the people of all nationalities in the country, under the leadership of the Communist Party of China and the People's Government, to emancipate the mind, to seek truth from facts, to work with one mind and one heart, and to strive to fulfil the national economic plans and financial tasks for 1980 and 1981.

8. REPORT OF THE BUDGET COMMITTEE OF THE FIFTH NATIONAL PEOPLE'S CONGRESS ON THE EXAMINATION OF THE FINAL STATE ACCOUNTS FOR 1979, THE DRAFT STATE BUDGET FOR 1980 AND THE FINANCIAL ESTIMATES FOR 1981

(Adopted by the Presidium of the Third Session of the Fifth National People's Congress at its Second Meeting on September 1, 1980)

The Budget Committee of the Fifth National People's Congress, after hearing the Report on the Final State Accounts for 1979, the Draft State Budget for 1980 and the Financial Estimates for 1981 delivered by the Minister of Finance, Wang Bingqian, on behalf of the State Council, discussed and examined the final accounts for 1979, the draft state budget for 1980 and the financial estimates for 1981, in the light of the opinions raised by the deputies. I am now submitting a report on the result of the examination on behalf of the Budget Committee:

According to the final state accounts for 1979 prepared by the State Council, revenues totalled 110,330 million yuan, expenditures totalled 127,390 million yuan, and expenditures exceeded income by 17,060 million yuan. To make up the difference, the state drew on the surplus of the previous years to the sum of 8,040 million yuan and took out an overdraft of 9,020 million yuan from the People's Bank of China. The Budget Committee holds that the state financial departments did a lot of work in 1979 to implement the policy of readjustment, restructuring, consolidation and improvement, and scored great successes. That year, the purchase prices of major farm and sideline products were increased by a fairly big margin; some taxes in the rural areas were reduced or remitted; 40% of workers and staff got pay rises; jobs were provided for more than 9 million people; a total floor space of 60 million square metres of housing for workers and staff were completed; back pay was given to rehabilitated cadres, workers and staff after their wrongs had been redressed, etc. At the same time, in accordance with the requirements of the economic readjustment and restructuring, the state increased fairly substantially its expenditures for developing agriculture, light industry and educational and scientific undertakings, and enlarged the financial powers of the localities and enterprises.

It is indeed something unheard of for many years that the state adopted so many significant measures and did so much that had to be done in a single year. This was necessitated by the effort to correct the serious disproportions in the national economy caused by the sabotage of Lin Biao and the Gang of Four and by the effort to gradually

solve the problems in production and in the people's livelihood left outstanding over the years. Although there was a considerable deficit in the final state accounts for 1979 and there were certain shortcomings and mistakes in our work, our financial work on the whole did promote economic readjustment and growth and the achievements were primary.

The draft state budget for 1980, put forward by the State Council, sets revenues at 106,290 million yuan and expenditures at 114,290 million yuan, the latter exceeding the former by 8,000 million yuan. The financial estimates for 1981 put the revenues at 115,460 million yuan and the expenditures at 120,460 million yuan, with a deficit of 5,000 million yuan. The Budget Committee holds that while 1979 saw a deficit of 17,000 million yuan, the difference would be narrowed to 8,000 million yuan for 1980 and further to 5,000 million yuan for 1981; this is in line with the need of national construction in this year and the next and with the possibility of increasing income and retrenching spending. These will be the results of tremendous efforts.

Judging by the economic and financial development in this year and the next, it is impossible to attain big increases in state revenues in these two years, because the failure to push energy industry up will affect the speed of growth of production to a certain extent, coupled with factors of temporary cuts in incomes resulting from the continued readjustment of the proportions in the national economy. On the other hand, drastic cuts in spending and an abrupt about-turn will also do harm to the national economy. Although necessary retrenchments have been made in appropriations for capital construction, in allocations of circulating funds to enterprises and in funds for national defence and preparations against war, overall expenditures cannot be reduced too much because of appropriate increases in allocations for culture, education, health work and science and for the maintenance of urban construction; for the establishment of a new development assistance fund for economically underdeveloped areas; for payments on principal and interest for foreign loans and appropriate arrangements for aid expenditures to agriculture; for tapping the potential of enter-

prises; for transforming enterprises; for trial-manufacturing new products; and for allocations related to the improvement of the life of the urban and rural population. In these circumstances, it is realistic to require a gradual narrowing and final elimination of deficits in this year and the next. On the whole, the arrangements for revenues and expenditures for these two years embody the requirement to continue to readjust the ratio between accumulation and consumption and gradually lower the rate of accumulation; they embody the requirement to effect a gradual improvement in the material and cultural life of the people on the basis of increased production; and they embody the requirement both to ensure the minimum need for the immediate production and construction and to prepare the conditions necessary for the sustained development of the national economy in the future.

On the basis of the above analysis, the Budget Committee proposes that the National People's Congress approve the final state accounts for 1979 and the state budget for 1980, adopt in principle the financial estimates for 1981, and approve the Report on the Final State Accounts for 1979, the Draft State Budget for 1980 and the Financial Estimates for 1981, delivered by the Minister of Finance, Wang Bingqian, on behalf of the State Council.

The stability and balance of state finances is an important condition for the four modernizations and also a significant hallmark for accomplishing the task of readjusting the national economy. The Budget Committee thinks that there will still be a deficit in this year and the next and that successive deficits will eventually affect the economic life. On the other hand, a number of unexpected problems may turn up in the course of economic readjustment and restructuring. Therefore, it will be a strenuous task to carry out the 1980 state budget and the 1981 financial estimates and to strive to narrow the gap between revenues and expenditures. The Budget Committee proposes that the present session of the National People's Congress raise the following demands on the departments concerned, all our personnel and the people of all nationalities in the country:

1. Work harder to increase production, practice economy, increase the varieties of products and expand sales, tap potential, improve economic performance, make sure that industry and agriculture will develop harmoniously and steadily; energetically develop foreign trade and tourism, do a good job with regard to remittances from Chinese nationals residing abroad, and explore more sources of revenue. On this basis, be sure to fulfil and strive to overfulfil the revenue

tasks for this year and the next.

2. Continue to expand textile and light industries energetically and increase the commodity supplies on the market to suit the needs of the ever-growing purchasing power of the urban and rural population. At the same time, it is necessary to advocate among the people diligence and thrift in running the family and to encourage them to deposit their savings in the banks and to exercise strict control over institutional purchases and reduce the issuance of bank notes. Powerful measures should be taken to keep the prices basically stable and to resolutely correct the erroneous practice in some areas or units to willfully raise the prices of consumer goods or to effect increases in a disguised form.

3. Implement the principle of building the country through diligence, thrift and hard work, and firmly combat extravagance and waste. At present, in the sectors of capital construction, production and distribution, it is not uncommon to neglect business accounting or economic performance, to stockpile goods and to incur losses and waste; it is very serious in some cases. All departments must take effective measures to get rid of these, strive to do more with less money, and do it well so as to divert money in order to aid the speedy development of science and education.

4. In line with the need to give full play to favourable conditions and to ensure competition and promote integration, it is necessary to speed up the pace of structural reform on the basis of trials and thus to further invigorate the economy. With regard to plans already set for reforms of the financial, taxation and enterprise finance systems, preparations must be hastened so that they can be put into effect step by step in this year and the next, and so that the reform of the financial administration system is coordinated with that of the economic system.

5. Be guided by the principle of attempting only what is possible and taking the overall situation into account, and strengthen overall balance. In economic work, we must be realistic and scientific and act in accordance with objective economic laws; combine the need of construction with our financial resources; and combine overall interests with local interests so as to do our production and construction work better.

6. Strengthen financial control and enforce strict financial and economic discipline. Violations of financial and economic discipline or those who act irresponsibly to render investments inefficient

or to cause heavy losses or waste, must be investigated and dealt with sternly as in the case of the capsizing of the oil rig *Bohai No. 2*. These cases should be used to educate our cadres as a warning and to urge them to heighten their sense of respon-

sibility to the cause of the people and their awareness to observe law and discipline and to perform their duties well.

The above is put to this congress for examination.

9. REGULATIONS ON BREEDING AND PROTECTION OF AQUATIC RESOURCES

(Promulgated by the State Council of the People's Republic of China
on February 10, 1979)

Chapter I. General Principles

Article 1. In accordance with Article 6 in the Constitution of the People's Republic of China that "mineral resources, waters and those forests, undeveloped land and other marine and land resources owned by the state are the property of the whole people" and with Article 11 that "the state protects the environment and natural resources and prevents and eliminates pollution and other hazards to the public," and in order to breed and protect aquatic resources and expand the aquatic production to meet the needs of the socialist modernization, these regulations have been enacted.

Article 2. Aquatic animals and plants of economic value in all stages of development, including their parents, younglings, roes and spore, as well as their environment, should all be protected under the stipulations in these regulations.

Article 3. The State Administration of Aquatic Products, fishing headquarters in all sea areas, and revolutionary committees at all local levels should strengthen their organizational work and leadership over the breeding and protection of aquatic resources, fully arouse and rely on the masses and conscientiously carry out the regulations.

Chapter II. What Is To Be Protected and Principles for Catching and Gathering

Article 4. Special attention should be paid to the protection of the following important and valuable aquatic animals and plants.

(1) *Fishes*. Sea fishes: hairtail, yellow croakers, small yellow croakers, round scad, sardine, Pacific herring, long-finned herring, and porgy, black sea bream, red-fin pargo, snapper, mullet, left-eyed flounder, right-eyed flounder, sole, grouper, codfish, lizard fish, golden thread, pomfrets, flat cod croaker, white Chinese croaker, spotted mackerel, chub mackerel, mackerel, sharp-toothed eel.

Fresh-water fishes: Common carp, black carp, grass carp, silver carp, big head, white fish, red-fin cutler, mud carp, golden carp, reeves shad, mandarin fish, triangular bream, bream, salmon, Yang-

tze sturgeon, Chinese sturgeon, sturgeon, scaleless carp of the Qinghai Lake, *Coilia nasus*, whitebait, river eel, ricefield eel and silver chub.

(2) *Shrimps and Crabs*. Prawn, small shrimp, freshwater shrimp, sea shrimp, Mitten crab, swimming crab and fresh-water crab.

(3) *Shellfishes*. Abalone, razor clam, ark shell, oyster, *Macra* (double-shelled Scallop), sea scallop, pen shell, hard clam, variegated clam, green mussel, blue mussel, hard-shell mussel, pearl shell, river mussel.

(4) *Seaweeds*. Laver, *Undaria*, *Gracilaria*, kelp, *Eucheuma spinosa*.

(5) *Freshwater Edible Plants*. Lotus-root, water chestnut, Gorgon fruit.

(6) *Others*. Chinese river dolphin, whale, giant salamander, green turtle, hark's bill turtle, sea cucumber, cuttlefish, squid, tortoise and turtle.

The revolutionary committees of provinces, autonomous regions and municipalities may make necessary additions to or subtractions from the above list according to the local aquatic resources.

Article 5. Aquatic animals must not be caught until they are sexually mature. Standards for catching (length or weight) and the maximum specific gravity of caught products below standards should be worked out for various kinds of animals. Adequate numbers of parent animals should be preserved to ensure the steady growth of aquatic animals.

All kinds of valuable seaweeds and freshwater edible plants must not be gathered until they are mature. Attention should be paid to reserving seeds and plants for rational rotation gathering.

Article 6. Various measures suited to local conditions should be taken in all areas to increase aquatic resources, such as improving the water conditions, putting fish fry and roe into water, drawing more water into rivers and streams for fish fry, rescuing fingerlings, transplanting and taming, eliminating harmful effects and introducing new varieties for cultivation.

Chapter III. Forbidden Fishing Zones and Periods

Article 7. Rational forbidden fishing zones and periods should be defined for some important fishes, prawns, shrimps and shells to spawn, winter or for the fingerlings to feed.

Fishing operations should be prohibited or restricted to some kinds of fishes or the number of certain fishing gear should be restricted, depending on the different conditions.

Article 8. Rivers where fishes and crabs migrate for spawning must not be entirely blocked for catching. Passages of a given width should be left to ensure that adequate numbers of parent fishes and crabs go upstream or downstream for spawning. Young fishes and crabs and parents migrating for spawning must not be caught at sluice-gates and, if necessary, forbidden fishing periods should be defined. Those who want to catch fish or crab fry for breeding must obtain approval from the aquatic products departments of provinces, autonomous regions and municipalities and carry out fishing operations in designated water areas and periods of time.

Chapter IV. Fishing Gear and Fishing Methods

Article 9. Minimum mesh sizes for all fishing nets should be stated separately for different kinds of aquatic products. The minimum mesh sizes for the trawl nets and purse nets of motor vessels and motorized junks' trawl nets shall be specified by the State Administration of Aquatic Products.

Manufacturing or selling of fishing gear not up to standard is prohibited.

Article 10. Existing fishing gear and fishing methods harmful to aquatic resources should be dealt with differently according to the degree of harm they do to resources. Those which do a little harm to resources should be improved step by step in a planned way. Those which do serious harm to resources should be prohibited or eliminated within a limited time. Areas and periods for operations should be restricted properly until they are all eliminated.

Small-mesh fishing nets for catching small mature fishes and shrimps are permitted for use only in designated areas and periods.

Article 11. Catching by blasting, poisoning,

electric shock or other practices that seriously jeopardize aquatic resources must be strictly prohibited.

Chapter V. Protection of Water Environments

Article 12. Sewage, oils, oil compounds and other pollutants and discarded materials that are harmful to aquatic resources must not be discharged into the fishing water. All factories and mines must strictly implement the "Tentative Standard for Discharging Industrial Wastes," the "Regulations on Prevention and Protection Against Radioactivity" and other relevant stipulations promulgated by the state.

Attention should be paid to the breeding and protection of aquatic resources when drugs or pesticides have to be injected into the fishing waters in order to prevent or eliminate epidemic diseases and pests. Flax retting in rural areas should be concentrated in designated water areas.

Article 13. Attention must be paid to the protection of the fishing waters when water conservancy projects are built. Proper fish passes should be built when dams are constructed across the rivers where fishes and crabs migrate. Wherever the built water conservancy projects obstruct the spawning migration of fishes and crabs, departments in charge of aquatic products and water conservancy projects should hold consultations to open the sluice-gates for the fry to come in or to catch fry for transplanting, provided the level, volume and quality of the water permits.

Reclamation on sea beaches and lakesides must be taken into overall consideration and proceed in a planned way on the condition that it does not jeopardize aquatic resources.

Chapter VI. Rewards and Penalties

Article 14. Units and individuals who do outstanding work in implementing the regulations should be recommended or given proper material rewards by the State Administration of Aquatic Products, the fishing headquarters in all sea areas or the revolutionary committees at all local levels as they see appropriate.

Article 15. Those who contravene the regulations should be criticized or be made to pay for the losses, or their catches and fishing gear should be confiscated or they should be fined, depending on the severity of the case. Actions must be taken against leaders who instigate people in con-

travening the regulations, or administrative or disciplinary penalties should be given if necessary. Criminal sanctions will be imposed on those who seriously impair and cause great damage to resources, or defy supervision or commit physical assault against and hurt supervisors. Resolute blows must be dealt to the sabotage of bad people and punishment must be given to them according to law.

Chapter VII. Leadership and Responsibility

Article 16. The breeding and protection of aquatic resources throughout the country is managed by the State Administration of Aquatic Products, assisted by other departments concerned. The revolutionary committees at all local levels should assign the administrative departments in charge of aquatic products and other departments concerned to see that the regulations are implemented, and set up fishery management organs in case of need. The fishing headquarters in all sea areas and the provinces, autonomous regions and municipalities should provide patrol vessels.

Management organs for the breeding and protection of aquatic resources or mass management committees may be set up at some of the bays, lakes, rivers and water reservoirs in case of need, with the approval of the revolutionary committees of provinces, autonomous regions and municipalities.

Article 17. Administrative departments in charge of aquatic products at all levels and the fishery management organs under them should earnestly strengthen the management over the breeding and protection of aquatic resources, establish a fishery licence system, check the

number of fishing boats and fishing gear and their types of fishing operations, register the fishing-boats and strengthen supervision and inspection so as to ensure the rational utilization of aquatic resources.

Aquatic research departments should make important surveys and protect aquatic resources and improve fishing gear and fishing methods, and should put forward proposals for the breeding and protection of aquatic resources and provide scientific data for working out the details of implementation of the regulations.

Article 18. Those who carry out fishery production in the waters outside their own provinces, autonomous regions and municipalities shall adhere to the local regulations on the breeding and protection of aquatic resources.

Those who engage in activities needed in scientific research but contravening the regulations or the local regulations on the breeding and protection of aquatic resources must report in advance to the administrative departments of aquatic products in the provinces, autonomous regions and municipalities for approval.

Chapter VIII. Appendix

Article 19. Revolutionary committees at all local levels should work out details of implementation of the regulations in light of the concrete conditions in their own localities and report them to the leading organs at the upper levels for the record.

Article 20. The regulations will take effect the day they are promulgated.

10. THE FOREST LAW OF THE PEOPLE'S REPUBLIC OF CHINA

(For Trial Implementation)

Approved in Principle at the Sixth Session of the Standing Committee of the Fifth National People's Congress on February 23, 1979

Chapter I. General Principles

Article 1. Forests are important resources of the country. They can provide timber and other forest products to meet the needs of national economic construction and the people's livelihood; they help to regulate the climate, conserve soil and water for streamflow, protect the land against windstorms and shifting sands and ensure the development of agriculture and animal husbandry; and they can prevent air pollution, protect and beautify the environment and improve people's mental and physical health. It is for the purpose of speeding up afforestation, strengthening forest protection and administration and ensuring the rational exploitation and utilization of forest resources that the Forest Law is formulated.

Article 2. Forest resources include woods, bamboos, woodlands as well as plants and animals in forest zones.

Forests are divided into the following five categories according to the different benefits they produce:

(1) *Shelter forests:* Those used mainly for providing protection. They include forests for soil and water conservation, forests for the preservation of water for streamflow, windbreaks and sand-fixing forests, shelter belts for farmland and grazing grounds, and trees planted to protect embankments and roads and for defence purposes.

(2) *Timber forests:* Those used mainly for the production of timber and bamboo.

(3) *Economic forests:* Those used mainly for the production of fruit, edible oil, industrial materials, and medicinal herbs.

(4) *Fuel forests:* Trees and shrubs for the production of fuel.

(5) *Forests for special purposes:* Forests and trees used mainly for such special purposes as environmental protection and scientific experiment. They include experimental forests, maternal forests, environment protection forests, landscape forests, woods around scenic spots, historical sites and sacred places of the revolution, and forests in natural preserves.

Article 3. According to the provisions in the Constitution concerning ownership of the means of production at the present stage, forests are owned by the people as a whole or by the working

people collectively — both of a socialist nature.

Trees planted by members of people's communes around their houses or at places designated by their production teams belong to the commune members themselves.

Trees planted by such units as government departments, people's organizations, army units, schools, factories, mines and agricultural and pastoral farms at places designated by local revolutionary committees belong to these units.

Ownership of forests and trees by the state, the collective and the individual is protected against encroachment. It is forbidden to transfer state-owned forests to collective or non-forestry units, to divide collectively owned forests among individuals or to appropriate the woods owned by communes or their subdivisions or trees owned by individual commune members without payment.

Article 4. The guideline for forest-zone counties, communes and their subdivisions is to engage mainly in forestry while developing the economy in an all-around way. As to which counties, communes, production brigades and production teams should be included in this category, it shall be determined by the revolutionary committees of the provinces, autonomous regions and municipalities directly under the central authorities [*Hereinafter, "municipalities" for short — Translator*].

Article 5. The guideline for the development of forestry is to take afforestation as the basis, put equal stress on tree planting and management, plant more trees than have been cut, combine seed collection with nursery of plants and make multiple use of the resources.

Article 6. In the development of forestry, the basic tasks are: making strenuous efforts in afforestation to increase forest cover and timber reserves continuously; improving forest protection, ensuring rational cutting, and reforesting the cutover areas promptly; speeding up the development of forest zones and improving forest management and administration to hasten the growth of trees and make rational use of forest resources; strengthening education in the science of forestry to train forestry technicians and stepping up scientific research to accelerate the modernization of forest production.

Article 7. Planting, cherishing and protecting trees is a glorious duty and a right of the people throughout the country. All localities should organize the masses to plant trees on the annual Labour Day and in other seasons that are fit for tree planting.

Revolutionary committees at all levels should constantly publicize the need to cherish and protect trees and should mobilize the masses to protect forests and trees.

Chapter II. Forest Administration

Article 8. A Ministry of Forestry shall be set up under the State Council to take charge of the development of forestry throughout the country. Forestry administrations shall be set up by the revolutionary committees of the provinces, autonomous regions, municipalities, autonomous prefectures, counties, autonomous counties and cities to take charge of forestry in their localities.

Specialized or joint companies may be set up to deal in seeds and engage in investigation, planning and designing, capital construction, timber production and processing, the production of chemicals, the supply of materials and the manufacture and maintenance of machines and equipment relating to the development of forestry. These companies shall operate as enterprises.

Article 9. State procuratorial departments shall appoint one to three spare-time forestry inspectors for each of the forestry departments of forest-zone counties, state-run forestry bureaux and major state-run forestry centres to check up on the implementation of government policies and decrees relating to forestry. The terms of reference of forestry inspectors shall be defined by the state procuratorial departments in a unified way.

The revolutionary committees of the provinces and autonomous regions, if need be, should set up public security bureaux and police stations, staffed with forest police, in major forestry centres to strengthen public security and protect forests.

Article 10. Revolutionary committees at all levels should strengthen the administration of forests. State-owned forests shall be under the unified management and administration of state-run forestry bureaux and state-run forestry centres. Forests and trees planted by government departments, organizations, army units, schools, factories, mines and agricultural and pastoral farms shall be managed and administered by these organizations themselves. Collectively owned forests shall be managed and administered by the tree farms or specialized teams of people's com-

munes or their subdivisions, or by their appointees.

Article 11. State-run forestry bureaux and forestry centres shall be administered at various levels. State-run forestry bureaux in major state-owned forest zones shall be led by the Ministry of Forestry or by the forestry departments of the provinces and autonomous regions where they are located. Large state-run forestry centres shall be led by the provincial, autonomous regional and municipal forestry departments.

All state-run forestry bureaux and forestry centres shall be run as enterprises. For forestry centres engaged mainly in afforestation, the whole process of operation before the start of timber production — including the collection of seeds, the nursing of saplings and the planting, tending and protection of trees — shall be regarded as the development stage in checking up on the results of investment.

Article 12. The provincial and autonomous regional forestry departments may set up specialized forestry companies in areas where there are many collectively-owned forests. These companies shall give guidance to communes and their subdivisions in the development of forestry by signing contracts with them or by other economic means.

Article 13. The state and the revolutionary committees at all levels should work out long-term forestry development programmes.

Forestry departments at all levels should, in accordance with state regulations, conduct periodic surveys of forest resources to keep abreast of the changing situation, such as the depletion or expansion of forests.

State-run forestry bureaux and forestry centres should draw up forest management plans in accordance with the long-term development programmes. These plans shall be submitted to the competent authorities for approval before they are implemented.

Forestry departments at all levels should give guidance to communes and their subdivisions and to government departments, organizations, army units, schools, factories, mines and agricultural and pastoral farms in mapping out their own forestry development plans.

Article 14. With regard to engineering and mining projects in forest zones which have to clear forests or trees or occupy woodlands, the construction departments should consult the forest management and administration departments and report to the provincial, autonomous regional or municipal revolutionary committees for approval.

In case more than 1,000 *mu* of woodlands would be occupied, this must be reported to the Ministry of Forestry for approval. The trees cut down shall be handled in a unified way by the forest management and administration departments. The losses caused by the occupation of woodlands or devastation of forests shall be made up for by the construction departments.

Article 15. Road construction in forest zones should be speeded up in order to improve forest management and administration. In state-owned forest zones, it should enjoy priority in the allocation of capital investment. In collectively owned forest zones, roads shall be built by the collective themselves or with government help.

Article 16. Considering the prolonged forest production cycle and the need to make up for the losses caused to forest resources by prolonged excessive cutting in the past, a forest development funding system shall be established by levying certain amounts of fees on sales of timber, bamboo and other forest products.

Forest development funds shall be used mainly for reforestation but may also be used for new afforestation projects. Their use shall be supervised by the financial and banking departments.

Such funds are divided into two kinds: those for state-owned forests and those for collectively owned forests. Funds for state-owned forests shall be controlled by provincial, autonomous regional and municipal forestry departments while the Ministry of Forestry has the power to redistribute them. The control of funds for collectively owned forests shall be stipulated by the provincial, autonomous regional and municipal revolutionary committees.

Coal-mining and paper-making departments may draw certain amounts of forest development fees in proportion to their output of coal and paper to be used for the cultivation of forests as sources of pit props and raw material for paper mills.

Specific measures governing the collection of forest development funds shall be formulated by the ministries of forestry and finance.

Chapter III. Forest Protection

Article 17. The revolutionary committees of the provinces, autonomous regions, municipalities and forest-zone counties, if need be, may organize the departments concerned to set up forest protection commands. Forest-zone communes and their subdivisions, state-run forestry centres and agricultural and pastoral farms, and factories and mines should set up grassroots forest protection organiza-

tions of a mass character. In forest zones located at the junctures of different administrative areas, joint forest protection organizations should be set up under the leadership of the revolutionary committees concerned.

Forest protection responsibility zones, staffed by full-time or part-time rangers, shall be designated under the leadership of county revolutionary committees for forest-zone communes and their subdivisions as well as for state-run forestry centres, agricultural and pastoral farms, factories, mines and other units.

The main duties of the rangers are:

- (1) *Patrolling forests.*
- (2) *Stopping any actions that may cause damage to forests.*
- (3) *Bringing the law-breakers who have caused forest fires or other damage to forests to the local public security departments for handling.*

Article 18. Revolutionary committees at all levels and other departments concerned must adopt effective measures to prevent forest fires and safeguard forests:

(1) *They must fix forest fire prevention periods, during which precautionary measures must be adopted to enforce strict control on all outdoor uses of fire in forest zones and all other activities that may cause a fire.*

(2) *They must set up forest protecting and fire preventing facilities in forest zones. Where there are large tracts of state-owned forests, the civil aviation departments should set up specialized aviation teams to protect forests from the air.*

(3) *In case a forest fire breaks out, they must promptly organize forces in an all-out effort to fight the fire. Local army units and commercial, food and public health departments should give them energetic support. In fighting a forest fire, the departments concerned have priority in using the transport and communications facilities of the railway, highway, shipping, aviation and posts and telecommunications departments.*

(4) *In case a forest fire breaks out, they must ascertain the causes, investigate into the losses, find out who are to blame and deal with them seriously.*

(5) *The state shall provide medical treatment for those injured and pensions for the families of those who have died in fighting forest fires.*

Article 19. Destruction of forests for land reclamation or for the development of side occupations is strictly forbidden. In case such destruction occurs, the forest-destroying units or persons shall be ordered to reforest the areas within the designated time limit.

It is forbidden to cut firewood, graze animals

or excavate sand or stone in areas of young growth, in areas where the hillsides are closed to facilitate afforestation, in windbreaks or sand-fixing forests, or in forests for special purposes.

Article 20. In areas where precious or rare animals and plants grow and propagate, the state and the provincial, autonomous regional and municipal revolutionary committees should mark out natural preserves and set up organizations to strengthen their protection and management and engage in scientific research.

Article 21. All persons entering forest zones must abide by the following regulations:

(1) *They must observe the rules for forest protection and fire prevention during the forest fire prevention periods.*

(2) *They must refrain from damaging forests, trees, roads, streams or other forestry facilities.*

(3) *Herdsmen must keep a close watch on their animals to prevent them from damaging trees.*

(4) *Hunters must observe the rules for the control of hunting.*

Article 22. Revolutionary committees at all levels, if need be, should set up institutions to actively prevent and treat plant diseases and insect pests, determine which tree seeds or saplings should be held in quarantine, delimit epidemic and protection zones, perform quarantine on tree seeds and saplings and prevent the spread of dangerous plant diseases and insect pests.

Chapter IV. Tree Planting

Article 23. The state and the revolutionary committees at all levels should work out afforestation programmes to be carried out within the appointed time-limits in accordance with the following provisions:

(1) *Nationally, the area under forest should reach 30% of the land. All provinces, autonomous regions and municipalities as well as autonomous prefectures, counties and autonomous counties should calculate the forested area, which in general should exceed 40% of the land in mountainous counties, 20% in hilly counties and 10% in counties on the plains.*

(2) *Shelter belts shall be built in agricultural and pastoral areas, at places suffering severely from soil erosion or wind and sand storms, on both sides of railways, highways and rivers, around reservoirs and along sea coasts and lakesides.*

(3) *The state and the provinces, autonomous*

regions and municipalities should systematically develop new timber forests and economic forests. Forest-deficient provinces and autonomous regions must achieve self-sufficiency in timber supply within fixed time limits.

(4) *Cities and industrial and mining areas, where conditions permit, should develop parks and environmental protection forests according to the requirement that there should be an average of no less than five square meters of green area for every person.*

(5) *In afforestation, it is essential to strictly follow the technical regulations and ensure the survival of trees. In large-scale afforestation and reforestation, attention should be paid to changing the species of trees and developing forests of mixed species.*

Article 24. Revolutionary committees at all levels should work out programmes for the afforestation, within fixed time limits, of the barren hills and land fit for this purpose. In case the work is not accomplished before the deadline without legitimate reasons, the leadership concerned shall be held responsible if the hills and land are state-owned and, if they are collectively owned, the state shall arrange for their afforestation and the benefits from this shall go to the tree-planting units.

Article 25. Along railways, highways, rivers and canals, around reservoirs, in industrial and mining areas, in the vicinity of government departments, schools and army barracks as well as in areas managed by agricultural and pastoral farms, trees should be planted by the organizations in charge within the time limits set by local revolutionary committees.

Coal mining, paper-making and other enterprises should make use of all possible conditions to develop timber forests.

Article 26. Renewal of cutover areas must be carried out, mainly by artificial means, in the same or the next year according to state regulations.

Article 27. The cultivation and felling of trees in state-owned forests and the improvement of low-yield forests should be included in state plans. Measures should be adopted according to local conditions to speed up the growth and to increase the yields of forests.

Article 28. Forestry departments at all levels should vigorously popularize fine-quality and fast-growing species of trees, set up maternal forests and seed farms and breed fine strains and robust saplings so that such strains are used everywhere.

Chapter V. The Opening Up and Utilization of Forests

Article 29. Forests should be opened up rationally. The annual cuts should not exceed the amount of growth, which shall be calculated on the basis of each county or state-run forestry bureau. All timber production by the state and the localities should be included in state plans. No cutting outside the plan is permitted.

For state-owned forests, the felling of trees should be carried out by state-run forestry bureaux and forestry centres according to the quota assigned by the state. For collectively owned forests, it should be carried out by the owners under the guidance of state plans and according to the contracts they have signed with forestry departments.

Felling of trees by communes and their sub-divisions in their own forests and for their own use must be reported to the county revolutionary committees for approval if the annual cut exceeds ten cubic metres. The felling of trees by government departments, organizations, army units, schools, factories, mines and agricultural and pastoral farms in their own forests and for their own use must be reported to the provincial, autonomous regional and municipal forestry departments for approval if the annual cut exceeds 100 cubic metres.

Article 30. Felling of trees in forests must abide by the following regulations:

(1) *For timber forests, felling of trees must proceed rationally according to state regulations to ensure the quality of the operation.*

(2) *For shelter, environmental protection, landscape and maternal forests, felling of trees is permitted only as is necessary for cultivating or renewing the forests.*

(3) *All tree felling is forbidden for forests in natural preserves.*

The forestry departments have the power to stop an operation that violates the above-mentioned regulations.

Article 31. Bamboos, firewood, charcoal and finished and semi-finished wood and bamboo products to be sold in batches shall be put under the unified management and control of the specialized companies set up by forestry departments; or the forestry department shall be responsible for organizing the production of these goods and the supply and marketing department shall be responsible for their marketing under the plans which are worked out jointly by the two departments in accordance with the principle of protecting forest resources and rational utilization

of odds-and-ends materials, and which are approved by the provincial, autonomous regional and municipal planning commissions. No other organizations or individuals are allowed to enter forest zones for the purpose of felling trees, processing or purchasing forest products.

Article 32. Shipment of timber, bamboo or their products, either finished or semi-finished, out of a county must have the permits issued by the county forestry department; shipment of these products out of a province or autonomous region must have the permits issued by the provincial or autonomous regional forestry department.

Article 33. Positive efforts should be made to promote the multiple use of timber, set up timber processing and forest chemical enterprises in forest zones in a planned way, and raise the utilization rates of forest resources and timber.

Article 34. Timber for construction projects shall be standardized step by step. Timber processing enterprises in forest zones shall produce according to demands and their products shall be supplied to appointed places. As to timber processing enterprises in cities, their production shall be concentrated and the supply of their products unified.

Chapter VI. Awards and Punishment

Article 35. Spiritual encouragement or material awards shall be given by the state or by revolutionary committees at various levels, according to the contributions made, to those organizations which have performed one of the following exemplary deeds:

(1) *Having conscientiously implemented the principles and policies relating to forestry, fulfilled state plans in an all-around way for three consecutive years and attained advanced domestic levels in major economic-technical indices.*

(2) *Having made outstanding achievements in forest protection or prevented the outbreak of any forest fires for three consecutive years.*

(3) *Having achieved high output, fine quality and low cost in nursing saplings and fulfilled their tasks for three consecutive years.*

(4) *Having achieved fine quality and high speed with less investment in afforestation and fulfilled all their afforestation tasks ahead of schedule.*

(5) *Having achieved remarkable results in speeding up the growth and increasing the yields of forests and trees through timely cultivation and positive efforts to improve low-yield forests.*

(6) *Having made remarkable achievements in ensuring rational cutting and timely renewal.*

(7) *Having increased timber utilization rates remarkably through positive efforts to make multiple and economic use of timber.*

(8) *Having made remarkable achievements in forestry education and scientific research.*

Article 36. Spiritual encouragement or material awards shall be given by the state or by revolutionary committees at various levels, according to the contributions made, to those individuals who have performed one of the following exemplary deeds:

(1) *Having worked at grassroots forestry units for 15 years or more, shown ardent love for the work and made remarkable achievements.*

(2) *Having made discoveries, inventions or important innovations in forest production, teaching and scientific research.*

(3) *Having stuck to their posts, observed discipline and fulfilled their forest production tasks with honours.*

(4) *Having exemplarily implemented forestry policies and decrees, firmly combated law-breaking actions and rendered remarkable meritorious services.*

(5) *Having distinguished themselves by their heroism, tenacity and selflessness in fighting forest fires.*

(6) *Having rendered meritorious services in preventing accidents and rescuing operations and protected the property of the state and the people from grave losses.*

Article 37. Different disciplinary sanctions, up to discharge from public service, shall be applied on the merits of each case to those government functionaries who have been found derelict of their duties in one of the following aspects:

(1) *Causing losses to forest production for failure to exercise effective leadership or inefficiency in management and administration.*

(2) *Violating forestry policies, decrees, rules or regulations, causing damage to forests or serious waste of timber.*

(3) *Ignoring state regulations in felling trees or reforestation.*

(4) *Diverting forest development funds for other uses.*

(5) *Making false reports of achievements by resorting to deceit or deception.*

Article 38. Anyone who destroys trees in cities and towns, around villages, along roads and streams or around houses must plant three trees

(counting only the surviving ones) for every tree destroyed or shall be fined.

Article 39. Anyone who commits one of the following offences against the Forest Law shall, if the offence is minor, be ordered to compensate for the losses or be fined, and all illegal earnings shall be confiscated; those who commit serious offences shall be punished according to law:

(1) *Causing forest fires.*

(2) *Destroying forests for land reclamation or for the development of side occupations, or causing damage to forests or trees while grazing animals.*

(3) *Cutting firewood, grazing animals or excavating sand or stones in areas of young growth, in areas where the hillsides are closed to facilitate afforestation, in windbreaks or sand-fixing forests, or in forests for special purposes.*

(4) *Violating the regulations governing the administration of natural preserves or the regulations for the control of hunting.*

(5) *Entering forest zones for unauthorized purchase of timber, bamboo, firewood, charcoal or wood or bamboo products, either finished or unfinished.*

(6) *Seizing or stealing trees, robbing or stealing timber.*

(7) *Speculating and profiteering in timber.*

(8) *Violating the Forest Law and causing physical harm to rangers in disregard of admonitions.*

(9) *Serious negligence of duty causing damage to forests.*

Article 40. Those who deliberately set fire to forests, gang up to destroy forests or murder rangers shall be seriously punished according to law.

Article 41. If the offenders against the Forest Law have acted on the instructions of their superiors, both they and their superiors should be held at fault for their offences and dealt with seriously on the merits of each case.

Chapter VII. Appendix

Article 42. Detailed regulations for the implementation of the Forest Law shall be formulated by the Ministry of Forestry and reported to the State Council for approval. Specific measures for the implementation of the Forest Law shall be formulated by the provincial, autonomous regional and municipal revolutionary committees in accordance with the Forest Law and the detailed regulations.

11. REGULATIONS ON SOME QUESTIONS CONCERNING THE DEVELOPMENT OF ENTERPRISES RUN BY RURAL PEOPLE'S COMMUNES AND PRODUCTION BRIGADES

Promulgated by the State Council (Draft for Trial Use)

(July 3, 1979)

I. The Significance of Developing Commune- and Brigade-Run Enterprises

In accordance with the Decision on Some Questions Concerning the Acceleration of Agricultural Development (Draft) adopted at the Third Plenary Session of the Eleventh Central Committee of the Communist Party of China, there should be a big expansion of enterprises run by rural people's communes and production brigades. The expansion of such enterprises can, above all, better serve the development of agricultural production, strengthen the collective economy at the commune and brigade levels and provide the funds required for mechanization. At the same time, it will open up new avenues of employment in production for the labour power which will be released by mechanization, make fuller use of local resources, aid the development of a diversified rural economy, increase collective income and raise the living standards of commune members. It will also gradually create the conditions for the people's communes to undergo the transition from the system of small-scale collective ownership to that of large-scale collective ownership and then to the system of ownership by the whole people. A big expansion of industries run by rural people's communes can provide society in general with large amounts of raw and semi-finished materials and industrial products, thus accelerating the development of China's industry as a whole; it can also avoid the disadvantage of overconcentration of industry in large and medium-sized cities. It is an important way gradually to narrow the differences between town and country, worker and peasant, and manual and mental labour.

II. Guiding Principles for Development

Commune- and brigade-run enterprises must persist in the socialist orientation and strive to produce what is needed by society, serving mainly agricultural production and the people's livelihood and also the needs of large-scale industry and for exports.

These enterprises must develop in line with local conditions and in accordance with local resources and social needs, and they must grow from small to big and from a lower to a higher stage.

They must not be initiated if their machines cannot be 'fed', nor, in the case of processing industries, should they be built with excessive production capacity. They must not compete with large-scale, advanced industries for raw materials and energy, and they must not cause damage to the natural resources of the country.

They must persist in self-reliance and hard struggle, democratic management and thrift, and must practice strict economic accounting.

Active attempts must be made to run enterprises which combine agricultural, industrial and commercial functions.

III. Business Scope

Crop cultivation, animal husbandry and fish-breeding must be expanded energetically. Where local conditions are favourable, forestry centres, orchards, tea plantations, silkworm farms, medicinal herb plantations, seed-production centres, edible-mushroom farms, livestock and poultry farms, and fish hatcheries must be set up. All these can provide the basis for developing processing industries for farm and side-line products. Farms can be set up where there is virgin territory.

Efforts must be made to develop processing industries for farm and side-line products. In accordance with the principle of economic rationality, all farm, forestry, animal husbandry and fishery products and special local products which are suitable for processing by communes and brigades can be processed by them. As to those products already being processed by factories set up by the state, whether they should be handed over to commune and brigade-run enterprises is to be decided by the revolutionary committees of provinces or autonomous regions in consultation with the departments concerned and after weighing both advantages and disadvantages.

Efforts must be made to run agriculture-related industries well. Small and medium-sized farm tool manufacturing and repair shops must be set up to process spare parts under the unified plans for local farm machinery undertakings. Where the necessary conditions exist, enterprises can be set up to produce humic acid fertilizer, bacterial fertilizer, insecticides and herbicides, and veterinary medicines, and to process fodder.

In line with local conditions, more fuel and raw materials extraction industries such as biogas stations, small coal fields, small iron, non-ferrous metal and other mines must be initiated, and small works for producing building materials — brick yards, lime kilns, quarries and cement plants — set up. Saltworks and saline chemical works can be set up where there are abundant resources of bittern.

A major effort must be made to develop the power industry. In the light of concrete conditions, hydro- and thermal-power stations with generating capacities of 12,000 kilowatts and less can be set up.

Localities with the necessary conditions can undertake the production of spare parts or certain products subcontracted to them by large-scale industries. In accordance with the demands of the market and with the availability of energy, small chemical works, hardware factories, smelters, and workshops turning out daily necessities must be set up to make use of leftover bits and pieces of industrial material, urban and rural wastes and old materials, as well as waste residue, waste water and waste gas.

Where it is necessary and feasible, building squads and transport teams can be organized to undertake certain tasks in urban and rural capital construction, transport and loading.

Efforts must be made to produce traditional handicrafts and goods for export where there are local resources or favourable technical conditions. Production bases for export commodities must be built up step by step, based on the requirements of foreign trade. When conditions permit, compensatory trade should be promoted.

Service trades such as sewing and repair, hotel and restaurant operation, should be initiated where they are needed.

IV. Plans for the Readjustment and Development of Enterprises

In the light of the spirit of the Third Plenary Session of the Eleventh Central Committee of the Communist Party, the percentage of income from nationwide commune- and brigade-run enterprises in the total income of rural people's communes at three levels should increase from 29.7% in 1978 to around 50% in 1985. The various provinces, municipalities, autonomous regions and counties must work out long-term plans for the development of commune- and brigade-run enterprises, plans which are tied closely to local plans for production in farming, forestry, animal husbandry and fisheries, industrial and transportation undertakings and for urban and rural construction, and they must see to it that these plans are implemented at the

commune level. In mapping out such plans, they must seek truth from facts, take the overall situation into account, and aim at rational distribution.

The first thing in working out development plans is to adhere to the general policy for readjusting the national economy, pursuing both progress and consolidation in the course of readjustment, and accomplishing the readjustment of commune- and brigade-run enterprises as soon as possible. Efforts must be made to increase the production of raw and semi-finished materials, fuels and power, and of all badly needed commodities for the home market and for export. Enterprises with excessive capacity for spare-part production and those where the technology is not up to standard or where the problem of supplies and marketing cannot be solved must readjust the orientation of their production, merge or close down according to the unified arrangement of the county revolutionary committees.

New enterprises must not be initiated blindly, but must be set up in a planned way with the approval of the departments in charge of commune- and brigade-run enterprises, and they must be rationally distributed. Industrial and commercial enterprises must be approved and licensed by the departments in charge of industry and commerce.

V. Sources of Funds

1. Capital must be accumulated mainly by the enterprises themselves through their own efforts. When an enterprise is first started, or where the necessary conditions prevail, appropriate sums can be drawn from the public reserve funds of production brigades or teams and treated as shares with the approval of the congresses of commune or brigade members.

2. Local revolutionary committees at the various levels must do their best to support commune- and brigade-run enterprises by allocating part of their reserve funds to the departments in charge of such enterprises for this purpose.

3. Normally, not less than half of the investment made by the state to support rural people's communes must be allocated to the departments in charge of commune- and brigade-run enterprises to support the poorer brigades in their effort to set up enterprises. The departments in charge may entrust these investment funds and those provided by local financial departments to the banks for disbursement and retrieval for continued use.

4. The Agricultural Bank must assign a certain proportion of annual agricultural loans as low-interest loans to support commune- and brigade-run enterprises. Those loans which are spent on buying equipment are normally to be repaid over a period of 3 to 5 years.

VI. Ownership

Commune- and brigade-run enterprises are collectively owned socialist enterprises. Those run by communes are owned by those communes, and those run by brigades are owned by the brigades. Economic exchanges between state enterprises and those run by communes and brigades, or between commune- and brigade-run enterprises and other collective economic units, should be exchanges of equal values. No organization or individual may obtain funds, products, equipment, or raw or semi-finished materials from commune- and brigade-run enterprises without compensation, or borrow money from them. The power of these enterprises to make their own decisions must be respected.

Nationalization of commune- and brigade-run enterprises is forbidden. Those enterprises taken over by the state after the First National Conference on Learning from Dazhai in Agriculture must be returned to their original owners; the pay and working conditions of workers and staff need not be affected.

In order to improve rational distribution, strengthen co-ordination, raise quality and reduce costs, it is necessary to encourage joint enterprises. These can be run by several communes or brigades, or by communes and brigades together. Hereafter, industrial enterprises should be run mainly by communes or by several communes jointly under the auspices of county authorities with cadres appointed by the county authorities and economic activities carried on in the capacity of county-run factories.

Joint enterprises can also be set up on a trial basis between communes and counties, the profits made to be shared between the two sides according to an agreed ratio. It is forbidden to nationalize joint enterprises, either those involving several communes which resemble county-owned factories in form or those run by counties and communes.

The revolutionary committees of various provinces, municipalities and autonomous regions should readjust unreasonable management fees and administrative charges levied against commune- and brigade-run enterprises by the departments concerned.

VII. The Farming Out of Production by Urban Industries

According to the needs of expanding production and the capacity of communes and brigades, urban industries can divert the production of some products or spare parts to rural communes.

When organizing the farming out of certain products from urban industries, it is necessary to give good technical guidance and in some cases to transfer special equipment and tools at fixed prices. For cooperation between urban industries and rural people's communes and brigades to be maintained, supplies of raw and semi-finished materials and marketing channels must not be interrupted. Commune- and brigade-run enterprises must guarantee the quality of products and fulfil their assumed tasks on time. Contracts must be signed and strictly observed by both parties. An overall solution to the problem of duplicated taxation must be worked out by the Ministry of Finance with respect to products turned out through such co-operative efforts.

Only after effective measures have been taken to prevent or deal with the discharge of poisonous substances in the production process can commune- and brigade-run enterprises be assigned the tasks of such production. Those goods that are unsalable and those that are already obsolete must not be assigned to commune- and brigade-run enterprises for production.

Urban industrial equipment lying idle or discarded in the course of retooling but suitable for use in commune- and brigade-run enterprises should be transferred to such enterprises at reasonable prices and may be paid for in a single or in several installments.

VIII. Improved Planning in Production, Supply and Marketing

Commune- and brigade-run enterprises are becoming an increasingly important component of the national economy. The planning commissions at all levels and all departments concerned, especially the industrial departments, must take charge of state and commune- and brigade-run enterprises. Every possible means must be employed to improve planning as related to the production, supply and marketing of commune- and brigade-run enterprises so that their plans dovetail with state economic plans at the various levels.

1. The departments in charge of commune- and brigade-run enterprises and the other departments concerned should give guidance to the people's communes when plans are being worked out

for the production of such enterprises. For some products, the production plans proposed by the departments concerned are to be brought into overall balance by the State Planning Commission and directly incorporated into the state economic plans at the various levels. The production plans for other products can be indirectly incorporated into the state economic plans at the various levels through contracts signed with the clients. As for those products which are not included in one or another level of the state economic plans but which are needed by society and are assured of raw and semi-finished materials and power supply, production plans can be worked out by the people's communes themselves.

Medium-sized and small farm tools, building materials and processed farm and side-line products turned out by commune- and brigade-run enterprises should be managed by the departments in charge of such enterprises. State and local funds and materials used for this purpose should also be managed and distributed by them. As to which other products can also be managed by the local departments in charge of commune- and brigade-run enterprises, this is a question to be decided by the revolutionary committees of the same level according to the terms of their jurisdiction.

Planning commissions at the various levels should pool the output value and revenue figures of commune- and brigade-run enterprises as well as the investment indices for agricultural production and capital construction and incorporate them into their respective comprehensive plans.

2. Materials required for the production of products directly included in the plans of various levels should be allocated according to plan by the planning commissions and departments responsible for arranging production. Special-use equipment should be provided by the departments in charge of the product category concerned. Materials required for the production of products which are only indirectly included in the plans should be provided by those ordering the products according to the terms of their contracts.

Local planning commissions at the various levels are to list the materials required by commune- and brigade-run enterprises for capital construction, the maintenance of equipment and technical improvement which are to be allotted by the state, and the means of transportation to be acquired by the enterprises themselves, and to work out overall arrangements; the State Planning Commission is to give them the necessary allotments. A certain amount of substandard steels and other waste materials recovered by the localities is to be allotted by the local planning commissions to commune- and brigade-run enterprises.

The departments in charge of commune- and brigade-run enterprises are to apply to the departments concerned (in accordance with the supplies system provisions) for the second and third-category materials and for labour protection articles required by the enterprises in order to fulfil production plans. Such materials can also be acquired through exchanges organized by offices of the same level in charge of co-ordination of materials, or can be purchased directly by commune- and brigade-run enterprises and the departments in charge of such enterprises.

3. Products which are directly included in the plans at various levels are to be purchased by the departments concerned and contracts are to be signed between the concerned parties on production and marketing. Products which are indirectly involved in the plans at various levels are to be purchased by those ordering the products according to contract. Products which are produced according to the plans of commune- and brigade-run enterprises themselves and surplus products which are produced according to the plans of various levels or according to contract and which are not to be allocated by the state are to be sold by the departments in charge of commune- and brigade-run enterprises or by the enterprises themselves. If such products are not purchased within the localities concerned, no restrictions should be placed on their sale outside.

With the approval of the state, a certain proportion of the products to be allotted by the state can be kept by the commune- and brigade-run enterprises themselves provided there is a genuine need for such products within the production process.

4. Applications by commune- and brigade-run enterprises for the transportation of the required raw and semi-finished materials, fuels, equipment and of finished products should be arranged by railway, transport and shipping authorities and such transportation should be included in their plans.

Departments in charge of commune- and brigade-run enterprises can sign contracts for production, supply, marketing and transportation with the departments or units concerned on behalf of such enterprises.

IX. All Trades and Lines of Work Must Actively Support Commune- and Brigade-Run Enterprises

All trades and lines of work must treat support for the development of commune- and brigade-run

enterprises as an important task. They must work out plans, adopt measures and do their part in greatly expanding commune- and brigade-run enterprises.

Planning departments must take all factors into consideration and make overall arrangements to see that commune- and brigade-run enterprises mesh with state enterprises, each displaying its own strong points and developing in close co-ordination with the other.

The various industrial departments must have regard for those commune- and brigade-run industrial enterprises which turn out the same line of products as themselves or which cooperate to produce spare parts as their competent assistants; they must guide these enterprises in developing in a planned way, help them to raise their technical levels, and provide them with special equipment and the necessary materials. The state should not set up new factories to produce products which can be produced by commune- and brigade-run industries.

Departments engaged in capital construction must guide and assist the communes and production brigades in their efforts to run construction enterprises, and must make overall arrangements for construction tasks, train construction teams for them and gradually mechanize these teams.

The railway, transport and shipping departments must guide and assist communes and brigades in their efforts to run transport and loading enterprises and must help commune- and brigade-run enterprises to solve effectively the problems of materials transportation.

Departments of commerce, supply and marketing, and foreign trade must guide commune- and brigade-run enterprises in their efforts to determine the needs of the market, to improve the quality of their products and to increase their variety, and must support them in the supply of materials and in product marketing. Commune- and brigade-run enterprises must be given their shares of the profits made from the sale of export commodities in foreign currency, in accordance with the unified regulations of the state.

Financial departments, banks and credit co-operatives must support commune- and brigade-run enterprises with funds while strengthening their guidance and supervision over the use of such funds. The banks should assist the departments in charge of such enterprises to do a good job of coaching in accounting so as to help the commune- and brigade-run enterprises institute business accounting; and the banks should make it convenient for them to open or close accounts.

Departments in charge of farming, forestry and aquatic products must help communes and

brigades to expand planting and breeding activities, to develop the processing and comprehensive use of forest and aquatic products. Commune- and brigade-run enterprises must be encouraged to produce the agriculture-related industrial products which fall within the jurisdiction of farming and forestry departments.

Scientific and technological departments and educational institutions must help communes and brigade-run enterprises train management and technical personnel, conduct scientific research, and exchange scientific and technological information.

Labour and public health departments must actively aid commune- and brigade-run enterprises in improving dust and poison prevention work so as to guarantee safety in production and protection of the environment.

Geological departments must help the people's communes solve problems arising in mineral prospecting so as to promote the expansion of mining by communes and brigades.

Administrative departments in charge of industry and commerce must actively help co-ordinate production, supply and marketing relationships and ensure the conduct of business in accordance with law through the registration of enterprises and the management of contracts.

X. Pricing Policy and Subsidies to Encourage Sales

Commune- and brigade-run enterprises must follow state pricing policies. In principle, products to be purchased by the state must be priced the same as those of similar quality turned out by state enterprises. The prices of products to be sold by the enterprises themselves are to be fixed through discussion between the buying and selling parties within the price limits set by the pricing departments.

Materials allotted by the state to commune- and brigade-run enterprises according to plan must be paid for at the state-determined prices for allotted or supplied materials; large batches of raw materials supplied by the market may be paid for at wholesale prices.

Awards, subsidies and advance purchases of certain products of commune- and brigade-run enterprises by the state and departments concerned must be continued and honoured. Materials awarded to encourage the sale of certain products and subsidies or compensatory materials which should be turned over to the production units must not be intercepted by the departments handling them or, indeed, by any other department.

XI. Tax Policy

The state applies reduced-tax or tax-exemption policies to the commune- and brigade-run enterprises. They, in turn, are duty-bound to pay state taxes according to the regulations and not to default or evade.

According to the concrete conditions prevailing in the localities, and with the approval of the revolutionary committees of the various provinces, municipalities or autonomous regions, those commune- and brigade-run enterprises directly serving agricultural production and the livelihood of the commune members may register specific products and services for exemption from industrial, commercial and income taxes.

In accordance with the stipulations set forth in Document Cai Shui Zi No. 21 issued by the Ministry of Finance in 1978, small iron mines, coal fields, power stations, and cement works are to be exempt from industrial, commercial and income taxes for a period of three years commencing in 1978. New enterprises of this kind are to be exempt from taxes for a period of three years from the time they are established. Other new enterprises which have difficulty in paying taxes in the initial stage may be exempted from industrial, commercial and income taxes for a period of 2-3 years with the approval of the revolutionary committees of the provinces, municipalities or autonomous regions.

In order to accelerate the growth of the rural economy in border areas and in areas inhabited by the minority nationalities, commune- and brigade-run enterprises in counties, autonomous counties or banners in such areas are to be exempt from income tax for a period of five years as from 1979. The revolutionary committees of the various provinces, municipalities and autonomous regions should also make up lists of those old revolutionary base areas which still suffer from difficult economic conditions and which should therefore be similarly exempted from taxes; these lists should be submitted to the State Council for approval.

Self-help undertakings run by communes and brigades in areas struck by natural disasters may be exempt from some or all industrial, commercial and income taxes for a set period of time, with the approval of the revolutionary committees of the provinces, municipalities or autonomous regions.

Commune- and brigade-run enterprises are to be taxed at the present tax rate of 20%. This rate will also apply to the income tax to be paid by the supply and marketing organs of the departments in charge of commune- and brigade-run enterprises or of specialized corporations.

XII. The Labour System, Labour Remuneration and Labour Protection

The labour system of the commune- and brigade-run enterprises involves both industrial and agricultural aspects. The labour force required by the enterprises is to be provided by communes or brigades in accordance with the principle of overall consideration and arrangement and through the transfer of personnel in consultation with the basic accounting units, on the precondition that a sufficient labour force remains in agricultural production. This labour force will gradually grow as the mechanization of agriculture goes forward. Enterprises should not recruit workers on their own or hand out jobs to friends or relatives.

Payment for labour in commune- and brigade-run enterprises must follow the principle of "to each according to his work." The common practice is "to have workers' grades determined by the factories, their work-points calculated by their production teams, their remuneration worked out by the factories and teams together, and their earnings distributed to them by their teams." Other systems can also be implemented. Where conditions are ripe, a wage system can be implemented. In the case of personnel whose registered permanent residence is in an urban area and who live on commodity grain, the wage system should apply. Technical subsidies should be granted by the enterprises to those personnel who are highly skilled and who contribute the most to the enterprises. The system of fixed production quotas should be implemented and material incentives given as appropriate to those groups or individuals who overfulfil their quotas and who guarantee the quality of the products. Men and women should enjoy equal pay for equal work.

An extra allowance for living expenses should be given to personnel who engage in high-temperature operations; work in mines or high above the ground; work at jobs detrimental to the health or in particularly heavy labour; and to those who cannot take meals at home. The extra grain ration for these jobs is to be drawn from the extra grain put aside by the collectives for extra-grain subsidies.

Payment by the enterprises to the production teams for labour should in general be higher than the distribution levels in the teams and, as far as possible, rich teams must not be left at a disadvantage. Accounts must be settled on time and obligations must be honoured. In the case of enterprises which are temporarily without income and, therefore, have difficulty in honouring payrolls, the communes or brigades can use the profits handed in by other enterprises, or can keep clear accounts and wait for such time as these enterprises begin to acquire an income.

Commune- and brigade-run enterprises should attach importance to production safety and strengthen education in this respect. Continued efforts must be made in improving working conditions, labour protection must be handled well, care must be given to the health of personnel, and attention paid to the special needs of women workers. Accidents resulting in injury or death in the course of duty must be reported and investigated promptly and dealt with seriously. Medical treatment should be provided to those injured while on duty and to those contracting occupational diseases; extra living allowances should be given to those who are disabled and pensions given to the families of any deceased.

The environment must be well protected. New enterprises must not pollute the environment, and existing ones should make an effort to eliminate pollution. Those that cause serious pollution must be required to provide remedies within fixed time-limits.

In those rural handicraft enterprises that have been transferred to commune management in accordance with Document No. 66 issued by the State Council in 1977, the wages of workers and staff, their grain rations, and the regulations concerning withdrawal or retirement, labour protection and other welfare conditions remain the same as before the transfer.

XIII. The Use of Profits

The use of the profits of the commune- and brigade-run enterprises is to be decided by the conferences of the representatives of members of the brigades and communes, and then approved by the communes or counties respectively. Leaders are strictly forbidden to give arbitrary personal instructions on the use of profits. Apart from expanded reproduction and the setting up of new enterprises, profits must be expended mainly on farm capital construction, the mechanization of agriculture and in giving support to the poor teams. A certain proportion may also be distributed among the commune members or spent on commune or brigade welfare undertakings. Waste and extravagance are prohibited and it is forbidden to spend profits on entertainment or gifts.

A certain proportion of the profits made can be left as enterprise funds in the hands of those enterprises which have fulfilled or overfulfilled their production plans.

XIV. The Establishment and Perfection of a System of Management Rules and Regulations

Commune- and brigade-run enterprises must persist in the principles of democratic management and thrift, give full play to the initiative of their personnel, and establish and perfect rules and regulations of business management.

Planning must be strengthened. Plans must be made by relying on the masses and regular checks must be conducted to guarantee their fulfilment. As production expands and management skills improve, the eight economic and technical indices — output, variety, quality, consumption, labour productivity, costs, profits, fixed assets and circulating funds — should be worked out and assessment procedures initiated.

Labour management must be strengthened. The labour force must be organized rationally and a system of fixed production quotas implemented. A system in which specialized groups or individuals take responsibility for each section of a production line must be established. Discipline must be strict, and awards and punishments fair.

Technical management must be improved. A system of personal responsibility for technical matters must be set up. Operational regulations must be worked out in accord with the special characteristics of the enterprises. Enterprise personnel should be graded according to technical proficiency as determined through regular assessments and they should be granted the titles appropriate for technical personnel.

Product quality control must be strengthened and the principle of "quality first" adhered to. Production must be organized according to the demands of variety, specification and quality. Strict product inspection rules must be formulated so that quality can catch up or surpass advanced levels for the various product lines. Substandard products must not be allowed to leave the factories and must not be included in total output values.

Materials management must be strengthened. There must be fixed quotas for the consumption of raw and semi-finished materials and other goods and there must be detailed rules governing the stocking or removal of materials from storehouses. Fixed assets such as machinery, equipment and means of transportation must be maintained by people especially assigned for the job and must be overhauled regularly. As regards abnormal losses, it is necessary to find out where the responsibility lies and to deal with such cases seriously.

Financial management must be strengthened. State regulations governing financial matters and the management of cash must be strictly implemented. The magnitude of circulating funds must be fixed and the depreciation funds for fixed assets set aside; mining operations must also set aside funds for technical transformation. Account-

ting must be improved and efforts must be made to practice strict economy while increasing production so as to reduce costs and boost profits. Commune- and brigade-run enterprises must make public their income and expenditures regularly and must report to the congresses or conferences of the representatives of commune members, accepting the supervision of the masses.

XV. Technical Innovation and Transformation

Commune- and brigade-run enterprises must actively engage in technical innovation and technical transformation, make an effort to tap production potentials and constantly raise production levels. Small groups or individuals that make contributions to technical innovation and technical transformation must be commended and awarded.

Depreciation funds generally and the technical transformation funds for mines must be expended on the renewal of equipment and on technical transformation; the surplus must be deposited in banks and must not be used otherwise. Departments in charge of commune- and brigade-run enterprises and other departments concerned must give active support to such enterprises in the renewal of equipment involved in their technical transformation so as to help change their production step by step. Those enterprises which have the necessary conditions can make use of their shares of foreign-currency profits to import advanced technology and equipment from abroad.

The study of science and training in technology must be strengthened, with commune- and brigade-run enterprises becoming schools for helping raise the scientific and cultural level of the rural population.

XVI. Consolidation of Enterprises

It is necessary to make a real effort to consolidate commune- and brigade-run enterprises this year and next. Consolidation must be centered on production and mainly on the improvement of management and the establishment of a national production order so as to lay the foundation for large-scale development.

It is necessary to teach cadres to work in close cooperation with technical personnel and all other personnel in the enterprises, to encourage rationalization proposals, to set up a proper production order, and to establish and perfect business management, especially the system of fixed responsibility for each section of the production line and the system of democratic management

of financial matters. It is imperative that all waste and extravagance, graft and embezzlement, speculation and profiteering be combatted.

It is necessary to help the cadres to learn production skills and business management, to persist in ideological work, to take the lead in observing rules and regulations and discipline, and to accept the supervision of the masses.

It is necessary to establish the system of electing the leading cadres of the enterprises democratically and to form good leading groups through consolidation. The leading cadres of an enterprise are to be elected by the personnel of that enterprise and approved by the leading organ at the higher level. Government functionaries who are assigned work in factories jointly run by several communes continue to enjoy remuneration and other conditions as state functionaries and, just as everybody else, they can assume leading posts only when elected to them and when their election is approved by leading organs of a higher level.

From now on, we must check the work of the enterprises regularly, sum up experiences and solve problems as they arise so as to enable commune- and brigade-run enterprises to develop in a healthy manner.

XVII. The Establishment of Efficient Administrative Organs

Commune- and brigade-run enterprises have broad prospects for development involving many sectors of the economy, and it is therefore necessary to set up powerful and efficient organs to take charge.

A General Administration for Commune- and Brigade-Run Enterprises is being established under the Ministry of Agriculture to take direct charge of the investments, materials and equipment allotted to such enterprises by the State Planning Commission and the State General Administration for Materials. Administrative bureaus for these enterprises are to be set up at the provincial and county levels, with corresponding organs at the prefectural level. The people's communes must assign persons to take special charge of commune- and brigade-run enterprises. Planning commissions at the various levels and the other departments concerned should also set up functional organs or assign persons to take special charge.

Departments in charge of commune- and brigade-run enterprises at various levels must implement the line, policies and principles formulated by the party and state for the development of these enterprises, work out and fulfil annual and long-term plans, do a good job of managing the products entrusted to them and of

the materials and funds allotted to the enterprises. They must co-ordinate their relations with the other departments concerned, mediate between producers, suppliers and sellers, and help the enterprises to improve management, popularize new techniques and sum up and exchange experiences.

The staff of the departments in charge of commune- and brigade-run enterprises at the various levels must be kept as small as possible (their actual size to be decided by the revolutionary committees of the various provinces, municipalities and autonomous regions) and must be drawn from existing staff. Expenses are to be included in the general financial expenditures at the various levels.

Departments in charge of commune- and brigade-run enterprises at the various levels must set up supply and marketing agencies and specialized corporations, which are themselves in the nature of enterprises. The tasks of such agencies and corporations are to organize production, exchange economic information, mediate between producers, suppliers and sellers, organize co-operative ventures, and do a good job of procuring materials and selling products. The expenses of their staffs must be paid out of commissions collected. The circulating funds required are to be provided through allocations by financial departments or through bank loans.

XVIII. The Strengthening of Leadership

Commune- and brigade-run enterprises are forging ahead and changing day by day. New cir-

cumstances, problems and experiences will inevitably keep presenting themselves. The leading organs at all levels must make unified plans and strengthen their leadership; they must listen to reports regularly, study and solve major problems, and sum up and popularize advanced experience.

It is necessary, under the leadership of the party committees of the various levels, to strengthen the political work in commune- and brigade-run enterprises and to arouse the masses in unfolding socialist labour emulation drives and campaigns to increase production and practice economy, and in exerting themselves to turn their enterprises into advanced operations and become model workers themselves. It is important to build up party and youth league organizations and give full play to the role of the party organizations as fighting bastions and the role of the youth league as the party's aide.

In accordance with the instructions of the Party Central Committee and Comrade Hua Guofeng, the leadership at all levels must display the spirit of the foolish old man who removed the mountains and make persistent and redoubled efforts to turn all bright hopes into reality as soon as possible.

The revolutionary committees of the various provinces, municipalities and autonomous regions should work out concrete plans for the implementation of the above regulations.

12. DECISION OF THE CENTRAL COMMITTEE OF THE COMMUNIST PARTY OF CHINA ON SOME QUESTIONS CONCERNING THE ACCELERATION OF AGRICULTURAL DEVELOPMENT

*Adopted at the Fourth Plenary Session of the 11th Central Committee of the Party
(September 28, 1979)*

The Chinese people have entered the new historical stage of realizing the four modernizations in the great cause of socialist construction. In 1979, the focus of the work of our party and state was shifted to socialist modernization. The first and foremost task now confronting us is to concentrate our efforts on speeding up the development of our still backward agriculture. As agriculture is the foundation of the national economy, its rapid development provides the essential guarantee for the realization of modernization. Only by speeding up agricultural production and bringing about modernization in agriculture step by step can our peasants, who comprise 80% of the population, become rich; and only then can the national economy as a whole prosper, the worker-peasant alliance be strengthened and the socialist system and dictatorship of the proletariat be consolidated in China. For this reason, the Central Committee has made a decision on the following questions:

I. Unifying Understanding in the Party on the Question of Agriculture

In order to speed up our agricultural development, it is essential for all comrades in the party to have a unified and correct understanding of the conditions prevailing in agriculture at present and of our past experience.

Since the founding of our People's Republic, the peasants in their millions and the large numbers of cadres, guided by Marxism-Leninism and Mao Zedong Thought, have worked hard and scored tremendous achievements. The socialist transformation of our agriculture has been a triumphant success. Grain output in 1978 showed a 2.7-fold increase over that in 1949, and cash crops, forestry, animal husbandry, side-line occupations, fisheries and enterprises run by the people's communes, production brigades and teams have all registered increases in output. Some areas have witnessed a striking expansion in agriculture. Many big, medium- and small-sized water conservancy projects have been completed throughout the country and large areas of farmland with stable high yields have been cultivated. There has

been a considerable increase in the production of chemical fertilizers, farm machinery, drainage and irrigation machinery and electricity. However, our overall agricultural development has not progressed very rapidly in the last 20 years and is highly incompatible with the needs of the people and of the four modernizations. From 1957 to 1978, our population increased by 300 million and the number of people not engaged in agricultural production increased by 40 million, whereas the acreage of cultivated land decreased because, among other reasons, more land was used for capital construction purposes. Although there has been a rise both in per-mu and in total grain yields, the average amount of grain per capita throughout the country in 1978 was more or less the same as in 1957. The average annual income of our agricultural population per capita was no more than 70-odd yuan; in nearly a quarter of the production teams, the members' average income was less than 50 yuan. The collective accumulation funds of the production brigades averaged less than 10,000 yuan, and in some places things were so bad that it was hard to go on with simple reproduction. Without an acceleration in agricultural development, any increase in industrial production or other forms of construction will be out of the question, as will be the four modernizations. The vital and pressing nature of this question merits the close attention of our comrades throughout the party.

In the past 29 years, China has followed a tortuous course in the development of agriculture. During the three years of rehabilitation and the period of the First Five-Year Plan after Liberation, we carried out agrarian reform on a nationwide scale, won the great victory in the socialist transformation of our agriculture, embarked on large-scale construction of the socialist economy in an orderly manner, and developed agricultural production to a fairly considerable extent. In these eight years, grain yields increased at an average rate of 7% a year. In the drive to establish people's communes and in the great leap forward in 1958, the masses of the people were imbued with lofty revolutionary zeal; they overcame blind faith, emancipated their minds and dared to think and act. Yet, at the end of the

1950's and the beginning of the 1960's, our agriculture suffered disastrous setbacks. Apart from natural calamities, annulment of contracts by the government of the Soviet Union and withdrawal of its experts, the reason for these setbacks lay in our lack of experience in giving nationwide leadership to collectivized, socialist agriculture and also in our failure to remain cool-headed, and thus the mistakes of giving arbitrary directions, being boastful and stirring up a "communist wind" were made. Under the leadership of the Central Committee of the Party and of Comrades Mao Zedong and Zhou Enlai and through the efforts by the entire party and the whole nation, we overcame the shortcomings and mistakes in our work and surmounted the difficulties in a relatively short period of time; as a result, agricultural production was rapidly rehabilitated and new developments were attained. During the ten years of the "cultural revolution," the counter-revolutionary, conspiratorial cliques of Lin Biao and the Gang of Four pushed an ultra-"Left" line, gravely undermining the various levels of the party organizations in the rural areas, the party's rural policies and its traditional fine style of work, disrupting the collective economy, and the worker-peasant alliance, and drastically checking the enthusiasm of the peasants and cadres. Nevertheless, thanks to resistance on the part of the cadres and masses to the perverse acts of Lin Biao and the Gang of Four, our agricultural production continued to increase to a certain extent in the 1970's.

Our 20 years of experience in agricultural development show us that, with the completion of socialist transformation, a correct appraisal of the class struggle should be made, correct policies adopted, and profound attention paid to maintaining political stability in our society; otherwise, the productive forces and the relations of production in socialist agriculture will be disrupted and rapid development in agriculture will be impossible. At the same time, we must do our work in accordance with natural and economic laws. In the past, in some specific aspects of our work, we failed to take agriculture as the foundation of the national economy, some of our policies and measures were unfavourable to the all-around development of farming, forestry, animal husbandry, side-line occupations and fisheries and to the promotion of the peasants' enthusiasm for socialist production, the state failed to give enough aid to agriculture or that aid failed to be efficiently utilized, technical transformation was not really grasped as a central task, scientific research and education in agriculture were not duly emphasized, and the principle of all-around development of farming, forestry, animal husbandry, side-line occupations and fisheries was not imple-

mented satisfactorily. All this impaired rapid development in agriculture. Therefore, in order to accelerate rehabilitation and development in agriculture, we must bear in mind the major lessons derived from our experience as follows:

1. We must maintain long-term political stability and unity. Without this prerequisite, neither the modernization of agriculture nor the realization of the four modernizations by the end of the century will be possible. Since the smashing of the Gang of Four, there has been stability and unity throughout the country. This has not been won easily. We must cherish it, safeguard it and do everything in our power to promote the excellent situation.

2. We must correctly understand and handle the class struggle in the rural areas and in the country as a whole, correctly conduct socialist education among the peasants, guard against interference by "Left" or Right deviations and pay special attention to eliminating the pernicious influence of the ultra-"Left" line of Lin Biao and the Gang of Four. After the co-operative transformation of agriculture, class struggle still exists in the rural areas, although class enemies who are hostile to and who sabotage socialism constitute only a very tiny fraction of the entire population. Therefore, it is wrong either to neglect or exaggerate class struggle. We shall firmly discourage the disruptive activities engaged in by the handful of class enemies, whose existence is an objective fact; but it is absolutely impermissible to wilfully confuse the two different types of contradictions, arbitrarily exaggerate class struggle, or artificially create it so as to undermine unity and harm fine people. Long years of practice in struggle have proven that the masses of peasants in China firmly support the leadership of the party and are willing to take the socialist road. In the course of our endeavour to modernize agriculture, we should rely more firmly on their enthusiasm and give it fuller play. As to the spontaneous tendency towards capitalism found among a small number of peasants, it is imperative to use painstaking persuasion and education to help them overcome it of their own accord. Here it is essential to clarify, first and foremost, what socialism is and what capitalism is. The diversified production engaged in by the communes and production brigades constitutes part of the socialist sector of the economy, and the small plots of land planted by commune members for their personal needs and the limited number of livestock raised by them for the same purpose, household side-line occupations and village fairs are subordinate and supplemental to the socialist economy; they definitely cannot be re-

garded as a form of capitalist economics and must not be repudiated and outlawed as such. "To each according to his work" and "more pay for more work" constitute the socialist principle of distribution, which must not be opposed as a capitalist principle. The three-level system of ownership by the commune, the production brigade and the production team, with the production team as the basic accounting unit, is suitable to the present-day stage of development of the productive forces in our agriculture, and it is absolutely impermissible to alter it arbitrarily in order to effect a premature transition in ownership.

3. We must concentrate our efforts on technical transformation in agriculture to develop agriculture's productive forces. Technical transformation is to be accomplished on the basis of collectivization in agricultural production. This is the fundamental line of our party on the question of agriculture and must never be forgotten. If it is forgotten, the worker-peasant alliance will not be consolidated, nor will capitalism be defeated by socialism, and that will mean departure from the vital interests of the party and the people. We must attach importance to the fact that the expansion of capital construction in different aspects of agriculture (including the increase of water conservancy works, farmland, pastures, forestry, fishing grounds, livestock sheds, fodder processing centres, slaughterhouses, storehouses, grain-drying grounds, roads, methane-generating pits and other natural resources) and the expansion of the commune- and brigade-run enterprises in the rural areas have played a remarkable role in transforming natural conditions in agricultural production and in increasing the material capacity of the peasants for expanded reproduction.

4. We must implement the party's rural policies for the present stage in a sustained and steady way. On no account must we make random changes in the policies that have been proved to be effective in practice, lest we thus lose the people's confidence and dampen the peasants' enthusiasm. However, we must resolutely alter and set right erroneous policies that are not conducive to promoting the peasants' enthusiasm for production and to developing the productive forces in agriculture.

5. We must steadfastly adhere to the policy of taking agriculture as the foundation. The Central Committee of the Party, the State Council and the various ministries and commissions in charge of economic work must pay special attention to ensuring effective implementation of this policy. In formulating plans for the national economy,

they must truly abide by the order of priorities in which agriculture is primary, followed by light industry and heavy industry, and they must maintain the balance between agriculture and industry, first taking into consideration whether agriculture can bear the burden for additional construction projects. The state and the municipalities, the departments of industry and communications, trade and finance, science and technology, culture, education and public health, and the People's Liberation Army must increase their material and technical assistance to agriculture.

6. We must correctly and comprehensively carry out the policies of "simultaneous development of farming, forestry, animal husbandry, sideline occupations and fisheries" and "taking grain as the key link, ensuring all-around development, suiting measures to local conditions and appropriately concentrating on specialized planting." Close attention must be given to grain production since it has a direct bearing on the livelihood of our 900 million people and on our preparedness against war and natural calamities. We were correct in going all out to promote grain production in the past, but in so doing we neglected and thus hindered production in cash crops, forestry, animal husbandry and fisheries, and failed to pay attention to maintaining the ecological balance. This has been a tremendous lesson to us. We must make the best use of favourable natural conditions in our country and fully tap the potential in all fields, so as to bring about large-scale growth in farming, forestry, animal husbandry, sideline occupations and fisheries. In the light of the special features of different localities, appropriate efforts should be made to increase the production of food grains and cash crops. A gradual and planned change should be effected in the present structuring of our agriculture and in our people's diet, and we should correct the emphasis on planting food grains to the neglect of production in cash crops, forestry, animal husbandry, sideline occupations and fisheries.

7. In guiding agricultural production, we must proceed from reality, act in accordance with natural and economic laws, and bear in mind the interests of the masses. We must firmly persist in the principle of running the people's communes democratically and respect and protect the democratic rights of the commune members. There must be no abuse of the right to issue administrative orders, nor must there be the delivering of arbitrary directions; and complex situations are not to be dealt with in a sweeping manner.

By smashing the Gang of Four, we removed the biggest obstacle on our march forward. We are

in a position to make full use of all favourable conditions and we are confident that we shall succeed in speeding up the development of our agriculture. Ours is the superior socialist system; we are rich in natural resources and have 800 million courageous and industrious peasants and a large contingent of long-tempered rural cadres, agricultural scientists and technicians. A relatively solid foundation has been laid for our industry, which will gradually be able to provide our agriculture with modern technology. In addition to 1.5 billion *mu* of cultivated land, we have wide stretches of wasteland, grassland, forest and mountain areas which are suitable for afforestation and grazing. We also have large bodies of fresh water and seas which are suitable for aquatic production. In short, there are amply favourable conditions for agricultural development. As long as we persist in the socialist road, the dictatorship of the proletariat, the party's leadership and Marxism-Leninism and Mao Zedong Thought, and as long as we are truly good at summing up both the positive and negative experience of the past, always adhere to the ideological line of dialectical materialism, uphold the Marxist principle of taking practice as the sole criterion for testing truth, continue to study new problems and sum up new experience, we shall certainly be able to mobilize all positive factors and realize the great goal of modernizing our agriculture by the turn of the century.

II. Twenty-Five Policies and Measures for Developing the Productive Forces in Agriculture at Present

In order to effect a rapid change in the backwardness of our agriculture, we must focus on implementing a series of policies and measures in the coming two or three years; policies and measures for accelerating agricultural development, lightening the burden of the peasants, and increasing their income. On this basis we shall gradually modernize our agriculture.

In formulating our agricultural and rural economic policies, our starting point is to bring into full play the superiority of our socialist system and the enthusiasm shared by our 800 million peasants. While strengthening ideological education in socialism among the peasants, we must show concern for them, both economically and politically, by protecting their material interests and guaranteeing their democratic rights. Enthusiasm on the part of any social class cannot rise of its own accord without ensuring certain material interests and political rights. Whether or not any of our policies meet the needs of the

development of the productive force will be determined by whether they serve to mobilize the working people's enthusiasm in production. The state, however, must also give more effective material and technical assistance to agriculture, provide it with advanced techniques and gradually raise the peasants' mastery of science and technology. Without such assistance and with sole reliance on the peasants' own material strength and enthusiasm, rapid development in agriculture will be impossible, as will modernization. Only when the state provides agriculture with more assistance will the peasants' enthusiasm rise; and only when the peasants' enthusiasm is fully aroused will assistance from the state yield better results. The two sides of the matter are complementary.

With the foregoing as a guideline, the Central Committee holds that the following 25 recommendations on policies for agriculture, economic policies for the rural areas and measures for increasing production must be adopted:

1. The ownership rights and decision-making power of the people's communes, production brigades and production teams must be effectively protected by the laws of the state, and no unit or individual shall deprive them of their interests or encroach upon them at will. Provided that it persists in the socialist orientation, carries out state policies, laws and decrees and accepts the guidelines of state plans, the basic accounting unit of a people's commune has the power to decide on the kinds of crops that shall be planted in the light of local conditions in different seasons, on the measures for increasing production and on ways of operation and management; it has the power to distribute its products and earnings in cash and the right to reject arbitrary directions issued by any leading organs or individuals.

2. No unit or individual is permitted to requisition or take possession of a production team's labour power, farmland, livestock, machines, funds, products or other materials. No enterprise or establishment run by a department of the state in the rural areas (excluding those set up by the peasants of their own free will) is permitted to increase the burden of the collective or of any individual member, except in cases stipulated by state laws and decrees. The principle of voluntary participation and mutual benefit must be upheld in carrying out capital construction in agriculture and in expanding enterprises run by the communes, production brigades or production teams. No unit is permitted to transfer labour power out of the communes, production brigades or production teams, except as in accordance with state plans; a contract, specifying rational terms for payment,

must be signed with contracted-for or temporary workers transferred in accordance with state plans.

3. The economic organizations at different levels in the people's communes must conscientiously carry out the distribution principle of "from each according to his ability, to each according to his work," "more pay for more work, less pay for less work," and "equal pay for equal work" irrespective of sex. There must be stricter control over production quotas, work should be paid according to the quantity and quality of products, a requisite system of rewards and penalties must be formulated, and egalitarianism must be overcome resolutely. Workpoints should be calculated on the basis of the fulfilment of fixed quotas or on a time-rate basis plus appraisal. On the premise of unified accounting and distribution at the production team level, it is also possible for quotas to be assigned to a production group and for payment to be worked out according to output of production, with rewards offered for overfulfilled quotas. No land shall be redistributed for individual farming. No output quotas shall be fixed on a household basis, except in certain cases in order to meet special requirements in side-line production or in outlying mountain areas where there are scattered, solitary households and where communication is inconvenient. Generally speaking, the amount of grain distributed to a commune member is fixed in accordance with the amount allotted for his or her workpoints in addition to the basic ration, or that which is allotted as preferential consideration. Another method is for distributed quantities to be decided upon by the majority of the commune members. The basic grain ration per member is fixed according to age groups. With the expansion of the collective economy, improvements must be made in the running of collective welfare undertakings, so that the livelihood of the old and the weak, the childless, and widowers, widows, orphans, members with disabilities, disabled demobilized army men and the families of revolutionary martyrs and army men will be better ensured.

4. The farming of small plots of land and the keeping of a limited number of livestock for commune members' personal needs, household side-line occupations and village fairs constitute an appendage of the socialist economy and supplement it, and must not be repudiated as vestiges of capitalism. On the contrary, while consolidation and expansion of the collective economy must be guaranteed, the peasants should be encouraged and supported to engage in household side-line occupations so as to increase their personal income and invigorate the rural economy.

5. The people's communes must continue to adhere steadily to the three-level system of ownership, that is, ownership by the commune, the production brigade and the production team, with the production team as the basic accounting unit, and concentrate their efforts on developing the productive forces in the rural areas. The basic accounting unit shall not be changed from the production team to the production brigade before conditions are ripe and the majority of the members agree; even when conditions are ripe and the vast majority of the members agree, the change shall not be made until approval by a leading organ at the provincial level is obtained. Where a production brigade is already the basic accounting unit and is able to manage as such, further efforts should be made to ensure its success.

6. In the next three to five years, investments by the state in agriculture will gradually rise to about 18% of its total investment in capital construction; expenditures for financing agricultural undertakings and assisting communes, production brigades and teams will gradually rise to about 8% of total state expenditures. Local financial revenues should go mainly to agriculture and those industries that serve agriculture.

7. From now until 1985, loans granted to agriculture will amount to more than twice as much as in the past. The state will provide, in a planned way, long-term loans for special purposes at low or very little interest, some of which may be repaid in 10 years, some in 15 years and others at the turn of the century. To meet the needs of developing the credit business in rural areas, the Agricultural Bank of China should do a good job of providing credit in the countryside.

8. From the time when the summer grain comes on the market in 1979, state purchase prices for grain will be raised by 20%, and the price of grain purchased in excess of quotas will be raised by 50% over the new prices. The purchase price for cotton, edible oils, sugar cane, livestock, aquatic and forest products will be raised correspondingly, step by step, according to the merits of each kind of product. On the basis of reduced production costs, wholesale and retail prices for manufactured products for agricultural use, such as farm machinery, chemical fertilizers, agricultural pesticides and plastics will gradually be lowered, with the peasants mainly benefitting from the reduced production costs. After state purchase prices for agricultural products have been raised, the sales price of grain to the consumer will remain unchanged; the sales prices of other agricultural products needed by the masses must be kept more

or less stable; and appropriate subsidies must be granted to the consumer in instances where the prices of some products must be increased. In the future, we shall continue to make necessary readjustments in the price parities between industrial and agricultural products in light of the development of the national economy and in accordance with the principle of exchange at equal value.

9. For a fairly long time to come, the total annual purchase quota of grain will be kept at the figure set for the five-year period from 1971 through 1975, and will even be reduced by 5 billion catties from 1979 onward so as to lighten the burden of the peasants and to spur production. No grain will be purchased by the state in those rice-planting areas where the grain ration per capita is less than 400 catties and in areas where food grains other than wheat and rice are planted and where the grain ration is less than 300 catties. In no case shall the purchase quota be increased.

10. While adapting measures to local conditions, firm and vigorous efforts must be kept up to do a good job of agricultural capital construction, which is indispensable for production, storing, transportation and processing in farming, forestry, animal husbandry, side-line occupations and fishing. The agricultural areas which chiefly produce food grains should continue to focus on water control and soil improvement; should go all out to plant trees and grass; should tackle problems relating to the utilization of mountains, rivers, farmland, forests and roads in an all-round way; and should actively and gradually change production conditions, enhance their ability to combat natural calamities, and increase the acreage of farmland with guaranteed stable and high yields irrespective of drought or water-logging. In the light of local conditions in different seasons, overall consideration should be given to production in cash crops, forestry, animal husbandry, side-line occupations and fisheries. By 1985, there should be a relatively noticeable increase in the total area of irrigated land and of farmland with stable and high yields all over the country. While the state will continue to build a number of key, large-scale water conservancy projects, the main task of the localities is to build medium- and small-sized conservancy projects and conveyance systems, thus combining the construction of large-, medium- and small-sized projects and integrating the efforts of specialized teams and the masses. Stress must be placed on actual results and quality must be guaranteed. Formalism should be eschewed. In all agricultural capital construction projects, the masses must be fully mobilized to conduct democratic discussions and, in accordance with actual local conditions,

comprehensive arrangements should be made and long-term plans worked out to be put into effect step by step. Capital construction and production should be considered comprehensively.

11. While making full use of available cultivated land, the state farms and people's communes should begin, where possible, to open up wasteland in a planned way. For the first five years, no purchase quota will be set for harvests gathered from newly-cultivated land by the people's communes, production brigades, or production teams. In the process of land reclamation, no forests, grasslands or water conservancy works are to be destroyed, neither shall flood water storage or release projects be hindered. Where possible, dykes can be built to reclaim land from the sea for planting, on condition that this will not affect or disrupt the production of sea salt. This does not apply to inland lakes or inshore areas which are better suited to aquatic or other products. Factories, mines and enterprises should make a conscientious effort to solve the problem of pollution, so as to prevent contamination of water, air and other natural resources, and damage to agriculture. No government offices, people's organizations, army units, enterprises or schools are permitted to appropriate at will farmland, pastures and forest land belonging to the people's communes and the state farms. Where capital construction projects must be carried out, it is still necessary to economize strictly on the use of land and most advisable to use little or no cultivated land at all. The Land Law should be adopted and promulgated as soon as possible.

12. Efforts must be made to operate the state farms well, so that they will provide the state with more commodity grain, cash crops and other farm and side-line products. The state farms that still show a deficit must make a change in the situation and start to earn profits within a time limit. The staff and workers of the farms that have been successful and have earned profits may increase their personal incomes. State farms are not required to turn over their profits to the state before 1985, but can use them to expand reproduction, diversify the economy, build processing centres for farm and livestock products, expand trade for the sale of their own products, and thus move as quickly as possible towards becoming integrated agricultural-industrial-commercial complexes. In this way they will play an exemplary role in the modernization of agriculture.

13. While guaranteeing quality, the production of chemical fertilizers, agricultural pesticides and plastics, and various kinds of weed killers must

be rapidly increased. Large quantities of farm manure must be stored, more green-manure crops planted, more bean-cake fertilizer and other organic fertilizers made, and more stalks returned to the fields after threshing. In increasing the production of chemical fertilizers, attention should be paid to keeping nitrogen, potassium and phosphorus in rational proportion. The production of different kinds of agricultural chemicals, weed killers and plastic materials for agricultural use should be increased by a large margin. It is necessary in order to popularize the scientific application of fertilizers and pesticides, make the best use of them and, at the same time, conscientiously work out effective ways of preventing and treating the pollution of crops, water and the environment that might result from their use. Active efforts should also be made to spread the use of biological controls.

14. Seed selection and breeding must be carried out, and improved varieties introduced and disseminated. The seed-breeding fields of production brigades and teams along with the seed multiplication farms of the counties and people's communes should continue to be run well and, at the same time, seed-producing bases at the provincial, prefectural and county levels should be set up — so that seed production can gradually become specialized, processing mechanized and quality standardized — so that plant varieties can be allocated to specified areas. A sound operational system for seed corporations should be set up; adequate rules and regulations should be drawn up for examining and approving varieties of seed, multiplying and popularizing fine strains, and for operational management, testing of seeds, and preventing degeneration and hybridization of seeds. The Seed Law should be adopted and promulgated at an early date. Prices for fine strains should be set according to their quality, so as to ensure increased production of grain.

15. Mechanization should be promoted in farming, forestry, animal husbandry, side-line production and fishing in the light of local conditions, and there should be more mechanized stock raising. Active efforts should be made to manufacture machines needed by agriculture for transportation, loading and unloading. We should carry out readjustment, restructuring, consolidation and improvement in the manufacture of farm machines, improve the quality of products, reduce production costs, gradually bring about standardization, serialization and interchangeability of machine parts, and conscientiously facilitate the supply of complete sets of farm machines and of spare parts for farm tools. The problem of supply-

ing accessories and spare parts for farm machines and tools must be solved within the next two or three years. The efficiency of existing farm machines will thus be greatly raised.

From now on, the main parts, accessories and spare parts of farm machines must be manufactured in a proportionate way. The Ministry of Farm Machine-Building should do a good job of unifying administration of scientific studies relating to farm machines, their design and manufacture, operation and management, maintenance and repair, supply and marketing, and also of the training of personnel and so on and so forth. There are two ways to set up tractor stations: 1. The people's communes, production brigades or teams can buy their own tractors for their stations, and those that are short of funds can apply for state loans; 2. The state can set up stations to provide tractors to the communes, production brigades or teams at a reasonable fee. The first way is considered preferable.

16. While stepping up the production of grain, conscientious efforts should be made to produce cotton, edible oils, sugar and other cash crops, to develop forestry, animal husbandry, sideline production and fisheries, and to promote their simultaneous development. All positive factors should be fully mobilized and all resources that can be brought into use should be gradually exploited and utilized for the flourishing of our rural economy as a whole.

17. Energetically go in for afforestation and try to ensure a high survival rate. We should focus on building a shelter belt from the Northwest to the Northeast, create networks of farmland skirted by trees and plant trees around every house and village, by roadsides and watersides in North China, the Central Plains and the Northeast. Among other key projects, quick-growing trees that can be used for timber should be planted in the ten provinces south of the Changjiang (Yangtse) River, cash forest regions should be established both in the north and south, and the old forest areas in the Northeast should be reforested. All localities should act realistically and should work out feasible plans to afforest wasteland and barren hills within a given time limit. Efforts should be made to adopt advanced techniques, make comprehensive use of lumber resources and fell trees in a rational way. Improved seedlings should be actively cultivated, introduced and popularized, and stress should be placed on planting more oil-bearing and edible fruit trees. We should conscientiously abide by the Forest Law and effectively protect the forests, strictly forbid arbitrary cutting and felling of trees, resolutely correct the

practice of felling trees without reforestation, and take strict precautions against forest fires.

18. Go all out to develop animal husbandry and increase its role in agricultural production. Special attention should be paid to the raising of herbivorous animals such as cattle, sheep and rabbits. In animal husbandry, importance should be attached not simply to numbers of livestock bred and kept, but to increasing the numbers immediately available for slaughter and the amount of meat produced. We should continue to encourage commune members to raise pigs, cattle and sheep on a household basis and actively increase the number of collectively-raised pigs, cattle and sheep. We should improve livestock breeds, redouble efforts to improve the condition of pastures, grass hills and slopes in agricultural regions, build water conservancy works, improve grass seeds, make rational use of pastures, adopt rotation grazing and expand grazing capacity. We should do a good job in preventing animal diseases. The Pasture Law should be promulgated as soon as possible. It is essential to establish a number of modernized livestock and poultry farms in the livestock-raising areas and in the suburbs of large and medium-sized cities in a planned way and to build a number of modernized slaughterhouses, cold storage plants and processing plants for animal products.

19. Make rational use of aquatic product resources; rapidly increase fishery production and the output of aquatic products. We should fully utilize and exploit waters and seacoasts and go all out to develop the breeding of freshwater and seawater animals and plants, such as fish, shrimps and prawns, shellfish, frogs, kelp and laver, and steadily expand artificial breeding areas. It is necessary for specialized institutions and personnel to take charge of making practical arrangements for investigation and utilization of resources, and of providing financial and material assistance, technical guidance and product processing, so as to ensure rapid growth in breeding different kinds of fish. Effective readjustments should be made with regard to inshore fishing and to opening up mid-sea fishing grounds. The Regulations for Reproduction and Protection of Aquatic Resources should be carried out, and the Fishery Law should be promulgated as soon as possible in order to strengthen administration and management of fisheries. We should adopt advanced techniques and equipment to promote modernized fishing, breeding, processing, storage and transportation in fisheries. A number of fishing grounds should gradually be built up. Great efforts should be made to develop breeding of various kinds of aquatic

animals in the suburbs of cities; centres for fish and shrimp breeding can be set up where conditions permit.

20. There should be a major expansion of the enterprises run by the communes, production brigades and teams, so that earnings from the enterprises will constitute a gradually increasing proportion of the total income of the three-level economy. The processing of farm and side-line products should gradually be taken up by these enterprises in those rural areas where it is suitable, economical and rational. Where feasible, urban factories should transfer part of the processing of products and spare parts to rural enterprises in a planned way, providing them with equipment and technical guidance. In keeping with the economic plans made at various levels, different methods should be developed to facilitate the production, supply and marketing of products by these enterprises, to ensure smooth supply and marketing. As regards these enterprises, the state should pursue a policy of reducing or remitting taxes, as conditions may dictate.

21. In commerce, the principle of exchange of equal values must be conscientiously applied to facilitate interflow of commodities between town and country. When purchasing farm and side-line products from the rural areas, prices should be fixed according to quality; it is strictly forbidden for buyers to force down grades and prices for goods. The means of production and of subsistence needed in the rural areas must be supplied in time, with quality guaranteed and at reasonable prices. Contracts must be signed for purchasing grain, cotton, edible oils and other commodities subject to unified purchase, and for unified, allotted or negotiated purchasing of other farm and side-line products. Contracts must be respected. There shall be no resorting to coercion or commandism.

22. It is imperative to make an effort to turn out more agricultural products for export. The state has decided to allocate a certain amount of foreign currency specifically for the purpose of assisting the provinces, municipalities and autonomous regions to expand production of cash crops and special local products, animal husbandry, side-line production and fisheries, to build corresponding processing industries, and, under unified state plans, to turn out products which will find a good market abroad and bring quick returns and earn foreign exchange. Specific measures will be worked out by the State Planning Commission together with the departments concerned.

23. Parts of the northwest and southwest, some old revolutionary base areas, outlying mountain areas, minority nationality regions and frontier areas have long been low-yield, grain-deficient areas where the population is impoverished. The slow speed of development in production in these areas presents not only an economic problem, but also a political one. The State Council is going to set up a special commission, composed of responsible comrades from relevant departments, to formulate an overall plan and to organize forces to focus on providing these areas with financial, material and technical assistance, and to help them to increase production and lift themselves out of poverty. The commission will also help poor communes, production brigades and teams to bring about a change as quickly as possible. Impoverished production brigades and teams must guarantee to use state allotted funds for production and construction.

24. Resolute efforts must continue to be made to practice family planning; conscientious propaganda and education must be conducted for this purpose; arbitrary and unsuitable methods must be corrected; and medicare services and medicinal supplies must be ensured. It is imperative to adopt more effective policies and measures, and chiefly economic measures, to bring down the population growth rate over the years; it is expected to drop to 0.5% by 1985.

25. Protecting and mobilizing the initiative of the large numbers of cadres at the grassroots level in the rural areas is vital to accelerating agricultural development. The overwhelming majority of rural cadres are good or fairly good. They live together with the masses all year around, braving the elements and working hard without complaint, and they have made magnificent contributions to our agriculture. Towards those cadres who have made mistakes, except for a handful of bad elements, it is absolutely necessary to rely on education to help them correct their mistakes and to continue to make progress. Many mistakes made by cadres at the grassroots can be attributed to authorities at higher levels or to the central authorities who set tasks and drew up policies that were unsuitable or inexplicit. Efforts must be redoubled to examine and redress the wrongs done to cadres at the grassroots level in past political movements. Salary and welfare problems of commune cadres and agricultural technicians should be gradually and appropriately solved. The income of chief production brigade cadres should be a bit higher in labour capacity than that of their peers. Those cadres who are successful in work should be commended and rewarded. Specific plans should

be made for their training and education in politics, culture, management and special skills. All cadres at the commune, brigade and production-team levels must be elected at regular intervals at congresses of the commune members or at general meetings of the commune members and they must put themselves under constant supervision by the masses. The various kinds of economic accounts should be published regularly. Democratic management should be upheld in running the communes, production brigades and teams, the cadres should carry forward a democratic style of work, and they should persist in taking part in collective productive labour. It is not advisable to change cadres too often.

The Party Committees at all levels should continue to guide the large numbers of cadres and peasants in learning from the basic experience of Dazhai, that is, in adhering to the principle of putting politics in command and placing Mao Zedong Thought in the lead, to the spirit of self-reliance and hard struggle and to the communist style of loving the country and the collective. At the same time, they must firmly carry out the party's policies for agriculture and the rural economy, learn from successful domestic and foreign experience, exert themselves to master advanced sciences and technology, and learn how to run modern agriculture on a large scale. Our cause is forging ahead with each passing day, a large number of advanced units have emerged in the Learn-from-Dazhai Campaign, and new ones will continue to emerge, one after another. Dazhai Brigade and other advanced units throughout the country should take an analytical approach towards themselves, and do their best to achieve new successes, acquire new experience, and make new contributions to the acceleration of the development of agriculture in China.

III. Arrangements for the Modernization of Agriculture

The overall modernization of agriculture and thorough transformation of China's rural areas is a revolution of unprecedented scale. In order to attain this goal we must proceed from existing conditions: our large population, limited arable land, weak foundation and low scientific and cultural levels — but vast territory, relatively rich natural resources and great labour reserves. We must earnestly sum up our own experience, modestly learn from the advanced experience of foreign countries, avoid insofar as possible the evils which have cropped up in the technically advanced countries, and follow a course of agricultural modernization suitable to our own national

circumstances. While conscientiously implementing the 25 policies and measures outlined above, we must continue to investigate and study, to carefully work out a plan for realizing agricultural modernization stage by stage and step by step and to resolutely work out arrangements for solving problems once a definite understanding of them is arrived at, all the while organizing our various forces and doing down-to-earth work so as to guarantee success.

1. The modernization of agriculture urgently requires that we arm our rural cadres and agro-technical personnel with modern scientific and technical knowledge, that we have a large contingent of specialists who understand modern agricultural science and technology, an enormous scientific and technical agricultural army, and sufficient numbers of good agricultural colleges and schools to train agro-technical and management personnel. At the same time, it requires that we greatly raise the scientific, technical and cultural levels of the entire peasantry, first and foremost the young peasants. These tasks will require several years — even a dozen or more years — to complete, and we must begin to take them firmly in hand right now, and not relax our efforts even for a moment. We must thoroughly correct the mistaken view that agricultural modernization can get along without the most modern scientific research and education, that agro-science research organs and advanced agricultural schools are optional, and that agricultural development can do without the active participation of specialists — and we must quickly restore and strengthen the research and educational conditions which they require. We must organize the scientific and technical forces of the entire nation to study and solve the scientific and technical problems involved in agricultural modernization. The central organs must do a good job of running key higher-level agro-science research institutes and higher agricultural schools such as the Chinese Academy of Agricultural Science and the Beijing Agricultural University and, on the basis of the plans of different agricultural regions, the various provinces, municipalities and autonomous regions must set up and operate a group of agro-science research organs, institutes and agro-technical secondary schools so as to gradually form a comprehensive, rationally-distributed agro-science research system. At the same time, we must work conscientiously to strengthen technical popularization. The agro-science experimentation network encompassing counties, communes, brigades and teams is our network for agro-technical promotion, and from the county on down we should do a good job with experimentation, demonstration, popularization

and technical training. We should lay down plans as quickly as possible and set about training county, commune and brigade cadres by rotation, and urgently-required agricultural equipment operators, agro-technicians and financial and accounting personnel. Over the next few years, virtually all cadres should undergo a stint of training and every commune and brigade should acquire sufficient numbers of qualified machinery operators, agro-technicians and financial and accounting personnel. Educated youth who are posted to, or return to, the countryside all have a certain cultural level and some practical experience and should be encouraged to engage in farming. According to their different levels and circumstances, they should be accepted for study at agricultural institutes, agro-technical secondary schools or various kinds of training classes, and efforts should be made to train them into a backbone force for large-scale agricultural modernization.

2. In order to modernize agriculture, we must actively push agricultural mechanization forward in a planned way. Agricultural mechanization must conform to the needs of production and be premised on realities. We should bring in, manufacture and popularize advanced agricultural machinery suited to China's particular conditions, run parts and repair services properly, and give full play to the potential of agricultural equipment so as to raise labour productivity by a wide margin. On the basis of available resources, we should strive to set up small rural hydro-electric and thermal power stations. We should popularize the use of marsh gas. Each region, depending on local conditions, should determine the steps and concrete requirements of popularization, include it in their plans for agricultural capital construction, allot the necessary funds, provide the necessary materials, and organize technical training. We should actively utilize wind and solar energy and adopt every practicable measure for expanding energy resources to serve agriculture. Taking local conditions into account, we should develop water conservancy and grassland irrigation and, differentiating between north and south, mountain and plain, paddy field and dry farmland, bring in water, store it, or pump it up where possible, and systematically develop sprinkler irrigation, so as to realize an irrigated agriculture — one in which we can freely increase or reduce the amount of water and thus achieve high and stable yields. We must speed up production of agriculture-related chemical products, and steadily provide our agricultural sector with chemical fertilizers, pesticides, plastic sheeting, herbicides and other products of fine quality and wide variety and at reasonable prices,

so as to facilitate the rapid development of agriculture. In light of the needs of agricultural modernization, the ministries of Agriculture, Forestry, State Farms and Land Reclamation, Agricultural Machinery, Water Conservancy, Power Industry and Chemical Industry should co-operate closely and, during 1980, should work out their own, all-around, long-term plans for modernizing agriculture and workable annual implementation schedules — and then apply themselves to implementing them.

3. To modernize agriculture, agricultural production as a whole must be rationally arranged, and we must progressively implement regionalization and specialization, continuously raising the level of socialization of agricultural production. If we don't do this, it won't be possible to carry out large-scale, all-around mechanization or to adopt advanced science and technology comprehensively and on an extensive scale. At the same time, we must ensure the balanced development of farming, forestry and animal husbandry, with different regions engaging in these activities as local natural conditions permit or, taking one as primary, pursuing a diversified economy. The relevant departments under the State Council and the various regions should organize their forces to complete, within three years, nationwide investigations into natural resources and natural conditions of soil, climate and so on, and into social conditions such as population, transport and communications, industry, commerce, science and education. On this basis they can put their heads together with peasants and rural cadres rich in local experience and work out plans for the progressive implementation of regional specialization varying in scope and magnitude, and make plans which co-ordinate farming, forestry, animal husbandry, fisheries, industry, side-line production, local and external trade, transport and communications, scientific education, and finance. On the basis of carefully worked out plans, we should also run experiments in a down-to-earth manner, sum up experiences, and advance in an orderly and step-by-step way.

4. State agricultural investment must be concentrated in the construction of a number of bases for producing marketable grain, cash crops, livestock, fish and forest products. These bases may be expanded versions of present state-run agricultural enterprises; they may be new state or collective farms set up in virgin territories; or they may be set up as joint enterprises by the people's communes. They should all acquire advanced equipment and adopt scientific methods in production and management step by step, and become large,

modern agricultural enterprises with high labour productivity and a high degree of commodity production. In addition to agriculture, some of these bases should go in for processing and marketing farm and side-line products, and should gradually develop into integrated agricultural-industrial-commercial complexes. Agricultural and forestry departments and relevant scientific and technical research institutions should establish close relations with these bases, co-operate with them, and help improve their production technology. A group of such bases will provide a more reliable guarantee for the supply to the state of required commodity grains, cotton, oil and sugar crops, fruit, animal, marine and forest products. The development of commodity agricultural bases is an important strategic measure for building a large-scale, modern, socialist agriculture, and we must concentrate the necessary state funds and do our utmost to run them well.

5. Agricultural modernization can't do without modern industry or transport and communications for a single instant. Basing ourselves on the characteristics of China's agriculture and on the demands of modernization and on the different conditions and production requirements of the various regions, within two or three years we must make overall arrangements and, while adhering to the principle of co-operative specialization, organize a rational national distribution of agriculture-related industry. We should see that various kinds of agricultural machinery and various kinds of agriculture-related chemical products are put into economically rational mass production, that their quality is continuously raised and that their costs are lowered. In the light of actual needs, each of the departments concerned, such as the ministries of Agricultural Machinery and Chemical Industry, should set up a number of specialized companies with strong management and attention to economic results; and effectively promote agriculture-related industry. The Ministry of Agricultural Machinery should orient itself toward the rural grassroots and, taking into consideration the needs of different economic zones, set up and flesh out agricultural mechanization service companies which progressively unify the management of provisioning, repair, rental and recall of agricultural machinery and various kinds of agriculture-related chemical products, and the management of technical training and application services, thereby offering convenient and timely service, and reducing commune and brigade expenditures. As for transport and communications, we should strive to build highways linking cities, towns and communes so that by 1985 it is generally possible to get from one county to another and from com-

mune to commune by motor vehicle. At the same time, we should strengthen the construction of communications links in herding, forest and fishing regions.

6. We must strive to establish modern agricultural and animal product processing industries based on principles of economic rationality — industries which meet the needs of and promote agricultural modernization. Such processing industries must be established in areas where production is concentrated, for the convenience of utilizing the products and resources of those areas and going as far as possible in comprehensive utilization. What is more, they must be in keeping with the transportation and communications conditions of these regions, be rationally distributed, and facilitate the commerce and supply requirements of both city and countryside. Only then will they be fully efficient economically. The ministries of Agriculture, State Farms and Land Reclamation, Light Industry, Textile Industry and Commerce, and the Federation of Supply and Marketing Cooperatives, together with other departments concerned under the State Council, should, through earnest discussions with the provinces, municipalities and autonomous regions, lay down development plans for this purpose as quickly as possible.

7. We must develop the construction of small towns in a planned way and must strengthen support for the countryside by the cities. This is the path we must take in order to hasten the modernization of agriculture and the four modernizations generally, and to gradually reduce the differences between town and country and between worker and peasant. At present, China has 800 million people in the countryside, 300 million of them agricultural labourers. With the advance of agricultural modernization, a great amount of agricultural labour power is bound to be saved. The labourers involved cannot and need not all enter the existing large and medium-sized cities, and neither can or should all our industrial and other construction undertakings be located in these cities. We must pay full attention to strengthening the construction of small towns and gradually build them up as advanced centres with modern industry and communications, modern commerce and services, modern educational, scientific, cultural and sanitation undertakings, centres for transforming the appearance of the entire countryside. First and foremost, stress should be placed on the planning for step-by-step construction of the more than 2,000 county towns and the economically more developed sub-county market towns and commune seats, based on the needs and

possibilities of economic development. The strengths of the existing big cities can also be utilized in the construction of some satellite towns in the surrounding countryside and in increased support for agriculture generally. Beijing, Shanghai, Tianjin, Shenyang, Wuhan, and all other cities strong enough to follow this course should, under the unified leadership of local party committees, take responsibility for helping several counties in their agricultural modernization.

8. In order to realize the modernization of agriculture, we must adhere to the general policy of concentrating our strength to fight wars of annihilation, going ahead piece by piece, a bit at a time. This is to say we should proceed in a wave-like advance and not take on everything at once. There should be unified management and employment of agricultural machines of which there should be complete sets; funds and materials allotted to agriculture must be used for key projects; only thus will it be possible to get maximum effects. Places where necessary conditions exist can go ahead first and procure more machines. For production to increase significantly and for peasant incomes to rise rapidly in places which go ahead first isn't a bad thing, but a good one; it can play a great demonstrative and motivational role for the entire country. In the first few years, if we concentrate on doing a good job in regions with, say, 5% of the national population, that would mean the raising of the incomes of more than 40 million people first; that is equivalent to a relatively large country in world terms, and domestically it would mean a great expansion in the internal market — it would be a remarkable achievement and of great encouragement to the whole of the 800 million peasants.

The Central Committee holds that agricultural modernization is an entirely new undertaking for us, and the above points cannot yet be said to be completely mature views, but are to be supplemented, corrected and perfected in the course of practice. The Central Committee hopes that party committees and governments at the various levels, and especially the agricultural departments and masses of rural cadres and workers in agricultural science, technology and education, will continue to immerse themselves in reality, will conscientiously carry on investigation and research, and will exert themselves even more practically and effectively to push forward the great cause of agricultural modernization.

IV. Strengthen Party and Government

The rapid development of agricultural produc-

tion and the active construction of an extensively modernized agriculture is a grand undertaking involving the entire party and people. The whole party and nation must be mobilized to put their all into agriculture. Party committees and governments at the various levels, from the centre to the localities, must all give priority to agricultural work, make the modernization of agriculture an important goal of long-term struggle, conscientiously strengthen their leadership, and lead an enormous and mighty army into this great, unprecedented battle.

For a long time in their direction and management of agriculture, some party committees, government organs, and departments concerned with agricultural work have been accustomed to rely solely on the issuing of administrative orders with general measures, indiscriminately demanding that subordinate levels down to the rural communes and brigades carry them out. Since this approach is divorced both from reality and from the masses, things often turn out contrary to their intentions, blunting the enthusiasm of the masses, causing losses in agricultural production and construction, and jeopardizing the liveliness and development of the rural economy. We must strive to change this.

Party committees at the various levels must pay close attention to the implementation of the party's line, principles and policies, and take firm hold of the major policies of rapidly developing agriculture and gradually realizing its modernization. They must strengthen the building of rural party branches and give play to the exemplary leading role of party members. At the same time, they must conscientiously carry out ideological and political work among the masses of cadres and peasants and do a good job of linking political with economic work so as to guarantee the smooth fulfilment of the various production and construction tasks. In the concrete operations of agricultural production and construction, they should give full play to the functions of the professional organs at different levels, letting them go about their work independently and responsibly; party committees should not concern themselves with everything or try to run everything. If the party committees get immersed in detailed professional matters, they will neglect party affairs and begin to replace governments; then not only will government departments and agricultural enterprises and operations have no way to carry on planned and orderly work with defined jobs, powers and responsibilities, but the party's leadership will also certainly be weakened, even to the point of losing its leading function.

In managing agriculture, state administrative departments should act independently and res-

ponsibly and must undertake a whole series of tasks successfully; for example, the planning of production and construction of a national or regional character; the control of major water systems and the construction of large- and medium-scale water conservancy projects; the construction of bases for commodity grains, cash crops, livestock and fisheries production; the construction of key forest regions and pasturelands; the research, planning and implementation of practical mechanization for agricultural modernization; investigation into natural resources and soil conditions and the planning of their utilization and transformation; research into and promotion of agro-science and technology; planning and conduct of agricultural education; the correct utilization and distribution of agricultural funds and materials; planning for the establishment and running of seed, fertilizer, fodder and agricultural machinery services companies; and so on. These are all things which agricultural and related departments at the various levels should and must tackle. In order to conscientiously strengthen work in these fields, the State Agriculture Commission should take responsibility for studying and putting forth the guidelines and policies for agricultural production and construction for the whole country; should, together with the State Planning Commission, give joint leadership to the departments concerned in laying down long-term and annual plans for agriculture; make overall arrangements for the distribution and use of agricultural funds and materials; examine, approve and direct the construction of major agricultural projects of national scope or involving the co-operation of a number of provinces and regions or a number of departments; co-ordinate work between agriculture-related ministries, between agricultural and other departments, and between the central departments and the localities; and resolve major problems arising in the course of agricultural work.

In the management of agriculture, the central and local departments should have clear divisions of labour and job responsibility. Those matters which affect the entire country or involve the joint efforts of several provinces are the responsibility of the central departments. Those things which affect an entire province or involve the joint efforts of a number of counties are the responsibility of the provincial departments. And so on for districts and counties. The upper levels must not take charge of everything for the lower levels but should give full play to the initiative of the lower levels.

The various administrative organs should and must provide the necessary planning and guidance to the rural collective economic units in their production and construction, but in determining

plans they must follow the mass line, carrying out full investigation at the base, deliberating and discussing things and achieving overall balance; aside from those things determined by law, it is impermissible to resort to administrative orders to compel communes and brigades to comply; they should be allowed to work out their own measures in the light of local conditions in different seasons, under the guidance of the state's unified plans; and their decision-making powers in this respect must be guaranteed if their initiative is to be brought into play. When giving guidance to the communes, production brigades and teams in scientific farming, the professional departments and scientific research institutions concerned should do their best to see that their guidance is truly scientific and suited to local conditions, and they too must abide by the principle of voluntary participation by the masses and must adopt the method of demonstration by model units which has proved effective over the years. Compulsion, commandism and arbitrary directions are to be guarded against.

To meet the needs of modernizing our agriculture, we must drastically transform our style and methods of leadership, restoring and upholding the fine traditions of seeking truth from facts, keeping close ties with the masses and promoting democracy, so as to raise the level and art of leadership and our ability to lead the extensive modernization of agriculture through practice. We must consciously act in accordance with natural and economic laws and resolutely overcome undesirable practices, such as failure to start from reality, lack of attention to practical economic results, lack of respect for science, and failure to follow the mass line. We must resolutely oppose subjectivism, bureaucratism and formalism, as well as any meeting, slogan, report, inspection tour,

visit or circulation of documents which fails to solve problems but squanders human and material resources. We must be resolute in implementing a system of job responsibility; there should be a person charged with special responsibility for each and every task, and any phenomenon of a link for which no one is held to account must be eliminated.

The important thing is to study. Not only must our cadres at every level — and especially leading cadres — continue to study Marxist-Leninist theories and strive to attain a comprehensive and accurate understanding of Mao Zedong Thought as a scientific system and the party's line and policies, but they must also possess the necessary scientific and technical knowledge and scientific economic knowledge, learn advanced agricultural management methods, and strive to make themselves experts in a particular post. We must carry out regular and strict assessments of cadres, particularly leading cadres, distinguishing between right and wrong, achievements and errors, rewards and penalties. Those cadres who study hard, work well, have a good style of work, are bold in liberating their minds and in raising, studying and solving problems, should be given rewards and be promoted. Those cadres who never study, remain amateurs, parrot others and bungle their work should be shifted to other posts or subjected to the appropriate criticisms or disciplinary measures. Our tasks being enormous and complex, if we are to complete this great revolution on China's agricultural front we must pay full attention to discovering, training and using talent in order to create a huge cadre contingent, both able and politically solid, capable of leading and managing the modernization of agriculture.

13. DECISIONS OF THE CENTRAL COMMITTEE OF THE COMMUNIST PARTY OF CHINA ON SOME QUESTIONS CONCERNING THE ACCELERATION OF INDUSTRIAL DEVELOPMENT (Draft)

(July 1978)

The 11th National Congress of the Communist Party of China and the Fifth National People's Congress defined the general task for the Chinese people in the new period of development in socialist revolution and socialist construction as: Firmly carry out the line of the 11th Party Congress; steadfastly continue the revolution under the dictatorship of the proletariat; deepen the three great revolutionary movements of class struggle, the struggle for production and scientific experiment, and transform China into a great and powerful socialist country with modern agriculture, industry, national defence and science and technology by the end of the century.

Industry is the leading factor in the national economy. To speed up industrial growth and bring about its modernization is decisive to the modernization of agriculture, national defence and science and technology. Our aims are: To establish an independent and fairly comprehensive industrial system by 1980; to set up 14 fairly strong industrial bases throughout the country and build up main industrial complexes in the six greater regions with varying levels and different characteristics by 1985; and to bring the output of China's major industrial products and their production techniques close to the levels achieved by the advanced countries by the year 2000. In a few industries, we will equal or outstrip the advanced nations, and our industry will be able to provide agriculture and other branches of the national economy with ample and diversified sources of energy, a multitude of new raw and semi-finished materials, large quantities of sophisticated modern equipment and a rich variety of manufactured goods for daily use, thus promoting the rapid growth of the national economy as a whole.

Tremendous achievements have been made in industrial production and construction since Liberation. The rate of industrial growth was absolutely unattainable in old China and was faster than that in many capitalist countries. This is a great victory for Chairman Mao's revolutionary line, which has held sway on the industrial front throughout the past 28 years. But, owing to the interference and sabotage by Lin Biao and especially by the Gang of Four — Wang Hongwen, Zhang Chunqiao, Jiang Qing and Yao Wenyuan, our industry did not grow at the anticipated rate and the present level of our industrial production lags far behind that of developed capitalist countries. We

will not be able to approach or overtake them in the next 22 years if we do not press ahead at a much faster rate.

Quickening the tempo of industrial development is essential to the enlargement of the socialist economic base and the consolidation of the dictatorship of the proletariat in our country, to the strengthening of defence capabilities and safeguarding our socialist motherland, and to the continual improvement of the standards of material and cultural life of the people and their well-being. Our party committees at every level, our industrial departments and industrial enterprises should all draw up their programs of action and arrange their work with a view to accelerating the development of industry and the national economy as a whole and turning China into a mighty socialist state by the end of this century. All our comrades should start up the machine, be bold in thinking, give full play to their wisdom and abilities, and strive to make outstanding contributions to the acceleration of the rate of growth.

In speeding up industrial development, it is fundamental to raise high the great banner of Chairman Mao under the leadership of the Party Central Committee headed by our wise leader Chairman Hua; to keep to the party's basic line, to the general line of going all out, aiming high and achieving greater, faster, better and more economical results in building socialism, and to the series of policies of walking on two legs; and to build up our country independently by means of our own initiative, self-reliance, hard work, diligence and thrift.

At present, it is necessary to grasp well the struggle to expose and criticize the Gang of Four and shake up the country's 3,000 or more big and medium-sized industrial enterprises and its 200,000 or more small industrial enterprises by stages and in groups in line with the "Charter of the Anshan Iron and Steel Company"¹ and the requirements set at the National Conference on Learning from Daqing in industry. At the same time, great efforts should be made to consolidate and strengthen leadership in and management of industry as a whole, implement Chairman Mao's line for running socialist industry and various policies correctly and, in a general way, translate into reality the goal put forth by Chairman Hua of achieving within three years marked and anticipated success in grasping the key link of class struggle

gle and running the country well, and lay a solid foundation for still faster development of industry in future.

The following decisions have been made on some questions concerning the acceleration of industrial development:

Chapter I. Expose and Criticize the Gang of Four

To do a thorough check-up of the enterprises and industrial management, speed up industrial growth and ensure the advance of our industry along the socialist road, it is imperative to grasp firmly the key link of the struggle between the two classes and between the two roads. At present and for some time to come, we must grasp firmly the struggle to expose and criticize the Gang of Four and carry it through to the end.

Great victory has been won in this struggle. By and large, the country-wide investigation has been successfully concluded. Investigation into the individuals and incidents associated with the gang's conspiracy to usurp party and state power has in the main been completed in most of the localities and departments. In a few localities and units where it got off to a late start or where the Gang of Four had their fingers deep in the pie, problems abound, resistance is strong and investigation is still an arduous task. These units must carry the investigation firmly and successfully through to the end and must not stop half way. All units must pay attention to the party's policies, strictly distinguish between the two different types of contradictions, help more people through education and narrow the target of attack.

A host of counter-revolutionary, revisionist fallacies spread by Lin Biao and the Gang of Four over the decade or so have seriously corroded our ranks like germs and wrought grave damage. Their pernicious influence must not be underestimated. All units must, in accordance with the plan of the Party Central Committee, mobilize the masses to conduct a scathing criticism of these fallacies one by one in close conjunction with the "ten needs and need not"² on the economic front and with their own specific conditions, and rectify all their reversals of right and wrong in the matter of line. This is a solemn struggle on the ideological and political front. The struggle must be waged in an organized way under proper leadership, rather than perfunctorily or superficially. Unless we succeed in this struggle and shatter the mental manacles the Gang of Four tried to fasten on the people, there can be neither emancipation of the mind nor substantial growth of productive forces.

The "three talks"³ and "comparison of the

lines" launched in Daqing and the petroleum departments provide a good model for conducting mass exposure and criticism of the crimes perpetrated by the Gang of Four, for clearing up right and wrong in the matter of line, and for carrying out class education. This model should be popularized in all localities and units in the light of their specific conditions. In the struggle, it is necessary to keep firmly to the general orientation, direct the spearhead of the struggle at all times at the bourgeois factional setup of the Gang of Four and their followers, and unite with over 95% of the cadres and the masses in a common fight against the enemy.

Dealing resolute blows to the class enemies for their disruptive activities and clamping down on the corrupt elements, embezzlers and profiteers is an important component of the movement to settle accounts with the crimes of the Gang of Four, strike at the Gang's social base and make a clean sweep of its pernicious influence. In the course of exposing and criticizing the Gang of Four thoroughly, all localities and units must, on the basis of consolidating the leading bodies and in light of their realities, devote a period of time to boldly arousing the masses to carry to success the "double blow" struggle in a guided and systematic way under the unified leadership and plan of the provincial, municipal and autonomous region party committees. The main target is the handful of class enemies engaged in disruptive activities, smash-and-grabbers, and those guilty of serious corruption, embezzlement and profiteering. Penalties must be meted out to them, and they must not be allowed to remain at large. Those who engage in graft, embezzlement or speculation and those who take advantage of their position of power to practice jobbery or bribery should be sternly criticized, educated and given help in mending their ways. Serious offenders must be dealt with. Economically, they must return or pay compensation for what they have unlawfully taken. Restitution should not be perfunctory, but it should be reasonable. As for those who fail to distinguish between public and private property, commit petty theft, or eat or take more than their share, the stress should be on self-education. They are encouraged to return public property. Once they have done so, no recurrences are permitted.

Chapter II. Learn from Daqing in a Thorough Way

A broader and sustained mass movement to learn from Daqing in industry and to popularize Daqing-type enterprises is the fundamental guarantee for shaking up and running well socialist enter-

prises and speeding up industrial development.

Daqing serves as a model for studying Mao Zedong Thought and applying to industry the theory of continuing the revolution under the dictatorship of the proletariat, and as a model for putting revolutionization in command of industrialization and following our own road of industrial development. Party committees of all provinces, municipalities and autonomous regions and all industrial departments should continue to increase their understanding of the need to learn from Daqing, strengthen leadership in the movement to learn from Daqing, and earnestly solve the problem of whether the units under them are learning truly or for show. In learning from Daqing, we must learn the essentials and grasp the three great revolutionary movements simultaneously. There must be meticulous work and down-to-earth measures to ensure that the movement advances soundly.

All localities and departments should work out plans for learning from Daqing in industry and popularizing Daqing-type enterprises, and make earnest efforts to sum up the experience, assess and compare the results and examine and approve them. By 1980, one-third of the industrial enterprises, first of all the key enterprises, must be turned into Daqing-type enterprises that measure up to the six standards. In building Daqing-type enterprises, we must maintain high standards and strict demands. Enterprises that already follow the Daqing model should continue to advance towards still higher goals; those which are not up to Daqing standards should try hard to catch up. A few enterprises should be stripped of the title of Daqing-type enterprise.

Chapter III. Consolidate Leading Bodies of Enterprises

Consolidation of the leading bodies of enterprises is the key to shaking up enterprises. It is also essential to the successful overhaul of party organizations and of the work style in enterprises.

Currently, leading bodies in our enterprises roughly fall into four categories: (1) good; (2) fairly good; (3) "soft, lazy or lax" to a serious degree with many problems; and (4) leadership is usurped by bad elements. Very few leading bodies fall into the last category.

In consolidating the leading bodies, the good should sum up their experience and continue to advance. If there are problems, they should be tackled in earnest. An active ideological struggle should be waged against those leading bodies that have erred but can still be won over; they should be changed ideologically and not pushed aside.

Those who refuse to mend their ways must be reorganized with a firm hand. Where the power of leadership has been usurped by bad elements, it must be resolutely seized back. Work teams should be sent to enterprises where problems abound. The relevant departments under the State Council and the provinces, municipalities and autonomous regions should share the responsibility for the consolidation of key enterprises.

A leading body that firmly implements Chairman Mao's revolutionary line, enjoys the support of the masses and is competent and dynamic should be set up in each enterprise in accordance with the five requirements for revolutionary successors and the principle of the three-in-one combination of the old, the middle-aged and the young. All leading bodies in enterprises must adhere to the basic principles of "three dos and three don'ts" [*practice Marxism, and not revisionism; unite, and do not split; be open and aboveboard, and do not intrigue or conspire* — Tr.].

Party committee secretaries and managers of the enterprises must cadres who are strong in party spirit, full of drive, good in work style and familiar with their work. People who harbour wild ambitions, are politically deviant and have an obnoxious work style must not be allowed to sit in leading bodies or be given important jobs. Veteran cadres must do a good job of passing on their experience to young cadres, warm-heartedly helping and guiding the latter.

Leading bodies must not be overstaffed, and the situation in which "secretaries are counted by the squad and standing committee members are counted by the platoon" must be changed. Proper arrangements should be made for cadres who are too advanced in age or too poor in health to work in enterprises. The composition of leading bodies, once consolidated, should remain stable so that the cadres can accumulate experience.

We must attach great importance to and do a good job of building grassroots party branches, workshops, teams and groups, as well as give full play to the role of the party branches as bastions and to the role of party members as vanguards of the struggle. Party branch secretaries and workshop directors should be politically advanced and active in production; they should be good at organizing and maintaining close ties with the masses. Team and group leaders should be dynamic at production, politically and ideologically adept and skilled in technical matters. We must give warm-hearted support and help to the grassroots cadres in enterprises so that they can take the lead both politically and in production and win the support of the masses.

All work and all political movements in each

enterprise must be placed under the unified leadership of the party committee. The party committee must conscientiously carry out the principle of combining collective leadership and division of responsibility, avoiding or overcoming the unhealthy tendency of making arbitrary decisions or shirking responsibility. The party committee should strengthen its leadership over the trade union, the Communist Youth League and other mass organizations, support their work and bring their due role into full play. The trade union should be made into an able aide to the party in maintaining ties with the masses in the enterprise; a mass organization to encourage the participation of the entire workforce and staff in management; and a school of communism.

Chapter IV. Build Up Our Ranks

It is impossible to develop industry at high speed or accomplish socialist modernization without contingents of workers able to stand stiff tests. All party committees in our enterprises must devote much effort to building up our ranks just as Daqing has done. Arm vast numbers of workers and staff with Marxism-Leninism-Mao Zedong Thought, and continue to educate them in the basic line, in classes and class struggle, in the general situation and in revolutionary traditions. Commend the advanced by great publicity, award model workers, and strive to effect a change of the backward workers and staff members. In the course of the three great revolutionary movements, gradually build up a huge army of industrial workers who are ideologically sound, full of drive, technically proficient, have a good work style, are closely united and strictly observe discipline.

All enterprises must rely whole-heartedly on the working class, implement the party's mass line and launch vigorous mass movements, criticize and overcome the erroneous thinking and practice of running enterprises by relying on a handful of isolated people instead of relying on the broad masses. Pay more attention to old workers and give full play to their role as the mainstay; be concerned about the growth of young workers and bring into play their role as a shock force. Apprentices should respect their masters, and masters should love their apprentices. Do work among the wives and other dependents of workers.

Enhance the revolutionary solidarity of the working class. Continue to criticize bourgeois factionalism. Those who encourage bourgeois factionalism should be criticized and educated and should not be allowed to split the workers' ranks. Action shall be taken against those who refuse to

mend their ways. Party members are absolutely prohibited from taking part in bourgeois factionalist activity. Disciplinary action will be taken against those who persist in so doing despite repeated admonition.

Chapter V. System Whereby the Factory Director Takes Charge of Production and Administration under the Leadership of the Party Committee, and Several Other Basic Systems in Enterprises

The following basic systems must be established and perfected in all our enterprises after summing up the experience, both positive and negative, of enterprise management in our country in line with Chairman Mao's consistent teachings:

1. *The system whereby the factory director takes charge of production and administration under the leadership of the party committee.* All major issues in the enterprise must be discussed and decided upon by the party committee collectively. It is the responsibility of the factory director to organize the implementation of decisions made by the party committee on important matters concerning production, technique, finance and welfare. The party committee of the enterprise should energetically support the factory's unified chain of command in production and administration headed by the director in performing its functions, and supervise and check its work. In case urgent matters arise in production, the factory director may and must deal with them without delay before reporting them to the party committee.

In units where government administration is integrated with factory management, the chairman of the revolutionary committee takes charge of production and administration in the enterprise under the leadership of the party committee.

The party committee of the enterprise should guarantee the fulfilment of state plans and the implementation of decisions made and directives issued by the higher authorities. If the enterprise party committee has differing views on any decision or directive of the higher authorities, it may raise the matter with the higher party committee, but must still act as directed pending any change.

2. *System of responsibility for chief engineer, chief accountant, etc.* Engineers and technicians in an enterprise shall have the power commensurate with their posts so that they shoulder real responsibility in technical matters.

3. *System of workers' congresses or conferences under the leadership of the party committee.* Congresses or conferences of workers in an enterprise should be convened at regular intervals so that workers may hear reports on work made by the leaders of the enterprise, discuss major issues of the enterprise, offer criticisms or suggestions on the work, and supervise the leading cadres of the enterprise. The workers' congress or conference has the right to suggest to the higher authorities the removal or the taking of disciplinary action against certain leading personnel who seriously neglect their duties or have an obnoxious work style.

4. *System of worker participation in management, cadre participation in labor, and three-in-one combination of leading cadres, workers and technicians.*

These basic systems ensure the successful management of enterprises and control over planning, production, technology, equipment, materials, labour and finance, the establishment and improvement of responsibility systems in various fields and the system of personal responsibility involving cadres, workers and technicians at all levels. In this way, nothing will be neglected, each person has clear-cut responsibilities, and the phenomenon of shirking responsibility will be thoroughly eliminated. The basic tasks of enterprises, such as meeting various quotas, keeping original records and measurements, must be established and perfected rapidly. All enterprises must organize production along rational lines, ensure clean conditions, reduce noise levels, and maintain good order. It is all the more necessary for scientific research and design units to have a quiet and good environment.

Leading cadres at all levels in the enterprises and technical and professional personnel shall be examined and assessed once every year. The good ones shall be commended and the bad ones criticized. Those who neglect their duties or are incompetent shall be removed or readjusted.

All enterprises must have strict, scientific rules and regulations. Irrational rules and regulations must be reformed in good time while rational ones must be preserved and enforced. The formulation or revision of rules and regulations should be conducted with the participation of the masses. The formulation or revision of important rules and regulations should be reported to the higher authorities for approval.

Chapter VI. Criteria for Shaking Up Enterprises

The shake-up of enterprises should be con-

ducted in the same way as we conducted the "four clean-ups" [namely, the political, economic, organizational and ideological clean-ups — Tr.] It is imperative to take the struggle to expose and criticize the Gang of Four as the key link; to continue to learn from Daging in industry; to arrange the consolidation of leading bodies, the building of contingents of workers, the overhaul of the management of enterprises and the "double blow" struggle; to carry out these measures step by step in a planned way, and link them closely with the consolidation of the party and the rectification of work style. Capable and strong work teams should be sent to enterprises that have many problems. The shake-up of enterprises should be carried out in stages and in groups, with the emphasis on putting the key enterprises in order in 1978.

Whether an enterprise is effectively shaken up should be appraised by the masses and strictly inspected and approved by the higher authorities. It should be judged by the following criteria: (1) whether the struggle to expose and criticize the Gang of Four is fruitful and whether the investigation into individuals and incidents associated with the Gang's conspiratorial activities has been successfully concluded; (2) whether a good leading body that firmly implements Chairman Mao's revolutionary line has been established; (3) whether the enthusiasm for socialism of the workers, technical personnel and cadres has been brought into play; (4) whether the disruptive activities of class enemies and such capitalist activities as graft, embezzlement and speculation have been dealt a blow and whether an end has been put to evil trends and practices of the bourgeoisie; (5) whether various rules and regulations centred around the system of job responsibility have been instituted and strictly enforced, whether the administrative structure of the enterprise has been streamlined, and whether the surplus non-productive personnel have returned to the frontline of production; (6) whether marked progress has been made in production, in the eight economic and technical norms — output, variety, quality, consumption of material, labour productivity, costs, profits and use of the circulating fund — and in the maintenance of all kinds of equipment and installations.

If these criteria are met, an enterprise can be considered as put in order. If not, work should be done to put the enterprise in order. These are the minimum requirements for a socialist enterprise. We must press ahead on this basis to build Daging-type enterprises.

Chapter VII. Tasks for Industrial Enterprises

It is on this question that the Gang of Four

created a great mess. The tasks should be redefined in accordance with Chairman Mao's consistent instructions.

Socialist industrial and transport enterprises are production units under socialist public ownership and are important bastions for consolidating the dictatorship of the proletariat. The routine work of an enterprise must be to put politics in command, grasp production as the key task, and fulfil or overfulfil the state plan in an all-around way. This task is shared by the enterprise's party organizations, its administration, trade union and Communist Youth League. Whether or not this task is fulfilled is the main criterion for judging the success of all work of an enterprise. By exercising leadership in everything, the party should not only provide able leadership in ideological and political work, but also guide production and construction work to success. To do well in production under the command of politics is the sacred duty of all members of the party and the Communist Youth League and all workers and staff in the enterprise, and the realization of its task of consolidating the dictatorship of the proletariat down to every grass-roots organization. The Gang of Four misrepresented the task of grasping production as "the theory of the productive forces" and spread the nonsense that "factories may not necessarily turn out products." Their aim was to undermine our socialist economy and the dictatorship of the proletariat. Their fallacies must be thoroughly repudiated and their pernicious influence eliminated. Every enterprise should engage in production with perfect justification and contribute its share to the accomplishment of the four modernizations.

Chapter VIII. Political Work in Industrial Enterprises

Politics commands everything; it is the soul in everything. Ideological and political work is the life-blood of economic work and guarantees its success. Putting politics in command means putting the party's line, its principles and policies in command. Only by firmly implementing Chairman Mao's line, conscientiously carrying out the "Charter of the Anshan Iron and Steel Company" and launching powerful ideological and political work is it possible for enterprises to keep to the socialist orientation, arouse the revolutionary spirit of their workers and staff and increase production so as to achieve greater, faster, better and more economical results.

Politics is the concentrated expression of the economy; it must reflect the requirements of the economy. In enterprises, political work must serve production; politics must be translated into action

in all work and in production. How can politics command if it fails to reflect the requirements of the economy or to advance production and technique? If we pay no attention to politics and bury ourselves in day-to-day routine, production will not increase and may even go astray. If we babble on about putting politics in command while making a mess of production, we are liars. When Lin Biao and the Gang of Four opposed translating politics into action in production and using politics to propel production, they intended to abolish putting proletarian politics in command and to use their bourgeois politics to disrupt socialist production.

Political work in the enterprises must be done alongside economic work. Political work must carry over into production processes, scientific experiments and the life of the workers and staff so that its mighty force of promoting production can truly be brought into play. The separation of political work from economic work as "two different skins" must be firmly rectified.

Every enterprise must, like Daqing, learn from and apply the experience gained by the People's Liberation Army by instituting a strong system of political work. Political departments and instructors should be set up. Routine ideological and political work must be performed in a lively and meticulous fashion in light of the actual conditions of production and the ideological conditions of the masses. The corrosive influence of bourgeois ideology of all stripes must be combated to ensure that the ranks of workers and staff are united as one, vigorous and in high morale ready to carry on the revolution and the struggle for production. The personnel in the political departments should be dynamic, have a decent work style, remain modest and prudent, familiarize themselves with professional work — both political work and production work, participate regularly in productive labour and, through their work, ensure the fulfilment of the tasks of production and construction.

Chapter IX. Fix Five Norms for Enterprises and Create Enterprise Funds

We would do well to fix five norms for enterprises to ensure stable production conditions. These norms govern:

1. The product line and the scope of production;
2. The size of the workforce and staff and their structure;
3. The consumption quotas of raw materials,

semi-finished materials, fuel, power and tools as well as the sources of supply;

4. The enterprise's fixed assets and circulating funds; and

5. The relations of coordination.

This work shall be conducted in groups by the ministries and commissions under the central government, together with local departments and enterprises, and shall be done on the basis of overall balance and regional distribution in combination with the mapping out of the long-term programme. We must strive to complete this work with the big and medium-sized enterprises in two years or a little longer. Once set, these norms will not be changed in the main, but they may be readjusted against the annual state plan. Any change, if necessary, shall be approved by the central and local departments in charge after consultation. In designing documents for new enterprises these five norms must be included; otherwise they will not be approved.

Enterprises must guarantee all-around fulfilment of the eight economic and technical targets set by the state and of the contracts for supply of goods. Enterprises that fulfil or overfulfil state plans in an all-around way may retain a portion of their profits as the enterprise fund, to be used mainly for collective welfare facilities in these enterprises. The portion of profits to be retained as the enterprise fund should vary from trade to trade, from enterprise to enterprise, and the specific provisions shall be worked out by the Ministry of Finance in conjunction with the relevant departments. When enterprises fail to fulfil state plans, investigations shall be made. If the failure is due to poor leadership, bureaucracy or other subjective causes, the leaders of the enterprise or the relevant units in charge shall be held responsible and even be removed from office.

Chapter X. Reorganize Industry According to the Principle of Coordination Between Specialized Departments

The fixing of five norms for enterprises should be combined with efforts to encourage coordination between specialized departments and raise the degree of organization in industry.

Coordination between specialized departments is an inevitable trend of the development of modern industry. All-embracing plants, whether large or small, lead to enormous waste; they also

seriously handicap the progress in production techniques and the increase of labour productivity. It is high time to make up our mind and change this backward form of enterprise organization.

Given our experience and the need to develop industrial production, we must, at present, undertake extensive work in the following areas:

- Strive to improve the standardization, serialization and interchangeability of products. Without this, there can be no specialized production, nor high quality, nor speed. The electronics, meters and instruments and machinery trades in particular must make earnest efforts to carry out this work on the basis of simplifying the types of machinery and reorganizing the present products, so as to use the least possible series of products to satisfy the needs of all consumers and use as many interchangeable parts as possible in the assembly of diverse products. Parts and accessories should be supplied by the manufacturers, or they should be made by specialized units at several locations so as to avoid their being produced by every user on its own.

- On the basis of unified planning, readjust the production schemes for enterprises engaged in the same line of production, institute a rational division of work among them and raise the level of specialized production. Specialized companies may be formed in one locality by incorporating similar enterprises and the small ones directly serving them.

- Organize around the manufacture of one or several products, the relevant enterprises found in one locality — including enterprises under collective ownership and run by communes and their subdivisions — so as to streamline production from raw materials to semi-finished goods to finished goods, and fix this relation of coordination.

- Gradually group the similar auxiliary workshops found in one locality, such as repairing and tools shops, into repair centres or tools supply centres. Foundry and forging, electroplating, heat-treatment and other centres can be set up in big cities.

- Gradually develop associations spanning provinces, cities and trades on the basis of coordination between specialized units.

The reorganization of industry is a very painstaking and complex task which requires various departments, localities and enterprises to make concerted efforts, adopt a firm attitude and proceed step by step in a planned way. The experience of Shanghai Municipality in organizing a variety of specialized companies, the experience of Zhangzhou city in streamlining and coordinating production and the experience of the Ministry of Chemical Industry in helping localities work out plans for the development of chemical industry

and coordinate specialized chemical enterprises should be assessed and generalized.

The work of overall planning and coordination between specialized units in the machine-building industry must be tackled rapidly and to good account. The organizational form of industrial management must be in keeping with the specialized production of the enterprises. When central departments are chiefly responsible for organizing coordination between specialized units that span provinces and cities, localities should support them; when localities are chiefly responsible for organizing coordination between specialized units in their respective areas, central departments should support them. In case contradictions arise, they should be settled by the localities and departments through consultation in accordance with the principle of developing production with greater, faster, better and more economical results. National taxation and pricing policies should be conducive to coordination between specialized departments.

All localities and departments in charge should examine one by one the existing relations of coordination among enterprises. The rational ones should be adopted, the irrational ones readjusted and new ones that are needed quickly set up. Coordinating parties must sign economic contracts, and stable relations of coordination should gradually lead to the signing of long-term contracts. Contracts, once signed, must be honoured strictly. Violation of coordination agreements or contracts is tantamount to undermining the socialist planned economy. Those who fail to act in accordance with the provisions of the contract and wilfully terminate relations of coordination shall be held responsible and compensate for the losses incurred. Disputes arising from the implementation of the economic contracts shall be arbitrated and handled by economic commissions at various levels.

Chapter XI. Initiative from Both Sides and the Industrial Management System

To strengthen leadership and management in industry, it is necessary to bring into play the initiative of both the central and the local authorities, provided the unified central leadership is consolidated. While the former must have absolute control over major issues, power should devolve on the latter with respect to minor ones. Power is to be centralized or devolved as the case may be.

The management system of industrial enterprises shall follow the principle of management by different levels under unified leadership. Industrial enterprises can be classified into three categories:

key enterprises that have a bearing on the economy as a whole (the field armies); other enterprises owned by the people as a whole (the regional forces); and collectively-owned enterprises run by the communes and their subdivisions, neighbourhoods and streets (the guerrilla units). These three categories should be managed by different levels under unified leadership.

A few key enterprises and research and design units that have a bearing on the economy as a whole should be put under dual leadership, with the central departments concerned assuming the chief responsibility. Where these key enterprises are concerned, the relevant central departments are responsible for drawing up their production and construction plans and financial plans, supplying them with the principal materials, assigning norms for labour power, and carrying out state plans for the distribution and transfer of products. The localities are responsible for improving party work and ideological and political work, organizing coordination and support from relevant circles, supervising and checking the key enterprises' implementation of the party's line, principles and policies and state plans, and ensuring the supply of materials distributed by the localities as well as of consumer goods. The appointment, removal or transfer of the principal leaders of these key enterprises are to be decided by the relevant departments together with party committees of the provinces, municipalities and autonomous regions. These enterprises must respect the leadership of the local party committees. For the fulfilment of state plans, processing enterprises can undertake some processing tasks for the localities if they have surplus processing capacity and the localities have raw materials. Enterprises engaged in the production of fuel and raw and semi-finished materials may, in general, give a certain portion of their products to the localities. The variety of products and the actual proportions to be given to the localities are to be decided by the State Planning Commission in conjunction with the relevant departments and localities. The list of enterprises that will be put under dual leadership, with the central departments concerned assuming the chief responsibility, shall be agreed upon through consultation by the departments in charge and the localities, and the list shall be submitted to the State Council for approval after examination by the State Economic Commission, the State Capital Construction Commission and the State Scientific and Technological Commission respectively. We must not retract power over every enterprise simply for the sake of strengthening centralization and unified leadership.

The other large and medium-sized enterprises should be managed by the localities or be put

under dual leadership with the localities assuming the chief responsibility. Enterprises whose management is to be transferred from the central departments should be put into the hands of the provincial authority or the municipal authority under the province; they must not be transferred from one level to another further down. The localities should be responsible for the production and construction plans of these enterprises, the balance between supply of raw materials, the production and sale of products and the distribution of labour power, but they must observe unified state plans and guarantee the fulfilment of the tasks for the production and transfer of auxiliary products. The relevant central departments should give guidance and support in planning, production and technology instead of washing their hands of these enterprises.

As for enterprises run by communes and their subdivisions and neighbourhoods and streets, the localities should strengthen leadership over them and assist them to develop in a planned way.

In capital construction, key projects that have a bearing on the economy as a whole shall be arranged by the state and the departments concerned; local projects shall be arranged by the provinces, municipalities and autonomous regions and included in state plans after nationwide balancing.

The system of control over materials should be in keeping with the system of enterprise management and the system of allocating investment in capital construction. Materials are, in principle, allocated according to the affiliation of enterprises. Enterprises whose materials are supplied by central departments and construction projects that are arranged by central departments receive materials from the central departments. Enterprises managed by the localities and construction items arranged by the localities receive the materials they need from the provinces, municipalities and autonomous regions. The principal materials needed in production by those local enterprises whose production plans are worked out by central departments and whose products are transferred on a national scale, may also be supplied by the central departments in charge. All materials shall be controlled in unified warehouses gradually set up by the supplies departments. They shall be supplied at the nearest possible location according to the quotas specified in national plans. Bulk materials are to be supplied at a fixed location and delivered directly. A network of stations shall be organized to supply materials in small quantities against the presentation of certificates. Industrial and mining enterprises will not be allowed to sell their products as they are or in a disguised form. The scope of products under unified

state distribution shall be enlarged. Sales agencies under various industrial departments shall gradually be put under the dual leadership of the departments concerned and the State Administration of Supplies, with the latter assuming chief responsibility. Continued efforts should be made to evaluate the operation of the system of material control and perfect it step by step.

Localities and central departments must be mindful of the overall interest, work in close co-ordination and in concert, and support each other. The initiative from both sides should be combined to do things well. While managing the enterprises under them well, central departments should make an effort to study policy matters, keep abreast of trends in production techniques at home and abroad, determine the direction for technical development in their respective trades, map out annual and long-term plans for all trades, and help the localities work out their plans and organize all types of enterprises along different trades so that they become streamlined. The central departments should also help the localities solve problems that the localities cannot solve on their own. The localities should not only run the enterprises under them well but also try by every possible means to support the key enterprises and projects that have a bearing on the whole situation as well as those enterprises that work in coordination with them, and push forward the production and construction of these enterprises and projects.

Chapter XII. Unified Planning

An important aspect of checking up industrial management is to strengthen unified state planning and to overcome the anarchy that still exists to a serious extent.

Production, construction, labour, wages, materials, prices, finance and other economic activities in both central and local units, in both units owned by the whole people and collectively owned units, including industrial enterprises run by communes and their subdivisions and streets and neighbourhoods, must all be included in the unified plans at relevant levels in one form or another and through one channel or another.

All regions and departments should endeavour to strike an overall balance in planning; should properly arrange the proportions between various sectors; should ensure smooth linking of supply, production, transportation and marketing; and should pay special attention to achieving a balance between the needs for raw and semi-finished materials, fuel and power and the possibility of their supply. The departments are responsible for the overall balance in each of the trades; the pro-

vinces, municipalities and autonomous regions are responsible for the overall balance in their respective areas. The State Planning Commission works out the overall balance for the whole country.

Every region, department and enterprise must arouse the masses to draw up its long-range plan in the light of needs and possibilities and in accordance with the state's Ten-Year Programme and Five-Year Plan, so that their vision will not be confined to the immediate step they are going to take.

In formulating plans, we must follow the mass line. Plans must be scientific and precise and they should reflect objective economic laws as much as possible. Different plans should be linked with one another. Targets set in plans should be forward-looking and reliable and have some leeway. Production tasks and construction projects listed in the plans must be assured of funds, materials and manpower.

Production and construction plans of the provinces, municipalities and autonomous regions and of the departments shall be submitted for examination and approval by the state as scheduled. Annual state plans must be made known to the enterprises before the beginning of the year. Plans must be serious. As for state plans made known to the lower levels upon the approval of the Central Committee, all regions, departments and enterprises must implement them with a firm hand and fulfil them in an all-around way. Readjustments to be made in the plans must be submitted for approval. Regular checks will be made to see how the plans are being carried out.

We must strengthen statistical work. Statistics must be made in good time and true to fact. Cheating or making false reports is not permitted. Such cases shall be sternly dealt with.

Chapter XIII. Chain of Command in Industry

A strong and able chain of command must be set up from top to bottom if we are to organize our massive industry to proceed with production and construction at high speed and in an orderly manner according to unified state plans.

Economic commissions should be formed and strengthened at all levels to take up the following tasks: specifically guide the movement to Learn from Daqing in Industry and do a good job of the political and ideological work in the industrial and transport enterprises, organize production, perform well in day-to-day command and control in production, and popularize advanced techniques; study and solve certain policy matters in industrial management and enterprise management, sum up

and exchange experience in this respect.

Economic commissions at every level must ensure the implementation of state plans. They should work in close coordination with planning commissions, capital construction commissions and scientific and technological commissions at corresponding levels under the unified leadership of party committees. We should avoid a situation of each going its own way.

The leading body of every central and provincial department should also be consolidated and strengthened. We should resolutely streamline those that are overstaffed and add more technical and professional cadres if they are weak.

Chapter XIV. Aid Agriculture Energetically

All industrial and communications departments and industrial enterprises must firmly foster the idea of taking agriculture as the foundation, must render better service to agriculture, and must contribute to the effort to popularize Dazhai-type counties, bring about the mechanization and modernization of agriculture and consolidate the worker-peasant alliance.

All industrial departments and enterprises must, in accordance with state plans, endeavor to provide agriculture with all kinds of means of production, help the peasants master modern science and technology and fulfil without fail the task of accomplishing the mechanization of agriculture in the main by 1980. Be sure to improve the quality of all products for rural use, reduce costs from time to time, and accordingly lower their factory and selling prices so as to impart the benefit by lowering costs to the peasants. The state will appropriately increase its investment in agriculture and in the industries aiding agriculture and, with regard to the distribution of financial and material resources, give more consideration to agriculturally backward and industrially weak areas and to areas inhabited by minority nationalities.

Every industrial city should, on the basis of achieving an overall balance and in line with its capabilities, take along one to several counties and help them develop agriculture and the small industries serving agricultural production.

Industrial and mining enterprises should do what they can to help nearby communes and their subdivisions increase the production of grain and non-staple foodstuffs and to run their industries well. But a clear line of distinction must be drawn between the two kinds of ownership, and no transfer of property between them is allowed.

Expansion of industries run by the communes

and their subdivisions is of great importance to consolidating and developing the collective economy in the people's communes; promoting the mechanization of agriculture; increasing the accumulation of the communes and their subdivisions and the income of commune members; narrowing the differences between town and country, between worker and peasant; and supporting national construction, the market and export trade. These industries must develop under unified plans and stronger leadership; they must keep to the socialist orientation, use local resources, engage in production at the original site, and serve mainly agriculture. These industries must not contend with big industries for fuel, power and raw and semi-finished materials. They should engage in both industry and agriculture.

We should educate the rural cadres and vast numbers of commune members so that they give warm support to industrial construction and care for the factories and state property. No commune, brigade, team or individual is permitted to seize state property.

Chapter XV. Give Prominence to Developing Fuel, Power, Raw and Semi-Finished Materials Industries and Transport and Communications Services

At present, fuel, power and raw and semi-finished materials industries lag behind the processing industries, especially in the acute shortages of electricity and coal and in the tensions in communications which seriously handicap speedy industrial growth. The state and the localities must direct their main forces to effect a faster development in these sectors.

Vigorous efforts must be made to tap the potentials of existing enterprises, to constantly raise efficiency and produce more coal, electricity, petroleum, iron and steel, non-ferrous metals, chemicals and building materials. The state should select places to build in stages and by groups a number of large bases of fuel, power, raw and semi-finished materials industries that use advanced technologies. Their layout should be considered from a strategic point of view and for the purpose of solving the question of speed in the long run. The localities should make full use of local resources, should actively develop medium-sized and small coal mines and power stations, consolidate and upgrade medium-sized and small iron and steel enterprises and non-ferrous metals enterprises, and boost the production of chemicals and non-metal materials. Medium-sized and small enterprises should be renovated technically and should pay attention to economic results.

Geological work should be strengthened. We should employ advanced prospecting techniques without delay to make a success of regional geological surveys and the general exploration of mineral resources. We should endeavour to find resources in the vicinity of existing industrial and mining areas and in the hinterland. The stress is on oil, gas, high-grade iron ore, non-ferrous metals and rare metals, on underground water resources, phosphur, sulphur and potassium and, in the south, on coal, low-calorie fuels including bone coal, lignite, oil shale, etc. We should strive for a major breakthrough in these fields as soon as possible. We should continue to develop mines on a large scale. Efforts should be made to shorten the time needed in opening new mines, to develop advanced and huge mining machinery, to raise by a large margin the extraction capacity of existing mines, and to solve the problem of mineral ores. We should not try to "cook a meal without rice."

We should step up the construction and technical transformation of railways, highways and water transport facilities, organize transportation in a rational way and do a good job of short-distance transport. It is necessary to strengthen coordination between production and communications departments, to continue to raise the efficiency of existing means of transportation, and to rapidly change the present passiveness resulting from backward transport and communications services. We should pay attention to the development of water transport so that it can carry more goods.

Machine-building and electronics industries should be organized under overall planning to speed-up coordination between specialized units and to bring about a rapid growth. We should vigorously turn out all types of top-quality and highly efficient machinery and equipment, raise the production levels of large-scale, precision and modern plants, greatly increase the output of computers and other electronic products to equip basic industries and other branches of the economy.

Along with the strengthening of basic industries, there should be a vigorous development of light industry. We should explore and open up more sources of raw materials, strive to increase the supply of agricultural raw materials, substantially increase the ratio of petrochemically produced raw materials such as chemical fibres and plastics to all raw materials used in light industry, produce a rich variety of light industrial goods that are cheap and beautiful so that light and heavy industry will develop in harmony. We should also pay attention to the development of handicrafts production and efficiently arrange the manufacture of articles for daily use, miscellaneous goods and commodities specially needed by the minority nationalities. Handicrafts products concern vast

numbers of families and are needed by the people at home and by international markets. They must not be overlooked.

Chapter XVI. Energy Policy

Energy is a problem of strategic importance. The speed of industrial development will in a large measure be determined by how we solve the energy problem.

We should exert efforts to explore all types of energy and use them rationally. While increasing the production of coal, oil and natural gas, we should energetically develop the generation of hydroelectric power, make full use of bone coal, gangue, peat, lignite, oil shale and various exhaust thermals, and develop bio-gas in a big way. It is also necessary to develop nuclear power generating in a planned way, to study the utilization of solar energy, geothermal power, wind and tidal energy, to explore and study new sources of energy, and to combine the exploration and utilization of energy sources appropriately with the distribution of industry.

We should use as much low-calorie fuels as possible in industrial boilers and for civilian purposes so as to save high-quality coal and crude oil — this is an important policy. Oil must not be used where it should not. Boilers using oil should be converted as soon as possible. We should mount extensive studies and experiments in using low-calorie fuels, in manufacturing equipment and in converting oil- and coal-burning equipment. We should mobilize scientific and technical personnel and workers to give full play to their abilities in this field. Marked results must be achieved in 1978 in the use of low-calorie fuels.

Rigid measures should be adopted to save energy. The state and the relevant departments should set up energy research institutes. All enterprises should achieve a balance in the use of heat and make full use of all kinds of exhaust heat. The system of supplying fuel and power under fixed quotas must be strictly implemented. Those who save energy shall be rewarded; those who waste energy shall be criticized, and the grave cases shall be penalized. We shall institute a pricing policy that facilitates the exploration of energy sources, encourages economy and inhibits waste.

Chapter XVII. Tapping Potential, Renovation and Transformation

All industrial and communications departments and enterprises must proceed from existing conditions and take the tapping of potentials, re-

novation and transformation as the primary ways to speed up industrial development.

All enterprises must fully arouse the masses to put forward rational proposals, to introduce technical innovations and to go on creating new production levels. Enterprises which have not reached their designed capacity or have not attained their previous good levels must reach or surpass them within given time limits. Those already up to their designed capacity or previous good levels should attempt to scale new heights. As for those enterprises whose production has stagnated and who have failed to reach their designed capacity over a long time, the relevant authorities should look into the matter, take appropriate measures and urge and help them to change the situation within given time limits instead of letting things drift.

In tapping the potential of enterprises and in renovating and transforming them, there must be overall planning and strengthened leadership. The stress is on increasing fuel, power, raw and semi-finished materials, and products in short supply, on improving the quality of products and reducing consumption. A number of enterprises in the processing industries that have surplus production capacity can be changed over to manufacture products in short supply. Expenses for renewal or technical transformation should be included in plans and put to good use. In distributing materials, equipment and funds, priority should be given to the need of tapping potential, renovation and transformation. Transformation items that can recoup investment and gain results the same year may obtain small loans from the financial departments if they are short of funds.

Experiences useful to tapping potential, renovation and transformation should be summed up and spread without delay, and earnest efforts made to solve problems that surface in the course of their popularization. Proven experiences should be included in rules of operation or product designs. Production capacity to be added in the future — except the new plants necessitated by changing industrial distribution or objective conditions — shall be obtained from existing enterprises, primarily from tapping their potential and upgrading them, or from reconstructing and expanding them if necessary.

Military enterprises should turn their production capacity to good account by integrating military with civilian needs and peace-time production with preparedness against war. Civilian enterprises that are in a position to do so should actively undertake military mobilization tasks.

Chapter XVIII. Multiple Utilization, Environmental Protection

Although the Central Committee raised this

problem on several occasions, it still has not aroused the attention of all of our comrades. Many valuable resources have yet to be used comprehensively and there is worsening pollution of the environment in some places. Every region and department should make a conscientious investigation into this matter and take necessary organizational and technical measures and tighten rules and regulations.

All departments and enterprises should bear the overall interest in mind, break the barriers between different trades and undertake multiple utilization. In geological work, we must do comprehensive prospecting and assessment; all resources must be explored and utilized in a comprehensive way according to state requirements. Multiple utilization involving different trades shall be organized by the relevant regions and departments.

All departments, enterprises, units and cities must work out plans and solve the treatment of "three wastes" [*waste water, waste gas and industrial residue* — Tr.] within given time limits. Certain enterprises that have caused serious damage to local inhabitants and to the environment and that have failed to solve the problem over a long period should be resolutely ordered to suspend operations and to solve the pollution problem within given time limits before resuming production. If no effort is made to solve those pollution problems arising from the "three wastes" that can be solved, it shall be judged a manifestation of indifference towards the interests of the people. Such enterprises cannot be cited as Daqing-type enterprises, and their leaders shall be held responsible. Newly built and reconstructed enterprises must resolutely observe the ruling that principal construction and the building of auxiliary facilities for treatment of the "three wastes" must go hand in hand and that their design, construction and commissioning should be simultaneous. The State Capital Construction Commission and Environmental Protection Office are asked to supervise and check up on this matter.

A law of environmental protection shall be formulated and promulgated by the state for implementation.

Projects for the comprehensive use and treatment of the "three wastes" should be included in departmental or regional plans. Big projects shall be listed in state plans. Allotted funds and materials should be guaranteed and must not be diverted to other purposes. The state will draw up certain policies to encourage and support these undertakings.

Chapter XIX. Give First Priority to Quality, Variety and Specifications

Major problems in industrial production at

present are poor quality, rapid-rate of consumption, inadequate variety, low efficiency and lack of spare parts. If these are not solved there can be no rapid acceleration, no technological advance, no realization of the four modernizations. We must follow Chairman Mao's teachings to bring our industrial work truly into the "quality first" orbit, seeking greater and faster results on the basis of better and more economical results, and achieving the unity of greater, faster, better and more economical results.

All enterprises should constantly improve the quality of products and produce goods that are highly efficient, have a long service life and a low consumption rate; add new varieties and specifications in a planned way; and engage in production with the needs of the users in mind. Trial production and manufacture of new products should be encouraged and supported. Industrial enterprises should improve packaging and be responsible for the losses resulting from poor packing. Transport enterprises should improve services and be responsible for losses caused in loading and unloading. We must oppose all bad practices that pay no heed to quality, produce substandard goods and incur enormous waste of state funds and property, practices that are irresponsible to the state and the people.

Products that fail to meet the standards in quality, variety, specification or the requirements set in contracts shall not be considered as part of the fulfilled quotas, or calculated in output value, or allowed to leave the factory. Users have the right to reject such products. Manufacturers are obliged to repair, replace or compensate for those that have already left the factory. Shops and stores are responsible for exchanging substandard goods sold through them if the buyers so demand. Investigations must be made into cases involving serious incidents to ascertain the responsibility and deal with them sternly. Criminal sanctions shall be imposed in some cases. Enterprises that turn out very low quality goods shall suspend operations to tidy things up and to make improvements within specified time limits.

All products that fail to reach previous required levels in quality are required to do so within a year. Those already up to previous levels should press ahead to catch up with and surpass domestic and international advanced levels.

A campaign should be launched on an extensive scale among the workshop teams and groups to turn out products of guaranteed quality. We should tighten operating rules, strengthen quality control and perform strict check-ups on every work process from the admission of raw materials into the factory through the delivery of products and on all spare parts and accessories. We should compare and assess quality from time to time,

commending the advanced and criticizing the backward.

We should seriously enforce the system of trademark registration. Products without trademarks are not allowed to leave the factory or to be put on sale. We should make efforts to manufacture brand-name products. In pricing policy, higher prices will be fixed for better goods.

Output value serves only as a calculation figure for the convenience of higher authorities, and cannot be used as a yardstick to judge the performance of an enterprise. Regions or departments are not allowed to allocate false norms in terms of output value to the enterprises.

Chapter XX. Increase Accumulation, Practice Economy

All industrial and transport enterprises must carry out state plans in an all-around way and fulfil or overfulfil the tasks set by the state for turning over profits and paying taxes, contributing more to the accumulation of the state. They must earnestly implement the policy of building up the country with diligence and thrift, and strictly enforce the system of economic accounting. Such acts as doing no business accounting, paying no regard to production costs, indulging in extravagance and waste and raising or lowering prices at will must be criticized severely and resolutely stopped.

All enterprises must do a good job of fixing the numbers of their staff and labour quotas, and strive to raise labour productivity. They should simplify the administrative structure, cut down on the number of non-production personnel and increase the ratio of production personnel. All those who should not be divorced from productive work must go back to their production posts without exception. Activities designed to be done in spare time should not be done during ordinary work hours. No labour power in excess of planned quotas shall be employed.

All enterprises must strictly control their consumption of materials according to quotas. Beginning from 1978, fuel, power and raw and semi-finished materials will be supplied on the strength of certificates according to minimum consumption levels previously attained by each enterprise. The quotas will be revised from time to time in accordance with technological progress and improved management. We should resolutely change the present situation in which no quotas are set for consumption and where materials and fuel are supplied without limit and where overstocking or waste goes unchecked. This matter should be grasped by industrial, communications and supplies depart-

ments at all levels. Failure to do a good job in this respect constitutes negligence. The method of giving a certain subsidy to the collection of used and waste material as practised in the past should be continued.

Every enterprise must retrench non-productive expenses and endeavour to lower production costs. On no account should spendings not itemized under the production costs be so listed. Enterprises that show deficits because of poor management must arrest these losses by the end of 1978. Those which fail to do so within the time limit will receive no subsidies from financial departments or credits from the banks. Effective measures should be adopted to check losses incurred by factors other than the enterprises, and notable results should be attained this year. Losses permitted under state policies shall be kept to the minimum.

We should speed up the turnover of circulating funds. Financial departments should work in conjunction with industrial departments to verify the amount of circulating funds for the enterprises one by one; the banks shall supervise this work.

Leading organs at all levels shall observe state plans and financial discipline, and they are not allowed to draw labour power, funds, materials or equipment from enterprises at will. If they do so, those enterprises have the right to resist.

Chapter XXI. Fight a Battle of Annihilation in Capital Construction

Capital construction plans must be decided upon in the light of our material, financial and manpower resources. We shall match our undertakings with the amount of money available and strive to get more done with less money. We must ensure the construction of key projects while giving due consideration to the other ones. Projects listed in the annual plans must be assured of planned investment, appropriations, equipment, materials and a construction work force.

Each project must give consideration to the auxiliary facilities and secure the supplies of water, electricity, raw and semi-finished materials and transport facilities once it goes into operation; otherwise it will not be approved. Arrangements must be made in advance for the acquisition of complete units of equipment needed in the newly constructed large and medium-sized projects.

In building a project, we must pay attention to the results from investment, shorten building time, reduce construction costs, and completely correct the erroneous tendency of grabbing for investment and projects to the neglect of investment results. From now on, every new construc-

tion project shall be strictly reviewed according to the following indices: newly-acquired production capacity, building time, actual amount of construction, quality of construction, consumption of materials, construction costs, the proportion turned into fixed assets, time limits set to recoup investments after the project goes into operation, and the time needed to reach the designed capacity. All construction projects should be completed quickly, leaving nothing unsettled. Inspection and testing must be strictly carried out upon their completion.

All capital construction items, including those built with funds raised by the localities and departments themselves, must be listed in the unified plan. No locality, department or unit is allowed to change the amount of capital construction for a project, enlarge the scope of construction, change the construction standards, alter the tempo of construction or erect buildings, guest houses and auditoriums without authorization or stand in violation of the state plan.

Funds not earmarked for capital construction shall not be used in capital construction. The People's Bank of Capital Construction is enjoined to control all appropriations for capital construction. It may refuse to disburse the sum requested to cover spending that goes against state regulations.

All construction work must follow strictly the procedures concerning capital construction.

We must continue to revolutionize design and actively use new techniques, technologies and materials that have proved effective. Capital construction units should undergo technical transformation in a planned way and raise their level of mechanization step by step. Strict rules and regulations and responsibility systems should be instituted concerning geological prospecting, design, construction and inspection.

Chapter XXII. Strengthen Scientific Research, Adopt Advanced Techniques

It is necessary to step up scientific research, adopt advanced techniques and catch up with and surpass advanced world levels. This goal must be put high on the agenda.

All industrial and transport enterprises are required to study and work out their own plans for technical development and technical policies in light of China's conditions and of new technical achievements in the world.

Every department, every industrial city and every big or medium-sized enterprise must have its own or joint scientific research and design units where necessary technical personnel are concen-

trated to study and solve the major technical and design problems in production in conjunction with mass scientific experimentation. Necessary pilot plants should be set up. Every enterprise must strengthen its technical back-up service and increase the proportion of technical personnel engaged in this work. Materials, funds, time and other conditions needed for scientific experiments should be guaranteed.

Industrial and communications departments at all levels should conscientiously popularize all new techniques, technologies and materials that have been successfully tested. Items to be popularized should be listed in plans at various levels and verified.

While maintaining independence and self-reliance, we should earnestly study what is good from other countries and import badly needed advanced technologies and equipment in a planned and selective way to make foreign things serve China. We should organize and train the necessary technical forces to quickly master the imported advanced technologies; they should not only know the how but also the why. We should assiduously study and learn to operate them before ever trying to improve and develop them.

We should strengthen scientific information work, oppose the practice of refusing to share information with others or make a monopoly of information.

Appropriate commendations and material awards should be given to those collectives and individuals who have achieved marked success in making inventions and technical innovations.

Chapter XXIII. Train Cadres, Workers and Technicians

To accomplish the four modernizations, we must raise the scientific and cultural level of the entire Chinese nation. It is a pressing task to train cadres, workers and technicians on a large scale and bring up more people who are both red and expert. Modernization of industry will remain empty talk if we fail to solve this problem, if we fail to make scores of millions of our industrial workers, millions of technicians and tens of thousands of cadres directing our industries at various levels master both modern technology and the expertise in managing modern industry.

All cadres, including leading cadres in industrial departments and enterprises, must assiduously study Marxism-Leninism-Mao Zedong Thought as well as technology and professionalism so as to become experts and raise their level in managing and organizing modern production. It is necessary to sponsor cadre training courses extensively and

run schools of every description to make plans to organize the principal leading cadres of industrial and communications departments and key enterprises on study tours abroad and to invite specialists, both domestic and foreign, and those who have returned from study tours abroad to give lectures.

Workers must energetically study politics and technique and sharpen their basic skills by all means. They should run well "July 21" colleges, workers' schools and technical evening schools, and make arrangements so that all the workers can get necessary technical training; they should institute a system of technical examinations and tests. Those who pass them can operate at their posts; those who fail must make up for it. In future, workers must pass technical and operating tests before being promoted. Every worker must study technique in their spare time at least twice a week.

Scientific and technical personnel must persist in their integration with workers and peasants, remould their world outlook, and at the same time diligently study the new technologies of the time and become proficient in their professions. Leaders at all levels should give them the time and opportunity to study. Scientists and technicians who have been improperly transferred to other trades should return to do what they were trained for. College graduates should be assigned to do technical work. Technical personnel shall be put to technical tests, and their jobs shall be readjusted according to their actual technical levels. We should restore the necessary financial schools and faculties to train financial cadres. We should make efforts to publish books on industrial management, enterprise management and all kinds of technical literature as well as popular readings to spread scientific and technical knowledge. We should make full use of the radio and television services to sponsor technical lectures.

Party committees at every level must commend those advanced elements who are both red and expert; restore and formulate the technical titles for technical personnel and professional managerial personnel and the system of promotion. In 1978, a group of outstanding technicians and skilled workers shall be promoted to engineers or assistant engineers. Educate those people who pay no heed to politics or do not study technique or professionalism.

Chapter XXIV. Labour Emulation and Revolutionary Contests

We should launch socialist labour emulation and revolutionary contests in a vigorous but down-

to-earth manner and keep at it, bringing about an upsurge in aiming high, emulating, learning from, catching up with and overtaking the advanced and helping the less advanced. In emulation and contests, the workers and staff members are encouraged to learn from and help each other, make up each other's deficiencies and make common progress, so that the advanced levels created by a few individuals and units will rapidly spread throughout the society.

All regions, departments and enterprises must make regular inspection, comparison and appraisal of work done, boldly compare contributions, elect models and pace-setters, cite the advanced, sum up and popularize their experience. In labour emulation, we must pay attention to practical results and prevent formalism. In organizing study tours and exchanges of experience, we must not go in for ostentation and extravagance.

Economic commissions, departments and trade union organizations at every level must grasp this work in earnest under the leadership of the party committees.

Chapter XXV. From Each According to His Ability, To Each According to His Work

In line with Chairman Mao's consistent teachings, we should combine communist ideological education and the economic policies for the present stage, and combine moral encouragement and material reward with stress on the former. We must persist in putting politics in command and encourage every worker to cultivate the communist attitude towards labour — exerting one's all in whole-hearted service to the people regardless of remuneration. In distribution, we shall adhere to the principle of to each according to his work, more pay for more work and less pay for less work. While opposing a wide wage spread, we recognize necessary differences and oppose egalitarianism. In this regard, the following methods and measures will have to be adopted:

1. Institute the normal system of pay increases. Wage increases will be effected after discussion by the masses and approval by the leadership according to the worker's political record, labour attitude, technical skills and contributions.

2. The time-wage system is to apply in most cases. A restricted version of the piece-wage system may be applied to a few jobs that involve heavy manual labour and strenuous hand operation.

3. Apply the system of payment by the hour with additional bonuses.

4. Step by step there should be pecuniary allowances for jobs requiring higher labour intensity or that are performed under poor working conditions.

5. Gradually reduce the wage disparity between different regions so that wages will be in keeping with price levels in the locality.

In applying the piece-wage system and the reward system, we must conscientiously sum up the past experience and avoid past drawbacks. Disparities should not be too great, appraisal for rewards should not be too frequent, and bonuses should not be too multifarious. It is necessary to step up ideological and political work and to prevent and discard the idea of solving every problem with bonuses. Labour departments shall make a comprehensive study of this work and put forth some methods for trial in selected places within 1978 before implementation.

We must explain to the masses that ours is still a developing socialist country and our life can only be improved step by step on the basis of increased production and higher labour productivity. In the absence of increased production, improvement of life is unrealistic and impossible. We must carry forward the fine tradition of plain living and hard struggle and endeavour to boost production.

Chapter XXVI. Be Concerned with the Well-Being of the Workers

Leaders at every level must carry forward the party's fine tradition of being concerned with the well-being of the masses, and of grasping production and the well-being of the people at the same time. In the enterprise, a deputy director should be put in charge of the well-being of the workers.

We should build more housing for the workers in a planned way. The state, the locality and the enterprise should join forces to draw up concrete plans and work in concert to appropriately resolve within several years the problem of providing living quarters for those workers and staff members in need. Workers' housing in cities should be included in urban construction plans.

We should vigorously improve the supply of non-staple foodstuffs in the cities and in the industrial and mining enterprises. Big and medium-sized cities should build the basis for producing non-staple foodstuffs, run mechanized pig and poultry farms, and effect notable improvements in one or two years in the supply of such non-staple foodstuffs as meat, eggs and vegetables. Industrial and

mining enterprises which are in a position to do so should act as the Daqing Oil Field and organize the workers and their family members to engage in farming, forestry, livestock breeding, side-line production and fishing so as to improve the workers' lives with their own hands.

We should take step-by-step measures to solve the problem of those husbands and wives who have worked and lived in separate places over a long period. We should vigorously create conditions to solve the problem within several years for those working in the strategically important interior areas.

Measures should be taken to run canteens, nurseries, medical and health units and other collective welfare facilities well and to organize spare-time recreational and sports activities. We should do a good job of family planning. We should check up on the methods of passing out welfare allowances as practiced in various regions and enterprises, and appropriate regulations should be formulated by the departments concerned.

We should do well in labour protection and improve working conditions. We should ensure safety in production; major incidents must be sternly dealt with.

We should combine work with adequate rest. We should do a good job in protecting women workers.

Chapter XXVII. City Work Should Serve Production and Workers

All cities must implement the principle of serving production and the workers, and run cultural and educational facilities, health undertakings, urban public utilities, commercial and service trades well, so as to facilitate production and provide amenities for the people. We shouldn't importune the enterprises to run those undertakings and services that cities should and can establish; we should not draw labour power willfully from the enterprises so that the enterprises can concentrate their energy on pushing the revolution and production forward. Funds earmarked by the state for urban construction are not to be diverted to any other purpose. A fairly large portion of the reserve fund in the cities should be used in urban construction.

Vast numbers of workers and staff members engaged in commercial and service trades, urban public utilities as well as educational and health work are components of the working class. Their labour is indispensable to society and their work should command the respect of society. Workers and staff members in these trades should love their

work, should constantly improve their services and should contribute their share to the accomplishment of the four modernizations.

Chapter XXVIII. Discipline

Owing to the interference and sabotage by the Gang of Four, discipline in many fields is lax and anarchism exists to a serious extent, causing much harm. It is imperative to strengthen organization, tighten discipline and wage a struggle against all acts in contravention with policies, systems or unified plans, or in breach of financial discipline and labour discipline.

The workers and staff must consciously observe discipline and protect public property.

Members of the Communist Party and the Communist Youth League and particularly leading cadres at all levels should be models in observing discipline. Support and commend those comrades who conscientiously implement the policies and systems and who dare to stick to principle; retaliation against them is absolutely impermissible.

Sternly criticize and educate those in breach of discipline. As for those who commit serious breaches and refuse to mend their ways despite repeated education, the following actions may be taken against them — the recording of a demerit, removal from post, demotion in rank and salary, being placed on probation within the factory (during this period the offender will get only the minimum living expenses) and expulsion. The last measure must be taken with prudence.

Chapter XXIX. Methods and Style of Work

In the great struggle to accelerate industrial development and bring about the modernization of industry, whether the cadres on the industrial front have correct methods and style of work is of important significance. We must restore and develop the party's fine tradition and style of work — seeking truth from facts and following the mass line.

All cadres, especially leading cadres at every level, must go to work at the frontline, take part in labour, do investigation and study among the masses, listen to each other's opinions and refrain from issuing arbitrary orders. They should earnestly sum up and spread the advanced experience created by the masses. While encouraging the advanced, they should be sure to work among the backward units and effect a change in them.

We should work in a down-to-earth manner

and guard against empty talk. We should cut down on meetings and make meetings and speeches short. Economic work must be performed in a meticulous way; we should oppose carelessness and flashiness. We should be responsible and keep improving; oppose shifting responsibility onto others or muddling through one's work. We should pay attention to efficiency; oppose being slack or dilatory. We should go in for "three honests and four stricts"⁴ and be honest and speak and act honestly; oppose boastfulness or deception.

We should promote materialist dialectics; oppose metaphysics and one-sidedness. Approach everything analytically. Be sure to criticize what is wrong and protect what is right. Take care that one tendency conceals another. Stick to the viewpoint of one dividing into two. Learn the good experience of other places and units, and overcome the erroneous idea of being complacent, conservative and parochially arrogant.

Chapter XXX. Overall Planning, Stronger Leadership

Overall planning and stronger leadership are indispensable to the accomplishment of the tasks mentioned above.

Since we have a lot of things to do, they must be tackled in close coordination. Under the unified leadership of the party committee, every region and department must make overall arrangements in the light of its actual conditions. We should give priority to the key points and avoid attending to too many things at the same time.

In line with Chairman Mao's instruction "formulate a whole set of concrete principles, policies and measures under the guidance of the general line," the central departments concerned shall, together with the localities, draw up rules and regulations for work in every trade and profession and in the industrial enterprises on the basis of making investigation and study and summing up the experience on the principles set out in this document.

The situation on the industrial front is getting better and better under the leadership of Chairman Hua and the Party Central Committee and under the guidance of Chairman Mao's revolutionary line. Our future is infinitely bright. All difficulties we may encounter on our road of advance are temporary and can be overcome. All cadres, workers and technicians on the industrial front must call forth all their vigour, work hard, and boldly shoulder the great historical mission of quickening the pace of industrial development and building up our mighty socialist country. Unite to win still greater victories!

Translator's Notes:

1. The "Charter of the Anshan Iron and Steel Company" is a set of guiding principles approved by Chairman Mao for running socialist enterprises, namely; keep politics firmly in command; strengthen party leadership; launch vigorous mass movements; institute the system of cadre participation in productive labour and worker participation in management, of reform of irrational rules and regulations, and of close cooperation among cadres, workers and technicians; and go full steam ahead with technical innovations and the technical revolution.
2. The "ten needs and need nots" are: need we or needn't we adhere to the party's basic line; need we or needn't we have party leadership; need we or needn't we rely whole-heartedly on the working class; need we or needn't we do well in production; need we or needn't we have rules and regulations; need we or needn't we have socialist accumulation; need we or needn't we apply the principle "From each according to his ability, to each according to his work"; need we or needn't we train the proletariat's own experts; need we or needn't we import new technology; and need we or needn't we stick to planned economy.
3. The "three talks" are: talk about the history of the struggle between the two lines; talk about what we suffered from the Gang of Four; and talk about what we did under the Gang's pernicious influence.
4. The "three honests and four stricts" are: be honest in thought, word and deed; set strict standards for work, organization, attitude and observance of discipline.

14. REGULATIONS ON AWARDS FOR QUALITY PRODUCTS OF THE PEOPLE'S REPUBLIC OF CHINA

*((Approved by the State Council and Promulgated by the State Economic Commission on
June 30, 1979))*

Chapter I. General Principles

Article 1. In order to encourage industrial enterprises to keep improving the quality of their products and strive to make more high-quality goods as required by China's socialist modernization programme and the need to steadily raise the people's living standards and increase exports, the state has decided to confer State Quality Awards on fine-quality industrial products.

Article 2. State Quality Awards are issued annually after evaluation, selection, consideration and approval of the eligible products. The awards are divided into two classes: Class A — gold medals; and Class B — silver medals.

Chapter II. Qualifications

Article 3. All products to be granted State Quality Awards must conform to the following qualifications:

1. They are suited to the needs of, are reliable and satisfactory to the users, and are sought for and appreciated in domestic and world markets;

2. Their quality indices are higher than those laid down in all existing technical standards, on a par with or close to the advanced international standards for the same category or products, or the products are unique and original in design and possess fine traditional qualities;

3. The products are placed first in quality contests among Chinese products of the same kind; and

4. Their designs have been finalized and approved for serial production, and the quality of the products improves steadily.

Chapter III. Selection and Approval

Article 4. Applications for State Quality Awards shall be submitted by the producers of high-quality products and studied by the organizations concerned under the auspices of the revolutionary committees of the provinces, municipalities and autonomous regions. If the applications are accepted, the products shall be tested, evaluated and selected nationally by the departments in charge under the State Council. The results shall

be re-examined by the State Administration of Standards and the General Administration for Industry and Commerce and reported to the State Quality Award Board for consideration and approval.

Article 5. The selection and approval of products for State Quality Awards must follow the principal of "high standards and strict demands." Resort to deceit or deception is strictly forbidden and offenders shall be dealt with seriously on the merits of each case.

Chapter IV. Awards

Article 6. All State Quality Awards shall be issued by the State Economic Commission, generally during the annual "Quality Promotion Month."

Article 7. The issuing of State Quality Awards represents a major policy to encourage the development of fine-quality products and must be regarded seriously. The localities, departments and units shall no longer issue medals, badges or cups as prizes for any industrial products.

Chapter V. Symbols of Honour

Article 8. Symbols of honour indicative of medal-winning high-quality products may be affixed to the products which have won State Quality Awards and to their directions and trademarks.

Article 9. The quality of all award-winning products may only be improved and not lowered. No unqualified products are allowed to use the symbols for State Quality Awards.

Article 10. If the quality of any award-winning products should deteriorate, the producer should immediately stop using the symbols for State Quality Awards and promptly report this to the relevant authorities. When the original quality is restored through improvement, the producer may apply to the departments concerned for using these symbols again.

Chapter VI. Appendices

Article 11. The policy toward quality products is to give them higher prices and priority in the supply of raw and semi-processed materials, fuel and electricity.

Article 12. The expenses involved in the

issuance of State Quality Awards shall be defrayed by special allocations from the state treasury.

Article 13. The right of interpretation of these Regulations is vested in the State Economic Commission.

Article 14. These Regulations shall come into force from the day they are promulgated.

15. REGULATIONS ON STANDARDIZATION CONTROL OF THE PEOPLE'S REPUBLIC OF CHINA

Promulgated by the State Council

(July 31, 1979)

Chapter I. General Principles

Article 1. Standardization is an important means of organizing modern production and an essential part of scientific management. Promoting standardization in the course of socialist construction is a major technical-economic policy of the state. Without standardization, there will be neither specialization, nor high quality, nor high-speed growth. These Regulations are formulated to strengthen standardization control, raise the level of standardization and bring its role into full play in the modernization of agriculture, industry, national defence, and science and technology.

Article 2. Technical standards (hereinafter, standards for short) provide a common technical basis for production, construction and the circulation of commodities. Standards must be worked out and implemented for all industrial goods in regular production, major farm products, engineering projects, and for environmental protection, safety, sanitation and other matters where the technical requirements should be unified.

Chapter II. Formulation and Revision of Standards

Article 3. In formulating or revising standards, full consideration should be given to the needs of the users, to natural conditions and to the rational utilization of the country's resources, so that the standards shall be technically advanced, economically sound, and reliable for safe operation.

Article 4. The formulation or revision of standards must be based on a selection, proper classification and serialization of the varieties and specifications of the products of the same category; the scope of application should be enlarged as far as possible for widely used spare parts, components, elements, apparatus, structural parts and fittings so as to improve their interchangeability. Different types of standards should be well-coordinated and be complementary to one another; attention should be paid to their applicability for both military and civilian purposes.

Article 5. With regard to the quality indices

for industrial and agricultural products, proper grading rules may be included in the relevant standards as required.

Article 6. Packaging standards should be worked out simultaneously with product standards and they must meet the quality and safety requirements, taking into consideration the conditions of loading, unloading, transportation and storage and paying attention to the economical use of materials.

Article 7. Internationally accepted standards and advanced foreign standards should be studied conscientiously and adopted as far as possible.

Article 8. With regard to products for export and the engineering projects China undertakes to build in foreign countries, standards geared to the needs of foreign trade markets should be worked out, if necessary, by the authorities in charge of production and construction, in cooperation with the departments in charge of foreign trade and foreign economic relations.

Article 9. Standards should be revised in time to keep pace with technical and economic development. They should be reviewed once every three to five years to see whether they should be reaffirmed, revised or abrogated.

Article 10. Standardization promoting programmes and plans shall be included in the national economic programmes and plans at all levels. The experimental and research projects necessary for the formulation of standards shall be included in the relevant scientific research plans of various levels.

Chapter III. Classification, Endorsement and Promulgation of Standards

Article 11. Standards are divided into three classes: state standards, ministry standards (specialized standards) and enterprise standards. Ministry standards should be replaced by specialized standards step by step. Neither ministry standards (specialized standards) nor enterprise standards should contravene state standards; and no enterprise standards should contravene ministry standards (specialized standards).

Article 12. State standards refer to those which are of cardinal importance to China's

economic and technical development and which must be uniform throughout the country. They include mainly: standards for basic raw materials and semi-processed materials; standards for major industrial and agricultural products which are vital to the people's livelihood, used extensively and in large quantities and produced inter-departmentally; safety and sanitation standards for the protection of the public and the environment; basic standards for interchangeability and common technical terminology; standards for general-purpose spare parts, components, elements, apparatus, structural parts, fittings, tools and measuring instruments; standards for commonly adopted experimental and testing methods; and international standards adopted in China.

Article 13. State standards shall be drafted by the departments in charge under the State Council (or the technical committees in charge of specialized standardization) and, depending on the scope of application of the standards, reported to the following departments for examination, endorsement and promulgation:

- The State Administration of Standards (for standards relating to industrial and agricultural products and products for both military and civilian uses);
- The State Capital Construction Commission (for standards relating to engineering projects and environmental protection);
- The Ministry of Public Health (for standards relating to pharmaceuticals, public health and disease prevention); and
- The defence industry departments (for standards relating to defence industries).

Important standards shall be reported to the State Council for examination and approval.

Article 14. Ministry standards (specialized standards) refer mainly to those which are unified for a specialized trade throughout the country. They shall be drafted under the auspices of, and endorsed and promulgated by, the competent authorities and reported to the State Administration of Standards to be put on record.

Article 15. Enterprise standards should be worked out for all products that are not covered by state standards or ministry standards (specialized standards). To ensure constant improvement of their products, enterprises may draw up higher quality standards than those laid down in state and ministry standards (specialized standards). Measures governing enterprise standards shall be formulated separately by the State Administration of Standards.

Article 16. All organizations and individuals may propose draft standards. Proposals for state and ministry standards (specialized standards) shall be considered by the national organizations in charge of technical matters relating to specialized standardization; proposals for enterprise standards shall be considered by the higher authorities of the enterprises concerned.

Article 17. The revision or abrogation of standards shall be endorsed and announced by the departments which approved the standards in question. These departments or the organizations they appoint are responsible for the interpretation of the said standards.

Chapter IV. Implementation of Standards

Article 18. As soon as standards are endorsed and promulgated, they become technical decrees, which must be strictly observed by all departments in charge of production, construction, scientific research and design and by all enterprises and undertakings; no organizations are allowed to alter or lower standards without authorization. Anyone who acts in violation of standards and thus causes ill consequences or even grave accidents shall be criticized, disciplined, given economic sanctions or brought to court, depending on the merits of each case.

Where there are real difficulties in implementing standards, the reasons must be explained and a report made on the time allowance requested and the measures to be adopted to apply the standards. After examination and endorsement by the higher authorities, the report shall be submitted to the standard-promulgating departments for approval.

Article 19. The material and technical conditions necessary for the implementation of standards should be guaranteed by the higher authorities; the major items should be included as part of the technical measures that are planned at various levels.

Article 20. All production enterprises must adhere to standards when checking raw materials, semi-processed materials and parts made by other enterprises, examining semi-finished products and inspecting finished products. Up-to-standard products shall be certified as such by the inspection departments; substandard products shall all be excluded from the statistics showing the fulfilment of plans and from output values, and are not allowed to be checked out.

Article 21. All engineering projects must be designed and built in accordance with standards. No project should start on substandard designs and no substandard project should be accepted as passed in final inspection.

Article 22. Full consideration should be given to the requirements of standardization in designing new products and projects, and the letters of designing assignments as well as the design papers must undergo standardization checks; the standardization control departments must be represented in such checks when a design is being examined and finalized.

No new product is allowed to go into serial production unless the standards for that product have been worked out.

Article 23. Full attention should be paid to standardization in reorganizing and improving old products, and the standardization control departments must be represented in the standardization checks.

Article 24. Full consideration must be given to the requirements of domestic standardization when importing equipment and techniques from abroad. There must be prior standardization checks by the departments concerned under the State Council, by the provincial, municipal or autonomous regional standardization control organizations or, if the imported items greatly affect domestic standardization, by the departments concerned under the auspices of the State Administration of Standards.

Chapter V. Quality Supervision and Inspection

Article 25. The State Administration of Standards and the provincial, municipal and autonomous regional bureaus of standards are in charge of the work of supervising and inspecting the quality of products, and they shall coordinate and guide the specialized inspection organizations concerned in carrying out the task. Specific measures shall be drawn up separately by the State Administration of Standards in cooperation with the other departments concerned.

The provinces, municipalities and autonomous regions should establish and improve the organizations charged with quality supervision and inspection in those cities where industries are concentrated. These organizations shall work under the leadership of the standardization control departments of the same level.

Article 26. The tasks of the organizations charged with quality supervision and inspection are: supervising and inspecting the quality of products against the standards; acting as arbiter-inspector when there are disputes over the quality of products between the producer and the seller; keeping the higher authorities informed of the situation and problems in implementing standards, and proposing improvements to the quality of products; giving guidance and help to enterprises in checking up on the quality of products.

Article 27. The departments in charge of quality supervision and inspection have the power to conduct regular and irregular check-ups on the quality of products, either directly or by proxy. They have the power to stop the issuance of quality certificates by those enterprises which do not produce according to standards and the products of which are of low quality; for especially serious cases, they have the power to propose to the competent authorities the application of economic sanctions on the enterprises and the personnel concerned, or to order the enterprises to suspend operation, pending improvement.

Article 28. A new product must be certified up-to-standard by the organizations in charge of quality supervision and inspection before an application for the registration of its trademark is made.

Article 29. With regard to fine-quality products, a quality-indicating system, an award system and a policy of higher price for better quality are adopted. Symbols for good-quality products shall be issued if the products have been certified as such by the organizations in charge of quality supervision and inspection, recognized by the departments concerned and approved by the higher authorities in charge. Specific measures for this shall be formulated separately by the State Administration of Standards together with the other departments concerned.

Chapter VI. Standardization Control Organizations and Personnel

Article 30. The main tasks of the standardization control departments are: enforcing the relevant principles and policies of the state; organizing the formulation and revision of standards; supervising and speeding up the implementation of standards; supervising and inspecting the quality of products and engineering projects; supervising and

checking up on the work of standardization relating to the design of new products; the reorganization of old products and the importation of equipment and techniques.

Article 31. The State Administration of Standards is the functional department under the State Council in charge of all standardization work in the country. Its responsibility is to put forward principles and policies for standardization, organize the formulation and implementation of national standardization programmes and plans, and take charge of all standardization work and quality supervision and inspection in the country.

Article 32. The bureaus of standards of the provinces, municipalities, autonomous regions and industrial cities and the standardization control organizations of autonomous prefectures and counties are the functional departments under the revolutionary committees of the same level and are responsible for standardization control and quality supervision and inspection in their localities.

Article 33. The standardization control organizations of the departments concerned under the State Council and in the People's Liberation Army are responsible for standardization control within their respective departments.

Article 34. The standardization control organizations or standardization control personnel in the specialized bureaus, companies, enterprises and undertakings of the departments concerned under the State Council and of the provinces, municipalities and autonomous regions are under the direct leadership of the officials in charge of technical work (or the chief engineers) and are responsible for standardization work in their own units or as assigned by the higher authorities.

Article 35. The State Administration of Standards and the departments concerned under the State Council should set up and strengthen standardization research institutes and standardization information and data-processing centres. The provincial, municipal and autonomous regional

bureaus of standards should set up and strengthen standardization information and data-processing centres.

Article 36. The national technical committees in charge of specialized standardization, the standardization research institutes of the departments concerned under the State Council and other organizations in charge of technical matters relating to specialized standardization shall conduct relevant scientific research, organize and undertake the formulation and revision of state standards and ministry standards (specialized standards), and participate in relevant international activities.

Article 37. Standardization and quality inspection are productive technical work. The scientists and technicians engaged in this work are part of the scientific and technical contingent, and they should enjoy the same political and economic treatment as the scientists and technicians of other departments. Those who have made outstanding achievements or important contributions should be awarded.

Chapter VII. Appendices

Article 38. Measures for the implementation of these regulations shall be worked out by the revolutionary committees of the provinces, municipalities and autonomous regions, the departments concerned under the State Council, and the departments concerned of the People's Liberation Army.

Article 39. The State Administration of Standards is responsible for the interpretation of these regulations.

Article 40. These regulations shall come into force from the day they are promulgated, and the former "Measures Governing Technical Standards for Industrial and Agricultural Products and Engineering Projects" shall cease to be effective.

16. TENTATIVE REGULATIONS (DRAFT) ON BONUSES FOR SAVING SPECIALLY DESIGNATED FUELS AND RAW MATERIALS IN STATE-OWNED INDUSTRIAL AND TRANSPORT ENTERPRISES, ISSUED BY THE MINISTRY OF FINANCE, THE STATE BUREAU OF LABOUR AND THE STATE ADMINISTRATION OF SUPPLIES

(Promulgated on November 10, 1979)

To increase production and practice economy is a common and long-range task in carrying out socialist modernization. With a view to increasing production and practicing economy in a far-reaching and sustained way and encouraging the staff and workers of enterprises to save funds and materials for the state, reduce the cost of production, increase the profits of enterprises and speed up the development of production, we have formulated the following regulations:

Article 1. All enterprises which consume large quantities of fuels, electricity, non-ferrous metals and other much-wanted products and precious materials in production and which have established management systems (including consumption quotas, consumption measurements, keeping original records, making regular inventories, checking product quality and assessing economic results) may, with the approval of the ministries which they are under, introduce a single-item bonus system for saving specially-designed fuels and raw materials on a trial basis in line with the specific requirements of the respective enterprises. Enterprises which do not have the above-mentioned requisites shall not introduce the system. Administrative action shall be taken against anyone who introduces this bonus system in enterprises which do not have the above-mentioned requisites.

Article 2. The fuels and raw materials that are designated for single-item bonuses are the ten categories that are consumed in large quantities, namely: coal, coke, electricity, gasoline, diesel oils, heavy oils, crude oil, timber, rare and precious metals or other non-ferrous metals that cannot be produced at home in large quantities, and high-quality rolled steel. The bonuses will be paid from the amount of value saved and counted as part of the production cost.

The saving of fuels and raw materials other than those mentioned above should be taken into consideration in issuing regular production bonuses, which shall be paid from the regular bonus funds drawn according to the percentages permitted by the state and shall not be paid again from the amount of value saved as a single-item saving bonus.

Article 3. The savings of fuels and raw materials in the enterprises should be counted according to the quotas set by the state. The actual consumption under a set quota is the saved amount.

The consumption quotas for the above-mentioned fuels and raw materials as a whole will be fixed by the respective ministries on the basis of the average best level of consumption ever achieved in the respective industries or trades. If some ministries have difficulties in fixing their quotas, the municipalities, provinces and autonomous regions may fix quotas on the basis of the local average best levels of consumption ever achieved. In principle, quotas should be revised once a year on the basis of the new level of consumption achieved so as to maintain the most advanced and rational levels.

Article 4. The rates of bonuses for the savings, worked out on the basis of the prices of the fuels, electricity and raw materials consumed and the degree of difficulty in reducing the consumption quotas, are defined as follows:

1—3% of the amount of value saved for non-ferrous metals and high-quality rolled steels;

3—8% of the amount of value saved for gasoline, diesel oils, heavy oils, crude oil and coke;

8—15% of the amount of value saved for coal, electricity and timber.

The ministries must obtain approval from the Ministry of Finance, the State Bureau of Labour and the State Administration of Supplies in working out the details of the rates of bonuses for each industry.

Article 5. Savings shall be assessed annually. Bonuses for savings may be given quarterly or monthly according to the actual amount saved. If more fuels, electricity and raw materials are consumed than the quotas permit in a quarter or a month, no bonus will be given for that quarter or that month, and the above-quota amount will be deducted from the amount saved in the next quarter or the next month, and bonuses will be given on the basis of the amount saved after deduction and according to the fixed rates of bonuses.

In the case of a combined operation in which a group of people doing different kinds of work take part, a shift, a group or a section will be taken

as a counting unit. In the case of an operation by an individual, the individual will be taken as the counting unit. The collective receiving the award should distribute the bonus to its members according to their contributions: bigger shares for bigger contributions, smaller shares for smaller contributions and no share for no contribution.

Article 6. Enterprises which introduce the single-item saving bonus system must check the quality of products strictly and must not alter the quality of products for the sake of saving fuels or raw materials. Bonuses shall be suspended if frauds are discovered and the quality of products drops. If bonuses are given in this case, the same amount of money shall be deducted from wages. Action shall be taken against those who are responsible for fraud. Disciplinary action shall be taken against individuals involved in serious cases.

Article 7. The departments of supplies and planning should, in accordance with the policy of

"savings to factories," leave to the factories the fuels and raw materials saved by reducing the factories' consumption quotas for above-quota production. The increased part of production will be distributed according to the relevant state regulations.

Article 8. The savings and the issued bonuses must be made known to the workers and staff from time to time in the interest of democratic management and mass supervision.

Article 9. Details may be worked out by the ministries under the State Council and the governments of provinces, municipalities and autonomous regions in line with this regulation. They should be sent to the Ministry of Finance, the State Bureau of Labour and the State Administration of Supplies for the records. Regulations previously published by the local governments and ministries which contravene this regulation should be abrogated.

**17. TENTATIVE MEASURES CONCERNING THE SHARING OF PROFITS IN
STATE-OWNED INDUSTRIAL ENTERPRISES,
ISSUED BY THE STATE ECONOMIC COMMISSION AND
THE MINISTRY OF FINANCE**

Approved by the State Council on January 22, 1980

In July 1979 the State Council issued the "Regulations on the Sharing of Profits in State-Owned Enterprises," and the Ministry of Finance, the State Economic Commission and the People's Bank also published the "Opinions Concerning Some Concrete Problems in the Experimental Work Of Putting into Effect the State Council Document on Restructuring the Enterprise Management System." These two documents have helped to bring into play the initiative of enterprises and to encourage enterprises to show interest in production and increase their profits.

In order to improve the experimental work, ensure the collection of state revenues and give consideration to the interests of the state, the enterprises and individual workers, the measures concerning the sharing of profits in state-owned industrial enterprises were revised after problems and opinions collected from various parts of the country in the course of the experiment were discussed at the National Planning Meeting. The revised measures are as follows:

Article 1. State-owned industrial enterprises which have maintained normal production order and management after consolidation, retained independent economic accounting and have profits may, with approval, try out the profit-sharing system in accordance with the Measures.

Article 2. The original method of drawing shares from the total profit is changed to the method of drawing shares from the basic profit and the increase in profit. If the profit of an enterprise in the current year is bigger than that in the preceding year, the enterprise may draw a share from the basic profit, which is equivalent to its profit in the preceding year, according to the assessed proportions, and then draw another share from the increase in profit, that is, the part above the profit in the preceding year, according to the proportions defined by the state.

If the profit of an enterprise in the current year is smaller than that in the preceding year, the enterprise may draw a basic share from its actual profit in the current year according to the assessed proportions. In calculating the shares to be drawn from the basic profit or from the increase in profit, the amount of increased profit attributable to technical measures adopted with depreciation

funds and funds pooled by the enterprise itself should be included.

An enterprise may use the shares drawn from the basic profit and the increase in profit for its production development fund, workers' welfare fund and workers' bonus fund.

Article 3. When an enterprise obtains approval to start the experiment, the proportions of shares it draws from the basic profit shall be determined by the percentage of the following expenses in the preceding year to the total amount of profit in the same year:

(1) Enterprises assigned to develop new products may, on the whole, calculate the cost of new product development at 1% of the total profit. Those enterprises which have been assigned to develop more new products may calculate the cost of new product development at 2% of the total profit. Machine-building plants may calculate the cost at 3% of the total profit. Enterprises which are not assigned to develop new products, e.g., coal mines, oilfields, power plants, power stations, lumber centres, railways and other communications, and other mining enterprises, shall not calculate this cost.

(2) An enterprise's expenses for scientific research and for workers' technical training are calculated on the basis of the government's actual allocations to the enterprise (not including the three special appropriations given by the government for scientific and technical work and expenses for adopting technical measures). The expenses not included in the production cost of an enterprise or its business turnover shall be calculated according to the formula stated above.

(3) The workers' welfare fund to be drawn from the cost of production shall be calculated at 11% of total wages.

(4) Workers' bonuses, paid from the cost of production as a whole, shall be calculated at 10% of the total basic wages of an enterprise. The percentage may be raised proportionately for a limited number of advanced enterprises, but it shall not constitute more than 12% of total basic wages.

(5) The percentage of enterprise funds to be drawn from the profit by a basic level enterprise shall be stated separately by the authorities and shall constitute no more than 5% of total wages, depending on varying conditions in enterprises.

The sums in items (1) and (2) constitute the production development fund. The amount in item (3) and 80% of the amount in item (5) constitute the workers' welfare fund. The amount in item (4) and 20% of the amount in item (5) the workers' bonus fund. Proportional shares of profits to be drawn by enterprises shall be assessed separately for the three funds.

The total profit for calculating the proportional share from the basic part is the amount of profit after the loan for technical measures to be returned is deducted. After the system of drawing the workers' welfare fund and bonus fund from the cost of production is replaced by the system of drawing them from profit, the total profit for calculating the proportion share from the basic part should be increased correspondingly.

After the profit-sharing system is introduced, the government shall no longer make appropriations for the expenses which should be paid from the share of profit, and enterprises shall no longer include expenses as part of the production cost nor draw enterprise funds.

Article 4. The proportions of shares which enterprises will draw from the increased part of profit are separately stated for different industries as follows:

(1) 10% for petroleum, power, and petrochemical enterprises and enterprises with complete plants imported from abroad which earn considerably more profits;

(2) 20% for metallurgical, machine-building, electronic, chemical, light industry, textile, building materials, timber, railway and other communications and other enterprises;

(3) 30% for coal mining, post and telecommunications, civil aviation and farm machinery enterprises.

Article 5. The proportions of shares from the basic part of profit shall be assessed level by level from top to bottom. The total proportions of shares of profits retained by the provinces, municipalities, autonomous regions and the ministries in charge of production shall be assessed by the State Economic Commission and the Ministry of Finance. The provinces, municipalities, autonomous regions and the ministries in charge of production may separately assess the proportions of shares of profits retained by the enterprises (or corporations) under them within the limits of the total proportions of shares assessed by the state.

Article 6. The assessed proportions of shares from the basic part of profit shall, in principle, remain unchanged for three years. Adjustments

may be made under the following circumstances:

(1) The readjustment of the prices of products, the prices of major raw materials and the restructuring of the taxation system lead to big increases or decreases in the profits of enterprises;

(2) The readjustment of the enterprises in the industrial reorganization leads to big increases or decreases in the profits of enterprises;

(3) The operation of workshops, branch factories and attached factories that are newly-built or expanded with government investment leads to big increases in the profits of enterprises;

(4) The profits of enterprises decrease after they pay taxes on fixed assets and interest on fixed loans.

Article 7. An industrial enterprise can draw a full share of profit as stated only when it reaches the four planned targets for output, quality, profit and fulfilment of its contracts to supply goods. If an enterprise fails to reach one of the four planned quotas, a deduction of 10% shall be made from its share of profit (including both the share from the basic part of profit and the share from the increased part of profit).

Quotas for assessment in the railway and other land and water transport, post and telecommunications and civil aviation enterprises shall be defined separately by the ministries in charge of these enterprises and the Ministry of Finance through consultation.

Article 8. An enterprise shall draw a full share from the basic part of profit as stated if it fulfills its monthly target; it shall draw 80% of its share in advance for the month if it fails to fulfil its monthly target. An enterprise may draw 50% of its share in advance from the increased part of profit as stated if it fulfils 50% or more of its annual quota in the first six months, but it is not permitted to draw any shares from the increased part of profit in advance if it fails to fulfil 50% of the annual quota. The share of profit an enterprise is entitled to shall be included in its final accounts at the end of a year. A surplus shall be refunded and a deficiency made up when the final accounts are settled after an examination by the department above in charge and by the financial department at the same level.

When an enterprise draws a share of profit, the profit shall be calculated after the enterprise repays its loan for technical measures.

Article 9. An enterprise shall draw its share from the basic part of profit according to the assessed percentages separately for the production development fund, the workers' welfare fund and the workers' bonus fund, and shall also manage

and use them separately for these purposes. The amount drawn by an enterprise from the increased part of profit to be used for development of production shall not be less than 60% and the amount used for workers' welfare facilities and bonuses shall not be more than 40%. The production development fund may be used together with the capital fund for replacing or revamping old equipment, but not for workers' welfare or bonuses. The bonuses issued to workers shall be paid from the workers' bonus fund, except the savings bonus stated separately by the government. An enterprise should draw the workers' bonus fund before using it and the bonus fund shall not exceed the quota. Total bonuses issued to the workers of an enterprise which draws a greater bonus fund than others, calculated on the basis of the enterprise as a unit, shall not exceed an amount equivalent to the basic wages of the workers in the enterprise for two months. The surplus of the bonus fund shall be carried over to the following year.

Article 10. An enterprise's plan for the use of the funds drawn from profit must be submitted to the workers' congress of the enterprise for discussion. The funds must be placed under full democratic management and mass supervision.

Article 11. The quantity of materials and equipment needed by an enterprise for adopting production measures or for improving welfare facilities with the retained share of profit should be reported to the planning commissions and departments in charge of surplus at all levels and should be included in the plans for settlement.

Article 12. In practising the profit-sharing system, enterprises must conscientiously carry out the party's policies and principles and state plans, and must adhere to financial guidelines; they must not resort to fraud and deception. If an enterprise violates the guidelines, the departments above in charge of the work should make a deduction from the share of profit accruing to the enterprise or suspend the enterprise's right to draw the share of profit in a given period, depending on the severity of the case, and the leaders of the enterprise and other people involved shall be dealt with sternly.

Subject to approval, these measures shall be adopted on an experimental basis in state-owned industrial enterprises beginning in 1980. Enterprises which have already started the experiment according to local measures must all change to adopt these measures as of 1980.

18. PROVISIONAL REGULATIONS FOR TOTAL QUALITY CONTROL IN INDUSTRIAL ENTERPRISES

*Promulgated by the State Economic Commission
(March 18, 1980)*

Chapter I. General Principles

Article 1. The present regulations are formulated for the purposes of popularizing total quality control in industrial enterprises, carrying out the policy of putting "quality in first place" and improving the quality of products steadily so as to meet the needs of the programme of Four Modernizations and the continuous rise in the people's living standards.

Article 2. Total quality control is a central link in enterprise management as well as a scientific method of quality control in modern industry. It means control of the quality of products in the entire process from designing, trial-production, manufacture through post-sale service. All the workers and staff of an enterprise and all the departments therein should learn and take part in quality control.

Article 3. The tasks for those involved in total quality control are: keep abreast of the needs of national reconstruction and the people's livelihood and investigate the developments of similar products in China and other countries and their market conditions; educate the workers and staff to foster the concept of putting "quality in first place" and correctly carry out advanced and rational technical standards; adopt scientific methods (including mathematical statistics) and, through specialized technical research, control various factors affecting product quality; undertake technico-economic analysis of the quality of products; offer technical services to users; constantly improve product quality in line with the requirements in their use and strive to turn out products that are good in quality, low in price, suited to buyer's requirements, satisfactory to users and competitive on both the domestic and overseas markets.

Chapter II. Planning for Product Quality

Article 4. Planning for the product quality is a constant and effective means of organizing total quality control. Such planning calls for a programme of action involving departments engaged in quality control. All industrial enterprises need to map out comprehensive plans for improv-

ing product quality, as well as specific plans for different items, periods and departments in line with the principle of achieving greater, faster, better and more economical results.

Article 5. Planning for product quality consists of:

1. Planning for catching up with or surpassing advanced levels in product quality. This means drafting plans for catching up with or surpassing advanced levels in trial-producing and manufacturing new products and improving existing products in line with users' requirements and the orientation of technological development. This requires the defining of concrete targets for catching up with or surpassing advanced levels in China and abroad and the setting of a time limit and rate of progress for fulfilling the targets.

2. Planning for quality targets. The comprehensive economic plan of an enterprise should embody the policy of putting "quality in first place." A separate plan defining the rates of first-grade and fine quality products should be drafted and examined in the light of specific circumstances.

3. Planning for measures to improve quality. This kind of plan defines the measures for quality improvement to be taken during the year and in each quarter and the departments to take the main responsibilities. The annual outlay for technical measures should, first of all, be spent on improvement of product quality and development of new products.

Article 6. Stress should be laid on the implementation of plans. Various plans for the quality of products should be carried out by all departments, brigades and individual workers, and their implementation should be linked up with examination, emulation, assessment, rewards and punishments.

Chapter III. Quality Control at Design and Trial-Production Stage

Article 7. The stage of designing and trial-production means the whole process of technical preparations prior to the stage of regular production of a product. It covers investigation and research, programme drafting, product designing,

technical designing, trial-production, testing and appraisal.

1. Investigation, research and drafting of programme. This means investigating users' requirements with respect to product quality, collecting relevant technical data in China and other countries, and studying ways of solving key technological problems. The work also includes the drafting of targets for quality and technical requirements that are suitable and reliable, satisfactory to customers, economic and rational.

2. Organization of users, sales, research, manufacturing, and quality control departments and a "three-in-one" combination of leading officials, technicians and workers for the examination of designs. Efforts should be made through such examination to meet the requirements of users, solve problems that may arise in the course of production, and select suitable design.

3. Work must be done well in the trial-production, testing and assessment of new products. After the completion of the trial-production of new products (including major improvements in existing products), the enterprise concerned should organize relevant personnel to make strict tests and appraisals. With regard to important products, the department in charge should organize user and other relevant units for appraisal and all-round technical and economic assessment.

4. Work must be done well in the examination of standardization. It is essential to ensure that product designs are up to or even above the various technical standards stipulated by the state and to raise the level of standardization, serializability and interchangeability of products.

Article 8. The following requirements must be met before a new product can go into serial production:

1. The technical standards of the product have been drawn up and gone through the formalities of report and approval;

2. The technical papers must be complete, accurate and clear;

3. A certificate of quality must be obtained from the authorities for supervising and inspecting the product, and a product ready to go into the market must have its trade mark registered;

4. There must be complete sets of equipment and devices for examining and testing product quality;

5. It must be in conformity with the requirements for environmental protection, security and sanitation.

Article 9. It is essential to adopt a scientific approach to the process of designing and trial-production and to act strictly according to the

stipulated procedures; it is forbidden to proceed with designing, experimenting and manufacturing simultaneously.

Chapter IV. Quality Control in Course of Production

Article 10. The tasks for those involved in quality control in the course of production are: establish a production system capable of constantly turning out qualified and top quality products, and do a good job of quality control at each link of the chain of production; strictly follow the technical standards, make sure that the quality of products reaches or surpasses all these standards, strive to turn out top quality products, and try to cut down rejects as far as possible.

Article 11. Close attention should be given to the following points if success is to be achieved in quality control in the course of production:

1. Establish or improve the system of responsibility for each and every workpost, map out or revise rules for various operations in good time, implement them strictly, and get everyone to observe technical discipline.

2. Do a really good job of working in a scientific way and, in particular, maintaining good order in production, rationally equip the work places with tools and make sure that the passageways for production are free from obstacles and that the work sites are tidy and clean. Trees should be planted in the surroundings and pollution and dust prevented.

3. Make good preparations before production starts and arrange production plans rationally; improve production management, strengthen weak links in time, and take steps to achieve a harmonious flow in production.

4. Make full use and flexible employment of mathematical statistics and other methods of quality control to maintain the quality of products in the course of production and prevent rejects.

5. Map out or revise technical standards for existing products. Enterprises which do not have such standards should institute their standards and those whose standards are backward should revise them; all enterprises should strictly implement their standards after they are submitted to and approved by the appropriate authorities.

6. Strengthen metrological work. To ensure the quality of products, all enterprises should institute special metrological organizations or personnel to be responsible for unified control of metrological work in measurement, temperature, mechanics, electricity, chemistry, etc., to implement metrological laws and decrees and the system

of metrological control, and to be responsible for the examination and maintenance of metrological instruments and the work of testing. It is essential to equip the enterprises with all necessary metrological devices and testing instruments and equipment and keep them constantly in good repair.

7. Establish or improve various systems for quality control centred round the system of responsibility for each workpost. Unqualified raw and other materials must not be used in production, unqualified semi-finished products must not be used, unqualified products must not be allowed to leave the factory as qualified products, nor must they be included in calculating the value and volume of production. Workpieces from one working procedure which are not up to standard must not be allowed to move to the next procedure; workers on the next shift have the right to refuse to take over if they find the equipment, the job being worked on and the environmental sanitation are not up to the standards for quality control. The principle of combining inspection by the workers themselves and by full-time personnel should be adopted in the inspection of product quality. Self-inspection and mutual inspection among the workers should be the main practice in the course of production whereas semi-finished and finished products should mainly be inspected by professional personnel. Records on quality should be established or improved and a good job should be done in keeping primary records about product quality and in making statistics and analysis.

8. Do a good job of quality control in the supply of materials. Examination and acceptance of materials going into storage should be done strictly according to rule. Materials that are not up to standard or not in conformity with the provisions of contracts may be returned or rejected. The care-takers of materials should take effective steps to avoid damage and deterioration. The quality of service should be raised so as to ensure timely supply of materials. Departments in charge of materials supply should assume total responsibility for the quality of those products whose purchase and marketing are monopolized by these departments.

9. Strengthen maintenance service so as to keep all equipment in good technical condition. Repaired equipment should be up to the specified requirements for quality. Tools and equipment should be kept well to ensure the required precision of tools, fixtures, measuring instruments and cutting tools.

10. Improve the quality of packing. Standards for packing should be instituted in line with the characteristics of products, packing and examination should be done in strict accordance

with the standards, and packing of products that is not up to standard must be done over again. Packing and decoration of products should be improved continuously to make them attractive.

11. Delivery of products should be handled in line with the specific contracts signed with the customers. It is impermissible to compel the customers to accept them on the pretext that they are up to certain general norms or to accept a mixture of quality and inferior products.

Chapter V. Quality in the Course of Use

Article 12. The assessment of product quality depends mainly on the users' evaluation. Quality control in the course of use is an extension of the work of an enterprise in quality control. The enterprise should constantly study and seek to improve product quality through visits to users and technical service for them.

Article 13. Active steps should be taken to develop technical service:

1. Compile manuals explaining the use of products. The contents of such manuals should generally include the characteristics, structure, installation, use and maintenance of the products, points for attention, the period of guarantee and conditions under which they are to be kept and transported, etc. Manuals for export products should be translated into foreign languages.

2. Impart techniques about the installation, use and maintenance of products and help train technicians in a variety of ways, and undertake to resolve knotty technical problems in the use of products.

3. Provide blueprints for the manufacture of parts that are easily worn out and supply users according to their needs with spare parts and accessories for maintenance purposes (assembly plants responsible for supplying users; factories making elements and components and factories rendering assistance responsible for supplying assembly plants).

4. Set up a network of repair shops or retail shops and in certain cases take service to users' doorsteps.

5. Manufacturers should help users with the installation and trial run of certain complex products or provide technical guidance.

Article 14. Introduce and maintain such practices as visiting users, manning sales counters or holding users' discussions regularly. Links between industry and commerce, and between production and marketing, should be strengthened. Every

enterprise should try through all possible channels to investigate the effects and requirements of its products in use, find out their flaws and problems, and feed these back in good time while comparing its own products with those of other enterprises and countries, so as to improve designs and raise product quality.

Article 15. All users (including units in the following working procedures) should, in the spirit of responsibility to the country and people and mutual assistance between enterprises, keep the manufacturing and supplying units informed of the quality of raw and other materials, parts and whole products. Assembly plants should keep abreast of the work of the quality control systems of supplying units and suggest improvements with respect to existing problems and take the initiative to solve the problems. All units involved should be organized in a coordinated effort to guarantee the quality of the end products. Manufacturing units should handle conscientiously problems concerning the quality of its ex-factory products. They should give prompt answers to criticisms and demands raised by users. They should enthusiastically help users acquire the techniques of using the products where problems have arisen because of inappropriate handling. In case of problems due to faulty manufacturing, the assembly plants should be responsible for repairing or substituting the parts concerned or for refunding, no matter whether the parts in question were made by themselves or bought from other factories. Damages should be paid in case of accidents occurring during the period of guarantee because of inferior product quality. Economic contracts should be concluded between assembly plants and factories supplying raw and other materials and accessories. The supplying units should deliver their consignments according to the quality, quantity and date of delivery specified in the contracts; those which fail to honor contracts should be held responsible for the economic losses thus incurred.

Chapter VI. System of Quality Control

Article 16. All enterprises should conscientiously implement the principles, policies, rules and regulations for quality control laid down by the party and state. It is essential to give full play to the enthusiasm and initiative of the technical personnel and the workers in quality control and define explicitly the tasks that must be fulfilled by each department, unit and individual worker, the responsibilities they are charged with and the limits of their authority. All departments and units should draft their own standards for high quality

work so as to use the high quality of work done to ensure the quality of products. A complete system for total quality control should be established, under which there should be people responsible for each product, each working procedure and each relevant piece of work.

Article 17. All enterprises should put total quality control as an important item on the agenda, and the managers or factory directors should bear full responsibility for the quality of products manufactured by their own enterprises. The chief engineers should, under the leadership of the factory directors, be responsible for the development and manufacture of new products, the drafting of plans for catching up with or surpassing advanced levels in product quality, and the solving of major technical problems concerning product quality.

Article 18. Establish comprehensive quality control organizations or full-time personnel whose major functions are: under the leadership of the managers or factory directors, assist the leadership in comprehensive, day-to-day work of quality control; be responsible for the tabulation of comprehensive statistics and examination of the implementation of the plans for quality control; study and popularize advanced methods of quality control; coordinate the work of quality control in related departments; organize investigations of the effects and requirements of use of products; take part in the assessment of new products; carry out publicity and education with regard to quality control; and organize mass participation in quality control.

All enterprises should establish or improve quality inspection organizations which are responsible for supervising the implementation of the standards for product quality. Their main tasks are: make strict inspection of product quality in accordance with the technical standards and orders for goods; undertake the inspection of the quality of raw and other materials, purchased parts, semi-finished products, finished products, and the principal working procedures; make comments on whether a new product can be put into regular production; sign certificates of inspection for products leaving the factory; and report to the managers or factory directors and the higher authorities on the actual quality of products manufactured by their own enterprises and parts supplied by support factories. The appointment and removal of chiefs of quality inspection divisions or sections should be done with the approval of the next higher authorities.

Article 19. Departments of distribution, ma-

terials supply and transportation should set up a system of responsibility for guaranteeing the quality of products during transportation and for improving the work of factories, workshops, warehouses and storage and transport facilities in this regard.

Chapter VII. Mass Participation in Quality Control

Article 20. All enterprises should, in the light of their own characteristics, mobilize the masses extensively and carry out various forms of activity for quality control. Quality control groups in different forms should be set up on a voluntary basis and with reference to the actual conditions, and they should carry out constant activities concerning quality control and tackle major problems in order to improve quality. Records should be kept on the establishment of quality control groups and their activities.

Article 21. The workers should be organized to take an active part in the "quality month" drive, emulation campaigns should be launched to turn out high quality products, pace-setters in improving quality elected, and all kinds of meetings on the work of quality control held to exchange experience, commend advanced workers and promote the steady improvement of products.

Chapter VIII. Education and Training

Article 22. Education in total quality control should be carried out in all enterprises, and leading cadres at various levels should take the lead in study and application. First of all, it is necessary to train a number of people as the backbone force in quality control.

Article 23. All workers should be given constant, repeated education in quality control. The contents and time of study should be stipulated according to the workers' different trades and needs. Education inside and outside of the factory should be integrated so that all concerned will be able to acquire the basic knowledge and methods of total quality control and apply them in a flexible way in the light of their own jobs.

Article 24. Effective steps should be taken to run technical schools and various types of technical training courses. A variety of methods such as on-site training, technical demonstrations, competitions of skills and election of skilled hands should be adopted in conjunction with everyday

production activities to encourage the workers to study techniques and raise their technical standards.

Article 25. New workers should be given basic technical training and education in total quality control following their recruitment. They must first pass the examination and acquire a certificate of qualification for operation before they are allowed to take over workposts and operate.

Article 26. All workers are subjected to technical and professional examinations on the improving of product quality according to rule. The results are to be entered in their records as an important basis for their promotion or upgrading

Chapter IX. Rewards and Punishments

Article 27. The principle to be followed is: high price for high quality, low price for low quality, and priority for advanced units in the supply of raw materials, fuel and power.

Article 28. The system of rewards in all enterprises should embody the policy of "putting quality in first place." Contributions to quality should be regarded as the foremost condition for winning overall rewards.

Separate terms should be drafted for rewarding full-time inspectors in enterprises. Examination of inspectors' records should be concentrated on the quality and amount of inspection they have done.

Article 29. Improvement of product quality should be integrated with the interests of the enterprises and the workers themselves. Outstanding groups and individuals who have made signal contributions to quality control and improvement of product quality should be given honorary diplomas and annual material rewards. Quality products up to the required standards may apply for regional, departmental or national rewards for quality.

Article 30. Those enterprises whose products are of inferior quality for long periods of time due to chaotic business management and therefore incur strong criticisms from users, must be ordered to make improvements within a set time. They should be ordered to stop production and straighten things out where necessary, and the wages of their leading cadres may be reduced appropriately and the bonuses for the workers suspended in the light of the circumstances, until the quality of

their products attains the standard.

Article 31. Where accidents pertaining to product quality have occurred, the enterprises concerned should find out the causes, handle them seriously, and report to the departments in charge promptly in accordance with relevant stipulations. In case of major accidents pertaining to quality, the leadership should be held responsible and those who are directly responsible should be criticized or punished according to the seriousness of their cases and their own attitudes. Those whose cases are serious and whose attitudes are bad should be dealt with according to law. Anyone who practises fraud on product quality, trumps up data, palms off inferior products as qualified ones,

cheats customers, or retaliates upon inspectors and others who expose his fraudulence, will be held responsible and dealt with severely.

Chapter X. Supplementary Articles

Article 32. The present regulations shall go into force from the day of their promulgation. Various regions and departments concerned may formulate their own by-laws for application according to their specific circumstances.

Article 33. The right of explanation of these regulations rests with the State Economic Commission.

19. PROVISIONAL REGULATIONS OF THE STATE CAPITAL CONSTRUCTION COMMISSION, THE STATE PLANNING COMMISSION, THE MINISTRY OF FINANCE, THE STATE BUREAU OF LABOUR AND THE STATE ADMINISTRATION OF SUPPLIES ON PROBLEMS RELATED TO THE BROADENING OF THE MANAGEMENT DECISION-MAKING POWER OF CONSTRUCTION ENTERPRISES

(May 4, 1980)

It is essential to broaden appropriately the decision-making power of construction enterprises in matters of management in order to operate them as basic units of material production with independent management and accounting, to further arouse the enthusiasm of the construction enterprises and their workers and staff, to improve management, to increase economic returns, and to fulfil capital construction tasks with greater, faster, better and more economic results. Following are the relevant regulations:

1. Broaden the power of decision of the enterprises in the management of production. The drafting of production plans for construction enterprises should, under the guidance of the unified state plan, be changed over step by step to the practice of taking contracts as the basis. While assigning construction tasks to the enterprises, the department in charge should guarantee the material conditions they require in order to fulfil the tasks. So long as they guarantee the fulfilment of the tasks assigned by the state, the enterprises should have the right to contract on their own certain construction jobs or to develop the provision of multiple services to construction work in the light of their own conditions and social needs. No unit or individual should interfere with the normal business of production and management within the enterprises.

2. Reform the methods of material supply. Building materials, forms, tools and materials for erecting large provisional facilities needed in capital construction projects should be supplied within the overall consideration of manpower, funds and material supplies. Before major reforms are made in the entire system of material supply, the following three methods can be adopted in the contracting of jobs and material supplies for construction enterprises:

A. Materials needed by construction enterprises under the ministries of metallurgical, coal, power, railways, communications, petroleum, second machine-building and chemical industries are allocated to the ministries concerned according

to existing regulations and then distributed by the ministries directly to the construction units in line with the needs of the projects to be built.

B. With regard to projects whose budgets are covered by the central government, the materials needed are to be determined by the central government in accordance with the progress of the projects, and the practice of delivering materials to the construction sites is to be adopted step by step.

C. The supply of materials for construction projects undertaken by enterprises under the State Bureau of Building Industry is to be handled in the following ways:

For local projects belonging to provinces, municipalities or autonomous regions, the practice of allocating materials to the departments in charge of construction or directly to the construction units is to be adopted by the related departments in the provinces, municipalities or autonomous regions concerned; for projects directly belonging to various departments under the State Council, the departments in charge may earmark quotas for material consumption or supply materials to the construction units directly; the construction units may use the materials in a flexible way in line with the order of priority of the projects.

3. Restore the practice of retaining legal profits. All state-run construction enterprises that practice independent accounting are entitled, beginning from 1980, to draw a legal profit equivalent, for the time being, to 2.5% of the budgeted cost of the project. The legal profit does not have to be turned over to the higher authorities but is kept entirely by the enterprises themselves in the first three years. After the first three years, the profit will be handled according to the ratio of distribution specified in Item 4. Following the adoption of the practice of retaining the legal profit, construction units will no longer charge the departments owning the projects for funds to operate schools for workers' children.

4. Introduce the practice of reserving part of the building cost saved in construction. The amount of building costs saved by the construction enterprises together with other income that remains after non-business expenditures and stipulated enterprise funds are duly deducted, will be divided in half, one of which is to be turned over to the financial authorities and the other to be kept by the enterprise. When the profits to be turned over by an enterprise to the higher authorities on a 50/50 basis exceeds the amount handed over in the previous year, the enterprise is then required to hand over only 20% of the excess portion while retaining the rest. In order to foster development in areas populated by national minorities and in remote provinces, construction enterprises belonging to the provinces and autonomous regions of Yunnan, Guizhou, Tibet, Xinjiang, Qinghai, Ningxia and Inner Mongolia, together with enterprises for constructing hydro-electric projects under the Ministry of Power Industry, are allowed to hand in to the financial authorities only 30% of the year's profits while keeping the rest. They do not have to follow the practice of reserving part of the excess portion of above-quota profits.

Those units which have been authorized by provincial, municipal or autonomous regional governments to practice the system of sole responsibility for profit or loss may continue to act according to existing rules.

The legal profit and the share of saved building costs reserved by construction enterprises should be used mainly for expanding production and for the workers' collective welfare facilities.

5. Replace the practice of receiving government investments by charging fees for construction tasks as payment for technical equipment needed by local state-run construction enterprises. Beginning from 1981, the government will no longer make investments to cover the expenses of technical equipment for local state-run construction enterprises. They can charge fees equivalent to 3% of the budgeted cost of the projects contracted and, if this is insufficient, borrow money from the Construction Bank to cover the balance. This practice may be introduced this year (1980) in those provinces, municipalities and autonomous regions which generally have not yet allocated funds for the purchase of technical equipment for construction enterprises. Funds earmarked for technical equipment must be used for this purpose only. The surplus left over from one year can be used during the following year. Departments in charge of construction enterprises in various areas should control an appropriate amount of such funds in their hands, make an overall arrangement

and use them flexibly according to the level of equipment and the tasks of different enterprises under them.

Regulations governing the equipment funds of those construction units directly under the departments of the State Council will be studied and formulated separately.

6. Introduce a quota system for expenditures on large temporary facilities and building materials. Specific quotas will be determined by the State Planning Commission, the State Capital Construction Commission, the Ministry of Finance and the State Bureau of Supplies in line with the circumstances of different construction enterprises and will be assigned to them separately. Surpluses can be used by the construction enterprises for building houses to improve the workers' living conditions.

7. Broaden the scope of authority of the enterprises in the management of labour and wages. In view of the fact that construction tasks change frequently, that workers are constantly on the move and are scattered and that construction projects often involve work high above ground and field operations, the enterprises may recruit temporary workers directly through local labour departments to meet the needs of the projects. When recruiting permanent workers in line with the state employment plan, the enterprises have the right to choose the best through examination according to the needs of production. In view of the characteristics of construction enterprises, the labour departments should allot to them as few women workers as possible. The enterprises may, on the principle of "to each according to his work" and in the light of specific tasks, adopt the system of time-wages plus bonuses or piece-rate wages. Bonuses may be given to those who complete their projects ahead of schedule while meeting the requirements for engineering quality, material consumption and safety in operation; bonuses are to be paid by project-owning units out of their own revenues. Bonuses may also be given to those who economize on the three major categories of building materials — 8 to 15% of the cost saved for timber; 3 to 8% of the cost saved for cement; and 1 to 3% of the cost saved for rolled steel. These bonuses are to be paid out of the money saved. The specific regulations for these matters will be drafted by the State Capital Construction Commission after consultation with the Ministry of Finance and the State Bureau of Labour.

8. Reduce the added burdens on construction enterprises. No unit or individual is permitted to apportion expenses to construction enterprises

or to transfer their personnel, equipment or funds to other uses beyond the explicit stipulations of the state. Or, the enterprises have the right to reject them. When personnel are transferred with authorization, their wages and expenses are to be borne by the units that employ them.

9. Uphold the principle of combining right and responsibility and fulfil obligations strictly. All enterprises must, under the leadership of the department in charge and under the supervision of the workers' congresses, correctly exercise their rights and strictly fulfil the following obligations:

A. Uphold the four basic principles (Communist Party leadership, the dictatorship of the proletariat, the socialist road, and Marxism-Leninism-Mao Zedong Thought); conscientiously implement state principles, policies, laws and decrees; and safeguard state property from encroachment.

B. Try in every way to fulfil the state construction plans, conscientiously honour contracts and strictly observe financial regulations.

C. Keep to the work processes of capital construction, continuously improve management, raise the quality of projects, shorten construction time, lower building costs, accelerate the turnover of funds and increase work efficiency.

D. Strive to train qualified personnel, adopt

advanced technology and scientific managerial methods, and work hard to raise technical and managerial levels.

E. Make rational use of basic depreciation funds, funds for major overhauls, legal profits and shares of saved building costs, tap potential and revamp enterprises systematically so as to expand production.

F. Ensure safety in operation, improve environmental protection, and improve the workers' physical fitness.

G. Correctly handle relationships among the state, the enterprises and the individual workers with regard to their material interests, and improve the workers' livelihood and welfare amenities step by step on the basis of expanded production.

H. Strengthen political and ideological work, continuously raise the workers' ideological awareness and communist ethics, educate them to observe state laws and decrees and labour discipline in an exemplary way.

The broadening of the decision-making power of construction enterprises in matters of management, which involves a wide range of complex problems, must be done actively and appropriately. All departments concerned should closely coordinate their efforts while consciously summing up experience so as to achieve success.

20. PROVISIONAL REGULATIONS APPROVED BY THE STATE COUNCIL ON STRENGTHENING THE WORK OF TAPPING POTENTIAL, RENOVATION AND TRANSFORMATION IN EXISTING INDUSTRIAL AND TRANSPORT ENTERPRISES

(June 21, 1980)

The State Council has approved the "Provisional Regulations on Strengthening the Work of Tapping Potential, Renovation and Transformation in Existing Industrial and Transport Enterprises" drafted by the State Economic Commission, the State Planning Commission and the Ministry of Finance and is now transmitting these regulations to you with the hope that you will study and implement them conscientiously.

Provisional Regulations on Strengthening the Work of Tapping Potential, Renovation and Transformation in Existing Industrial and Transport Enterprises

China has established the beginnings of an independent and fairly comprehensive industrial complex through 30 years of socialist construction. Relying on existing enterprises, tapping their potential, renovating and transforming them and giving full play to their role — this is the starting point of our modernization programme and the "base area" from which we set out on a new "Long March." During the period of the readjustment of the national economy, in particular, the growth of our industry and transport, the increase of commodities for the domestic market and for export, and the expansion of accumulated funds will mainly rely on the tapping of the potential of existing enterprises. Adhering to the principle of "production before capital construction and tapping potential before building new enterprises" and doing a good job of tapping the potential, renovating and transforming existing industrial and transport enterprises is, therefore, a cardinal issue which has a direct bearing on the overall situation. It is of special importance for winning success in the first campaign of the new "Long March" and for accelerating the advance of the modernization programme.

1. The potential-tapping renovation and transformation of existing enterprises must be linked up with the restructuring of our country's system of economic management, with the broadening of the decision-making power of the enterprises in matters of management. Along with the restructuring of the system of economic

management, the enterprises should be given greater decision-making power in management, including the right to improve their production techniques continuously and to accelerate the expansion of production through the tapping of potential, renovation and transformation in line with the state plans, market demands and their own economic interests.

2. The tapping of potential, renovation and transformation of existing enterprises means carrying out technical renovation and transformation of present factory buildings and equipment by adopting new technologies and processes while maintaining simple reproduction so as to tap the production potential of the enterprises to the fullest possible extent and increase their economic returns comprehensively.

3. In tapping potential and in carrying out renovation and transformation during the period of economic readjustment, emphasis should be placed on: A. Saving energy by giving first priority to such measures as reducing oil consumption, substituting coal for oil in use as boiler fuel, using exhaust heat for power generating and other purposes, developing central heating and conserving power; B. Giving priority to the development of light, textile and handicraft industries; C. Strengthening weak links in communications and transport, chiefly the bottleneck sections of several old railway lines and several harbours; D. Improving the quality of products, increasing varieties and designs, raising the production of raw and other materials in short supply and expanding the production capacity of export commodities.

4. Formulation and examination of programmes for tapping of potential, renovation and transformation.

Programmes should be drawn up before projects for these purposes are carried out. All areas and departments should conscientiously map out their own programmes for tapping of potential, renovation and transformation in line with the aim of the readjustment of the national economy and the principles and tasks of the long-range programme, in the interest of coordination between different specialities and the requirements for the reorganization of industry and in conformity with

the orientation and emphasis of the national drive for potential, renovation and transformation. All areas and departments should provide guidelines for their subordinate enterprises in drafting their programmes for these purposes, be responsible for examining these programmes and organize efforts to carry them out.

All enterprises which need to carry out such projects should draw up their own economical, rational and practical programmes in accordance with the requirements specified in the programmes of their areas and industries, and with reference to their own orientation in production and specific circumstances and in the light of the problems that exist in their production and management, technological processes, factory buildings and equipment. These enterprises should try to make their products readily marketable while avoiding increases in their average consumption of fuel, power and raw materials. They should not try to expand themselves into integrated enterprises. No project should be included in such a programme unless the related geological resources have been clearly established, the technological processes and techniques are up to standard, the supplies of fuel, power and raw materials and transport facilities are guaranteed and the problems of environmental pollution have been solved. No projects of tapping potential, renovation and transformation involving large amounts of work are allowed to start unless they have been included in the programmes of an area or department so that blindness in action can be avoided.

Unified programmes should be drawn up by the relevant local authorities or departments in charge for certain comprehensive regional projects and those involving several industries. Local authorities and relevant departments of the State Council should cooperate closely and support each other in this regard. Before assigning projects to various areas, the departments concerned should first obtain approval from the planning and economic commissions of the relevant provinces, municipalities or autonomous regions; on the other hand, various localities should submit for examination to the departments in charge those projects they intend to apply for inclusion in the national programme.

All areas and departments should map out programmes and annual plans for tapping potential, renovation and transformation with the following contents: A. Names and contents of the projects; B. The funds needed and their sources; C. The equipment and materials needed and their sources; D. The sources of fuel, power and raw materials needed and ways to achieve a balance in their supply; E. The economic returns expected; F. The time limits set for the projects.

Systematic steps should be taken to carry out the projects included in the programmes and plans according to their order of priority, on the principle of easy ones before difficult ones and with a view to minimizing the cost, shortening the time, increasing returns and achieving satisfactory results. Efforts should be made to acquire the funds, equipment, materials and labour power needed for those projects already included in the annual plans. Those enterprises which cannot solve the problem of labour power may request the capital construction commissions at various levels to make an overall arrangement.

As to the procedures of examining and approving programmes and plans for tapping potential, renovation and transformation, those projects which fall in line with the requirements of regional and departmental programmes and whose expenses can be covered by the sponsoring enterprises out of their reserve funds need only be reported to the local authorities or departments in charge for the record; those projects which need to go through the procedures of requisitioning land, call for a unified balance in the supply of fuel, power and raw materials or have to apply for bank loans or government subsidies, should first go through examination by the departments in charge (and by the bank as well in instances where loans are required) and then be submitted for approval to the economic and planning commissions and financial departments at various levels. Major projects should be handled with reference to the procedures for capital construction. Small loans and odd construction items are to be handled according to existing rules.

In drafting their programmes and plans for tapping potential, renovation and transformation, the enterprises should fully practise democracy, follow the mass line, adopt the "three-in-one combination" of leading cadres, technical personnel and workers. The programmes and plans should be submitted to the workers' congresses for discussion and approval, and their execution should be reported to the congresses regularly.

5. Ways of acquiring and using funds for tapping potential, renovation and transformation. Pending an all-round reform of the system of economic management, funds needed for these purposes may be obtained from the following sources:

A. That part of the basic depreciation funds reserved for these purposes. The State Council document Guo Fa (1978) No. 12 and the document (1979) Cai Qi No. 675 jointly issued by the Ministry of Finance and the State Economic Commission, stipulate that a certain portion of

basic depreciation funds should continue to be set aside in the state budget mainly for the purpose of ensuring the conservation of energy and other such important projects. Basic depreciation funds in the hands of various departments and local authorities should be spent entirely on the renewal of existing equipment and major projects of tapping potential, renovation and transformation. Similar funds reserved by the enterprises and those deducted according to the quantity of production should also be spent entirely on renewing and transforming fixed assets (including development and extension in mining) and must not be diverted to other purposes.

In order to accelerate the renewal and technical transformation of machinery and equipment, those enterprises which have been authorized by the State Economic Commission and the Ministry of Finance to experiment with the broadening of their decision-making power in management may raise their rate of basic depreciation for machinery and equipment by 0.05% in 1980 on the basis of increased profits.

B. The share of profits kept by the enterprises that may be used for the purposes of tapping potential, renovation and transformation.

C. Loans that may be provided by the banks (including small loans for introducing technological measures and loans for special purposes).

D. Small sums in subsidies granted by the state or local authorities.

E. Funds pooled in partnership. Comprehensive regional projects like central heating may be started with funds pooled by the enterprises being benefited. Specialized items, such as the multiple utilization of timber, can be started as joint ventures between central and local authorities, between different provinces, between different cities and counties within the same province, or between enterprises under ownership by the whole people and those under collective ownership by breaking the bounds of different localities, trades and systems of ownership. The products, profits and other revenues of such joint ventures may be shared among the partners on the principle of mutual benefit and according to reasonable proportions agreed upon through consultation. Enterprises may apply for reduction or exemption of tax on those products they have increased through the treatment of industrial wastes and may reserve part of the profits thus increased in accordance with relevant state regulations.

Those enterprises which carry out technical transformation in connection with major over-

hauls may combine the use of funds for major overhauls with funds for the renewal and transformation of equipment. Funds for the purposes of tapping potential, renovation and transformation not in use for the time being should be deposited in banks under separate accounts; departments in charge of the enterprises may co-operate with the banks in using such deposits as loans to those enterprises which are short of funds for these purposes. Enterprises that raise loans should make sure to repay them. A low rate of interest is to be adopted on both deposits and loans in this regard. No department has the right to transfer or to divert to other uses funds of enterprises for the said purposes.

6. Enterprises should first of all make full use of over-stocked goods in their warehouses in providing the equipment and materials needed for the said purposes. In case such goods fall short of needs, central or local departments in charge of the enterprises should draw up unified plans for supply on the principle that whichever level provides them with funds shall provide materials as well, and shall apply for help separately to departments of supplies at various levels in accordance with the present system of material distribution. Departments of supplies at various levels should, in line with plans for tapping potential, renovation and transformation approved by the central or local authorities, treat materials needed for these purposes in the same way as production, maintenance and capital construction, open separate accounts, include them in the plans for the distribution of materials at different levels, give them priority and see to it that the relevant plans are carried out. When various areas, departments and enterprises under them start up projects for the said purposes using funds raised by themselves, they should in principle solve the problems regarding equipment and materials on their own; those which cannot solve these problems may apply for help. Projects for which the materials needed cannot be obtained should not be included in the annual plans. Economic commissions at various levels should participate in examining and approving plans for distributing materials and should assist departments of supplies with the work of coordination in the course of executing the plans.

7. Enterprises should make full use of existing labour power, improve their labour organization and raise labour productivity in tapping their potential, renovating and transforming themselves. If it becomes essential to increase the numbers of some workers, the quotas should be examined and determined by labour departments at various levels

through consultation with the planning and economic commissions at the same level and should be included in the plans for the distribution of labour power at different levels.

8. Projects for the said purposes should be linked up with the popularization of advanced techniques developed in China and the introduction of advanced techniques from abroad. Importance should be attached to the systematic application of existing advanced techniques in China to the technical transformation of old enterprises. Imported advanced technologies and equipment should be used first of all in the transformation of old enterprises.

9. Funds for the said purposes are to be managed by the Construction Bank. Special loans issued by the People's Bank for introducing technical measures should continue to be managed by the People's Bank. Funds raised by enterprises on their own should be used on the principle of depositing before using.

Foreign exchange needed by enterprises for importing technical patents and equipment should be included in the state plan for balance in foreign exchange, and the enterprises concerned should raise loans in foreign exchange in accordance with the "Regulations Governing Short-Term Loans in

Foreign Exchange" approved and transmitted by the State Council.

10. Strengthening of leadership. Economic commissions at various levels are responsible for supervising the entire work of tapping potential, renovation and transformation. They should supervise the drafting of programmes and plans, organize efforts to carry them out and strive for good economic results. All industrial and communication departments under the State Council should also take practical steps to do this work well. Financial departments and banks at various levels should strengthen management and supervision of the use of funds for these purposes. Departments in charge of enterprises should report to the economic commissions and financial, banking and statistical departments at the same level on the results of the use of funds. Provincial, municipal and autonomous regional economic commissions and financial bureaus should pool information on the way local enterprises use their funds for the said purposes and report it to the State Economic Commission and the Ministry of Finance. Statistical departments and departments in charge of enterprises at all levels should strengthen their statistical force and establish or improve their system of statistics and reports on the implementation of plans for tapping potential, renovation and transformation.

21. PROVISIONAL REGULATIONS CONCERNING THE PROMOTION OF ECONOMIC COMBINATION

*Adopted by Executive Meeting of the State Council
(July 1, 1980)*

Following the preliminary reform of the system of economic management, certain forms of economic combination have emerged in many places. Such combination helps to make full use of the advantages of each economic unit, while making up for its deficiencies, achieving greater economic results and speeding up production and construction. It helps to channel the material and financial resources of the local governments and enterprises into serving the urgent needs of the nation's construction. It helps to build up the horizontal connections between different areas and departments according to economic laws and to break down regional blockades and unreasonable division of production and distribution by the various departments. It facilitates the reorganization of industry according to the principle of specialized co-operation, avoiding such practices as small factories squeezing out big ones, duplication in the building of plants and blindness in production. To take the path of combination and to organize various forms of economic combination is a requirement of the readjustment of our economy and of the further reform of our economic system. It represents an inevitable trend of development in our national economy. With a view to promoting economic combination, the following provisional regulations have been worked out:

1. In organizing economic combination, one must proceed from the urgent needs of the development of production, adhere to the principle of voluntary participation and must not use administrative orders to force various enterprises to combine. Generally, the combination of enterprises should start at the lower level, although in some cases it may also begin at the top. It should proceed gradually, from the easier to the more difficult and should expand step by step. The combination should not be accomplished in haste.

The combination of enterprises should not be restricted by trades, territories and ownership or by their relationship of subordination. However, the ownership, relationship of subordination and financial relations of the combined enterprises must not be changed arbitrarily. These enterprises must not change their original arrangement for handing over their income, or their credit and debt relationships with banks. If changes must be made, they should obtain the prior agreement of the

relevant financial department and bank.

Combination must be effected according to the principle of equality and mutual benefit, and consideration must be given to the economic interests of all parties concerned. On the basis of their respective contributions, including funds, raw materials, technology, labour power, sites, equipment and installations, the parties to the combination will determine the proportion in which the proceeds of their operation (profit and products) will be divided among themselves and an agreement or contract will be signed accordingly.

The form of combination should conform to actual conditions. Many different forms are allowed and no one particular type should be enforced.

2. Provided that targets set by the state are met, the combinations of various types may dispose of their products in excess of the planned targets, as well as products manufactured with materials arranged by themselves, in the following ways: They may ask the commercial and supply departments to purchase certain kinds of their products. For others, they may market them directly according to state policy, with each supplying what the others need.

3. Combinations of producers and processors of raw materials should be promoted. First of all, the tasks set by the state for the transfer of raw materials must be fulfilled. For some raw materials it has supplied to the processor in excess of planned targets, the producer may be compensated through consultation by receiving a suitable share of the profit or processed goods from the processor. As for others, they may be processed on the spot under the joint management of the processor and the producer of the raw materials.

If one of the combined enterprises requires raw materials produced by another, it may obtain them directly from the latter without going through the intermediate links of commercial, supply and marketing and materials distribution departments. As for certain kinds of materials that are distributed by the state, these can still be sent to the processor by the producer directly, or through the commercial, supply and marketing and materials distribution departments. This is to be done according to the original relation of subordination of each party and according to principles of economy and rationality.

4. All combined enterprises must guarantee their payment of taxes and profits to the state so as to fulfil their obligations. They are not allowed to make inroads in state revenue.

The parties to the combination should continue to carry out their original regulations concerning wages and welfare benefits for the workers and staff, and may not change these regulations as they please.

5. The leadership of the combined enterprises should practice democratic and scientific management in a spirit of co-operation and of taking joint responsibility. The enterprises should have a combination committee as the organ of authority consisting of the representatives of all parties concerned. None of these parties has the right to change the decisions made by the committee, and arbitrary interference by the administrative departments is not allowed.

The parties to a combination shall not interrupt their co-operative relationships with other departments without mutual agreement through consultation. While fulfilling their contracts of co-operation, they may establish business relations with other enterprises outside the combination. Enterprises which have joined a combination for specialized co-operation should not "eat the rice cooked in one big pot" and each should be responsible for its own income and expenditure.

6. After an agreement on combination has been reached, each party to the combination should report to its own department in charge and to the concerned department of administration of industry and commerce for the record. The combination agreement and contract signed by the parties to the combination shall be protected by the law of the state, and its funds, equipment and materials shall not be appropriated or transferred by any person or organization. If any party to the combination fails to fulfil the agreement or contract or in the event of a dispute in the process of executing it, the department in charge will mediate between the parties. Should the mediation fail to produce any result, the dispute shall be settled by arbitration by the court.

7. With regard to an economic combination involving several provinces, municipalities or regions, or of different trades, the constituent parties may work out temporary arrangements on

problems of administrative leadership, material supply and the distribution of products.

8. The governments at all levels should give competent leadership to economic combination. They should support and encourage all forms of economic combination which facilitate the development of production, accelerate supplies and marketing and promote economic prosperity. The governments should respect the power of the enterprises to make their own decisions, and should not cause any unjustified administrative interference in the affairs of the enterprises. To speed up our socialist construction, the governments at all levels should be good at guiding the enterprises to adapt their enthusiasm for economic combination to the sound development of production in society.

Along with the development of various types of economic combination, a series of new problems may crop up which require the departments concerned to make corresponding improvements in policies, regulations and measures so as to promote the consolidation and expansion of economic combination. The planning departments should strengthen overall balance. The departments in charge of the administration of industry and commerce should improve their work to make the various forms of combination beneficial to the readjustment and development of the national economy. The banks should use such means as credit and interest rates to support the different combinations, giving priority to those that operate more successfully. The banks should organize account-settling work and try out various kinds of trust agreements according to the characteristics of the various forms of economic combination. The financial and tax authorities should improve the taxation system and solve the problem of double taxation on components which are produced by one of the enterprises within the economic combination, and which are used in the assembly of a complete piece of equipment produced by another, etc. Promoting economic combination is an important policy of our country. All localities and departments should enthusiastically protect and support it and continuously sum up experiences so as to enable this policy to develop healthy.

We hope that all localities and departments will carry out the present provisional regulations in light of their specific conditions.

22. PROVISIONAL REGULATIONS CONCERNING THE DEVELOPMENT AND PROTECTION OF SOCIALIST COMPETITION

*Adopted by Executive Meeting of the State Council
(October 17, 1980)*

Since the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, competition has developed steadily with the implementation of the policy of "readjustment, restructuring, consolidation and improvement" of our economy, especially with the expansion of the rights of enterprises to make their own decisions and the utilization of the regulating role of the market. Having displayed its vitality in our economic life, competition is giving an impetus to economic development and technological progress. There are essential differences between socialist competition and capitalist competition. The former, being developed on the basis of the public ownership of the means of production and under the guidance of the state plan, serves the socialist economy. It plays an important role in bringing into play the initiative and creativity of production and business units and of the workers, in making full use of their strongpoints and avoiding their weaknesses, in promoting the combination of enterprises and further activating our economy so as to constantly meet the people's demands and speed up the four modernizations. We should gradually reform the existing system of economic management, energetically develop competition and protect its smooth progress. For this purpose, the following provisional regulations have been worked out:

1. In the course of developing competition, all production and business units should ensure the fulfilment of their production and sales plans as set by the state and make great efforts to improve management, strengthen business accounting, increase the varieties of their products, raise their quality, reduce the consumption of energy, raw and processed materials, cut down costs and expenses, raise labour efficiency and improve their services. They should try to compete with each other, steadily raising the level of production and technology and the level of business management so as to achieve good economic results.

2. To develop competition, an enterprise must be granted greater power to make its own decisions and its status as a relatively independent commodity producer should be respected. No local authority or department is allowed to interfere with the rights which an enterprise is entitled to enjoy under government policies, laws and re-

gulations, rights with regard to production, supply and marketing, personnel, finance and materials. Agreements and contracts concluded between enterprises will be honoured by both parties and protected by the laws of the state. If a party breaks a contract, it shall be held responsible economically and legally. An enterprise may work out its own production plan or undertake tasks in co-operation with other enterprises according to market demand, provided that such plans ensure the supply of goods as required by the state. In addition to materials to be allocated by the state, an enterprise may purchase the materials it needs from other areas and units, insofar as this is permitted by government policies and laws. The areas and departments concerned must not hinder them. As for materials that are allocated by the state according to plan, steps should be taken gradually to give enterprises some freedom in choosing where to buy them. An enterprise has the right to resist all attempts to violate its power to make its own decisions and may lodge complaints with higher authorities.

3. While the socialist public ownership plays the dominant role in the economy, competition shall be allowed and encouraged among the various economic sectors and among the enterprises, enabling each to bring its own advantages into play. In economic activities, no monopoly of commodities shall be allowed, except those which the state has specified to be handled exclusively by certain departments and units. Tenders may be invited and submitted for the construction of production and business projects which can be undertaken by contractors. Those collective and individual economic units which are beneficial to the national economy and the people's livelihood should be given help after they have registered and started business. With overall arrangements in place, they should be given lenient treatment with regard to the supply of goods, payments for goods, taxation, labour power, marketing of products, etc. Their legitimate rights and interests should be protected by the laws of the state. No department or person shall appropriate their assets, impose irrational burdens on them or encroach on their interests.

4. Channels of commodity circulation shall be increased to open ground for competition. In

principle, an enterprise may market products that are its own in excess of the planned target, those turned out with raw and processed materials arranged by itself, and goods it has trial-produced. Goods in short supply and those to be purchased, marketed and allocated exclusively by the state must be first of all purchased by the state. The enterprise may be permitted to market a portion of certain products itself. The prices of the products thus sold should be fixed according to the relevant stipulations. Distribution channels shall be increased while the number of intermediate links reduced. The enterprises shall be permitted to use various distribution channels and to reduce the number of intermediate links, to adopt diverse forms of operation to link up production with demand and to speed up the circulation of commodities. With a view to promoting the marketing of their goods, enterprises of a certain area may set up marketing offices in other areas, hold trade fairs there, or commission others to act as their agents. Urban enterprises may do the same in rural districts, and vice versa.

5. To develop competition, irrational prices must be readjusted gradually. The prices of certain commodities selected by the state are allowed to fluctuate within a prescribed range. In accordance with state policies and the changes in the condition of supply and demand on the market, the enterprises have the power to lower the prices of the capital goods they have turned out, provided that this will not affect their delivery of profit to the state. If an enterprise wants to raise the prices of its goods, it must obtain the approval of the relevant authorities as stipulated by the division of power in price management. The prices of all major commodities which are closely related to the people's livelihood must be kept basically stable.

6. To promote competition, regional blockades must be broken and the partition of the market by different departments must be stopped. No area or department is allowed to enforce a blockade or to forbid the sale of outside products in its own area or department. It must ensure the export of the raw and processed materials it produces according to the state plan, and any blockade is impermissible. To facilitate competition, the departments in charge of industry, communications, finance and trade must revise that part of existing regulations and rules which hinders competition. It is illegal to adopt administrative means to protect the backward and to restrict the advanced, obstructing the normal circulation of commodities; such practices must be abolished.

7. In order to encourage technological innovation and inventions, and to protect the economic benefits due to the departments and personnel concerned, compensation should be made for the transfer of the possession of important technological achievements. For this purpose, the State Council departments concerned shall draw up relevant policies and regulations. Before such documents are formulated, the problem should be solved through consultation between the enterprises. In the course of competition, we should promote technical exchange in the spirit of socialist co-operation.

8. To engage in competition, enterprises should strictly observe government policies and laws and practise lawful means. Attention should be paid to building up reputation and observing business morality. It is impermissible to practise fraud, to offer and accept bribes, to engage in speculation and to seek exorbitant profits at the expense of the interest of the state and the people. Those who violate law and discipline should be dealt with by law according to the severity of the circumstances.

9. Government at all levels and the departments in charge of different enterprises should deepen their understanding, keep abreast of the current situation and give better leadership to competition as the circumstances demand. They should work in a down-to-earth way to render services, coordinate, plan as a whole and supervise, grasp the new situation and resolve new contradictions and problems in good time. In order to ensure that competition develops soundly, they should learn to master the law of economics and work out the necessary economic laws and regulations by making use of such economic links as prices, taxes, credit and rates of interest. Those enterprises which consume less energy and materials in turning out good-quality products at low cost should enjoy priority in obtaining raw and processed materials and energy resources. With regard to backward enterprises, some should be consolidated and helped to improve their management and administration so as to catch up with the others. In the course of readjusting the national economy, others shall be reorganized, change their line of production or merge with other enterprises. They shall be encouraged to take the path of combination. The economically developed areas should pay attention to helping the underdeveloped areas. Economic management departments at various levels must give better guidance to planning and market management, do a good job in making market investigation and forecasts, make comprehensive analyses of the trends of develop-

ment of products and the market situation so as to guide the enterprises to improve their production and management and avoid blindness in production and construction that may arise in the course of competition.

10. It is hoped that all economic enterprises will earnestly try out the above provisional regulations in the light of their specific conditions. Every area and department may work out implementing rules on the basis of these regulations, to protect the development of competition.

23. THE STATE COUNCIL'S CIRCULAR ON THE INTRODUCTION OF A FINANCIAL MANAGEMENT SYSTEM BY WHICH THE SCOPE OF REVENUE AND EXPENDITURE WILL BE DEFINED FOR THE CENTRAL AND LOCAL GOVERNMENTS RESPECTIVELY AND EACH WILL BE RESPONSIBLE FOR THE BALANCE OF ITS OWN BUDGET

(February 1, 1980)

In order to carry out the policy of "readjustment, restructuring, consolidation and improvement" of our economy, to bring the initiative of both the central and the local governments into full play, and to meet the need of gradually realizing the modernization programme, the State Council has decided to introduce from 1980 a system of financial management by which the scope of revenues and expenditures will be defined for the central and local governments respectively and each will be responsible for the balancing of its own budget. The recently held national planning conference has discussed and decided on the basic norms of revenue and expenditure fixed for local governments, the ratio between that part of revenues to be handed over to the central government and the part to be used locally, and the fixed amounts of subsidies for areas entitled to such help. Herewith, we are transmitting a copy of the Provisional Regulations Concerning the Introduction of a Financial Management System by Which the Scope of Revenue and Expenditure Will Be Defined for Central and Local Governments Respectively and Each Will Be Responsible for Balancing Its Own Budget, hoping you will abide by them.

To define the scope of revenues and expenditures for central and local governments and to make each responsible for the balance of its own budget is an important reform of the system of financial management by the state, a reform which will not only affect the structure of revenues and expenditures, the division of financial powers and the readjustment and improvement of the distribution of financial resources, but will also affect the readjustment and improvement of the system of management of planning, capital construction, materials supply, enterprises and public undertakings. To make this reform a success is of great significance to promoting the development of the national economy and the gradual realization of the Four Modernizations. All localities and departments must pay great attention to this question, give better guidance and ask the cadres to take the overall situation into consideration and correctly handle the relationship between the whole and the part and between national and regional interests. In combination with this reform, they should properly readjust and improve relevant systems and

regulations concerning economic management so as to facilitate our work in all fields. In the course of introducing the new financial system, they must promptly grasp the current situation, sum up experiences and study and solve any new problems that may crop up in order to make a success of the work of reforming the system of financial management.

Appendix

Provisional Regulations Concerning the Introduction of a Financial System by Which the Scope of Revenue and Expenditure Will Be Defined for the Central and Local Governments Respectively and Each Will Be Responsible for Balancing Its Own Budget

In order to carry out the policy of "readjustment, restructuring, consolidation and improvement" of our economy, and meet the need of gradually realizing our modernization programme, beginning in 1980 the state will introduce for the provinces, municipalities and autonomous regions a system of financial management by which the scope of revenues and expenditures will be defined for central and local governments respectively and each will be responsible for balancing its own budget. The basic principle is that under the condition that the unified leadership and planning by the central government is consolidated and that the indispensable expenditure of the central government is ensured, the power and responsibility of governments at various levels in financial affairs should be made clear, so that each will exercise its function and shoulder its responsibility, and the initiative of both central and local governments will be brought into full play.

1. Clearly divide the different kinds of revenue and expenditure between the central and local governments according to their relationship of subordination as specified under the system of economic management.

Revenue: income of the enterprises under the administration of the central government; custom

duties and other income of the central government belong to the Ministry of Finance, as its regular sources of revenue. Income of enterprises under local administration; salt tax; agricultural and animal breeding taxes; industrial and commercial income tax; local taxes and other income of the local governments belong to the local financial departments as their regular sources of revenue. The income of those local enterprises which have been placed under the direct administration of the central ministries, with the approval of the State Council, will be divided according to a fixed ratio — 80% will be handed over to the Ministry of Finance and 20% to the local financial departments. Industrial and commercial taxes will be used to supplement the revenue of the central and local governments.

Expenditure: capital investments handled by the central government; the circulating funds of the enterprises under central administration; expenses for the tapping of potential and the technological transformation of the enterprises; and trial manufacture of new products for geological prospecting; national defence; foreign aid, material reserve of the state; operating expenses for cultural, educational, health and scientific undertakings at the central level; those for agriculture, forestry, irrigation and meteorology and those for the industrial, communications and commercial departments will be disbursed from state revenues. The capital investment handled by the localities, the circulating funds of the local enterprises (including those of the projects built by the central government for them); funds for the tapping of potential and the technological transformation of enterprises; funds for the trial manufacture of new products; financial aid to rural people's communes; operating expenses for agriculture, forestry, irrigation, meteorology, etc.; operating expenses for industrial, communications and commercial departments; maintenance fees for the cities; funds for building anti-air-raid defence works; funds for moving people from the cities into the countryside; operating expenses for cultural, educational, health and scientific undertakings; social relief funds; and pensions for the disabled and for families of the deceased; administrative expenses, etc. will be disbursed from the revenue of the local governments.

Expenditures on a few particular items, such as relief fees for extraordinary natural disasters, subsidies for campaigns against extraordinary droughts and floods and developing funds in support of underdeveloped regions will be earmarked by the central government and will not be included in the budgets of the local governments.

2. The basic norms fixed for the revenue and expenditure of a local government will be calculated and worked out on the basis of estimated revenues and expenditures for 1979, with suitable readjustments made according to the aforesaid division of the scope of revenues and expenditures. Where local revenues are larger than expenditures, a part of the surplus will be handed over to the central government according to a fixed ratio. Where revenues are not enough to cover expenditures, the deficiency will be made by allowing the local government to keep a portion of the industrial and commercial tax. In places where revenues are still insufficient to cover expenditures even if income from the industrial and commercial taxes has been left entirely with the local government, the Ministry of Finance will give the local government a fixed amount of subsidies. Once the ratio by which the local government divides its revenues with the central government and the amount of the subsidies are fixed, they will, as a rule, remain unchanged for five years; should the local government earn more, it may spend more.

After the introduction of the system by which the scope of revenues and expenditures is defined for central and local governments and each is responsible for the balance of its own budget, if an enterprise or public undertaking originally administered by the central government is placed under local leadership, if a large enterprise which has been newly put into operation is put under local administration, or if a new kind of tax is levied and, as a result, the revenues and expenditures of the central and local governments are seriously affected, the division of local revenues and the amount of subsidies granted by the central authorities should be readjusted. Or, as an alternative, the central financial authorities will settle accounts with the local authorities. When other economic measures are adopted in accordance with decisions of the central government, including the readjustment of prices, increases of wages for factory and office workers, readjustments of tax rates, and tax reductions and exemptions, the aforesaid division of local revenues and expenditures and the amount of subsidies shall not be changed, unless otherwise stipulated. In the case of an exceptional natural disaster, the central government will give aid to the affected areas according to the consequences of the disaster.

3. In order to help step up production in remote border areas, the autonomous areas of minority nationalities, former revolutionary bases and other economically underdeveloped areas, the central government will, as far as its financial capacity permits, establish development funds for the

economically underdeveloped areas. Such funds will gradually increase to account for 2% of state expenditures; these funds will be allocated by the Ministry of Finance. They will be earmarked for special purposes and used on more important projects.

4. The autonomous regions of the nationalities will continue to adopt the system of financial management that has been stipulated for the nationalities autonomous areas. The special provisions laid down for their finances will remain unchanged. But the amount of subsidies granted to them by the central government will remain unchanged for a period of five years once it is fixed, instead of being changed every year. Within the five years, their increased income will be entirely retained for local use. In the meantime, to give special consideration to the needs of the nationalities autonomous areas in developing their production, construction and culture and education, the central government will increase the amount of subsidies to the autonomous areas at a rate of 10% each year.

5. After the reform of the system of financial management has been effected, all provinces, municipalities and autonomous regions should make overall arrangements for the production, construction and expenditure of their respective areas according to the guidelines, policies and plans of the state. In working out its budget, the local government must act cautiously and not over extend itself, see to it that revenues and expenditures are balanced, with a small surplus on the credit side. They must not make a budget with a deficit, issue local bonds, or appropriate the funds of and apportion expenses to enterprises under them. The budgets of the localities shall be compiled by the local governments and, after being collected and examined by the Ministry of Finance, submitted to the State Council for approval.

The central departments in charge of the enterprises and public undertakings will no longer make overall arrangements for expenses of enterprises of the same trade, or allocate expenditure targets to the localities as before. However, the various central departments shall continue to formulate guidelines and point to the orientation of

work, adopt policies and measures and check up on the economic effects so as to help the local governments to do their work well. The provinces, municipalities and autonomous regions should take the interests of the whole into account, and respect the opinions of the central departments. Those expenses which have been assigned to a local government and which serve the production and construction of the whole country or of the area concerned must be included in the local budget. The local government must guarantee the transfer from its own area of materials and commodities as required by the state.

6. In executing both the central and the local budgets, all income must be collected according to government policies, all expenses paid must conform to the budgets, and all additional expenses must be made through proper procedures. All income that should be included in the budgets must be treated accordingly. On important questions that concern the whole country such as the taxation system, price policy, the issuance of public bonds, wages and bonus standards, the scope of payment of the costs of enterprises, the proportions of the profit to be used as special funds and the standards of important expenditures, all localities and departments must follow the provisions that apply to the whole country. No changes shall be allowed unless they are approved by the proper authorities. Discipline in economic and financial affairs must be enforced. To grant tax reductions or exemptions, or to encroach on state revenues by going beyond the limits of one's authority as prescribed by the state, is strictly prohibited. All localities and departments must strive to increase production, practise economy, increase their income and cut down expenses, so as to fulfil their tasks with regard to revenues and expenditures and to make greater contributions to the state.

7. The specific kind of system of financial management which a province, municipality or autonomous region adopts in relation to counties and cities under its administration shall be decided by the province, municipality or autonomous region concerned in conformity with the spirit of the present regulations.

24. REGULATIONS CONCERNING THE WORK OF FINANCIAL SUPERVISION

Promulgated by the Ministry of Finance

(Approved for Transmission by the State Council on July 2, 1980)

To strengthen supervision over financial affairs is an important guarantee for upholding financial discipline, for promoting the increase of revenues and the economy of expenditure and for accelerating the socialist modernization of our country. With a view to combatting graft, embezzlement, extravagance, waste and all violations against financial discipline, to correctly carrying out the financial policies, laws and regulations of the state, and to successfully realizing the state budget, the following regulations have been worked out:

1. The Setting Up of Financial Supervisory Organizations.

A financial supervisory department will be set up under the Ministry of Finance. Financial supervisory offices will also be set up under the financial department (bureau) of each province, autonomous region and municipality directly under the central government. A financial supervisory section will be set up under the financial bureau of each prefectural administrative office, city directly under the province and autonomous *zhou*. Under the financial section of each county (city) and autonomous county there will be a sub-section or persons in charge of financial supervision.

The financial departments of the ministries, commissions and departments directly under the State Council and of the provinces, autonomous regions, and municipalities directly under the central government may set up financial supervisory offices or sections or may appoint persons in charge of such work according to the requirements of the work.

Where the required conditions exist, the financial departments may engage financial supervisory correspondents from among the accountants in enterprises, public undertakings and government organizations.

2. The Tasks of the Financial Supervisory Organizations.

The tasks of the financial supervisory organizations are as follows:

a) To supervise and check up on government organizations, public bodies, enterprises and public undertakings in their carrying out of the financial policies, laws and regulations, and to discover existing problems;

b) To supervise and check up on the financial departments and related personnel to see whether

they are abiding by financial policies, laws and regulations, and to discover the existing problems;

c) To take up and investigate cases of disruption of financial regulations and of violations against financial discipline as well as cases in which people suffered from retaliation for having persisted in following financial regulations;

d) To make proposals for the improvement of financial management and administration on the basis of the problems discovered;

e) To conduct education in socialist legality and financial discipline.

3. Leadership Over the Financial Supervisory Organizations.

Administratively, the financial supervisory organizations are under the leadership of the financial departments at their corresponding levels. In professional matters, they are guided by higher financial supervisory organizations. The lower financial supervisory organizations should periodically report their work to the higher financial supervisory organizations. If necessary, they may bypass their immediate leadership and report to the higher authorities. The financial supervisory organizations at a higher level have the right to check up on the work of the financial supervisory organizations at lower levels.

The appointment, dismissal and transfer of the chief responsible personnel of a financial supervisory organization should be reported for the record to the financial department at the next higher level.

4. Rights of the Personnel in Charge of Financial Supervision.

The personnel in charge of financial supervision have the right:

a) To ask the leaders and other persons concerned in the unit under investigation to provide the necessary information and to attend the relevant meetings;

b) To examine the budget and final accounts, and to plan for revenues and expenditures, reports and forms of statistics, account books, original vouchers, and other related records and files of the unit being investigated; and, if necessary, to Xerox or duplicate some of the important material;

c) To check up on the cash, materials and bank deposits of the unit under investigation, and go to the building-sites, workshops and storehouses concerned to investigate;

d) To make investigations and collect materials from units involved in the case;

e) To inquire about any person who is involved in the case and ask him to give an answer on the spot or write down his answer.

When a person in charge of financial supervision performs the above functions, the units under investigation and the people concerned should cooperate voluntarily and give a truthful account of the facts, and should not obstruct the process in any way.

5. The Handling of Cases Under Financial Supervision.

In handling a case it has accepted, the financial supervisory organization concerned should carefully determine the facts and promptly write a report on the result of its investigations. And, according to the specific nature and circumstances of the case, it should make a proposal for its settlement and submit it to the unit under investigation or the department in charge of the unit so as to settle the case. If the case being handled calls for disciplinary action against the offenders, the case should be handed over to the relevant authorities which are in charge of these cadres. If the case is a serious one that calls for punishment by law, it should be handed over to judicial organs to be judged according to law. The financial supervisory organizations should propose to the units concerned the commendation of people who adhere to financial regulations, or provide awards to those who protect state property and dare to combat violations against financial discipline.

The investigation report must be shown to the

unit and persons under investigation to ask for their opinions. If they do not agree with the report they are allowed to state their reasons and to present a written statement, which should be appended to the report.

After a case has been dealt with, the unit under investigation or the department in charge should send a copy of its decisions on the case to the financial supervisory organization concerned. If the latter has differing views regarding the handling of the case, it may present its views to the department which has made decisions on the case or report to the higher authorities.

6. Requirements for Personnel in Charge of Financial Supervision.

a) They must conscientiously study the financial and economic policies, laws and regulations of the state, be knowledgeable about financial affairs and accounting, and love their work;

b) They must closely rely on the masses, intimately cooperate with the relevant departments, combine their own work with supervision by the masses;

c) They must adhere to principle, abide by law and discipline, be unintimidated by the powerful and the influential, be not swayed by personal considerations, and dare to combat all violations against financial discipline;

d) They must seek truth from facts, pay serious attention to evidence and investigation, be scrupulous about every detail and heed the opinion of everyone concerned, including the units and people who are being investigated.

25. THE INCOME TAX LAW OF THE PEOPLE'S REPUBLIC OF CHINA CONCERNING JOINT VENTURES WITH CHINESE AND FOREIGN INVESTMENT

*Adopted on September 10, 1980 by the Fifth National People's Congress of the
People's Republic of China at its Third Session.*

Article 1. Income tax shall be levied in accordance with this Law on the income derived from production, business and other sources by any joint venture with Chinese and foreign investment (hereinafter called joint venture for short) in the People's Republic of China.

Income tax on the income derived from production, business and other sources by branches within or outside the territory of China of such joint ventures shall be paid by their head office.

Article 2. The taxable income of a joint venture shall be the net income in a tax year after deduction of costs, expenses and losses in that year.

Article 3. The income tax rate on joint ventures shall be 30%. In addition, a local surtax of 10% of the assessed income tax shall be levied.

The income tax rate on joint ventures exploiting petroleum, natural gas and other resources shall be stipulated separately.

Article 4. In the case of a foreign participant in a joint venture remitting its share of profit from China, an income tax of 10% shall be levied on the remitted amount.

Article 5. A newly established joint venture scheduled to operate for a period of 10 years or more may, upon approval of the tax authorities for an application filed by the enterprise, be exempted from income tax in the first profit-making year and allowed a 50% reduction in the second and third years.

With the approval of the Ministry of Finance of the People's Republic of China, joint ventures engaged in such low-profit operations as farming and forestry or located in remote, economically underdeveloped outlying areas may be allowed a 15-30% reduction in income tax for a period of 10 years following the expiration of the term for exemptions and reductions mentioned in the preceding paragraph.

Article 6. A participant in a joint venture which reinvests its share of profit in China for a period of not less than five years may, upon approval of the tax authorities for an application filed by the said participant, obtain a refund of

40% of the income tax paid on the reinvested amount. A participant which withdraws its reinvested funds within five years shall pay back the tax amount refunded.

Article 7. Loss incurred in a joint venture in a tax year may be carried over to the next tax year and made up with an equal amount drawn from that year's income. Should the income in the subsequent tax year be insufficient to make up for the said loss, the balance may be made up with further deductions from income year by year over a period not exceeding five years.

Article 8. Income tax on joint ventures shall be levied on an annual basis and paid in quarterly installments. Such provisional payment shall be made within 15 days after the end of each quarter. The final settlement shall be made within 3 months after the end of a tax year. Excess payments shall be refunded by the tax authorities or deficiencies made good by the taxpayer.

Article 9. Joint ventures shall file their provisional income tax returns with the local tax authorities within the period prescribed for provisional payments. The taxpayer shall file its final annual income tax return together with its final accounts within 3 months after the end of the tax year.

Article 10. Income tax levied on joint ventures shall be computed in terms of Renminbi (RMB). Income in foreign currency shall be assessed according to the exchange rate quoted by the State General Administration of Exchange Control of the People's Republic of China and shall be taxed in Renminbi.

Article 11. When joint ventures go into operation or when they change the nature of their business, change their address, close down, and change or transfer registered capital, such joint ventures shall register with the General Administrative Bureau for Industry and Commerce of the People's Republic of China, and within 30 days of such registration, present the relevant certificates to the local tax authorities for tax registration.

Article 12. The tax authorities have the right to investigate the financial affairs, account books

and tax situation of any joint venture. Such joint venture must make reports according to the facts and provide all relevant information and shall not refuse or conceal the facts.

Article 13. A joint venture must pay its tax within the prescribed time limit. In case of failure to pay within the prescribed time limit, the appropriate tax authorities, in addition to setting a new time limit for tax payment, shall surcharge overdue payments at one half of one per cent of the overdue tax for every day in arrears, starting from the first day of default.

Article 14. The tax authorities may, acting at their discretion, impose a penalty on any joint venture which has violated the provisions of Articles 9, 11 and 12 of this Law.

In dealing with any joint venture which has evaded or refused to pay tax, the tax authorities may, in addition to pursuing the tax, impose a penalty of not more than five times the amount of tax underpaid or not paid, according to the seriousness of the offence. Cases of gross violation shall be handled by the local people's courts according to law.

Article 15. In case of disputes with tax authorities about tax payment, joint ventures must pay tax according to the relevant regulations first before applying to higher tax authorities for reconsideration. If they do not accept the decisions made after such reconsideration, they can bring the matter before the local people's courts.

Article 16. Income tax paid by a joint venture or its branch in other countries may be credited against the assessed income tax of the head office as foreign tax credit.

Where agreements on avoidance of double taxation have been concluded between the Government of the People's Republic of China and the government of another country, income tax credits shall be handled in accordance with the provisions of the related agreements.

Article 17. Detailed rules and regulations for the implementation of this Law shall be formulated by the Ministry of Finance of the People's Republic of China.

Article 18. This Law shall come into force from the date of promulgation.

**26. DETAILED RULES AND REGULATIONS FOR THE IMPLEMENTATION
OF THE INCOME TAX LAW OF THE PEOPLE'S REPUBLIC OF CHINA
CONCERNING JOINT VENTURES WITH CHINESE AND FOREIGN INVESTMENT**

*Approved by the State Council on
December 10, 1980*

Article 1. These detailed rules and regulations are formulated in accordance with the provisions of Article 17 of the Income Tax Law of the People's Republic of China concerning Joint Ventures with Chinese and Foreign Investment (hereinafter called Tax Law for short).

Article 2. "Income derived from production and business" mentioned in article 1 of the Tax Law means income from the production and business operations in industry, mining, communications, transportation, agriculture, forestry, animal husbandry, fisheries, poultry farming, commerce, tourism, food and drink, service and other trades.

"Income from other sources" mentioned in Article 1 of the Tax Law covers dividends, bonuses, interest and income from lease or transfer of property, patent right, ownership of trade marks, proprietary technology, copyright, and other sources.

Article 3. "A local surtax of 10 per cent of the assessed income tax" in Article 3 of the Tax Law means a surtax to be computed and levied according to the actual amount of income tax paid by joint ventures.

Reduction or exemption of local surtax on account of special circumstances shall be decided by the people's government of the province, municipality or autonomous region in which the joint venture is located.

Article 4. A foreign participant in a joint venture, who wants to remit its share of profits from China, shall report to the local tax authorities; the remitting agency shall withhold an income tax of 10% from the remittance. No tax shall be levied on that part of its share of profits which is not remitted from China.

Article 5. "The first profit-making year" mentioned in Article 5 of the Tax Law means the year in which a joint venture has begun making profit after its losses in the initial stage of operation have been made up in accordance with the provisions of Article 7 of the Tax Law.

Article 6. A participant in a joint venture, who reinvests its share of profit in this enterprise or in other joint ventures with Chinese and foreign

investment for a period of not less than five years in succession, may receive a refund of 40% of the income tax already paid on the reinvested amount upon the examination and approval of the certificate of the invested enterprise by the tax authorities to which the tax was paid.

Article 7. The tax year for joint ventures starts from January 1 and ends on December 31 on the Gregorian calendar.

Article 8. The amount of taxable income shall be computed by the following formulae:

1. Industry:

A. Cost of production of the year is equal to direct material used in production of the year plus direct wages plus manufacturing expenses.

B. Cost of production of the year is equal to inventory of semi-finished product at the beginning of the year and in-production product plus cost of production of the year minus inventory of semi-finished product at the end of the year and in-production product.

C. Cost of sale of product is equal to cost of product of the year plus inventory of product at the beginning of the year minus inventory of product at the end of the year.

D. Net volume of sale of product is equal to total volume of sale of product minus (sales returns plus sales allowance).

E. Profit from sale of product is equal to net volume of sale of product minus taxes on sales minus cost of sale of product minus (selling expenses plus administrative expenses).

F. Amount of taxable income is equal to profit from sale of product plus profit from other operations plus non-operating income minus non-operating expenditure.

2. Commerce:

A. Net volume of sale is equal to total volume of sale minus (sales returns plus sales allowance).

B. Cost of sales is equal to inventory of merchandise at the beginning of the year plus [purchase of the year minus (purchase returns plus purchase discount) plus purchase expenses] minus inventory of merchandise at the end of the year.

C. Sale profit is equal to net volume of sale minus sale tax minus cost of sales minus (selling expenses plus overhead expenses).

D. Amount of taxable income is equal to sale profit plus profit from other operations plus non-operating income minus non-operating expenditure.

3. Service trades:

A. Net business income is equal to gross business income minus [business tax plus operating expenses plus overhead expenses].

B. Amount of taxable income is equal to net business income plus non-operating income minus non-operating expenditure.

4. Other lines of operation:

For other lines of operations, refer to the above-mentioned formulae for calculation.

Article 9. The following items shall not be counted as cost, expense or loss in computing the amount of taxable income:

1. Expenditure on the purchase or construction of machinery, equipment, buildings, facilities and other fixed assets;

2. Expenditure on the purchase of intangible assets;

3. Interest on capital;

4. Income tax payment and local surtax payment;

5. Penalty for illegal operations and losses in the form of confiscated property;

6. Overdue tax payment and tax penalty;

7. Losses from windstorms, floods and fire risks covered by insurance indemnity;

8. Donations and contributions other than those for public welfare and relief purposes;

9. That part of the entertainment expenses for operating purposes above the quota of three per thousand of the total sale income in the tax year or above the quota of ten per thousand of the total operational income and those entertainment expenses that are not relevant to production and operation.

Article 10. Depreciation of fixed assets in use shall be calculated on an annual basis. Fixed assets of joint ventures cover houses, buildings, machinery and other mechanical apparatus, means of transport and other equipment for the purpose of production with useful life of more than one year. But items with a per-unit value of less than 500 yuan and a short useful life can be itemized as expenses according to the actual number in use.

Article 11. Fixed assets shall be assessed according to the original price.

For fixed assets used as investment, the original price shall be the price agreed upon by the participants at the time of investment.

For purchased fixed assets, the original price shall be the purchase price plus transport fees,

installation expenses and other related expenses incurred before they are put to use.

For self-made and self-built fixed assets, the original price shall be the actual expenditures incurred in the course of manufacture or construction.

Article 12. In depreciating fixed assets, the residual value shall be assessed first and deducted from the original price, the principle being making the residual value at 10% of the original price; those requiring to retain a little or no residual value, shall be submitted for approval to the local tax authorities.

The depreciation of fixed assets shall generally be computed in average by the method of straight line.

Article 13. The useful life for computing depreciation of fixed assets is as follows:

1. The minimum useful life for houses and buildings is 20 years;

2. The minimum useful life for trains, ships, machines and equipment and other facilities for the purpose of production is 10 years;

3. The minimum useful life for electronic equipment and means of transport other than trains and ships is 5 years.

For cases where the fixed assets of joint ventures, owing to special reasons, need to accelerate depreciation or where methods of depreciation need to be modified, applications shall be submitted by the said ventures to the local tax authorities for examination and then relayed level by level to the Ministry of Finance of the People's Republic of China for approval.

Article 14. Expenditures arising from the increase of value of fixed assets in use as a result of technical reform shall not be listed as expense.

The fixed assets continuing in use after full depreciation shall no longer be depreciated.

Article 15. The balance of the gain of joint ventures derived from sale of fixed assets at the current price after the net sum of non-depreciated assets or the residual value is deducted shall enter the year's loss and gain account.

Article 16. Intangible assets such as technical know-how, patent right, ownership of trade marks, copyright, ownership of sites and other royalties used as investment shall be assessed by amortization according to the sums provided in the agreements or contracts from the year they begin in use; for the intangible assets that are bought in at a fixed price, the actual payment shall be assessed from the year they are put in use.

The above-mentioned intangible assets with provision of time limit for use, shall be assessed by amortization according to the provision of time limit for use; those without the provision shall be assessed by amortization in ten years.

Article 17. Expenses arising during the period of preparation for a joint venture shall be amortized after it goes into production or business, with the amount of amortization not exceeding 20% each year.

Article 18. Inventory of merchandise, raw materials, in-production products, semi-finished products, finished products and by-products shall be computed according to the cost price. For the method of computation, the joint ventures may choose one of the following: First-in first-out, shifting average and weighted average. In those cases where a change in the method of computation is necessary, it shall be submitted for approval to the local tax authorities.

Article 19. Income tax to be paid in quarterly installments as prescribed in Article 8 of the Tax Law may be computed as one-fourth of the planned annual profit or the actual income in the preceding year.

Article 20. Joint ventures shall file their income tax returns and their final accounting statements with the local tax authorities within the prescribed period irrespective of profit or loss in the tax year and send the reports on auditing by the chartered public accountants registered in the People's Republic of China.

The accounting statements submitted by branches of joint ventures within China to their head offices shall be submitted to the local tax authorities at the same time for reference.

Article 21. Joint ventures shall file tax returns within the time limit set by the Tax Law. In case of failure to submit the tax returns within the prescribed time limit owing to special circumstances, application should be submitted in the said time limit, and the time limit may be appropriately extended upon the approval of the local tax authorities.

The final day of the time limit for tax payment and filing tax returns may be extended if it falls upon an official holiday.

Article 22. Income of joint ventures in foreign currency shall be assessed according to the exchange rate quoted by the State General Administration of Exchange Control on the day when the tax payment certificates are made out and

shall be taxed in Renminbi.

Article 23. The accounting on the accrual basis shall be practised for revenue and expenditure of joint ventures. All accounting records shall be accurate and perfect and shall have lawful vouchers as the basis for entry account.

Article 24. The method of finance and accounting of joint ventures shall be submitted to local tax authorities for reference.

When the method of finance and accounting of joint ventures contradicts the provisions of the Tax Law, tax payments shall be computed according to the provisions of the Tax Law.

Article 25. Vouchers for accounting, accounting books and reports used for joint ventures shall be recorded in the Chinese language or in both Chinese and foreign language.

Accounting vouchers, accounting books and reports shall be kept for at least 15 years.

Article 26. Sales invoices and business receipts shall be submitted for approval to the local tax authorities before they are used.

Article 27. Officials sent by tax authorities shall produce identification cards when investigating the financial affairs, accounting books and tax situation of a joint venture and undertake to keep secret.

Article 28. Tax authorities may impose a penalty of not more than 5,000 yuan on a joint venture which has violated the provisions of Articles 9, 11 and 12 of the Tax Law according to the seriousness of the case.

Article 29. Tax authorities may impose a penalty of not more than 5,000 yuan on a joint venture which has violated the provisions of Paragraph 2 of Article 25, and Article 26 of these detailed rules and regulations.

Article 30. Tax authorities shall serve notices on cases involving penalty in accordance with the relevant provisions of the Tax Law and these detailed rules and regulations.

Article 31. When a joint venture applies for reconsideration in accordance with the provisions of Article 15 of the Tax Law, the tax authorities concerned are required to make decisions within three months after receiving the application.

Article 32. Income tax paid abroad by joint ventures or its branches on their income earned

outside China may be credited against the amount of income tax to be paid by their head offices upon presenting the foreign tax payment certificate. But the credit amount shall not exceed the payable tax on the income abroad computed according to the tax rate prescribed by China's Tax Law.

Article 33. Income tax returns and tax payment certificates used by joint ventures are to be printed by the General Tax Bureau of the Ministry of Finance of the People's Republic of China.

Article 34. The right of interpreting the provisions of these detailed rules and regulations resides in the Ministry of Finance of the People's Republic of China.

Article 35. These detailed rules and regulations come into force on the same date as the publication and enforcement of the "Income Tax Law of the People's Republic of China Concerning Joint Ventures with Chinese and Foreign Investment."

27. INDIVIDUAL INCOME TAX LAW OF THE PEOPLE'S REPUBLIC OF CHINA

Adopted by the Fifth National People's Congress of the People's Republic of China at its Third Session on September 10, 1980

Article 1. An individual income tax shall be levied in accordance with the provisions of this Law on the incomes gained within or outside China by any individual residing for one year or more in the People's Republic of China.

For individuals not residing in the People's Republic of China or individuals residing in China less than one year, individual income tax shall be levied only on that income gained within China.

Article 2. Individual income tax shall be levied on the following categories of income:

1. Wages and salaries;
2. Remuneration for personal services;
3. Royalties;
4. Interest, dividends and bonuses;
5. Income from lease of property; and
6. Other kinds of income specified as taxable by the Ministry of Finance of the People's Republic of China.

Article 3. Individual income tax rates:

1. Income from wages and salaries in excess of specific amounts shall be taxed at progressive rates ranging from 5% to 45% (see appended tax rate table).
2. Income from remuneration for personal services, royalties, interest, dividends, bonuses and lease of property, and other kinds of income shall be taxed at a flat rate of 20%.

Article 4. The following categories of income shall be exempted from individual income tax:

1. Prizes and awards for scientific, technological or cultural achievements;
2. Interest on savings deposits in the state banks and credit co-operatives of the People's Republic of China;
3. Welfare benefits, survivors' pensions and relief payments;
4. Insurance indemnities;
5. Military severance pay, decommission or demobilization pay for cadres and fighters of the armed forces;
6. Severance pay or retirement pay for cadres, staff members and workers;
7. Salaries of diplomatic officials of foreign embassies and consulates in China;
8. Tax-free incomes as stipulated in international conventions to which China is a party or as stipulated in agreements China has signed;
9. Incomes approved as tax-free by the Ministry of Finance of the People's Republic of China.

Article 5. The amount of taxable income shall be computed as follows:

1. For income from wages or salaries, a monthly deduction of 800 yuan shall be allowed; that part in excess of 800 yuan shall be taxed.
2. For income from remuneration for personal services, royalties or lease of property, a deduction of 800 yuan shall be allowed for expenses if the amount in a single payment is less than 4,000 yuan; for single payments in excess of 4,000 yuan a deduction of 20% shall be allowed. The balance remaining after deduction shall be taxed.
3. Interest, dividends, bonuses or other kinds of income shall be taxed on the full amount received in each payment.

Article 6. For individual income tax, the income earner shall be the taxpayer and the paying unit shall be the withholding agent. Taxpayers not covered by withholding are required personally to file declarations of their income and pay tax themselves.

Article 7. Taxes withheld each month by a withholding agent and those to be paid each month by taxpayers filing personal returns shall be turned in to the state treasury and the tax return submitted to the tax authorities within the first seven days of the following month.

Any taxpayer who earns income outside China shall pay the tax due to the state treasury and submit a tax return to the tax authorities within 30 days of the end of each year.

Article 8. All incomes shall be computed in terms of Renminbi (RMB). Income in foreign currency shall be assessed according to the exchange rate quoted by the State General Administration of Exchange Control of the People's Republic of China, and shall be taxed in Renminbi.

Article 9. The tax authorities have the right to conduct investigations concerning the payment of tax. Withholding agents and taxpayers filing personal returns must report according to the facts and provide all relevant information and shall not refute or conceal the facts.

Article 10. A commission of 1% of the tax amount withheld shall be paid to the withholding agents.

Article 11. A withholding agent or a taxpayer filing personal returns must pay the tax due within the prescribed time limits. In case of failure to pay within the prescribed time limits, the appropriate tax authorities, in addition to setting a new time limit for tax payment, shall surcharge overdue payments at one half of 1% of the overdue tax for every day in arrears, starting from the first day of default.

Article 12. The tax authorities may, acting at their discretion, impose a penalty on a withholding agent or on a taxpayer filing personal returns who has violated the provisions of Article 9 of this Law.

In dealing with those who have concealed income or evaded or refused to pay tax, the tax authorities may, in addition to pursuing the tax, impose a penalty not more than five times the amount of tax underpaid or not paid, according to the seriousness of the offence. Cases of gross violation shall be handled by the local people's courts according to law.

Article 13. In case of disputes with the tax authorities on the payment of taxes, the withholding agent or taxpayer filing personal returns must pay taxes according to the relevant regulations first before applying to higher tax authorities for reconsideration. If they do not accept the decisions made after such reconsideration, they can bring the matter before the local people's courts.

Article 14. Detailed rules and regulations for the implementation of this Law shall be formu-

lated by the Ministry of Finance of the People's Republic of China.

Article 15. This law shall come into force from the date of promulgation.

Individual Income Tax Rates
(Applicable to wages and salaries)

Grade	Range of Income	Tax Rate (%)
1	Monthly income of 800 yuan and less	Exempt
2	That part of monthly income from 801 yuan to 1,500 yuan	5
3	That part of monthly income from 1,501 yuan to 3,000 yuan	10
4	That part of monthly income from 3,001 yuan to 6,000 yuan	20
5	That part of monthly income from 6,001 yuan to 9,000 yuan	30
6	That part of monthly income from 9,001 yuan to 12,000 yuan	40
7	That part of monthly income above 12,001 yuan	45

28. DETAILED RULES AND REGULATIONS FOR THE IMPLEMENTATION OF THE INDIVIDUAL INCOME TAX LAW OF THE PEOPLE'S REPUBLIC OF CHINA

*Approved by State Council
(December 10, 1980)*

Article 1. These detailed rules and regulations are drawn up in accordance with the provisions of Article 14 of the Individual Income Tax Law of the People's Republic of China (hereinafter called Tax Law for short).

Article 2. "Any individual residing for one year or more in the People's Republic of China" mentioned in Article 1 of the Tax Law means any individual who resides in China for a full 365 days within a tax year. No subtractions shall be made of the number of days of temporary absence from Chinese territory within the tax year.

A tax year starts from January 1 and ends on December 31 on the Gregorian calendar.

Article 3. Individuals residing in the People's Republic of China for one year or more but less than five years shall pay tax only on that part of their income gained abroad which is remitted to China; individuals whose period of residence in China exceeds five years shall pay tax on all their income gained outside China beginning from the sixth year of residence.

Article 4. The range of the various categories of income mentioned in Article 2 of the Tax Law is as follows:

a) "Wages and salaries" means wages, salaries, bonuses and year-end extras gained from work in offices, organizations, schools, enterprises, undertakings and other units.

Bonuses mentioned in the preceding paragraph do not include prizes and awards for scientific, technological or cultural achievements.

b) "Compensation for personal services" means earnings from personal services in designing, installation, drafting, medical treatment, practising law, accounting, consultation, lecturing, news reporting radio and television broadcasting, contributions to publications, translation, calligraphy and painting, sculpture, cinema, drama and opera, music, dancing, acrobatics, ballad singing and comic talk, sports and technical services.

c) "Royalties" means income from the provision and transfer of patent right, copyright, the right to use proprietary technology and other rights.

d) "Interest, dividends and bonuses" means interest on deposits, loans and various kinds of

securities and dividends and bonuses from investments.

e) "Income from lease of property" means income from lease of houses, warehouses, machinery and equipment, motor vehicles and boats, and other kinds of property.

f) "Other kinds of income" means income specified as taxable by the Ministry of Finance of the People's Republic of China other than that provided in the preceding items.

Article 5. The following categories of income from sources in China, regardless of whether the place of payment is in China or not, shall be taxed according to the Tax Law:

a) Individual income from work and compensation for services within China. But, for individuals whose period of residence in China does not exceed 90 days, the above compensation paid by employers outside China shall be exempted from taxation.

b) Dividends and bonuses gained by any individual within China. But dividends and bonuses derived from joint ventures and from urban and rural cooperative organizations shall be exempted from taxation.

c) Remuneration for staff members sent to work abroad by governmental offices at all levels of the People's Republic of China.

d) Royalties and interest derived by any individual within China and income from lease of property within China as well as other kinds of income specified as taxable by the Ministry of Finance of the People's Republic of China.

Article 6. For a taxpayer, who has two or more categories of taxable income as provided in Article 2 of the Tax Law, income tax shall be computed and levied separately.

Article 7. If a taxpayer's taxable income is paid in kind or in marketable securities, that part of the income thus paid shall be computed in terms of money according to the market price at the time of its acquirement.

Article 8. "Prizes and awards for scientific, technological or cultural achievements" mentioned in item 1, Article 4, of the Tax Law mean prizes and awards given to individuals by the Chinese

Government or Chinese or foreign scientific, technological or cultural organizations for inventions or creations in the fields of science, technology and culture.

Article 9. "Interest on savings deposits in the state banks and credit cooperatives of the People's Republic of China" mentioned in Item 2, Article 4, of the Tax Law includes interest on savings deposits in Renminbi and foreign currency and interest on savings deposit in other banks entrusted by the state banks.

Dividends in investments by individuals in local construction (investment) companies in China, which pay no bonuses and whose dividends are not higher than the interest on savings deposits in state banks and credit cooperatives, are also exempt from tax.

Article 10. "Salaries of diplomatic officials of foreign embassies and consulates in China" mentioned in Item 7, Article 4, refer to salaries of diplomats in foreign embassies, consuls and other persons enjoying the same treatment as diplomats.

Tax exemption for salaries earned by other persons in foreign embassies and consulates in China shall be kept at the same level as the tax exemption for persons of similar status in Chinese embassies and consulates granted by the relevant countries.

Article 11. Compensation for personal services, royalties and income from lease of property gained in China by individuals not residing in China shall be taxed on the full amount received in such payment.

Article 12. "Income from compensation for personal services, royalties or lease of property" "in a single payment" mentioned in Article 5 of the Tax Law means income gained on one single occasion or income from performance of only one piece of task of matter, and the amount so paid is counted as a single payment. For succeeding income from the same item that cannot be obviously divided into separate payments, such income received within a month is combined and counted as a single payment.

Article 13. For the same item of income gained by two or more persons in collaboration, deduction for expenses, if eligible according to the Tax Law, may be made from each share separately.

Article 14. The withholding agents in making various kinds of taxable payment shall withhold the taxes according to the Tax Law, turn them in

to the state treasury in time and put them in itemized records for future reference.

The various kinds of taxable payment referred to in the preceding paragraph includes payment in cash, payment by remittance, payment by the transfer of accounts and payment in marketable securities or in kind, the value of which is computed in terms of money.

Article 15. Withholding agents and taxpayers filing personal returns shall submit tax returns within the time limit prescribed by the Tax Law. In cases of failure to submit the returns within the prescribed time limit on account of special circumstances, applications for extension shall be submitted within the prescribed time limit for approval to the local tax authorities.

The final day for tax payment and submission of tax returns may be extended if it falls upon an official holiday.

Article 16. For individuals residing in China for one year or more, the income gained outside China shall be computed and taxed separately from the taxable income earned within China. The amount of taxable income shall be computed after deducting expenses for different categories as provided in Article 5 of the Tax Law.

Income tax paid by taxpayers outside China for income earned abroad may be credited against the amount of income tax computed according to the tax rate prescribed by the Tax Law of China through applications by presenting tax payment certificate.

Article 17. Individual income in foreign currency shall be assessed according to the exchange rate quoted by the State General Administration of Exchange Control on the day when the tax payment certificate is made out and shall be taxed in Renminbi.

Article 18. Individuals liable to the tax in China who desire to leave the country are required to pay off the tax to the local tax authorities seven days before departure from China and only then can they go through exit formalities.

Article 19. In conducting investigations concerning the payment of tax by withholding agents or taxpayers filing personal returns, the tax officials sent by tax authorities are required to produce identification cards and undertake to keep secret.

Article 20. For the commission of 1% of the tax amount paid to the withholding agents provided in Article 10 of the Tax Law, the local tax authorities shall make out refund notice for

the withholding agents on the monthly basis in accordance with the actual amount of tax withheld and the withholding agents may go through refunding formalities at the designated banks.

Article 21. A withholding agent or taxpayer filing personal returns who has violated the provisions of Article 9 of the Tax Law shall be penalized 500 yuan or less by the tax authorities according to the seriousness of the case.

Article 22. A withholding agent or a taxpayer filing personal returns who has violated the provisions of Article 14 and 15 of these detailed rules and regulations shall be penalized 500 yuan or less by the tax authorities.

Article 23. The tax authorities shall serve notices on cases involving penalty in accordance with the relevant provisions of the Tax Law and these detailed rules and regulations.

Article 24. For cases of applying for reconsideration by a withholding agent or a taxpayer filing personal returns according to the provisions of Article 13 of the Tax Law the tax authorities concerned are required to make decisions within three months after the application is received.

Article 25. Tax returns and tax payment certificates for individual income tax are to be printed by the General Tax Bureau of the Ministry of Finance of the People's Republic of China.

Article 26. The right of explanation of the present detailed rules and regulations resides in the Ministry of Finance of the People's Republic of China.

Article 27. These detailed rules and regulations come into force on the same date as the publication and enforcement of the "Individual Income Tax Law of the People's Republic of China."

29. CIRCULAR ON IMPROVING THE PAYMENT OF INDUSTRIAL AND COMMERCIAL INCOME TAX BY COOPERATIVE STORES AND INDIVIDUAL ECONOMIC UNITS

*Promulgated by the Ministry of Finance
(October 9, 1980)*

The existing regulations concerning the levying of income tax on cooperative stores and individual economic units were ratified by the State Council in 1963 for trial implementation. A 9-grade progressive tax rate is imposed upon cooperative stores on their income over and above a specified limit, and a 14-grade one on the gross income of individual economic units. It is also stipulated that a higher tax rate applies to those whose yearly income has exceeded the specified figure. In 1979, the Ministry of Finance abolished the stipulation of imposing a higher income tax rate on cooperative stores whose yearly income has surpassed the specified sum. At the same time, it made it clear that the provinces, municipalities and autonomous regions may allow those stores with difficulties tax reductions or exemptions, provided that they do not pay less tax than the handicraft cooperatives. But no changes have been made with regard to the above-mentioned 9-grade progressive tax, the 14-grade one and the higher tax rate for individual economic units.

At present, the government encourages the development of the collective economy and permits individual economy to expand to a certain extent, so as to promote economic prosperity, enliven the market and create more work opportunities for young people awaiting jobs in cities and towns. Certain departments in charge and local governments, however, have reported that the tax burdens of cooperative stores are still too heavy. Although the stores are no longer required to pay according to a higher tax rate when their yearly income exceeds the specified figure, they are still encountering difficulties in operation. Therefore, the departments and local governments demanded that the 8-grade progressive tax rate that is imposed on incomes in excess of the specified limit of collectively owned handicraft industry be applied to these stores. For individual economic units, they proposed to abrogate the stipulation of collecting a higher rate of tax from them if their annual income is more than the

specified sum, and to lower their tax rate.

To appropriately lighten the income tax burden of cooperative stores and individual economic units, the Ministry of Finance, upon approval of the State Council, has decided to take the following interim measures before a new income tax law is enacted:

1. Starting on October 1, 1980, income tax will be levied on cooperative stores in cities, towns and the countryside according to the 8-grade progressive tax rate which has been imposed on the income of the collectively owned handicraft industry in excess of the specified limit. The provinces, municipalities and autonomous regions should act according to the spirit of this regulation and make proper arrangements for implementation in the light of their local conditions.

2. To those cooperative stores engaged in catering, services and repair trades which still have difficulties after the aforesaid 8-grade progressive tax rate has applied to them, the provinces, municipalities and autonomous regions may, after examining their cases, allow appropriate tax reductions.

3. The 14-grade progressive taxation on gross income and the current practice of collecting income tax at a higher rate from those units whose yearly income has surpassed the specified limit may not be applied to individual economic units for the time being. The provinces, municipalities and autonomous regions may, with local conditions in mind, determine the actual standard of the tax burden of these units according to the principle that it will correspond to the 8-grade progressive tax rate that has been imposed on the income of handicrafts industry. Regulations concerning the management and collection of taxes shall likewise be formulated for implementation by the various localities.

30. PROVISIONAL REGULATIONS ON PROVIDING LOANS FOR CAPITAL CONSTRUCTION PROJECTS

*Approved for Transmission by the State Council
(August 28, 1979)*

For the purpose of speeding up socialist modernization, upgrading the financial management of capital construction and making the most of the investment capital, provisional regulations are hereby issued to provide loans for some capital construction projects.

Chapter I. The Lending Institution

Article 1. The institution authorized to grant loans for capital construction projects is the People's Construction Bank of China (hereinafter called the Construction Bank).

Chapter II. The Eligible Borrowers and the Purposes For Which the Loans Are to be Used

Article 2. The Construction Bank shall grant loans for investment capital to enterprises engaged in industry, transport, land reclamation, animal husbandry, marine products, commerce, tourism, etc. who have instituted an independent accounting system and are able to repay the loans.

Investment capital required by government organizations and non-profit institutions and for construction projects specified in the state plans shall be allocated by the Ministry of Finance.

Article 3. The borrower must be an independent entity who assumes economic responsibility for production. Where loans are to be used for renovations or extension of existing plants, it is the responsibility of the existing enterprise to apply for and repay the loans; in case of establishing a new enterprise, it is the responsibility of the preparatory organ who will be in charge of production after the project is in operation. If the borrower has been incorporated into a specialized or regional enterprise, it is the responsibility of that specialized or regional enterprise.

Chapter III. Prerequisites for Borrowing

Article 4. Before a project is financed by the Construction Bank, the borrower shall submit a target plan duly approved by the competent authorities and a preliminary design of the project that has been included in the state plans for capital

construction for the current year.

The planning commissions at all levels and the departments in charge must invite the Construction Bank to join them in examining and approving the target plan for the project and in deciding on the current-year plan for capital construction. The capital construction commissions at all levels and the departments in charge must do likewise when examining and approving the preliminary design of the project.

When approved, a copy each of the target plan, the preliminary design and the current-year plan for capital construction shall be provided to the head office of the Construction Bank or its branch, whichever is involved in the financing.

Article 5. The projects must meet the following conditions before they are financed:

1) The production technique is up to standard and the products in good demand;

2) Factors of production such as raw materials, fuel, power, water supply, transport are in place and ready to be used;

3) An acceptable estimate of the time it takes to generate enough returns to pay for the investment, and an assurance that repayment of the loan will be made when due;

4) The construction site, equipment, materials and construction manpower have been duly arranged.

Chapter IV. Application, Examination and Approval of the Loan

Article 6. After the approval of the target plan, the borrower may submit a preliminary application to the Construction Bank who shall, if agreeable, sign an agreement with the borrower. Funds needed for the preparatory stage before the start of the project may be borrowed from the Construction Bank, if the department in charge stands surety for the borrower.

Article 7. After the preliminary design is approved, the borrower will ask the department in charge to include the project in the current-year plan for capital construction and simultaneously submit a formal application to the Construction Bank with supportive documents such as an estimate of the total cost for the preliminary

design duly approved by the authorities higher up, a yearly construction plan and an agreement signed with other enterprises to work in cooperation during the construction of the project. When the documents are found in order, the Construction Bank shall sign a loan contract with the borrower.

Article 8. The loan contract shall set forth the term of the loan, the total loan amount, interest rate and the purposes for which the loan is granted. The contract shall also include yearly plans for the drawdown and repayment. The contract specifies the responsibilities of both parties: the borrower undertakes to use the loan for the purposes as stated in the contract, to make repayment when due and the Construction Bank undertakes to provide loanable funds according to the progress of the project.

The contract is legally binding on both parties. Either party in a breach of the contract shall indemnify the other party for the losses incurred.

Article 9. For the project in progress for which a loan contract has been signed, the planning commissions at all levels and the departments in charge shall guarantee the continuity in construction in the subsequent years so that the project will be completed on time or ahead of schedule. The materials and equipment needed for construction shall be provided by the departments in charge of supplies.

Article 10. The Construction Bank may provide loans to finance small-size projects that do not take long to construct with all factors of production in place and ready for use, that will turn out products in urgent demand, and that will yield quick returns and larger profits. Such loans are to be provided within the Bank's quota of freely disposable loanable funds.

Chapter V. Drawdown and Supervision of the Loan

Article 11. According to the progress of the project, the borrower shall make out an annual drawdown plan up to the total amount of the loan and present it to the Construction Bank who shall, if agreeable, provide the funds according to the plan.

If the amount that needs to be drawn out in any one year exceeds the amount listed in the annual drawdown plan, the matter is to be settled between the Bank and the borrower. In case the total drawdown exceeds the total loan amount but

comes within the estimate of the total cost of the project, a supplementary loan contract may be signed. For drawings in excess of the said estimate, consent must be obtained from the departments who have respectively approved the preliminary design and the target plan for the project.

Article 12. The Construction Bank shall supervise the performance of the borrower and oversee how the loan is being utilized. Upon discovering that the borrower has diverted funds to unauthorized construction work, to aimless purchases of materials and equipment or has violated financial regulations, the Construction Bank shall give warnings and demand such misbehaviour be corrected within a specific period of time. If not heeded, the Bank has the right to suspend the loan before maturity and report to authorities higher up.

The borrower shall provide financial statements and statistics to the Construction Bank. The Bank should be given access to materials it needs for examination.

Chapter VI. Repayment of the Loan

Article 13. The borrower must repay the loan plus interest on maturity as set out in the loan contract.

The term of the loan is to be counted from the date of the loan contract to the date of full repayment. For enterprises in heavy industry, it shall not be longer than 15 years; for others no longer than 10 years, except those referred to in Article 10 for which the term shall not exceed 5 years. The term of the loan is to be determined according to the specific case and set out in the loan contract.

Article 14. Interest shall be charged on an annual basis as from the date of the drawdown. Normally, the interest rate is 3% per annum. The specific rate is to be determined by the borrower's line of trade, its importance in the development of the national economy and according to the government economic policies.

Where the loan is not fully repaid on maturity, interest rate on the overdue loan shall be charged at double the rate. In case the loan is diverted to unauthorized projects, interest rate on the diverted portion shall be tripled.

Article 15. Sources of funds for repayment: During the period of repayment, newly established enterprises may repay the principal and interest out of the depreciation reserves for fixed assets, charges payable to the government for the

use of the fixed assets and profits to be turned over to the government after the project is in operation. This shall also apply to existing enterprises that have borrowed from the Bank for renovations or extension of existing plants provided that they have instituted an accounting scheme to assess the economic gains from the borrowings. If not, they must repay out of profits to be turned over to the government corresponding to the proportion of the new fixed assets to the entire fixed assets as well as out of the depreciation reserves for the new fixed assets and charges payable to the government for the use of the new fixed assets.

For enterprises that have difficulty in repaying the loan out of the above-mentioned funds because of heavy tax and low profits, the industrial-commercial tax may be exempted during the period of repayment, if recommended by the provincial internal revenue department and approved by the Ministry of Finance.

Prior to the completion of the project, interest may be paid out of the loan and the portion so used shall be free of interest.

Borrowers that have completed construction on time or ahead of schedule and are thus able to repay the loan before maturity may use the funds set aside for repayment to expand production and improve the welfare of their workers and staff. In case borrowers fail to make repayment when due, they shall repay out of funds earmarked for making technological innovations or from capital

accounts. They are not permitted to make repayment by way of including the loan in the cost of products or out of profits previously accumulated.

Chapter VII. Supplementary Regulations

Article 16. Where a dispute over the implementation of the loan contract cannot be settled between the borrower and the Bank, the case shall be submitted to an economic court for arbitration. If the court has not been established, the matter shall be dealt with by the Capital Construction Commission in their locality.

Article 17. The present regulations are applicable to state-owned enterprises. Loans to collectively owned enterprises may be handled on the principle of these regulations.

Article 18. The head office of the Construction Bank shall formulate and make public detailed rules for implementing these Provisional Regulations.

Article 19. Loans granted by the Construction Bank before these regulations become effective shall continue to be handled according to the provisions previously issued.

Article 20. The present regulations shall come into force on the date of issue.

31. PROVISIONAL REGULATIONS ON GRANTING LOANS TO AND OPENING ACCOUNTS BY THE UNEMPLOYED YOUTH IN CITIES AND TOWNS FOR SETTING UP ENTERPRISES OF COLLECTIVE OWNERSHIP

*Issued by the People's Bank of China
(October 12, 1979)*

1. Enterprises of collective ownership that are in operation with the approval of the competent authorities at a level not lower than the county or district (part of city) under licences issued by the Administration of Industry and Commerce, that have a certain amount of working capital, that have instituted an independent accounting system and are responsible for their own profits and losses may open accounts with the People's Bank of China (hereinafter called "the Bank").

2. Industrial enterprises of collective ownership who have opened accounts with the Bank, and met the requirements mentioned in (1) above, and provided their products are of fine quality, in good demand and profit-yielding may apply for industrial loans to cover shortage of working capital to pay for the concentrated arrival of raw materials they ordered. The Bank shall extend credit facilities to such enterprises consistent with the regulations for granting loans to collective industrial enterprises in cities and towns.

Enterprises that need to buy machines and equipment to expand production or upgrade the quality of products may apply for loans for purchasing equipment, provided that their investments will bring economic returns and the borrowers are able to repay the loans when due. The Bank shall extend support to such enterprises consistent with the regulations for granting loans to collective industrial enterprises in cities and towns for buying equipment.

3. Commercial enterprises of collective ownership that have opened accounts with the Bank and met the requirements mentioned in (1) above may apply for marketing loans to cover a temporary shortage of funds to stock up for the busy seasons, festivals or for urgent needs. The accounts to be opened thereunder should be kept separate from the deposit accounts they have opened, i.e., transactions of loans and deposits should be passed to the respective loan and deposit accounts.

No loans will be granted by the Bank to commercial enterprises of collective ownership who are subsidiaries of the state commercial enterprises, or who act as sales/purchase agents of the supply and marketing cooperatives, or who have obtained from them initial capital to launch themselves.

4. Collectively owned enterprises engaged in catering, services and repairs who have opened accounts with the Bank and met the requirements mentioned in (1) above, may obtain funds from the Bank to finance the purchases of raw materials they need. In addition, the Bank may provide a temporary credit facility, but for once only, to finance the purchases of simple equipment and tools vital to their business operations. Applications for such loans should be submitted by the enterprises with the departments in charge standing surety for them. The term of the loan is to be determined by the specific circumstances but no longer than two years. Repayment is to be made by installments.

5. To provide funds for production and business operations, the enterprises mentioned in (2), (3) and (4) above should improve their business management, make a sound distribution of profits and have an increasing accumulation of surplus. The surplus should be set aside first to repay the loans and replenish their working capital.

6. Collectively owned enterprises failing to meet the requirements mentioned in (1) above, must have their accounts opened en bloc with the Bank in the name of the street administrative office, neighbourhood committee or the business entity with which the enterprises are affiliated. Generally, no loans are to be granted to them.

7. The Bank may provide loans to cooperative shops not only to stock up for the busy seasons or festivals but to cover temporary shortage of funds to keep the shops stocked in order to increase sales.

The Bank and its branches shall give active support to and exercise strict supervision over the collectively owned enterprises run by the unemployed youth in cities and towns. In providing loans, the Bank should stick to the principle of "three assessments" (i.e. to assess the creditworthiness of the borrowers, to assess their applications for loans and to assess the effectiveness of the loans after they are granted); the term of the loan must be set and repayment made when due, so as to ensure the healthy development of the enterprises.

No credit will be granted to those enterprises that operate at a loss. Interest for the loans is to be charged at the prevailing rates for industrial/commercial loans.

The Bank's branches in the provinces, cities and autonomous regions may grant loans within the quotas allocated to them for industrial/commercial loans.

32. PROVISIONAL REGULATIONS ON PROVIDING SPECIAL SHORT- AND MEDIUM-TERM LOANS FOR THE LIGHT AND TEXTILE INDUSTRIES BY THE PEOPLE'S BANK OF CHINA

(January 14, 1980)

For the purpose of carrying out the policy of "readjustment, restructuring, consolidation and improvement" and taking special measures to boost the light and textile industries so as to meet market demands at home and abroad, provisional regulations are hereby issued for the People's Bank of China and the Bank of China to provide special short- and medium-term loans and foreign-currency loans in the form of buyers' credits to the light and textile industries.

Chapter I. Eligible Borrowers and the Purposes for Which Loans Are to be Used

Article 1. Loans are to be granted to state-owned and collectively owned enterprises in the light and textile industries (including specialized companies responsible for their own profits and losses). The loans are to be used primarily for the purposes of tapping production potential (including raw material potential), making technological innovations and launching small-scale construction and renovation projects related to such purposes.

Article 2. No loans shall be granted for construction of new factories or for extension of existing factories.

Chapter II. Prerequisites for Borrowing

Article 3. Applicants must meet the following requirements:

a) They must be able to generate quick returns, more profits and more foreign exchange earnings in proportion to the money borrowed.

b) They must have the necessary materials, equipment, design and construction manpower in place and ready to be used for the project undertaken, and must be assured of the availability of raw materials, power and labour force once the project is in operation. They must be able to find markets to sell their products.

c) Their production techniques must be up to standard.

d) They must promise economic yields and must be able to repay the loan with operating profits when due.

e) They must be able to take effective measures to prevent environmental pollution.

Chapter III. Term and Repayment of Loans

Article 4. A loan is normally available for one to two years but not longer than three years.

Article 5. A borrower must institute a separate accounting system to monitor the economic gains from the loan. Repayment of the loan plus interest shall be made out of earnings attributed to the loan, not from previous earnings.

State-owned enterprises must repay loans out of the profits from new projects or from the depreciation reserves for fixed assets or from the charges payable to the government for the use of fixed assets. If the above-mentioned funds are not sufficient for repayment, the deficit may be covered by the industrial-commercial tax that would otherwise be collected by the government on the increased output attributed to the loan.

Collectively owned enterprises must repay loans out of the accumulated profits from the new project after tax (during the period of repayment, the department in charge is not allowed to collect profits or other funds from the borrower for tax purposes) or from the depreciation reserves for fixed assets. If these funds are inadequate for repayment, the deficit may be covered by the income tax and industrial-commercial tax that would otherwise be collected by the government on the increased output attributed to the loan.

Article 6. If a loan cannot be repaid when it falls due, owing to suspension of the project in the course of construction or to failure of the borrower to generate the expected returns, repayment must be made out of the depreciation reserves for fixed assets and other reserves.

Article 7. The interest rate to be charged for a loan is 4.2% per month and interest is to be paid as soon as the financed project is in operation.

Chapter IV. Applications for Loans, Examination and Approval of Applications

Article 8. Plans for borrowing shall be examined and approved as follows:

The Bureau of Light Industry, the Bureau of Light Industry No. 2 (handicrafts) and the Bureau

of Textile Industry in the provinces, municipalities and autonomous regions (hereinafter called "local departments in charge") shall submit annual plans for borrowing on the basis of their programmes for tapping production potential and for making technological innovations duly approved by the Economic Commission in their locality. Plans for borrowing are to be examined by the local branches of the People's Bank of China (hereinafter called "bank branches"). They are to be submitted for re-examination by the head office of the People's Bank of China (hereinafter called "bank head office") and the ministries of light and textile industries (hereinafter called the "responsible ministries") who will, after adding their comments, submit the plans for further approval to a joint conference chaired by the State Economic Commission and attended by the bank head office, the State Planning Commission, responsible ministries and the Ministry of Finance. Then, the responsible ministries and the bank head office shall send back to the local departments in charge the approved plans for borrowing involving maximum project financing of over two million yuan for the textile industry and over one million yuan for light industries, with copies sent to the bank branches, the local economic commissions, planning commissions and finance bureaus. As for loans below the said maximum amounts, the bank head office and responsible ministries shall send back the approved plans for borrowing to the bank branches with copies sent to the local departments in charge.

Article 9. Authority to deal with applications for loans: Borrowers shall submit their applications to the bank branch where they keep an account. If a loan is below the said maximum amount, the bank branch has the right to approve the application in consultation with the local departments in charge. A report shall be sent to the responsible ministries and bank head office and a copy sent to the local economic commission, planning commission and finance bureau. For a loan over the maximum amount, the application shall be examined by the bank branch together with the local departments in charge and then, if agreeable, submitted to the bank head office and the responsible ministries for approval. The bank head office and the responsible ministries shall send back the approved application to the bank branches and local departments in charge with copies sent to the State Economic Commission, State Planning Commission and Ministry of Finance and their respective organizations.

Article 10. After approval of the project to be financed, the borrower and the bank shall sign a

loan agreement whereby the bank is to provide funds within the approved amount in accordance with the progress of the project.

Article 11. A loan that has not been completely drawn down in the current year may continue to be available in the next year. Repayment received during the current year may be used for lending by the bank within its jurisdiction.

Chapter V. Supply of Materials for Projects to Be Financed

Article 12. The planning commission and supply administration at different levels shall be responsible for the supply of materials such as steel, timber, cement, etc. needed by the projects to be financed. These materials shall first be supplied from the local stockpile. The State Administration of Supplies will provide half of the necessary amount, which is then included in its distribution plans for tapping production potential and technological innovation. The ministries of light and textile industries shall make suggestions on the allocations of materials to be provided by the State Administration of Supplies. Accordingly, the State Administration of Supplies will instruct its local branches to supply the materials on the spot. The remaining supplies are to be provided, in principle, by the local authorities.

Article 13. Special equipment shall be supplied by the ministries of light and textile industries; general equipment by the State Administration of Supplies and its local branches; and optional equipment by the local authorities.

Chapter VI. Periodic Review and Supervision of Loans

Article 14. The People's Bank of China and the departments in charge shall inquire into each project before financing it and oversee the performance of the borrower after the loan is granted. They must carefully check whether the project conforms to the provisions of Articles 1, 2 and 3 and see to it that all necessary measures have been taken, giving preference to those borrowers who promise good returns and have the ability to repay loans.

Article 15. The loan must be used to finance the project for which it is granted. The bank has the right to suspend the loan before maturity in case the borrower changes its plans and raises its expenditure without the bank's consent or diverts

the loan and construction materials to projects other than those agreed upon by the bank.

Article 16. The People's Bank of China and the departments in charge should work in close cooperation to help the borrower run its enterprise and regularly check the progress of the project and how the loan is being utilized so as to urge the enterprise to make the most of the loan with early returns.

Article 17. The borrower must submit to the departments in charge and the bank branch quarterly and annual reports on the progress of the project and how the loan is being used, with supporting statements and statistics. On the basis of these reports, the ministries of light and textile industries shall submit a quarterly consolidated report to the State Economic Commission and State Planning Commission with a copy sent to the bank head office.

Chapter VII. Loans in Convertible Foreign Currency

Article 18. When light and textile industrial enterprises require loans in foreign currency, such

loans shall generally be in the form of buyers' credits. In addition to the funds from buyers' credits, the Bank of China may, if necessary, grant a supplementary loan in convertible foreign currency to cover down payment for imported equipment plus freight and insurance, or to import major components to fit the equipment to be manufactured by the borrower, or to import such things that are not covered by buyers' credits, thereby accelerating the development of light and textile industries.

Article 19. Foreign currency loans are to be applied for and granted according to the regulations issued by the Bank of China.

Chapter VIII. Supplementary Regulations

Article 20. These regulations are to be formulated and amended by the head office of the People's Bank of China. Branch banks in the provinces, municipalities and autonomous regions may issue supplementary rules to suit local conditions and submit a report to the head office for the record.

These regulations shall come into force on the date of issue.

33. PROVISIONAL REGULATIONS OF THE BANK OF CHINA ON FOREIGN EXCHANGE CERTIFICATES

(March 19, 1980)

1. With a view to strengthening exchange control, the State Council has authorized the Bank of China to issue Foreign Exchange Certificates (hereinafter called "Exchange Certificates").

2. Exchange Certificates are in seven denominations, namely, 100 yuan, 50 yuan, 10 yuan, 5 yuan, 1 yuan, 5 jiao and 1 jiao. The yuan expressed in them is equivalent in value to the renminbi yuan. No refund is allowed in case of loss.

3. Exchange Certificates are usable only in China for specific purposes. They are to be used by short-time visitors (foreigners, overseas Chinese, Hongkong and Macao compatriots), personnel of the diplomatic corps and foreign representative offices in China at the following places or for making the following payments:

a) at travel services dealing exclusively with foreigners, overseas Chinese, Hongkong and Macao compatriots, friendship stores, companies provisioning foreign ships, arts and crafts stores, curios shops, foreign trade centres and special shop counters for selling imported goods;

b) at guest houses, hotels and clubs accommodating exclusively foreigners, overseas Chinese, Hongkong and Macao compatriots;

c) payment of fares for through train or ship to Hongkong or Macao, and charges for transporting luggage or personal effects;

d) payment of fares for domestic or international flights and charges for transporting luggage or personal effects;

e) payment of international telecommunication charges and international parcels post;

f) at places where Exchange Certificates are required for payment as approved by the State General Administration of Exchange Control (or its branches) or according to official regulations.

4. Convertible foreign banknotes, bills of exchange or payment instruments in foreign currency that are immediately cashable or remittances from abroad may be exchanged by the above-mentioned categories of persons for Exchange Certificates at the Bank of China or its designated exchange centres throughout the country. When handing out Exchange Certificates, the Bank of China (or its exchange centres) shall issue to the customer an "exchange memo."

5. Holders of Exchange Certificates may within six months and against the "exchange memo," convert the Exchange Certificates into Renminbi special deposits or foreign currency deposits with the Bank of China, or into foreign currency, or take them out of the country.

6. No private dealings in Exchange Certificates are permitted. Speculation in or counterfeit of Exchange Certificates is strictly prohibited. Violators will be punished for undermining the socialist economic order according to Chapter 3 of the Criminal Law of the People's Republic of China.

34. REGULATIONS FOR PROVIDING SHORT-TERM LOANS IN FOREIGN CURRENCY BY THE BANK OF CHINA

Approved for Transmission by the State Council on

August 30, 1980

With the funds it raises from abroad, the Bank of China is ready to provide loans in foreign currency to export-oriented industries and other enterprises in order to boost their foreign exchange earnings on the basis of self-reliance, thereby speeding up the socialist modernization of our country. It is for these purposes that the following regulations are formulated.

Chapter I. Eligible Borrowers and the Purposes for Which Loans Are To Be Used

Article 1. Loans are to be granted to export-oriented industries and other enterprises earning foreign exchange income directly or indirectly who can meet the prerequisites for borrowing. The loans are primarily for encouraging export-oriented industries to tap production potential and renovate obsolete plants and equipment.

Article 2. The loans are to be used for:

- a) financing imports of advanced technology, equipment and materials essential to upgrading the borrower's productivity and the quality, variety and packaging of export goods;
- b) financing imports of raw materials and components to be processed for export;
- c) developing transportation and tourism and carrying out engineering projects contracted with foreign firms;
- d) supporting the processing of raw materials and assembling of parts supplied by foreign buyers, and for supporting compensatory trade; and
- e) providing short-term working capital to production that earns foreign exchange directly or indirectly.

Chapter II. Prerequisites for Borrowing

Article 3. Applicants must meet the following requirements:

- a) Effective productivity of the loan: Preference is given to borrowers who are able to earn more foreign exchange in proportion to the money invested and repay bank loans sooner. Borrowers should be able to run their enterprises efficiently, make the most of the imported advanced technology, equipment and raw materials, tap their production potential, renovate obsolete plants and equipment, enhance the competitiveness of their

export goods in the international markets, thereby earning more foreign exchange for the country.

- b) Assurance of repayment: Borrowers must give evidence of a reliable source of foreign exchange income and the ability to repay loans plus interest for which they are required to submit a schedule of repayment.

Where loans are granted to the export-goods industry, the increased output attributed to the loan should be primarily for export and not be included in the state domestic marketing plan. The income from the increased output and the export proceeds in foreign exchange should first be set aside for repayment of the bank loan. In case the goods are to be turned over to a foreign trade corporation for export, the borrower should sign a sales contract with this corporation which commits the latter to repay the bank loan in foreign exchange for the borrower.

Enterprises not directly related to the export trade must submit a document of approval signed by the department in charge committing the latter to repay the loan from its own foreign exchange income. When necessary, the bank may demand that some organization that has a regular foreign exchange income stand surety for the borrower.

- c) Readiness of domestic factors of production to make imported materials and equipment operational. Domestic factors of production refer to factory buildings, equipment, steam, water, electricity and fuel, raw materials, labour force, technological expertise and counterpart funds in Renminbi requisite to making the imported equipment and materials operational. These items must be duly arranged and approved by the Planning Commission or the authorities in charge who have to list them in their plans or sign contracts with the borrower.

- d) With respect to the items mentioned above, borrowers should obtain prior approval of higher authorities for those items that require allotment of funds for capital construction or technological installations.

Chapter III. Applications for Loans, Examination and Approval of Applications and Drawdowns of the Loans

Article 4. Application for loans should be submitted to the Bank of China (or People's Bank

of China where the Bank of China does not exist) together with the following supporting documents: a document evidencing the approval of the proposed project by the department in charge; a list of imports the loan is to finance; a schedule proving the domestic factors of production are in readiness or a copy of the relevant contract; a document approved by the department in charge showing that counterpart funds in Renminbi have been earmarked for repayment of the loan (if the borrower is not directly involved in the export trade); a copy of the sales contract signed with a foreign trade corporation which commits itself to repay the loan in foreign exchange for the borrower (if the borrower is to repay the loan with export proceeds).

Article 5. Applications for loans by the departments under the State Council shall be examined item by item against the prerequisites for borrowing by the head office of the Bank of China. Applications by local departments and enterprises shall be reviewed by the Bank of China's regional branches in the provinces, municipalities and autonomous regions within the bounds of their respective loan quotas assigned by the head office. Cases that need to be reviewed by the head office or ministries concerned should be submitted to them for approval. In examining the applications, the bank should keep in touch with the departments in charge and work in cooperation with them.

Article 6. After the application is approved, the borrower should sign a loan agreement, open a loan account with the Bank of China and place an order for imports. If the borrower fails to sign the loan agreement or submit a list of imports within the specified time, the bank may revoke its approval of the loan. The list of imports must be signed by the bank before the order is placed. Without the approval of the bank, neither the purpose for which the loan is to be used nor the descriptions and quantities of imports should be changed. The borrower should submit to the bank a copy of the contract signed with the foreign trader who provides the goods. The bank should help the borrower to make the most of the loan.

Article 7. For a substantial loan, the borrower should submit a quarterly drawdown plan according to which the bank will raise the funds. In case the plan needs to be adjusted because of miscalculation or unexpected changes of circumstances, the borrower should apply to the bank for adjustment a month before the end of the quarter. For failure to carry out the plan, the borrower shall bear additional bank charges on the

amount of the drawdown falling short of, or in excess of, the planned amounts so as to compensate the bank for losses in raising funds from abroad.

Chapter IV. Term of Loans and Rates of Interest

Article 8. The term of the loan is to be counted from the day of the drawdown to the day of repayment. Loans for importing raw materials and components to be processed for export are normally available for one year. Loans for importing equipment or materials to be used in making equipment, and loans for other purposes shall not exceed three years. Where loans take the form of buyers' credits, the maturity shall not exceed five years.

Article 9. The interest rates for loans are to be determined and made public by the head office of the Bank of China on the basis of the cost of raising funds on the international money markets plus its handling charges.

Chapter V. Repayment of Loans

Article 10. Full repayment must be made on the due date specified in the loan agreement. If the borrower fails to repay, the surety is responsible for repayment. If necessary, the Bank of China or the People's Bank of China may force repayment by debiting the foreign currency deposit account of the borrower or the surety (or by writing off the foreign exchange quota allotted to the borrower and seizing his counterpart funds in Renminbi earmarked for the purchase of the foreign exchange quota).

Article 11. A borrower who has a regular foreign exchange income should repay the loan from foreign exchange earnings. A borrower who is not directly involved in the export trade should repay the loan from export proceeds received through a foreign trade corporation. This corporation or some other organization which stands surety for the borrower should issue a certificate to "repay foreign exchange quota" against which the borrower may purchase foreign exchange with Renminbi from the Bank of China to repay the loan. Foreign exchange earnings from the processing of raw materials and assembling of parts provided by foreign buyers or earnings from compensatory trade must first be set aside for repayment of the loan.

Article 12. Loans made to finance a construction project by a state-owned enterprise may

be repaid out of profits derived from the increased output, out of depreciation reserves for fixed assets, or out of charges payable to the government for the use of fixed assets. Enterprises that are authorized to retain a portion of their profits may make repayment from the retained profits after deductions for the staff's welfare fund and bonus fund. However, deductions for the production development fund and for retention of increased profits are not allowed. Loans to collectively owned urban enterprises may be repaid out of profits derived from the increased output (profits before tax) or from depreciation reserves for fixed assets. The department in charge is not allowed to collect profits or demand payment out of the project financed by the bank loan so long as the loan remains to be repaid.

If the above-mentioned funds are sufficient to repay the loan and a surplus remains, income tax shall be paid on the surplus or a percentage of profits shall be turned over to the government as required. If not, the deficit may, with the consent of the Internal Revenue Bureau, be covered by the industrial-and-commercial tax on the increased output which would otherwise be collected by the Bureau. When applying for the loan, the borrower should send a copy of the application to the Bureau for its reference.

Chapter VI. Buyers' Credits

Article 13. When loans are provided in the form of the buyers' credits, the following rules shall apply, apart from other provisions in the regulations:

a) The borrower must abide by the provisions in the buyer's credit agreement that the Bank of China has signed with a foreign bank and must place orders for imports from the country in which the foreign bank is located.

b) The borrower must indicate in the order for imports that the buyer's credit is to be used for payment. The sales contract signed between the Chinese foreign trade corporation and the foreign seller should indicate the name of the bank providing the buyer's credit.

c) At the time the sales contract is signed, the Bank of China shall negotiate with the foreign bank providing the buyer's credit and sign an agreement on the drawdown of the credit. The agreement shall be signed by the Bank of China head office or by one of its branches with its authorization.

Chapter VII. Bank Supervision

Article 14. The borrower must maximize the

effective productivity of the loan by relying on cost accounting. Preference is given to the borrower who earns more foreign exchange in proportion to the amount of the loan granted and makes repayment sooner. The borrower who performs poorly or who is unable to repay his loan upon maturity, will not receive further loans until he shows improvement in management.

Article 15. Both the bank and the borrower shall abide by the loan agreement: The bank undertakes to provide the loanable funds; the borrower undertakes to draw on the loan and utilize its productive potential effectively. The bank shall raise the interest by 10-50% for overdue loans counting from the maturity date, and by 100% for loans diverted to uses other than those authorized by the bank.

Article 16. The bank shall inquire into each project before financing it, examine the borrower's application before approving it and oversee the performance of the borrower after the loan is granted. The bank has the duty to help the borrower achieve its economic goals. In this way the bank shall fulfil its role of promoting, regulating and supervising the economic activities of the borrower.

For large loans, the bank shall sit in on the negotiations between the borrower and the foreign supplier and make suggestions as to the preferred currency for making payment and the method of payment. The borrower must provide the bank with all necessary information, documents, statistics and a duplicate of the relevant contract.

The borrower shall be held accountable for violation of government decrees and policies; failure to abide by the regulations, the contract or the agreement; dissipation of foreign exchange; or failure to repay the loan when due. At the same time the bank may take such disciplinary actions as suspending or recalling the loan before maturity, raising the interest rate or even suing the borrower in a court of law.

Chapter VIII. Supplementary Regulations

Article 17. On the date the regulations come into force, "Regulations for Providing Short-term Loans in Foreign Currency," issued by the Ministry of Finance on September 29, 1978, shall no longer be valid except for loans and loan agreements previously approved and signed. Detailed rules for the enforcement of the regulations shall be formulated separately by the Bank of China.

35. PROVISIONAL REGULATIONS FOR EXCHANGE CONTROL OF THE PEOPLE'S REPUBLIC OF CHINA

Promulgated by the State Council

(December 18, 1980)

Chapter I. General Provisions

Article 1. These provisional regulations are formulated for the purpose of strengthening exchange control, increasing national foreign exchange income and economizing on foreign exchange expenditure so as to expedite national economic growth and safeguard the rights and interests of the country.

All foreign exchange income and expenditure, the issuance and circulation of all kinds of payment instruments in foreign currency, dispatch and carriage into and out of the People's Republic of China of foreign exchange, precious metals and payment instruments in foreign currency shall be governed by these regulations.

Article 2. Foreign exchange herein mentioned refers to:

a) Foreign currencies, including banknotes, coins, etc.

b) Securities in foreign currency, including government bonds, treasury bills, corporate bonds and debentures, shares, interest and dividend coupons, etc.

c) Instruments payable in foreign currency, including bills, drafts, cheques, bank deposit certificates, postal savings certificates, etc.

d) Other foreign exchange funds.

Article 3. The People's Republic of China pursues the policy of centralized control and unified management of foreign exchange by the state.

The administrative organ in charge of exchange control of the People's Republic of China is the State General Administration of Exchange Control (SGAEC) and its branch offices.

The specialized foreign exchange bank of the People's Republic of China is the Bank of China. No other financial institution shall engage in foreign exchange business, unless approved by the SGAEC.

Article 4. All Chinese and foreign organizations and individuals in the People's Republic of China must, unless otherwise stipulated by law or decree or in these regulations, sell their foreign exchange proceeds to the Bank of China. Any foreign exchange required is to be sold to them by the Bank of China in accordance with the quota approved by the state or with relevant regulations.

The circulation, use and mortgage of foreign currency in the People's Republic of China are prohibited. Unauthorized sales and purchases of foreign exchange and unlawful seizure and possession of foreign exchange in whatever ways and by whatever means are prohibited.

Chapter II. Exchange Control Relating to State Organizations and Collective Economic Units

Article 5. Foreign exchange income and expenditure of state organs, units of the armed forces, non-governmental bodies, educational institutions, state enterprises, government establishments, and urban and rural collective economic units in China (hereinafter referred to as domestic organizations) are all subject to control according to plan.

Domestic organizations are permitted to retain a proportion of their foreign exchange receipts in accordance with relevant regulations.

Article 6. Unless approved by the SGAEC or its branch offices, domestic organizations shall not possess foreign exchange; deposit foreign exchange abroad; offset foreign exchange expenditure against foreign exchange income; or use the foreign exchange belonging to state organs stationed abroad or Chinese enterprises and establishments resident in foreign countries or in the Hong Kong and Macao regions, by way of borrowing or acquisition.

Article 7. Unless approved by the State Council, domestic organizations shall not issue securities with foreign exchange value inside or outside China.

Article 8. Departments under the State Council and people's governments of various provinces, municipalities and autonomous regions shall compile annual overall plans for domestic organizations under their respective jurisdiction whereby loans may be accepted from banks or enterprises in foreign countries or in the Hong Kong and Macao regions. These plans shall be submitted to the SGAEC and the Foreign Investment Control Commission for examination and forwarding to the State Council for approval.

The procedure for examining and approving individual borrowings shall be prescribed separately.

Article 9. The portion of foreign exchange retained by domestic organizations, non-trade foreign exchange and foreign exchange under compensatory trade received in advance for later payments, funds borrowed in convertible foreign currency, and other foreign exchange held with the approval of the SGAEC or its branch offices, must be placed in foreign currency deposit accounts or foreign currency quota accounts to be opened with the Bank of China, and must be used within the prescribed scope and be subject to the supervision of the Bank of China.

Article 10. When domestic organizations import or export goods, the banks handling the transactions shall check their foreign exchange receipts and payments either against the import or export licences duly verified by the Customs or against the Customs declaration forms for imports or exports.

Article 11. State organs stationed abroad must use foreign exchange according to the plan approved by the state.

The operating profits of enterprises and establishments in foreign countries or in the Hongkong and Macao regions must, except for the portion kept locally as working funds according to the plan approved by the state, be transferred back on schedule and be sold to the Bank of China.

No Chinese organization stationed abroad is permitted to keep foreign exchange for domestic organizations without authorization.

Article 12. Delegations and workgroups sent temporarily to foreign countries or to the Hongkong and Macao regions must use foreign exchange according to their respective specific plans, and must, upon their return, promptly transfer back to China their surplus foreign exchange to be checked by and sold to the Bank of China.

Foreign exchange earned in their various business activities by the delegations and workgroups referred to in the above paragraph and by members thereof, must be promptly transferred back to China and must not be kept abroad without the approval of the SGAEC or its branch offices.

Chapter III. Exchange Control Relating to Individuals

Article 13. Foreign exchange remitted from

foreign countries or from the Hongkong and Macao regions to Chinese or foreign nationals or stateless persons residing in China must be sold to the Bank of China, except the portion retained as permitted by the state.

Article 14. Chinese and foreign nationals and stateless persons residing in China are permitted to keep in their own possession foreign exchange already in China.

The foreign exchange referred to in the above paragraph shall not, without authorization, be carried or sent out of China either in person or by others or by post. If the owners wish to sell the foreign exchange, they must sell it to the Bank of China and are permitted to retain a portion thereof as convertible foreign currency according to the percentage prescribed by the state.

Article 15. When foreign exchange that has been kept in foreign countries or in the Hong Kong and Macao regions by Chinese residents in China prior to the founding of the People's Republic of China, by overseas Chinese prior to their returning to and settling down in China, by Hongkong and Macao compatriots prior to their returning to and settling down in their home places, is transferred to China, the owners are permitted to retain a portion thereof as convertible foreign currency according to the percentage prescribed by the state.

Article 16. When foreign exchange belonging personally to individuals sent to work or study in foreign countries or in the Hong Kong and Macao regions is remitted or brought back to China, the owners returning after completion of their missions are permitted to retain the entire amount as convertible foreign currency.

Article 17. The percentages of foreign exchange retention permitted under Articles 13, 14 and 15 of these regulations shall be prescribed separately.

Foreign exchange retained by individuals as permitted under Articles 13, 14, 15 and 16 of these regulations must be deposited with the Bank of China. These foreign exchange deposits may be sold to the Bank of China or remitted out of China through the Bank of China, or taken out of China against certification by the Bank of China. It is however not permitted, without authorization, to carry or send deposit certificates out of China either in person or by others or by post.

Article 18. Foreign exchange remitted or brought into China from foreign countries or from the Hong Kong and Macao regions by foreign na-

tionals coming to China, by overseas Chinese and Hongkong and Macao compatriots returning for a short stay, by foreign experts, technicians, staff members and workers engaged to work in domestic organizations, and by foreign students and trainees, may be kept in their own possession, or sold to or deposited with the Bank of China, or remitted or taken out of China.

Article 19. Chinese and foreign nationals and stateless persons residing in China may apply to the local branch offices of the SGAEC for the purchase of foreign exchange to be remitted or taken out of China. When approved, the required foreign exchange will be sold to the applicants by the Bank of China.

When foreign experts, technicians, staff members and workers engaged to work in domestic organizations require foreign exchange to be remitted or taken out of China, the Bank of China will deal with their applications in accordance with the stipulations in the contracts or agreements.

Chapter IV. Exchange Control Relating to Foreign Representations in China and Their Personnel

Article 20. Foreign exchange remitted or brought into China from foreign countries or from the Hong Kong and Macao regions by foreign diplomatic missions, consulates, official commercial offices, offices of international organizations and nongovernmental bodies resident in China, diplomatic officials and consuls as well as members of the permanent staff of the above units, may be kept in their own possession, or sold to or deposited with the Bank of China, or remitted or taken out of China.

Article 21. The conversion into foreign currency, if required, of visa and certification fees received in Renminbi from Chinese citizens by foreign diplomatic missions and consulates in China, is subject to approval by the SGAEC or its branch offices.

Chapter V. Exchange Control Relating to Enterprises with Overseas Chinese Capital, Enterprises with Foreign Capital, and Chinese and Foreign Joint Ventures and Their Personnel

Article 22. All foreign exchange receipts of enterprises with overseas Chinese capital, enterprises with foreign capital and Chinese and foreign joint ventures, must be deposited with the Bank of

China, and all their foreign exchange disbursements must be paid from their foreign exchange deposit accounts.

The enterprises referred to in the above paragraph must submit periodic reports and statements of their foreign exchange business to the SGAEC or its branch offices, all of which are empowered to inspect their activities in respect to their foreign exchange receipts and payments.

Article 23. Except where otherwise approved by the SGAEC or its branch offices, Renminbi should in all cases be used in the settlement of accounts between enterprises with overseas Chinese capital, enterprises with foreign capital, Chinese and foreign joint ventures and other enterprises and individuals residing in the People's Republic of China.

Article 24. Enterprises with overseas Chinese capital, enterprises with foreign capital and foreign partners in Chinese and foreign joint ventures may apply to the Bank of China for remitting abroad their net profits after tax as well as other legitimate earnings by debiting the foreign exchange deposit accounts of the enterprises concerned.

The enterprises and foreign partners referred to in the above paragraph should apply to the SGAEC or its branch offices for transferring foreign exchange capital abroad by debiting the foreign exchange deposit accounts of the enterprises concerned.

Article 25. An amount not exceeding 50% of their net wages and other legitimate earnings after tax may be remitted or taken out of China in foreign currency by staff members and workers of foreign nationality and those from the Hongkong and Macao regions employed by enterprises with overseas Chinese capital, enterprises with foreign capital and Chinese and foreign joint ventures.

Article 26. Enterprises with overseas Chinese capital, enterprises with foreign capital and Chinese and foreign joint ventures which wind up operations in accordance with legal procedure, should be responsible for the liquidation within the scheduled period of their outstanding liabilities and taxes due in China, under the joint supervision of the relevant departments in charge and the SGAEC or its branch offices.

Chapter VI. Control Relating to Carrying Foreign Exchange, Precious Metals and Payment Instruments in Foreign Currency into and out of China

Article 27. No restriction as to the amount is

imposed on the carrying into China of foreign exchange, precious metals and objects made from them, but declaration to the Customs is required at the place of entry.

To carry foreign exchange out of China or to carry out of China the foreign exchange previously brought in shall be permitted by the Customs against certification by the Bank of China or against the original declaration form at the time of entry.

To carry out of China precious metals and objects made from them or to carry out of China precious metals and objects made from them previously brought in shall be permitted by the Customs according to the specific circumstances as prescribed by government regulations or against the original declaration form at the time of entry.

Article 28. Renminbi traveller's cheques, traveller's letters of credit and other Renminbi payment instruments convertible into foreign currency may be brought into China against declaration to the Customs, and taken out of China against certification by the Bank of China or against the original declaration form at the time of entry.

Article 29. Unless otherwise approved by the SGAEC or its branch offices, the carrying or sending out of China either in person or by others or by post of the following documents and securities held by Chinese residing in China is not permitted:

Bonds, debentures, share certificates issued abroad;

Title deeds for real estate abroad;

Documents or deeds necessary in dealing with creditor's right or owner's right to possession regarding inheritance, real estate and other foreign exchange assets abroad.

Article 30. The carrying or sending out of

China of Renminbi cheques, drafts, passbooks, deposit certificates and other Renminbi instruments held by Chinese or foreign nationals or stateless persons residing in China, is not permitted, either in person or by others or by post.

Chapter VII. Supplementary Provisions

Article 31. All units and individuals have the right to report any violation of these regulations. Reward shall be given to such units or individuals according to the merit of the report. Violators shall be penalized by the SGEAC, its branch offices or by the departments of public security, or by the departments of Administration of Industry and Commerce, or by the Customs. According to the seriousness of the offence, the penalties may take the form of compulsory exchange of the foreign currency for Renminbi, or fine or confiscation of the properties or both, or punishment by judicial authorities according to law.

Article 32. The exchange control regulations for special economic zones, for trade in border areas, and for personal dealings between inhabitants across the border shall be formulated by the people's governments of the provinces, municipalities and autonomous regions concerned in the spirit of these regulations and in the light of specific local conditions, and shall be enforced upon the approval of the State Council.

Article 33. Detailed provisions for the enforcement of these regulations shall be formulated by the SGEAC.

Article 34. These regulations shall come into force on March 1, 1981.

36. THE LAW OF THE PEOPLE'S REPUBLIC OF CHINA ON JOINT VENTURES USING CHINESE AND FOREIGN INVESTMENT

*Approved on July 1, 1979 by the Fifth National People's Congress
of the People's Republic of China at its Second Session*

Article 1. With a view to expanding international economic cooperation and technological exchange, the People's Republic of China permits foreign companies, enterprises, other economic entities or individuals (hereinafter referred to as "foreign participants") to incorporate themselves, within the territory of the People's Republic of China, into joint ventures with Chinese companies, enterprises or other economic entities (hereinafter referred to as "Chinese participants") on the principle of equality and mutual benefit and subject to authorization by the Chinese Government.

Article 2. The Chinese Government protects, by the legislation in force, the resources invested by a foreign participant in a joint venture and the profits due him pursuant to the agreements, contracts and articles of association authorized by the Chinese Government as well as his other lawful rights and interests.

All the activities of a joint venture shall be governed by the laws, decrees and pertinent rules and regulations of the People's Republic of China.

Article 3. A joint venture shall apply to the Foreign Investment Commission of the People's Republic of China for authorization of the agreements and contracts concluded between the parties to the venture and the articles of association of the venture formulated by them, and the commission shall authorize or reject these documents within three months. When authorized, the joint venture shall register with the General Administration for Industry and Commerce of the People's Republic of China and start operations under licence.

Article 4. A joint venture shall take the form of a limited liability company.

In the registered capital of a joint venture, the proportion of the investment contributed by the foreign participant(s) shall in general not be less than 25 per cent.

The profits, risks and losses of a joint venture shall be shared by the parties to the venture in proportion to their contributions to the registered capital.

The transfer of one party's share in the registered capital shall be effected only with the consent of the other parties to the venture.

Article 5. Each party to a joint venture may contribute cash, capital goods, industrial property rights, etc., as its investment in the venture.

The technology or equipment contributed by any foreign participant as investment shall be truly advanced and appropriate to China's needs. In cases of losses caused by deception through the intentional provision of outdated equipment or technology, compensation shall be paid for the losses.

The investment contributed by a Chinese participant may include the right to the use of a site provided for the joint venture during the period of its operation. In case such a contribution does not constitute a part of the investment from the Chinese participant, the joint venture shall pay the Chinese Government for its use.

The various contributions referred to in the present article shall be specified in the contracts concerning the joint venture or in its articles of association, and the value of each contribution (excluding that of the site) shall be ascertained by the parties to the venture through joint assessment.

Article 6. A joint venture shall have a board of directors with a composition stipulated in the contracts and the articles of association after consultation between the parties to the venture, and each director shall be appointed or removed by his own side. The board of directors shall have a chairman appointed by the Chinese participant and one or two vice-chairmen appointed by the foreign participant(s). In handling an important problem, the board of directors shall reach decision through consultation by the participants on the principle of equality and mutual benefit.

The board of directors is empowered to discuss and take action on, pursuant to the provisions of the articles of association of the joint venture, all fundamental issues concerning the venture, namely, expansion projects, production and business programmes, the budget, distribution of profits, plans concerning manpower and pay scales, the termination of business, the appointment or hiring of the president, the vice-president(s), the chief engineer, the treasurer and the auditors as well as their functions and powers and their remuneration, etc.

The president and vice-president(s) (or the

general manager and assistant general manager(s) in a factory) shall be chosen from the various parties to the joint venture.

Procedures covering the employment and discharge of the workers and staff members of a joint venture shall be stipulated according to law in the agreement or contract concluded between the parties to the venture.

Article 7. The net profit of a joint venture shall be distributed between the parties to the venture in proportion to their respective shares in the registered capital after the payment of a joint venture income tax on its gross profit pursuant to the tax laws of the People's Republic of China and after the deductions therefrom as stipulated in the articles of association of the venture for the reserve funds, the bonus and welfare funds for the workers and staff members and the expansion funds of the venture.

A joint venture equipped with up-to-date technology by world standards may apply for a reduction of or exemption from income tax for the first two to three profit making years.

A foreign participant who reinvests any part of his share of the net profit within Chinese territory may apply for the restitution of a part of the income taxes paid.

Article 8. A joint venture shall open an account with the Bank of China or a bank approved by the Bank of China.

A joint venture shall conduct its foreign exchange transactions in accordance with the Foreign Exchange Regulations of the People's Republic of China.

A joint venture may, in its business operations, obtain funds from foreign banks directly.

The insurances appropriate to a joint venture shall be furnished by Chinese insurance companies.

Article 9. The production and business programmes of a joint venture shall be filed with the authorities concerned and shall be implemented through business contracts.

In its purchase of required raw and semi-processed materials, fuels, auxiliary equipment, etc., a joint venture should give first priority to Chinese sources, but may also acquire them directly from the world market with its own foreign exchange funds.

A joint venture is encouraged to market its products outside China. It may distribute its export products on foreign markets through direct channels or its associated agencies or China's foreign trade establishments. Its products may also be distributed on the Chinese market.

Wherever necessary, a joint venture may set

up affiliated agencies outside China.

Article 10. The net profit which a foreign participant receives as his share after executing his obligations under the pertinent laws and agreements and contracts, the funds he receives at the time when the joint venture terminates or winds up its operations, and his other funds may be remitted abroad through the Bank of China in accordance with the foreign exchange regulations and in the currency or currencies specified in the contracts concerning the joint venture.

A foreign participant shall receive encouragements for depositing in the Bank of China any part of the foreign exchange which he is entitled to remit abroad.

Article 11. The wages, salaries or other legitimate income earned by a foreign worker or staff member of a joint venture, after payment of the personal income tax under the tax laws of the People's Republic of China, may be remitted abroad through the Bank of China in accordance with the foreign exchange regulations.

Article 12. The contract period of a joint venture may be agreed upon between the parties to the venture according to its particular line of business and circumstances. The period may be extended upon expiration through agreement between the parties, subject to authorization by the Foreign Investment Commission of the People's Republic of China. Any application for such extension shall be made six months before the expiration of the contract.

Article 13. In cases of heavy losses, the failure of any party to a joint venture to execute its obligations under the contracts or the articles of association of the venture, force majeure, etc., prior to the expiration of the contract period of a joint venture, the contract may be terminated before the date of expiration by consultation and agreement between the parties and through authorization by the Foreign Investment Commission of the People's Republic of China and registration with the General Administration for Industry and Commerce. In cases of losses caused by breach of the contract(s) by a party to the venture, the financial responsibility shall be borne by the said party.

Article 14. Disputes arising between the parties to a joint venture which the board of directors fails to settle through consultation may be settled through conciliation or arbitration by an arbitral body of China or through arbitration by an arbitral body agreed upon by the parties.

Article 15. The present law comes into force on the date of its promulgation. The power of

amendment is vested in the National People's Congress.

37. REGULATIONS ON LABOUR MANAGEMENT IN JOINT VENTURES USING CHINESE AND FOREIGN INVESTMENT

*Approved by the State Council of the People's Republic of China
(July 26, 1980)*

Article 1. Labour management problems concerning joint ventures using Chinese and foreign investment (hereinafter referred to as "joint ventures") should be handled in accordance with the regulations, in addition to the pertinent stipulations in Article 6 of the "Law of the People's Republic of China on Joint Ventures Using Chinese and Foreign Investment."

Article 2. Matters pertaining to employment, dismissal and resignation of the workers and staff members, tasks of production and other work, wages and awards and punishment, working time and vacation, labour insurance and welfare, labour protection and labour discipline in joint ventures shall be stipulated in the labour contracts signed.

A labour contract is to be signed collectively by a joint venture and the trade union organization formed in the joint venture. A relatively small joint venture may sign contracts with the workers and staff members individually.

A signed labour contract must be submitted to the labour management department of the provincial, autonomous regional or municipal people's government for approval.

Article 3. The workers and staff members of a joint venture either recommended by the authorities in the locality in charge of the joint venture or the labour management department, or recruited by the joint venture itself with the consent of the labour management department, should all be selected by the joint venture through examination for their qualification.

Joint ventures may run workers' schools and training courses for the training of managerial personnel and skilled workers.

Article 4. With regard to the surplus workers and staff members as a result of changes in production and technical conditions of the joint venture, those who fail to meet the requirements after training and are not suitable for other work can be discharged. However, this must be done in line with the stipulations in the labour contract and the enterprise must give compensation to these workers.

The dismissed workers and staff members will receive assignments for other work from the authorities in charge of the joint venture or the labour management department.

Article 5. The joint venture may, according to the degree of seriousness of the case, take action against those workers or staff members who have violated rules and regulations of the enterprise that result in certain bad consequences. Punishment by discharges must be reported to the authorities in charge of the joint venture and the labour management department for approval.

Article 6. With regard to the dismissal and punishment of workers and staff members by the joint venture, the trade union has the right to raise an objection if it considers them unreasonable, and send representatives to seek a solution through consultation with the board of directors. Should the consultation fail to arrive at a solution, the matter will be handled in accordance with the procedures set forth in Article 14 of the present regulations.

Article 7. When workers and staff members of a joint venture, on account of special conditions, submit their resignation to the enterprise through the trade union in accordance with the labour contract, the enterprise should give its consent.

Article 8. The wage levels of workers and staff members in a joint venture will be determined at 120 to 150% of the real wages of workers and staff members of state-owned enterprises of the same trade in the locality.

Article 9. The wage standards, the forms of wages paid, and bonus and subsidy systems are to be discussed and decided upon by the board of directors.

Article 10. The bonuses and welfare funds drawn by the joint venture from the profits must be used as bonuses, awards and collective welfare and should not be misappropriated.

Article 11. A joint venture must pay for the Chinese workers' and staff members' labour insurance, cover their medical expenses and various kinds of government subsidies in line with the standards prevailing in state-owned enterprises.

Article 12. The employment of foreign workers and staff members and their dismissal, resigna-

tion, pay, welfare and social insurances and other relevant matters should all be stipulated in the employment contracts.

Article 13. Joint ventures must implement the relevant rules and regulations of the Chinese Government on labour protection and ensure safety in production and civilized production. The labour management department of the Chinese Government is authorized to supervise and inspect their implementation.

Article 14. Labour disputes occurring in a joint venture should first of all be solved through consultation by both parties. If consultation fails

to arrive at a solution, either party or both parties may request arbitration by the labour management department of the people's government of the province, autonomous region or municipality where the joint venture is located. Either party that disagrees to the arbitration may file a suit at the people's court.

Article 15. The right of interpretation of the present regulations belongs to the State Bureau of Labour of the People's Republic of China.

Article 16. The regulations come into force on the date of their promulgation.

38. REGULATIONS ON THE REGISTRATION OF JOINT VENTURES USING CHINESE AND FOREIGN INVESTMENT

*Approved by the State Council of the People's Republic of China
(July 26, 1980)*

Article 1. The present regulations are worked out in accordance with stipulations laid down in the "Law of the People's Republic of China on Joint Ventures Using Chinese and Foreign Investment" and for the purpose of registering such ventures to protect their legitimate operations.

Article 2. A joint venture using Chinese and foreign investment should, within one month after approval by the Foreign Investment Commission of the People's Republic of China, register with the General Administration for Industry and Commerce of the People's Republic of China.

The General Administration for Industry and Commerce authorizes the administrative bureaus for industry and commerce in the provinces, municipalities and autonomous regions to register joint ventures using Chinese and foreign investment in their localities. Licences for operations shall be issued to the said joint ventures after examination by the General Administration for Industry and Commerce of the People's Republic of China.

Article 3. In applying for registration, a joint venture using Chinese and foreign investment should produce the following documents:

a) The document of approval issued by the Foreign Investment Commission of the People's Republic of China;

b) The agreement on the joint venture reached by the various parties involved, the contract and the articles of association of the venture, in both Chinese and foreign language and each in triplicate;

c) A duplicate of the licence and other documents issued by the departments concerned under the government of the country (or region) from which the foreign participants in the joint venture come.

Article 4. In applying for registration of a joint venture using Chinese and foreign investment, a registration form, in triplicate, shall be completed in Chinese and the relevant foreign language. Items to be registered include the name of the venture, its address, scope of production and business, forms of production and business, registered capital of the parties concerned, chairman and vice-chairmen of the board of directors, general manager and deputy general managers or general director and deputy directors of the plant,

the number and date of approval on the document, the size of the entire staff, and the number of foreign workers and staff members.

Article 5. A joint venture using Chinese and foreign investment is regarded as having officially been established the day when the licence for its operation is issued, and the legitimate production and business shall be protected by the law of the People's Republic of China.

An unregistered enterprise shall not be permitted to begin operation.

Article 6. A joint venture using Chinese and foreign investment shall, by producing the licence for its operation, open an account with the Bank of China or another bank approved by the Bank of China, and register with the local tax bureau for payment of taxes.

Article 7. In cases where a joint venture using Chinese and foreign investment desires to move to a new site, shift its production, increase or cut or transfer the registered capital, or extend the contract period, the said venture shall, within one month after approval by the Foreign Investment Commission of the People's Republic of China, register the changes with the Administrative Bureau for Industry and Commerce in the province, municipality or autonomous region where it is located.

In cases where changes to other items are effected, the said venture shall have to forward at the end of the year a written report about these changes to the Administrative Bureau for Industry and Commerce in the province, municipality or autonomous region where it is located.

Article 8. In registering or getting its changes registered, a joint venture using Chinese and foreign investment shall pay the registration fee or the fee for getting its changes registered, the sum of which is to be fixed by the General Administration for Industry and Commerce of the People's Republic of China.

Article 9. A joint venture using Chinese and foreign investment, upon the expiration of the contract period of the venture or desirous of terminating the contract before its expiration date, shall upon production of the document of appro-

val issued by the Foreign Investment Commission of the People's Republic of China register for the nullification of the contract with the Administrative Bureau for Industry and Commerce in the province, municipality or autonomous region where it is located. The licence of the said venture shall be handed in for cancellation after examination by the General Administration for Industry and Commerce of the People's Republic of China.

Article 10. The General Administration for Industry and Commerce of the People's Republic

of China and the Administrative Bureaus for Industry and Commerce in the provinces, municipalities and autonomous regions are authorized to supervise and inspect the joint ventures using Chinese and foreign investment in the areas they govern. In cases of violations of the present regulations the violator shall be given a warning or be fined in accordance with the varying degrees of seriousness in each specific case.

Article 11. The present regulations come into force on the date of their promulgation.

39. REGULATIONS ON SPECIAL ECONOMIC ZONES IN GUANGDONG PROVINCE

(Approved by the 15th Session of the Standing Committee of the Fifth National People's Congress on August 26, 1980)

Chapter I. General Principles

Article 1. Certain areas are delineated from the three cities of Shenzhen, Zhuhai and Shantou in Guangdong Province to form special economic zones (hereinafter referred to as "special zones") in order to develop external economic cooperation and technical exchanges and promote the socialist modernization programme. In the special zones, foreign citizens, overseas Chinese, compatriots in Hong Kong and Macao and their companies and enterprises (hereinafter referred to as "investors") are encouraged to open factories or set up enterprises and other establishments with their own investment or undertake joint ventures with Chinese investment, and their assets, due profits and other legitimate rights and interests are legally protected.

Article 2. Enterprises and individuals in the special zones must abide by the laws, decrees and related regulations of the People's Republic of China. Where there are specific provisions contained in the present regulations, they have to be observed as stipulated herewith.

Article 3. A Guangdong Provincial Administration of Special Economic Zones is set up to exercise unified management of the special zones on behalf of the Guangdong Provincial People's Government.

Article 4. In the special zones investors are offered a wide scope of operation, favourable conditions for such operation are created, and stable business sites are guaranteed. All items of industry, agriculture, livestock breeding, fish breeding and poultry farming, tourism, housing and construction, research and manufacture involving high technologies and techniques that have positive significance in international economic cooperation and technical exchanges, as well as other trades of common interest to investors and the Chinese side, can be established with foreign investment or in joint venture with Chinese investment.

Article 5. Land-levelling projects and various public utilities in the special zones such as water supply, drainage, power supply, roads, wharves, communications and warehouses, are undertaken by the Guangdong Provincial Administration of Special Economic Zones. When necessary, foreign

capital participation in their development can be considered.

Article 6. Specialists at home and abroad and persons who are enthusiastic about China's modernization programme will be invited by each of the special zones to form an advisory board as a consultative body for that special zone.

Chapter II. Registration and Operation

Article 7. Investors wishing to open factories or take up various economic undertakings with their investment should apply to the Guangdong Provincial Administration of the Special Economic Zones, and will be issued licences of registry and use of land after examination and approval.

Article 8. Investors can open accounts and deal with matters related to foreign exchange at the Bank of China in the special zones or other banks set up in the special zones with China's approval.

Investors can apply for insurance policies at the People's Insurance Company of China in the special zones and other insurance companies set up in the special zones with China's approval.

Article 9. Products of the enterprises in the special zones are to be sold on the international market. If an enterprise wants to sell its products in the domestic market in China, it must have the approval of the Guangdong Provincial Administration of Special Economic Zones and pay Customs duties.

Article 10. Investors can operate their enterprises independently in the special zones and employ foreign personnel for technical and administrative work.

Article 11. If investors want to terminate their business in the special zones, they should submit the reasons for termination to the Guangdong Provincial Administration of Special Economic Zones, go through related procedures and clear all debts. The assets of the closed enterprises can be transferred and the funds can be remitted out of China.

Chapter III. Preferential Treatment

Article 12. The land in the special zones remains the property of the People's Republic of China. Land to be used by investors will be provided according to actual needs, and the length of tenure, rent and method of payment will be given favourable consideration according to different trades and uses. Concrete methods will be specified separately.

Article 13. Machinery, spare parts, raw materials, vehicles and other means of production for the enterprises in the special zones are exempted from import duties. The necessary consumer goods shall be subjected to full or lower import duties or exempted, depending on the merits of each case. Imports of the above-mentioned goods and exports of products of the special zones must go through existing Customs procedures.

Article 14. The rate of income tax levied on the enterprises in the special zones is to be 15%. Special preferential treatment will be given to enterprises established within two years of the promulgation of these regulations, enterprises with an investment of US\$5 million or more, and enterprises involving higher technologies or having a longer cycle of capital turnover.

Article 15. Legitimate after-tax profits of the investors, salaries and other proper earnings of the foreign, overseas Chinese and Hong Kong and Macao workers and staff members of the enterprises in the special zones after deduction of personal income tax can be remitted out of China through the Bank of China or other banks in the special zones in line with the zone's foreign exchange control measures.

Article 16. Investors who reinvest their profits in the special zones for five years and longer may apply for exemption of income tax on profits from such reinvestment.

Article 17. Enterprises in the special zones are encouraged to use China-made machinery, raw materials and other goods. Preferential prices will be offered on the basis of the export prices of China's similar commodities and settled in foreign exchange. These products and materials can be shipped directly to the special zones with the vouchers of the selling units.

Article 18. Entry and exit procedures will be simplified and convenience offered to foreigners, overseas Chinese and compatriots in Hong Kong and Macao going in and out of the special zones.

Chapter IV. Labour Management

Article 19. Labour service companies are to be set up in each of the special zones. Chinese staff members and workers to be employed by enterprises in the special zones are to be recommended by the local labour service companies or recruited by the investors with the consent of the Guangdong Provincial Administration of Special Economic Zones. Enterprises can test them before employment and sign labour contracts with them.

Article 20. Employees of the enterprises in the special zones are to be managed by the enterprises according to their business requirements, and, if necessary, can be dismissed in line with the provisions of the labour contracts.

Employees of enterprises in the special zones can submit resignation to their enterprises according to the provisions of the labour contracts.

Article 21. Wage scales and forms of wages, award methods, labour insurance and various state subsidies for Chinese staff members and workers in the enterprises are to be included in the contracts signed between the enterprises and the employees in accordance with the stipulations of the Guangdong Provincial Administration of Special Economic Zones.

Article 22. Enterprises in the special zones should take the necessary measures for labour protection to ensure that the staff members and workers work in safe and hygienic conditions.

Chapter V. Administration

Article 23. The Guangdong Provincial Administration of Special Economic Zones is to exercise the following functions:

- a) Draw up development plans for the special zones and organize their implementation;
- b) Examine and approve investment projects of investors in the special zones;
- c) Handle the registration of industrial and commercial enterprises in the special zones and land allotment;
- d) Coordinate the working relations among the banking, insurance, taxation, Customs, frontier inspection, postal and telecommunications and other organizations in the special zones;
- e) Provide staff members and workers needed by the enterprises in the special zones and protect the legitimate rights and interests of these staff members and workers;
- f) Run education, cultural, health and other

public welfare facilities in the special zones;

g) Maintain law and order in the special zones and protect according to law the persons and properties in the special zones from encroachment.

Article 24. The Shenzhen Special Zone is under the direct jurisdiction of the Guangdong Provincial Administration of Special Economic Zones. Necessary agencies are to be set up in the Zhuhai and Shantou Special Zones.

Article 25. A Guangdong Provincial Special Economic Zones Development Company is to be set up to cope with the economic activities in the special zones. Its scope of business includes fund-raising and trust investment, operating enterprises

or joint ventures with investors in the special zones, acting as agents for the investors in the special zones in matters related to sales and purchases with other parts of China outside the special zones, and providing services for business talks.

Chapter VI. Appendix

Article 26. These regulations shall be enforced after their adoption by the Guangdong Provincial People's Congress and after they have been submitted to and approved by the Standing Committee of the National People's Congress of the People's Republic of China.

40. INTERIM REGULATIONS OF THE PEOPLE'S REPUBLIC OF CHINA CONCERNING THE CONTROL OF RESIDENT OFFICES OF FOREIGN ENTERPRISES

*Promulgated by the State Council
(October 30, 1980)*

Article 1. The regulations hereunder are formulated with a view to facilitating the development of international economic and trade contacts and the control of resident offices in China of foreign companies, enterprises and other economic organizations (hereinafter referred to as "foreign enterprises").

Article 2. Any foreign enterprise desiring to establish a resident office in China should first apply for permission and then, after securing approval, go through the registration procedure.

No foreign enterprise is allowed to start business activities in the nature of those of a resident office before approval is granted and the registration procedure completed.

Article 3. When applying for permission to establish a resident office in China, a foreign enterprise should produce the following documents and reference materials:

a) An application form signed by the chairman of the board of directors or the general manager of the enterprise. The application form should include such details as the name of the resident office to be established, the name(s) of the responsible member(s), the scope of activity, duration and site of the office;

b) The legal document sanctioning the operation of that enterprise issued by the authorities of the country or the region in which that enterprise operates;

c) The capital creditability document issued by the banking institution(s) having business contacts with that enterprise; and

d) The credentials and brief biographies of the members of the resident office appointed by that enterprise.

A banking or insurance institution which desires to open a resident office should, apart from producing the documents and reference materials as specified in Paragraphs a, b and d above, produce at the same time an annual report showing the assets and liabilities and losses and profits of the head office of that enterprise, its constitution and the composition of its board of directors.

Article 4. Applications of foreign enterprises for permission to establish resident offices are to be submitted to one of the following organizations for approval:

a) A trader, manufacturer or a shipping agent

should apply to the Ministry of Foreign Trade of the People's Republic of China;

b) A banking or insurance institution should apply to the People's Bank of China;

c) A maritime shipping operator or a maritime shipping agent should apply to the Ministry of Communications of the People's Republic of China;

d) An air transport enterprise should apply to the General Administration of Civil Aviation of China;

e) Enterprises outside these lines of activity should, according to the nature of their operations, apply to the proper commissions, ministries or bureaus under the Government of the People's Republic of China.

Article 5. When granted approval to establish a resident office, a foreign enterprise should, within 30 days of the date of approval, go to the General Administration for Industry and Commerce of the People's Republic of China on the strength of the approval document and go through the registration procedure. The enterprise must fill in a registration form and pay registration fees before it is issued a registration certificate. The original approval document should be recalled in case of failure to register within the deadline.

Article 6. After approval for the establishment of a resident office is granted in accordance with the stipulations in Article 4, the members of that office and their families should, on the strength of the approval document, apply to the local public security organ for residence permission before they are issued residence permits.

Article 7. When a resident office desires to change its name, its responsible member(s), scope of operation, or duration or site, it should apply to the original approval-issuing organization and, after securing approval, go to the General Administration for Industry and Commerce of the People's Republic of China on the strength of the approval document and go through the procedure for effecting a change in registration and pay the fees. It should also go through the procedure with the local public security organ for changing the residence permits.

Article 8. A resident office should, on the

strength of the registration certificate and in accordance with the relevant stipulations of the Bank of China, open an account at the Bank of China or at any bank which the Bank of China may designate.

Article 9. A resident office and its members should, in accordance with the stipulations of Chinese tax laws, go through the tax registration procedure with the local tax office and pay taxes in accordance with the regulations.

Article 10. A resident office and its members should declare to China's House of Customs the imported office articles, articles for daily use and means of transport and pay customs duties and the unified industrial and commercial tax as stipulated.

Imported vehicles and ships should be registered with the local public security organ before the licence plates and permits are issued. Fees should be paid to the local tax office for the use of the

Unauthorized transfer or sale of the above-mentioned imported goods are not permitted. In the event of a necessary transfer or sale, an application should be put forward to the House of Customs and approval obtained before such a transfer or sale can be effected. Imported goods can be sold only to designated shops.

Article 11. A resident office should entrust local service units for foreigners or other such units as may be designated by the Chinese Government with such matters as renting a house or engaging the service of Chinese personnel.

Article 12. The Government of the People's Republic of China undertakes to protect, in accordance with law, the legitimate rights and interests of resident offices and their members and facilitate their normal business activities.

Article 13. Resident offices are not allowed to set up radio stations on Chinese territory. They should apply to the local telecommunications bureaus for the renting of such commercial communications lines or communications equipment as may be necessary for their business operations.

Article 14. The members of a resident office

and their families should abide by Chinese laws, decrees and relevant regulations in all their activities in China and in entering and leaving China.

Article 15. In case a resident office and its members violate the "Interim Regulations" or engage in other law-breaking activities, the proper Chinese authorities have the power to look into the cases and deal with them in accordance with law.

Article 16. A resident office, when the duration of its operation expires, or if it decides to end its business activities before the due date, should notify in writing the original approval-granting organization 30 days in advance of the termination of its operation. After clearing up its debts, paying its taxes and winding up other related matters, the resident office should go through the formalities with the original registration certificate-issuing organization for cancelling the registration and turn in the certificate.

The foreign enterprise which the said resident office represented, should continue to be held responsible for any matter that the said resident office may leave unfinished at the time of its termination.

Article 17. Those resident offices that have already been established with approval should, within 30 days of the promulgation of the "Interim Regulations," go through the procedure of registration with the General Administration for Industry and Commerce of the People's Republic of China on the strength of the documents of approval.

Article 18. Any other matter that may not be covered in the "Interim Regulations" should be handled in accordance with the relevant Chinese laws, decrees and regulations.

Article 19. The "Interim Regulations" should apply to all foreign enterprises which desire to appoint a resident representative or representatives as well as to those desiring to establish resident offices.

Article 20. The "Interim Regulations" enter into effect on the day of promulgation.

41. ANNOUNCEMENT OF THE GENERAL ADMINISTRATION FOR INDUSTRY AND COMMERCE OF THE PEOPLE'S REPUBLIC CHINA CONCERNING THE REGISTRATION OF RESIDENT OFFICES OF FOREIGN ENTERPRISES

(December 8, 1980)

The Interim Regulations of the State Council of the People's Republic of China Concerning the Control of Resident Offices of Foreign Enterprises (hereinafter called "Interim Regulations") have been promulgated for implementation. The present announcement concerns matters relating to registration:

1. As stipulated in the Interim Regulations, resident offices or representatives of foreign enterprises, having secured the approval of the departments in charge under the State Council, should register at this Administration. To enable resident offices or representatives of foreign enterprises to go through the registration procedure at convenient and nearby places, this Administration, upon approval of the State Council, entrusts the administrations for industry and commerce in various provinces, municipalities and autonomous regions to take up this work on its behalf.

2. Resident offices or representatives of foreign enterprises, approved by the departments in charge under the State Council before the promulgation of the Interim Regulations, must go through the registration procedure before December 20, 1980, at the administrations for industry and commerce in the provinces, municipalities and autonomous regions where they are located, on the strength of the approval documents of the departments concerned and copies or duplicates of the documents listed in Article 3 of the Interim Regulations, and obtain a Registration Certificate for Resident Offices of Foreign Enterprises issued by the General Administration for Industry and Commerce of the People's Republic of China.

3. Resident Offices or representatives of overseas Chinese, Hong Kong and Macao enterprises that have been granted approval by the departments in charge under the State Council before

and after this announcement is made, must also register in accordance with the Interim Regulations and obtain a Registration Certificate for Resident Offices of Overseas Chinese, Hong Kong and Macao Enterprises issued by the General Administration for Industry and Commerce of the People's Republic of China.

4. Resident offices or representatives of foreign enterprises approved by people's governments of various provinces, municipalities and autonomous regions or departments under them, must go through the registration procedure with the administrations for industry and commerce in the relevant provinces, municipalities or autonomous regions in accordance with the regulations of the respective provinces, municipalities or autonomous regions, and obtain a Registration Certificate for Resident Offices of Foreign Enterprises issued by the administrations of industry and commerce of the provinces, municipalities or autonomous regions.

5. When going through the registration procedure, the resident office or representative of a foreign enterprise, upon approval, should pay a registration fee of 600 yuan. When going through the procedure for changing the registration certificate, it should pay a registration fee of 300 yuan. When going through the procedure for effecting a change in name, responsible member, scope of operation, duration or site, it should pay a fee of 100 yuan.

6. The period of validity of a Registration Certificate for Resident Offices of Foreign Enterprises is the same as the approved duration of operation, beyond which the registration should be renewed. Offices approved to operate for more than one year should go through the registration procedure once every year.

42. PROVISIONAL REGULATIONS CONCERNING THE EXPORT LICENCE SYSTEM

*Issued by the Import and Export Commission and
the Ministry of Foreign Trade
(June 3, 1980)*

The following regulations have been formulated with a view to strengthening the control of foreign trade:

Article 1. The introduction of the export licensing system by the People's Republic of China is a necessary measure to strengthen the control of export commodities and to coordinate foreign trade transactions and exports of different localities and departments, so as to achieve unity in dealing with foreign countries. The Ministry of Foreign Trade of the People's Republic of China (hereinafter referred to as the "Ministry of Foreign Trade") and the foreign trade bureaus of provinces, municipalities and autonomous regions that have been authorized by the Ministry are designated by the state as the organizations which shall carry out the export licensing system.

Article 2. The general import and export corporations under the Ministry of Foreign Trade and their branches, as well as the corporations authorized by the Import and Export Commission to engage in export business, have the right to conduct export business within a prescribed sphere. Any corporation that wishes to export certain commodities must first make an application and can start business only after it has received approval from the Import and Export Commission and has registered with the Ministry of Foreign Trade or the foreign trade bureaus of the province, municipality or autonomous region and with the customs office concerned, while presenting to it its document of authorization.

Article 3. According to the provisions of Article 2, a corporation which has been authorized to engage in export business, when exporting commodities within the prescribed sphere, is generally regarded as having obtained authorization to export, and customs give clearance to the export commodities according to the "export declaration" filled in by the corporation. It is not necessary for the corporation to apply for an export licence. But an export licence should be applied for in any of the following cases:

a) When commodities are limited by the countries and regions to which they are exported (specific rules shall be worked out separately by the Ministry of Foreign Trade);

b) In case of commodities to which the

Ministry of Foreign Trade thinks it necessary to apply the export licence system and of which the Ministry has fixed the amounts to be exported by different localities and departments, so as to ensure that the total amount of such commodities exported by different localities and departments will not exceed the marketing capacity of the countries and regions to which the commodities are exported;

c) In the case of commodities to which the Ministry of Foreign Trade thinks it necessary to apply the export licence system and for which minimum export prices must be fixed in order to prevent the export prices from being set too low;

d) In the case of commodities which are to be exported under control or which are forbidden for export as explicitly declared by the relevant departments of the State Council;

e) In the case of export commodities which the Ministry of Foreign Trade thinks should be suitably controlled within a certain period of time because of changes in the world market or because of the need to carry out policies towards some specific countries.

Article 4. Export licences are necessary in the cases as follows:

a) Goods to be sent abroad by enterprises, state organs, public organizations, schools or individuals who are not authorized to conduct export business;

b) Goods for sale at exhibitions organized by Chinese departments, enterprises or public organizations in foreign countries;

c) Commodities which are produced by various enterprises, factories or mines on the basis of contracts signed with foreign countries on the basis of compensatory trade, on the processing of goods with materials supplied by clients and on loan grants and which they want to export directly without going through the foreign trade corporations;

d) Goods sent abroad by foreign diplomatic missions, business representatives, citizens and tourists;

e) Goods in excess of the reasonable amount to be taken out of China by foreign citizens and tourists for their own use.

Article 5. In the following cases, the Ministry of Foreign Trade may notify any enterprise at any

time to stop, postpone or reduce its export of any commodity to any country or region:

a) If the exports do not conform to the policies of China towards the countries or regions to which the exports are directed;

b) If the exports do not conform to the content and spirit of bilateral trade agreements or payment agreements between China and the countries or regions to which the exports are directed;

c) If the exports have to be postponed or reduced in order to achieve a balance of foreign exchange in bilateral trade;

d) If inspection by the General Bureau for Imports and Exports Inspection has shown that the quality of the export commodities are not up to the standard fixed by the state, or do not conform to the provisions of the contract.

Article 6. Export licences should be applied for, respectively, by enterprises, government organizations, public bodies, schools, people's communes and individuals. Entries in the application include the names of the commodities (or goods), specifications, the countries and regions to which they are to be exported, quantity, unit price, total value of the exports, date of delivery and method of payment (i.e., how foreign currency is to be collected for the exports. Export licence application form will be issued separately). Application must be submitted for examination and approval by the Ministry of Foreign Trade or the authorized foreign trade bureau of the province, municipality or autonomous region concerned before the dispatch of the goods.

In applying for export licences, the applicants shall not try to obtain the licences through deception or by making false entries in the application form. Those who do so must be investigated and held responsible. Serious cases must be dealt with according to law.

Article 7. After the application has been examined and approved by the department concerned, the applicant will be issued a "licence for the exportation of goods" (hereinafter referred to as "export licence") in triplicate copies. One copy will be kept by the applying unit or individual. The other two will be handed over, together with

the "export declaration," to customs, which will examine it and give clearance accordingly. Customs will keep one of these two copies, while the third one, after being signed by customs, will be sent to the local branch of the Bank of China, which will check it, settle the account and collect foreign currency accordingly.

Article 8. The customs of the People's Republic of China at various levels should exercise supervision and control over export commodities and goods in accordance with these provisional regulations and other relevant provisions. When passing commodities and goods that require an export licence through the customs, the exporter must present the export licence to customs for inspection. If customs find that the export commodities do not tally with the export licence, they should urge the unit concerned to apply for a new export licence or correct the errors before they give clearance. Those commodities which require an export licence shall not be passed until the licence is granted for them.

Article 9. The term of validity of an export licence should be fixed on the basis of the time goods are to be delivered as prescribed in the contract and according to other factors. The term of a licence should not exceed six months starting from the date the licence is issued, and the licence will become invalid after the specified date. If the applicant cannot deliver the goods within the period of validity he may apply for an extension, unless the export licence has stipulated otherwise. The licence may be extended only once, and for a period of two months. If the applicant still cannot send the goods abroad within the extended period but still needs to export them, he should apply for a new licence. The authorities responsible for its approval should examine the application again in the light of the conditions then prevailing.

Article 10. The list of commodities which require an export licence as stipulated in these regulations will be drawn up by the Ministry of Foreign Trade and will be readjusted from time to time according to the actual situation and distributed to units concerned for them to abide by.

43. PROVISIONAL CUSTOMS REGULATIONS FOR INWARD AND OUTWARD BAGGAGE OF OVERSEAS CHINESE AND OTHER PASSENGERS

*Promulgated by the Ministry of Foreign Trade
(July 1, 1979)*

1. To effectively implement foreign trade control policy as well as serve the needs of those passengers having relatives in China or abroad, viz. overseas Chinese, foreigners of Chinese origin, permanent aliens residents in China and Chinese nationals on visits to relatives abroad, Customs shall deal with their inward and outward baggage according to the present regulation, subject to the "Rules for Customs Supervision and Control over Inward and Outward Passengers' Baggage."

2. Baggage carried by the above-mentioned passengers, if within the prescribed limit set on the

attached table, shall be released on entry or departure either free of duty or on payment of duty. In case the imported articles listed as items Nos. 1 to 14 of the table exceed the import duty-free limit, they may still be released on payment of duty, provided they are in reasonable quantities for personal use and their total value does not exceed 200 yuan.

Articles exceeding duty-free and dutiable limits shall be returned abroad or to places in China as the case may be, except watches, radios, cameras and other items necessary for the journey, which shall be registered with Customs and taken

Table of Import/Export Limits for Duty-free or Dutiable Articles

Category	Item	Import Limit	Export Limit

	5. Musical instruments (accordions or violins)	1	
	6. Ginseng/deer antlers	150 g.	

* Luxuries are dutiable

**Without recording facility

out of or brought back to China by the passengers at the time of exit or entry.

The provisions of this Article also apply to baggage carried by the accompanying spouse and children of passengers. For children under 16 years of age, only half of the quantities specified under items Nos. 1 to 14 shall be duty-free. For children between the ages of 12 and 15, one watch per person may also be released duty free.

3. The above-mentioned passengers shall be subject to the Customs Rules for Short-term Visitors from the second time of entry or departure if they enter or leave China more than once within a year.

4. The limits prescribed in the table attached to the present regulation do not apply to baggage carried by the above-mentioned passengers who are coming to China or going abroad for resettlement.

Their baggage may be released free of duty on entry or departure provided it is in reasonable quantities for personal use.

5. New handicrafts bought at state-owned shops, cultural relics (ascertained by the authorities in charge of cultural relics as permissible for export), old handicrafts, jewellery, gold and silver ornaments, etc., bought at Friendship Stores or Relics Stores by overseas Chinese or foreigners of Chinese origin with Renminbi obtained by the exchanging of foreign currencies, shall be presented on departure to Customs together with the relevant invoices and foreign exchange certificates, on the strength of which Customs shall release the articles concerned.

6. The present regulation came into force on April 5, 1978.

44. RULES OF THE PEOPLE'S REPUBLIC OF CHINA GOVERNING THE LEVYING OF IMPORT DUTY ON ARTICLES OF PASSENGERS' BAGGAGE AND PERSONAL POSTAL PARCELS

Article 1. These rules have been drawn up with a view to implementing the policy of State control of foreign trade, protecting the country's socialist economy, and simplifying the procedures for the collection of customs duties so as to facilitate regular traffic.

Article 2. Import duties on dutiable articles carried by inward passengers, imported by means of personal parcels, carried by crew members of inward means of conveyance for personal use or imported by any other means for personal use (all hereunder referred to as "imported articles") are to be levied by Customs according to these rules.

The import duty referred to in these rules includes both customs duty and the industrial and commercial consolidated tax.

Article 3. The schedule of import duty rates is as follows:

Tariff No.	Description of Articles	Rate of Import Duty
1.	Cereals, cereal flours	20%
2.	Medical equipment, scientific instruments and electronic computers	20%
3.	Pharmaceutical products and preparations, medicinal and aromatic substances of animal or vegetable origin	50%
4.	Office or household machines, recorders, cutting tools, hand tools, hand farm implements, and parts or accessories thereof	50%
	Television sets and parts or accessories thereof	50%
	Sports equipment, musical instruments	50%
5.	Foodstuffs and beverages	100%
6.	Deer antlers, musk, ginseng	100%
7.	Cotton cloth, linen, clothing and other articles for personal wear made of cotton or linen, cotton or linen fabrics and other cotton products	100%
8.	Radio sets, record-players, and parts or accessories thereof	100%
	Bicycles and other vehicles, and parts or accessories thereof	100%

9. Fabrics of woollen, silk, artificial and synthetic fibres and clothing and other articles for personal wear made thereof, clothing and articles for personal wear made of other materials (such as leather, fur, plastics, etc.) 150%
- Cameras, photographic supplies or materials, video recorders, and parts or accessories thereof 150%
10. Birds' nests, sharks' fins, beche-de-mer, awabi, compoy, fish maws, fish lips 200%
- Tobacco and products thereof, wine and spirits 200%
- Cosmetics and perfumes 200%
11. Wrist-watches, pocket-watches and parts or accessories thereof 200%
12. Duty-free articles:
 1. Books, newspapers, periodicals, educational films and lantern-slides, and language records which are allowed to be imported;
 2. Contraceptive devices and medication;
 3. Gold and silver, and articles made thereof.
13. Articles not otherwise provided for in the above tariff numbers 100%

Article 4. Articles not enumerated in the above schedule shall be classified by Customs under the most appropriate tariff number.

Import duty on an article is to be levied at the tariff rate in force on the date of issue of the Customs Duty Memorandum.

Article 5. Imported articles are liable to ad valorem duties. An articles duty-paying value shall be assessed by Customs on the basis of its c.i.f. value. If the c.i.f. value cannot be ascertained, the duty-paying value shall be assessed by Customs in light of domestic prices.

Article 6. Should a duty-payer be dissatisfied with the tariff classification and/or the duty-paying values of the imported articles as determined by Customs, he shall first pay the import duty in full and then file an appeal in writing with

Customs within 14 days of the date on which the duty is paid. On receipt of the written appeal, Customs shall reconsider the case within 7 days. If the original decision is maintained, Customs shall, within 14 days of the date of receipt of the original appeal, transmit the appeal, together with its comments, to the Customs Administration of the People's Republic of China for consideration. If the original decision is modified, the duty-payer is to be duly notified and the duty adjusted accordingly. Should the duty-payer still be dissatisfied with the modified decision, he may file another

appeal within 7 days of the date of receipt of the notification of the modified decision. Customs shall, within 7 days of the date of receipt of the second appeal, forward the case to the Customs Administration of the People's Republic of China for consideration. The decision of the Customs Administration of the People's Republic of China shall be final.

Article 7. After approval by the State Council, these rules shall be promulgated and put into force by the Ministry of Foreign Trade.

45. REGULATION FOR CUSTOMS CONTROL OVER BAGGAGE OF PASSENGERS COMING FROM OR GOING TO HONG KONG AND MACAO

Promulgated by the Ministry of Foreign Trade

(July 1, 1979)

Article 1. Baggage carried by passengers coming from or going to Hong Kong and Macao (hereinafter referred to as "passengers"), if in reasonable quantities for personal use and within the limit specified in the "Table of Duty-free and Dutiable Articles Carried by Passengers" (see Appendix 1), shall be released either free of duty or on payment of duty after Customs inspection.

Article 2. Inward passengers carrying baggage which is within the import duty-free limit as

specified in the attached table may pass through "Green Channel" where it is so provided by Customs. Should articles carried by such a "Green Channel" passenger be found exceeding the import duty-free limit, which is deemed a violation of Customs regulations, Customs shall inflict on the offender a fine not greater than 500 yuan according to the nature of the case. In addition, the articles exceeding the import duty-free limit shall be returned to Hong Kong or Macao. Should dutiable articles be found in such a case, it shall be

Appendix 1:

Table of Limits for Duty-free and Dutiable Articles Carried by Passengers

Category	Item	Import Limit	Export Limit
Duty-free	Total weight in which:	30 kg.	30 kg.
	1. Clothes of all kinds	35 pcs. (in reasonable quantities)	Total value not exceeding 15 yuan for traditional Chinese medicines, in which the total weight of Chinese medicinal herbs shall not exceed 1 kg; each kind of medicine 250g.; Yunnanbaiyao 12 g.
	2. Shoes/socks/scarves	10 prs./pcs. of each	
	3. Bedding	1 pc. or pr. of each kind, but 3 pcs. or prs. in all	
	4. Dress material (single width)	10 m.	
	5. Foodstuffs	15 kg.	
	6. Wine and spirits (including medicated wine)	2 bottles (not exceeding 750 g. each)	
	7. Cigarettes	400 pcs.	
	8. Therapeutic medicines and home remedies	in reasonable quantities for personal use only	
	9. Daily necessities	RMB 20 yuan (in reasonable quantities for each kind)	
Dutiable	1. Pocket calculators	1 pc.	
	2. Watches, radios, TV sets, recorders (including combinations), cameras, electric fans, bicycles, sewing machines, and accessories thereof	1 pc. per person a year with a reasonable quantity of accessories.	
	3. Ginseng/Deer antlers	100 g. of each	
Remarks	1. For children under 16 years of age, only articles necessary for personal use shall be released free of duty.		
	2. Furniture or unsanitary old clothes shall not be allowed to be brought into China.		
	3. Musks, toad cake, cinnabar, eucommia, gastrodia elata, Chinese caterpillar fungus, Pianzihuang, Angongnuihuang pills, Liushen pills and unappraised cultural relics shall not be allowed to be taken out of China.		
	4. Articles bought with Renminbi obtained through the exchanging of foreign currencies may be taken out on the strength of the relevant commercial invoices.		

deemed an act of smuggling and dealt with accordingly.

Article 3. Inward passengers carrying articles which are dutiable and/or over the import duty-free limit as specified in the table shall pass through "Red Channel," where it is so provided by Customs, and declare their articles to Customs, who shall release the articles after inspection according to the present regulation.

Article 4. Baggage carried by outward passengers may be released at the time of exit provided it does not exceed the limit as specified in the attached table.

Article 5. For passengers who will return within 24 hours, only items necessary for their personal use on the journey shall be released.

Article 6. For passengers coming in or going out for resettlement in China or Hongkong or Macao, Customs shall, on the strength of the relevant papers, deal with their baggage according to the provisions of the "Rules for Customs Supervision and Control over Inward and Outward Passengers' Baggage."

Article 7. Articles carried by outward passengers, if found to be in excess of the prescribed export limit, shall not be permitted to be taken out whereas articles carried by inward passengers, if found to be in excess of the prescribed import limit, shall be detained by Customs. In the latter case, the detained articles may be reclaimed and returned to Hongkong or Macao within a month. On expiry of the time limit, the Customs shall dispose of the articles and remit to the national treasury the proceeds realized from their disposal. However, passengers may make a request to bring along articles necessary for the journey guaranteeing the re-importation or re-exportation of such articles. With Customs approval and registration, such articles shall be released but must be brought back to or taken out of China at the time of re-entry or exit.

Article 8. Passengers shall be forbidden to bring into or take out of China certain prohibited articles (see Appendix 2). However, jewelry and gold and silver ornaments brought in by passengers at the time of entry and registered with Customs may be taken out at the time of exit.

Article 9. Selling for profit of the Articles

released by Customs for inward passengers' personal use shall be strictly forbidden.

Article 10. Offenders of the present regulation shall be dealt with according to the relevant provisions of the regulations.

Appendix 2:

List of Prohibited Import/Export Articles of the People's Republic of China

Prohibited Import Articles

- (1) Arms, ammunition and explosives of all kinds;
- (2) Radio transmitter-receivers and principal parts;
- (3) Renminbi;
- (4) Manuscripts, printed matter, films, photographs, phonograph records, cinematographic films, loaded recording tapes and video-tapes, etc. detrimental to Chinese political, economic, cultural and moral interests;
- (5) Deadly poison, addictive narcotics, opium, morphia, heroin, etc.;
- (6) Animals, plants, and products thereof infected with or carrying harmful germs and insect pests;
- (7) Unsanitary foodstuffs and germ-carrying foodstuffs from infected areas;
- (8) Other articles the importation of which is prohibited by national regulations.

Prohibited Export Articles

- (1) Arms, ammunition and explosives of all kinds;
- (2) Radio transmitter-receivers and principal parts;
- (3) Renminbi and securities in Renminbi;
- (4) Foreign currencies, bills and securities in foreign currencies (with the exception of those allowed to be taken out);
- (5) Manuscripts, printed matter, films, photographs, phonograph records, cinematographic films, loaded recording tapes and video-tapes, etc. which contain state secrets or otherwise not permissible for export;
- (6) Valuable cultural relics and rare books relating to China's revolution, Chinese history, culture and art;
- (7) Rare animals, rare plants and their seeds;
- (8) Precious metals and articles made thereof, jewelry and ornaments made thereof (with the exception of those within the quantity allowed to be taken out by outward passengers);
- (9) Other articles the exportation of which is prohibited by national regulations.

46. PROVISIONAL REGULATIONS CONCERNING PIECE-RATE WAGES IN STATE-OWNED ENTERPRISES (DRAFT)

*Issued by the State Planning Commission, the State Economic
Commission and the State Bureau of Labour
(April 1, 1980)*

With a view to better carrying out the principle of "from each according to his ability, to each according to his work," to arousing the labour enthusiasm of the workers and staff members, to enhancing labour productivity and impelling the enterprises to improve their management so as to speed up the development of socialist production and construction, the present regulations have been worked out:

1. Those enterprises which carry out the piece-rate wage system must possess the following conditions:

a) They should have adequate production tasks and a normal supply of raw and processed materials, fuels and power and a stable market for their products;

b) They should have advanced, rational production quotas and strict standards for measuring the quantity of products and for checking on their quality;

c) They should have a fairly sound management system (with original records of production, statistical data, check-up and acceptance of products and economic accounting).

2. The enterprises which possess the necessary conditions for the implementation of the piece-rate wage system may apply it to all workers for whom the system is suitable.

3. In the course of carrying out the piece-rate wage system, the enterprises must guarantee that their products are up to the fixed standards, and that the quota for material consumption is not exceeded, and they must bring about a clear-cut reduction in the costs of per-unit products and wages. If, after an enterprise has adopted the piece-rate wage system, the quality of its products is lowered, its consumption of materials exceeds the fixed quota, or the costs of per-unit products and wages are increased, it should immediately stop practising the system. Meanwhile, the leadership of the enterprise must to a certain degree be held responsible for resultant economic losses and must recover that portion of wages that should not have been paid to the workers.

4. In practising the piece-rate wage system, an enterprise must strengthen the management of

production quotas. Wherever there are unified production quotas set by the department in charge, the enterprise should adopt these quotas for its workers. Where there are no unified quotas, the enterprise may set its own quotas, but it must report them for approval to the higher authorities in charge before adopting these production quotas.

The production quotas of an enterprise, be they stipulated by the department in charge or set by the enterprise itself, must always be advanced, rational quotas. As a rule, they should be re-examined and revised every six months or each year. A timely revision must be made if any of the following cases arises:

a) Major changes made in the specifications of products or raw materials;

b) Major changes made in production equipment, instruments and in the technological process;

c) The worksite or geological conditions have changed obviously;

d) The level of some quotas have been set too low or too high;

e) The level of quotas is seriously affected by the adoption of inventions, technical innovations or rationalization proposals (the collective or individuals who have made the inventions, innovations or rationalization proposals may be allowed to keep the original level of quotas unchanged for half a year, in addition to receiving the bonuses due to them).

When production quotas are introduced by an enterprise, they first should be tried out for a certain period, but generally for not more than three months.

5. In practising the piece-rate wage system, an enterprise should fix reasonable piece prices per unit. The unit piece price of a product will be fixed on the basis of production quotas to be fulfilled by workers within a prescribed time, the standard-time wages corresponding to the equivalent grade of the object of work and the current level of workers' wages. The grade of the object of work is determined by the technical complexity, the strenuousness of the work, the weight of responsibility and the condition of the production equipment involved.

When a production quota has been revised, the unit piece price must be changed accordingly.

6. To encourage workers to raise the quality of products, the piece prices of all products that are classified according to quality of all products should be fixed according to the principle of "higher price for better quality." The piece prices of high-quality products should be set a little higher than that of average up-to-standard products.

To facilitate the upgrading and renewal of products, the piece price of a new variety of product may also be set higher when it is trial-produced.

7. An enterprise may apply the piece-rate wage system to the collective or to the individual according to the characteristics of its production. But among the workers of the same group or team, it shall not apply the collective piece-rate wage system to some and a time wage system to others.

8. Whether the piece-rate wage system is applied to a collective or to individual workers, an enterprise should pay the wages on the basis of piece price according to how well the collective or the workers fulfil their production quotas.

Provided that production quotas are advanced and rational, no limit should be imposed on extra wages earned by workers who overfulfil their quotas.

9. In groups or teams to which the collective piece-rate wage system is applied, the piece-rate wage received should be distributed according to the respective contributions of their members in production. It should not be distributed on a basis of equal portions.

10. The workers to whom the piece-rate wage system is applied may be given economy bonuses in accordance with the Tentative Regulations (Draft) on Bonuses for Saving Specially Designated Fuels and Raw Materials in State-Owned Industrial and Transport Enterprises as jointly promulgated on December 10, 1979 by the Ministry of Finance, the State Bureau of Labour and the State Administration of Supplies. But they shall no longer receive regular production bonuses.

11. When a worker who is paid according to the piece-rate wage system produces items that are rejected due to his own fault, the enterprise concerned shall not pay wages for the rejects but shall

ask him to compensate for a part or the whole of the loss according to the seriousness of the loss he has caused. While a basic living standard is guaranteed to the worker, the maximum amount of the compensation he pays per month should not exceed 25% of his standard monthly wage and generally the compensation should be paid off within a period not exceeding six months.

12. Before an enterprise introduces the piece-rate wage system, it must make a plan and send it to the department in charge for approval and then report the system to the local labour management department for the record.

13. An enterprise practising the piece-rate wage system should at three-month intervals inform the bank with whom it has opened an account how the system is being carried out so that the bank may supervise its execution. If the bank discovers that the unit costs of a product and wages have increased after the enterprise introduced the piece-rate wage system, it has the right to examine the financial affairs of the enterprise and refuse to pay the piece wages.

14. While practising the piece-rate wage system, the enterprises should strengthen political ideological work among the workers and staff members, educating them to adopt a communist attitude towards labour, to co-operate well with each other in production, and to strictly observe labour discipline and the operating rules. Those who practise fraud, who damage equipment and tools and who waste too much raw material should be given disciplinary sanctions in accordance with the relevant regulations. The portion of wages received through fraud should be ascertained and all of it returned.

15. The provinces, municipalities and autonomous regions as well as the various departments of the State Council may, in light of their specific conditions, work out concrete rules according to the provisions of these regulations to be transmitted to their subordinate units and, at the same time, send copies of these rules to the State Planning Commission, the State Economic Commission and the State Bureau of Labour for the record.

**47. A JOINT CIRCULAR OF THE STATE ECONOMIC COMMISSION,
THE GENERAL ADMINISTRATION OF INDUSTRY AND COMMERCE AND THE
PEOPLE'S BANK OF CHINA ON A NUMBER OF
QUESTIONS REGARDING THE SUPERVISION OF ECONOMIC CONTRACTS**

(August 8, 1979)

To the Administrations of Industry and Commerce, the Economic Commissions and Branches of the People's Bank of All Provinces, Municipalities and Autonomous Regions:

To practise the contract system, i.e., to stipulate in the form of a contract the details of contact and coordination between enterprises in the production, supply, shipment and marketing of goods, to stipulate each other's economic commitments and responsibilities and to seriously carry out these stipulations, is an important measure for raising the level of management of enterprises, strengthening business accounting, guaranteeing the fulfilment of the state plan and managing the economy by economic measures. This system should be actively pursued in the realization of the Four Modernizations in socialist construction. In order to strengthen the supervision of contracts, to urge the enterprises to execute their contracts strictly and to defend the just interests of both sides, the following circular on a number of major questions regarding the supervision of economic contracts is made in the light of the documents concerned as issued by the Central Committee of the Chinese Communist Party and the State Council:

1. In accordance with the State Council Document No. 102 (1979), the economic contracts on goods supply, production and sales, processing, shipment, etc. are to be supervised by the following authorities on the basis of division of work:

The economic contracts between units belonging to the same department or economic sector, such as industry, agriculture, material administration, communications and transport, commerce (which includes foreign trade, grain and supply and marketing cooperatives, here and below), are to be supervised by the authorities in charge of that department or sector.

Economic contracts between different industrial departments; between industrial enterprises and material administration, building industry and agricultural departments; between industrial, agricultural, commercial, material administration and building units and communications and transport

departments; as well as those between industrial, communications and transport departments and government organs, mass organizations, army units and institutions; are to be supervised by economic commissions at various levels or by other corresponding authorities.

Economic contracts between different commercial departments, between commercial units and units of industrial and agricultural departments as well as government organs, mass organizations, army units and institutions are to be supervised by the administrations of industry and commerce at various levels.

2. Before signing a contract, the enterprises or units concerned must conduct realistic and full consultations on an equal footing on the basis of the policies, decrees and laws and plans of the state and in the spirit of the principles of producing according to needs, ensuring supplies and promoting development of the national economy. A contract must have specific details, clear commitments and responsibilities of each side and unequivocal wording.

The main contents of a contract should include: name of the product, its model, specification, quality, quantity, measuring unit, the technical specification of industrial products, package requirements and the supply and retrieval of packing materials, means of delivery and destination, shipment, date of delivery (and taking delivery) of the goods, the price of the product, modes of settlement of accounts, settling bank, the bank account number of the units, economic commitments and responsibilities, etc.

3. For the guarantee of contracts, we do not make any unified stipulations for the time being. The contract supervisory authorities of each province, municipality and autonomous region can make their own decisions in this connection in accordance with actual conditions. But if both the supplier and buyer sides of a contract demand a guarantee, the contract should be guaranteed.

For all the guaranteed contracts, the guarantor authorities should be responsible for the check-up of the contracts' legality and their main contents, and those which do not conform to the policies or stipulations of the state should be corrected.

The guarantor authorities should be the contract supervisory authorities of the region where the supplier side of the contract is located.

4. Once a contract is signed, it has a legal effect. Both sides must scrupulously keep their word and strictly execute the contract. If any side does not execute the contract seriously and causes losses to the other side, it should bear the economic and legal responsibilities.

5. Once a contract is signed, neither side can change it or terminate it on its own authority. If it is necessary to make any changes or terminate the contract, it should be agreed on by both sides through consultations and an agreement should be signed on the amendment to the contract or on its termination. If an important product controlled by the state plan is involved, such an agreement should be reported for the record to the authorities in charge of the product; if a guaranteed contract is involved, it should be reported for the record without exception to the guarantor authorities. Before such an agreement is signed, the original contract remains valid and neither side can refuse to execute it on any excuse. Any losses incurred by the amendment or termination of the contract should be compensated on a fair and reasonable basis by the side which asked for the change or termination.

6. If any disputes arise during the execution of the contract, the two contracting sides should actively consult each other and do their best to find out a reasonable solution. If they fail to agree with each other, any side may apply for arbitration to the Economic Commission (or corresponding authorities) or the Administration of Industry and Commerce of the county or the district, in the case of a big or medium-sized city, where the other side is located, in accordance with the division of work among the contract supervisory authorities. If any side refuses to accept the ruling, it may apply to the next higher supervisory authorities for reconsideration within ten days after the day the notice on the ruling is received. If it still remains unconvinced by the reconsidered ruling, it may sue at the people's court within ten days after the day the notice on the reconsidered ruling is received. In case one side concerned does not apply for reconsideration or does not sue at the court within the ten-day period while refusing to execute the ruling, the People's Bank should transfer the sum of money and the contract-breaking side should pay for the goods or compensate for the losses to the other side's account in accordance with the ruling notice.

For disputes or economic contracts between

units belonging to the same department or sector, the mediation and arbitration procedure can be decided by the authorities in charge of that department or sector.

During the period of mediation and arbitration, the arbitrating authorities, in the light of the actual situation, may notify both contractors to stop executing the contract for the time being.

7. The People's Bank is to supervise all enterprises' execution of their economic contracts by means of credit and settlement management. The People's Bank will gradually take the measure of granting loans to enterprises in accordance with their economic contracts, on the basis of the state plan. The rules of settlement must be conscientiously followed and settlement discipline strictly adhered to. Both contractors must settle the account in accordance with the mode of settlement specified in the economic contract, and the bank should handle acceptance or refusal of payments, or deduct the required sum of money from the account of the enterprise which delays payment for the goods or payment of compensation, in accordance with the specific regulations of the rules of settlement.

8. The money paid in compensation caused by an enterprise's own errors should not be included in the cost of production of the goods, but should be paid out of the enterprise's share of the profits or out of its own funds. If a serious violation of this rule occurs, a fine will be deducted from the wages of those who are responsible for it, and an investigation into their administrative or legal responsibilities should be made.

For any failure in executing the contract caused by force majeure or other reasons which are really not brought about by the enterprise itself, the enterprise can be freed from economic responsibilities when the above causes are proved through investigation by the arbitrating authorities. The authorities in charge can take other measures to recoup as much of those economic losses as possible.

9. In order to supervise enterprises and to encourage them to execute their contracts conscientiously, the supervisory authorities have the right to verify both the statistics and data concerned and the actual execution of the contract. If problems that hamper the execution of the contract are discovered, the departments concerned should be asked to take effective steps to solve the problem in time. Any violations of the law — such as performing shoddy work or using inferior materials, making profits by acting as a broker, selling a contract at a profit, or purposely avoiding

supervision — should be put to the Administration of Industry and Commerce for investigation and punishment. If it is a serious case, it should be handed over to the judiciary for punishment by law.

10. Economic contracts are major business documents. All enterprises should establish files, compile ledgers and keep them properly. For a guaranteed contract, the enterprise should give a copy to the guarantor authorities for special filing.

11. In their work, the contract supervisory authorities should closely cooperate with judicial, planning and other business departments concerned. Necessary liaison systems should be established for exchanging information, coordinating actions and strengthening collaboration.

12. All parts of the country are asked to adopt the above points as experiments, to sum up their experiences and to offer suggestions for further amendments.

48. REGULATIONS ON CONTROL OF THE PURCHASING POWER OF SOCIAL GROUPS

(Revised by the Financial and Trade Group of the State Council, the State Planning Commission, the State Commission, the Ministry of Finance, the People's Bank of China, the Ministry of Commerce, the All-China Federation of Supply and Marketing Cooperatives and the State Statistical Bureau on November 17, 1980.)

Economizing on non-production expenses, by limiting the purchasing power of social groups, is an important measure for the implementation of the policy of "building the country industriously and thriftily" and speeding up the process of the Four Modernizations. This measure should be enforced over a long period of time. In light of the development and changes of the economic situation, we have revised the "Regulations on Control of the Purchasing Power of Social Groups" adopted in 1977 as follows:

I. The Scope of Control

The purchasing power of social groups refers to the public funds spent by social groups in the market for non-production commodities. Its scope is defined in the "Provisions on the Scope of the Purchasing Power of Social Groups," an appendix to the "Regulations on Control of the Purchasing Power of Social Groups" issued by the State Planning Commission and three other departments in 1977.

Except for some specially controlled commodities, no control quotas are imposed on neighbourhood offices in the cities, on districts, towns and people's communes of the counties and their affiliated enterprises and establishments, or on units of the People's Liberation Army below battalion level. The provinces, municipalities and autonomous regions, the General Logistics Department and the General Bureau of Frontiers can work out their own regulations on control of the purchasing power of social groups.

II. Control Measures

The purchasing power of social groups shall be controlled through planning, quotas, authorization for specially controlled commodities and supply quotas. Concrete measures are as follows:

A. Control through Planning. The state will fix annually the purchasing power quotas of social groups and decide on the extent of their increase

or decrease as part of the national economic plan in accordance with the needs of developing the national economy and of maintaining balance in the market. The quotas should be implemented at all levels.

When making plans for the production, importation and distribution of commodities, the departments of planning, materials, commerce and foreign trade at various level should keep an overall balance between production, supply and marketing. With regard to those commodities specially produced for social groups, the departments should decide on the quotas after consultations with relevant departments at the same levels.

B. Control Through Quotas. All provinces, municipalities and autonomous regions should allocate the quotas distributed by the higher authorities to the independent accounting units at the grass-roots level before the beginning of a new fiscal year with reference to the actual fulfilment of the quotas of the previous year, in proportion to the number of workers and staff members and with the expansion of the units in mind. The quotas can be allocated at one time or at several times; when the base figure is not available, it is better to allocate the quotas quarterly. Allocating the quotas it is necessary to deal with each case on its own merit. Efforts should be made to control the quotas in the spirit of practising strict economy while not interfering in the work of the units concerned. Purchasing power quotas should be closely integrated with financial quotas.

The purchasing power quotas of social groups are completely controlled. However, quotas for such commodities as medicines, medical apparatus and instruments, labour safety supplies, coal for drinking water, bathing and heating, and fuel for cars used for non-production purposes can be allocated to grassroots units or kept at the provincial, municipal or autonomous regional level. The purchasing power of local enterprises and establishments located outside the capital belonging to the central government departments and the standing organs of the central government departments should be controlled by the local department concerned.

All units should deal properly with the quotas allocated by the higher authorities in accordance with the actual situation and distribute them to those departments in need of the commodities. The departments in need of the commodities should regularly work out plans for purchasing non-production commodities and purchase the commodities within the framework of the quotas. The accounting section of the units that purchase commodities under the purchasing power of social groups should enter the purchased items according to the invoice in the subsidiary account book for the purchasing power of social groups. Commodities purchased by the enterprises and establishments as production commodities but later used for non-production purposes should also be entered in the subsidiary account book. The finance section should strictly check and supervise non-production expenses and see that they do not exceed the quotas. Meanwhile, it should submit the precise statistical figures to the higher authorities as required.

C. Authorization for Specially Controlled Commodities. The purchase of specially controlled commodities should be authorized on the basis of the "Regulations on the Purchase of Specially Controlled Commodities by Social Groups" issued by the Ministry of Finance and four other central government departments in 1980, and related documents. All units which purchase commodities under special control should go through the necessary procedures and refrain from fraudulently purchasing these commodities without the authorization of the department concerned. A unit which purchases specially controlled commodities in other provinces should have an "authorization paper" issued by the authorities of the province in which the unit is located.

D. Supply by Quota. All units supplying commodities under the purchasing power of social groups should supply those items strictly on the basis of the quota and relevant regulations. Supply in excess of the quota and plan is not allowed. The supply unit should submit the marketing plan for these commodities and the actual marketing situation to the local office in charge of controlling the purchasing power of social groups.

All regions and departments should establish step by step the quota system for the commodities and expenses which can be put under quota control.

III. Relying on the Masses

The method of combining professional

management with mass administration shall be put into effect. The significance of controlling the purchasing power of social groups should be repeatedly made known to the masses. It is necessary to rely on the masses to work out thrift measures, draw up warehouse inventories, tap the latent potential of enterprises, repair and utilize old or discarded articles, use substitute materials to practise thrift and actively further the movement to increase production and practise economy.

When planning its expenses related to the purchasing power of social groups and reporting specially controlled commodities to the higher authorities, each unit shall consult democratic management and supervisory setups, regularly publicize the implementation of the regulations on the purchasing power of social groups, solicit opinions and suggestions from the broad masses and place itself under the surveillance of the masses.

IV. Strict Discipline

All government and mass organisations, PLA units, schools, enterprises and institutions must observe the financial and economic discipline of the state, act according to the present regulations and various other provisions. In case of statutory violations, financial departments have the power to reject accounts to be rendered, banks have the power to refuse to pay and transfer accounts, commodity supply units have the power to refuse to supply goods, departments of public security and traffic supervision and control have the power to refuse to issue car licences, and the office of controlling purchasing power of social groups and financial organs have the power to confiscate the indiscriminately purchased commodities. In serious cases, reports will go to the leadership for taking disciplinary actions against the violators.

A regular inspection system shall be set up with one or two general and special inspections organized by each province, municipality and autonomous region per year. Various units and departments shall undertake regular book-keeping activities and carry out joint auditing and mutual inspections so as to learn from and supervise each other.

V. Strengthening the Leadership

Leading groups and offices of controlling purchasing power of social groups shall be established by the people's governments above the county level. Leading groups shall consist of leading comrades from the State Council Financial Office, the State Planning Commission, the State Economic

Commission, financial, banking, commercial, supply and marketing, statistical and other departments. Each group leader is to be selected from among the leading comrades by the people's government. The leading group is to hold regular meetings, review its work and strengthen the leadership in earnest. The offices of controlling purchasing power of social groups are standing executive organs of the said leading groups. Each office must have a regular authorized size and enough staff members to suit the needs of its work.

All responsible departments, enterprises, institutions and administrative units must appoint special persons to take charge of the work of controlling the purchasing power of social groups.

All departments of planning, finance, banking, commerce, supply and marketing, materials, statistics, public security, transportation and communications at various levels shall adopt a clear-cut division of labour, work in close coordination, support and cooperate with each other. The imple-

mentation of the present regulations must be included in the system of personal responsibility for checking on and appraising through comparison cadres in charge of finance and taxes, financial accountants, employees of commodity supply units, bank bookkeepers, cashiers, public security personnel, and workers of traffic supervision and control.

The regulations on control of the purchasing power of social groups for the Chinese People's Liberation Army and the People's Armed Frontiers Police of China shall be prepared separately, in the light of the present regulations, by the General Logistics Department of the Military Commission of the Central Committee of the Chinese Communist Party and the General Bureau of Frontiers of the Ministry of Public Security.

The present regulations shall come into force as of January 1, 1981. In case of any contravention between the present regulations and previous regulations, the present regulations shall hold.

49. THE ENVIRONMENTAL PROTECTION LAW OF THE PEOPLE'S REPUBLIC OF CHINA

(For Trial Implementation)

(Adopted in Principle at the 11th Meeting of the Standing Committee of the Fifth
National People's Congress on September 13, 1979)

Chapter I. General Provisions

Article 1. This law is established in accordance with Article 11 of the Constitution of the People's Republic of China which provides that "the State protects the environment and natural resources and prevents and eliminates pollution and other hazards to the public."

Article 2. The function of the Environmental Protection Law of the People's Republic of China is to ensure, during the construction of a modernized socialist state, rational use of natural environment, prevention and elimination of environmental pollution and damage to ecosystems, in order to create a clean and favourable living and working environment, protect the health of the people and promote economic development.

Article 3. For the purposes of this law, "environment" means: the atmosphere, water, land, mineral resources, forests, grassland, wildlife, wild plants, aquatic plants and animals, famous spots and historic sites, scenic spots for sightseeing, hot springs, health resorts, nature conservation areas, residential districts, etc.

Article 4. The guidelines governing environmental protection work are: overall planning, rational layout, comprehensive utilization, conversion of harm into good, reliance upon the masses with everybody taking part in the protection of the environment for the benefit of the people.

Article 5. The State Council and its subordinate bodies, and the local people's governments at all levels shall endeavour to carry out environmental protection work in earnest and do a good job of it. They shall make overall plans for the protection and improvement of the environment in planning for national economic development and take practical measures for its implementation. Where pollution of the environment and other hazards to the public have already been caused, plans should be worked out to eliminate such in a systematic and orderly manner.

Article 6. All enterprises and institutes shall

pay adequate attention to the prevention of pollution and damage to the environment when selecting their sites, designing, constructing and planning production. In planning new construction, reconstruction and extension projects, a report on the potential environmental effects shall be submitted to the environmental protection department and other relevant departments for examination and approval before designing can be started. The installations for the prevention of pollution and other hazards to the public should be designed, built and put into operation at the same time as the main project. Discharge of all kinds of harmful substances shall be in compliance with the criteria set down by the State.

The units which have caused pollution and other hazards to the environment shall, according to the principle of "whoever causes pollution shall be responsible for its elimination," make plans to actively eliminate such, or alternatively submit an application to the competent authorities for approval to transfer the property or move to some other place.

Article 7. In rebuilding old cities or building new ones, assessments shall be made of the potential environmental effects in industrial and residential areas, public utility facilities, and green belts by reference to the meteorological, geographical, hydrological and ecological conditions; and overall planning and rational layout shall be made to prevent pollution and other hazards to the public so as to build a clean modern city in a planned way.

Article 8. The citizen has the right to supervise, accuse and bring a complaint before the court against the unit or the individual who has caused pollution and damage to the environment. The unit or the individual thus accused and charged shall not take any retaliatory action.

Article 9. Foreigners or foreign aircraft, ships, vehicles, goods, plants and animals, etc. entering or passing Chinese territory, territorial waters, or airspace shall be subject to the present law and other regulations and rules relating to the protection of the environment.

Chapter II. Protection of Natural Environment

Article 10. Use the land rationally according to local conditions, improve the soil and increase the vegetation to prevent soil erosion, hardening, alkalization, desertification, and water losses.

Comprehensive scientific surveys shall be carried out before going ahead with plans to reclaim wasteland, put up dykes along the seacoast or lakes, and construct new large- or medium-sized water conservancy facilities. Practical measures for protection and improvement of the environment shall be taken to prevent damage to the ecosystems.

Article 11. Keep bodies of waters such as rivers, lakes, seas, reservoirs, etc., from being polluted so as to preserve the quality of water in a good state.

Protect, develop and utilize aquatic flora and fauna in a rational way. Fishing to the extent of threatening extinction of, and damage to, living resources is prohibited.

Exercise tight control over, and economize, use of water in industry, agriculture, and in daily life. Exploit rationally the subsoil waters to prevent exhaustion of water resources and surface subsidence.

Article 12. In exploiting mineral resources, comprehensive surveying, evaluation and utilization should be carried out. Excavating and mining at random is strictly forbidden, and tailings and slags should be appropriately disposed of, to prevent damage to resources and pollution of the natural environment.

Article 13. Strictly adhere to the National Forestry Law; protect and develop forest resources; fell trees in a rational way; tend trees and reforest at the appropriate time. Destroying forest to reclaim land and arbitrary cutting and felling are strictly forbidden. Preventive measures should be taken against forest fires.

Efforts should be made to plant trees everywhere and make barren hills, wasteland, desert areas and semi-desert areas green; tree planting should be vigorously carried out in villages, towns, and industrial and mining districts. Make good use of all available scattered open spaces inside and outside factory compounds, mining districts, school campuses, office compounds, along roadsides, river banks, and around villages and houses by planting trees and grass so as to turn the whole country into a big park.

Article 14. Protect and develop forage re-

sources. Actively plan and carry out the grassland development programme; herd sheep and cattle rationally; maintain and improve the regenerating capacity of the grasslands, and prevent the grasslands from deteriorating. Abusive exploitation of grassland is strictly forbidden. Efforts should be made to prevent grassland fires.

Article 15. Protect, develop, and utilize rationally wildlife and wild plant resources. National regulations forbid hunting of rare animals and felling of precious trees.

Chapter III. Prevention and Elimination of Pollution and Other Hazards to the Public

Article 16. Actively prevent and control noxious substances from factories, mines, enterprises and urban life, such as waste gas, waste water, waste residues, dust, garbage, radioactive material, etc., as well as noise, vibration, and bad odours from polluting and damaging the environment.

Article 17. Enterprises or institutions that will cause pollution of the environment shall not be set up in the residential areas of the cities and towns, water resource protection zones, places of historic interest and scenic beauty, scenic spots for sightseeing, hot springs, health resorts and nature conservation areas. Where such units have been established, a target date shall be set for elimination and control of the pollution, or making necessary adjustments, or removal.

Article 18. Actively conduct experiments and adopt new technology, techniques and devices which are pollution-free or will reduce pollution.

Strengthen business management and carry out civilized production; make comprehensive use of such environment-polluting substances as waste gas, waste water and waste residues, and transform them into useful things. Discharge of such substances where necessary shall be in compliance with the criteria laid down by the State. Where such national criteria cannot be met for the time being, a later date will be set for compliance; if national standards still cannot be met by the deadline, a limit shall be set to production.

In cases where release of pollutants goes beyond the limits of the specified national standards, a fee shall be charged towards dealing with the release of such pollutants according to the quantities and concentrations of the pollutants released as specified in the relevant regulations.

Article 19. All smoke-discharging devices, industrial furnaces, motor vehicles, ships, etc. shall

take effective measures to eliminate smoke and dust, and discharge of noxious gas shall be in compliance with the standards laid down by the State.

Develop and use on a large scale coal gas, liquefied petroleum gas (LPG), natural gas, marsh gas, solar energy, terrestrial heat and other non-polluting or less polluting energy sources. In the cities, district central heating should be promoted.

Article 20. Dumping garbage and waste residues into the waters is prohibited. Discharge of sewage shall be in compliance with the standards set down by the State.

Ships are prohibited from discharging substances containing oil, poison, and other harmful wastes into the waters protected by the law of this country.

It is strictly prohibited to discharge poisonous and harmful waste water by way of seepage pits, crevices, lava holes, or dilution methods. Prevent seepage of water containing industrial filth to ensure that subsoil water is not contaminated.

Take strong measures to protect sources of drinking water from contamination and gradually perfect the sewage discharge piping system and sewage purification facilities.

Article 21. Actively develop effective, low-toxin and low-residue agricultural pesticides. Promote comprehensive and biological methods of prevention and control; use rationally sewage for irrigation so as to prevent pollution of the soil and crops.

Article 22. Step up control of noise and vibration in urban and industrial districts. All kinds of noisy machines, motor vehicles, aircraft, etc. with heavy vibrations are required to install noise suppressors and antivibration devices.

Article 23. The units which emit harmful gases or dust should actively adopt sealed production equipment and technology, and install ventilating, dust collecting and purifying, and recovery facilities. The amount of harmful gases and dust in the working environment must conform with the standards for industrial hygiene specified by the law of this country.

Article 24. Registration and control of toxic chemicals must be strictly carried out. Highly toxic substances should be tightly sealed to prevent leakage during storage and transportation.

Radioactive materials, electro-magnetic radiation, etc. should be strictly monitored and controlled according to the applicable law of this country.

Article 25. Strict precautions shall be taken to prevent pollution of food in the course of production, processing, packing, transportation, storage, and marketing. Food inspection shall be strengthened, and the sale, export and import of foods not meeting the requirements of national hygienic standards shall be prohibited.

Chapter IV. Environmental Protection Office and its Functions

Article 26. The State Council has established an Environmental Protection Office whose main functions are:

- a) To implement and supervise the carrying out of national guidelines, policies, laws and acts relating to environmental protection;
- b) To draft regulations, rules, standards, economic and technical policies relating to environmental protection in conjunction with relevant departments;
- c) To develop long-term programmes and annual plans for protection of the environment in conjunction with relevant departments and to encourage and supervise their implementation;
- d) To make unified plans for organizing the monitoring of the environment; carry out investigations and keep under review the environmental situation and development trends of the whole country, and recommend improvement measures;
- e) To organize and coordinate, in conjunction with relevant departments, research and educational programmes in environmental science, and actively promote foreign as well as domestic advanced experiences and techniques in the field of environmental protection;
- f) To direct the environmental protection work of all the departments under the State Council, and of the provinces, autonomous regions, and municipalities directly under the central government;
- g) To organize and coordinate international cooperation and communication in the field of environmental protection.

Article 27. The people's governments of the provinces, autonomous regions, and municipalities directly under the central government shall establish environmental protection bureaus in their respective areas. The people's governments of the municipalities, autonomous prefectures, counties, and autonomous counties may establish environmental protection organizations as required.

The main functions of the local environmental protection organizations at every level are: To supervise and urge the implementation of the na-

tional guidelines, policies, laws and acts relating to the protection of environment in the various departments and units within their jurisdictions; to draft applicable local standards and specifications concerning environmental protection; to organize monitoring of the environment and keep under review the local environmental situation and development trends; to develop long-term programmes and annual plans applicable locally for the protection of the environment in conjunction with the relevant departments, and supervise their implementation; to organize local research and educational programmes in environmental science in conjunction with relevant departments; to actively promote foreign as well as domestic advanced experiences and techniques in the field of environmental protection.

Article 28. The relevant departments under the State Council, the local people's governments at all levels, large- and medium-size enterprises, and relevant institutions shall establish, as required, environmental protection offices separately responsible for the protection of the environment within their own system of affiliated organizations, departments, and units.

Chapter V. Scientific Research, Propaganda and Education

Article 29. China Environmental Science Research Institute, relevant scientific institutes, universities and colleges should devote major efforts to research in the following areas: fundamental principles of environmental science, environmental management, environmental economics, comprehensive control techniques, environmental quality evaluation, environmental pollution and human health, rational use and protection of natural environment, etc.

Article 30. Cultural and publicity departments should actively carry out publicity and educational programmes to disseminate the knowledge of environmental science so as to enhance the understanding of the general public about the significance of environmental protection work and to raise the scientific and technical standards in the environmental field.

Environmental protection specialists should

be trained in a planned way. The educational departments should establish a required course or speciality in environmental protection in the relevant departments of the universities and colleges. Middle and primary school textbooks should include appropriate texts relating to environmental protection.

Chapter VI. Rewards and Punishments

Article 31. The State will give commendations and rewards to units and individuals who have made outstanding achievements and contributions to the work of environmental protection.

The State will grant tax reductions or exemptions on, and apply a preferential pricing policy to, products manufactured by utilizing waste gas, waste water, and waste residues as main material, and the profits originating therefrom need not be turned over to the higher authorities but will be used by the manufacturers concerned to control pollution and improve the environment.

Article 32. Units which have violated this law and other environmental protection regulations and rules by polluting and damaging the environment and causing hazards to the people's health shall, according to the merit of each case, be criticized, warned, fined, or ordered to pay damages and stop production and control and eliminate such pollution, by the environmental protection organizations at various levels subject to the approval of the people's government of the corresponding level.

Unit leaders, persons directly responsible or other citizens who have caused serious pollution and damage to the environment resulting in casualties or substantial damage to farming forestry, animal husbandry, side-line production and fishery shall be held responsible administratively, economically, and even criminally, as the case may be, according to law.

Chapter VII. Supplementary Articles

Article 33. The State Council may establish regulations and rules relating to environmental protection according to the present law.

**50. REGULATIONS REGARDING THE NATURAL SCIENCE AWARDS OF THE
PEOPLE'S REPUBLIC OF CHINA**
Promulgated by the State Council
(December 21, 1979)

Article 1. In order to encourage and bring into full play the initiative and creativeness of scientific workers, speed up the development of China's sciences and promote socialist modernization, the present regulations are hereby formulated.

Article 2. Awards for natural sciences shall be conferred on those collectives or individuals whose research into the phenomena, characteristics or laws of nature have produced results with great significance for scientific and technological development.

Article 3. Awards for natural sciences are divided into four grades:

First-class awards include a certificate of honour, a first-class medal and a monetary award of 10,000 yuan.

Second-class awards include a certificate of honour, a second-class medal and a monetary award of 5,000 yuan.

Third-class awards include a certificate of honour, a third-class medal and a monetary award of 2,000 yuan.

Fourth-class awards include a certificate of honour, a fourth-class medal and a monetary award of 1,000 yuan.

Article 4. A special award shall be given to those whose scientific research results, as provided in Article 2, are of specially great significance. Separate awards for such cases shall be reported by the Scientific and Technological Commission of China to the State Council for approval.

Article 5. Recommendations for awards can be made by research institutes, institutions of higher learning, national academic societies or by a group of over ten scientific workers at or above the level of associate research fellows.

Article 6. Preliminary examination of the items recommended for award shall be organized, in accordance with their special fields, by the Chinese Academy of Sciences, the Ministry of Education, the Scientific and Technological Association of China, the State Agriculture Commission, the Ministry of Public Health, the State Economic Commission, the Science and Tech-

nology Commissions for National Defence and the Office in Charge of National Defence Industry of the State Council. In the preliminary examination, the related units should hold meetings, with the participation of those in the same trade or occupation, to choose items for award through public evaluation and make suggestions on the grade of the award.

Article 7. The issuance of awards is under the unified leadership of the Scientific and Technological Commission.

The Natural Science Awards Committee under the Commission is in charge of evaluating items and grades for awards. Its recommendations will be examined and approved by the Commission which will confer the awards.

Article 8. When the natural science award belongs to an individual, the certificate of honour, medal and monetary award will be conferred on the individual; when the award belongs to a collective, the certificate of honour will go to the collective, the medal will go to the collective and the personnel who made the biggest contributions in the scientific research, and the monetary award will be distributed among the participants in the research effort in proportion to their contributions.

Article 9. The natural science awards may be conferred, in accordance with the regulations, upon those Chinese nationals residing in foreign countries and foreigners who are engaged in natural science research and whose outstanding achievements have contributed enormously to the development of science and technology in the People's Republic of China.

Article 10. Recommendation and assessment of items for awards should be practical, realistic and serious. Cases of malpractice for selfish ends and deception will be dealt with sternly according to the seriousness of each case.

Article 11. The regulations will enter into effect on the date of promulgation. In cases of contravention with previous regulations regarding the natural science awards, the present regulation will hold.

SECTION III:

MONOGRAPHIC STUDIES ON CURRENT ECONOMIC POLICY

1. HOW TO LOOK AT THE PRESENT ECONOMIC SITUATION

By Xue Muqiao

I. The Economic Situation Is Excellent

The present economic situation is excellent. It is an excellent situation rarely seen since the founding of New China. Why do we say it is an excellent economic situation?

Achievements in Economic Growth. Firstly, we base our conclusion on the record of economic growth. The rate of industrial growth in 1979 and 1980, 8.5% and 8.7% respectively, was lower than in 1977 and 1978 (14.3% and 13.5%). However, the high rate of growth in 1977 and 1978 included some misleading elements. A considerable part of what was produced was not needed by the market, but was stocked in warehouses. As in previous years, little attention was paid to the needs of the people's livelihood; moreover, light industrial production was limited to the development of heavy industry. Thus, the bigger the growth rate, the more serious the economic imbalance.

No high quotas were set in drawing the 1979 and 1980 economic plans and heavy industrial production was limited to the development of light industry. This was why economic growth in 1979 was sounder than in the two previous years. Growth was even sounder in 1980. Unlike previous years, in 1979 the growth rate of light industry surpassed that of heavy industry. In 1980, heavy industry grew by 1.4% while light industry increased by 18.4%. This marked the beginning of economic development in a direction more suited to conditions in China. Agricultural production grew by 9% in 1978 after corrections of "Left" deviationist mistakes in relevant policies. It went up again by 8.6% in 1979, thus producing major growth in two successive years. Last year the drought in the north and water-logging in the south were more serious than in several decades. Nevertheless, total agricultural output value was 2.7% higher than in 1979. Moreover, the proportional balance among the different branches of the national economy has become more rational.

Improvements in the Livelihood of the People. Secondly, our conclusion is based on the improved livelihood of the people. The Third Plenary Session of the 11th Central Committee of the Communist Party of China held towards the end of 1978 decided to cut back the scale of capital construction, raise the purchasing prices of agricultural produce, increase pay for a portion of the work force and provide bonuses. Under the

original plan, capital investment for 1979 was to be 9,000 million yuan less than in 1978 and the income of both workers and peasants would be increased by 10,000 million yuan (not including pay for new workers and income from extra purchases of agricultural produce). By the end of 1979, however, total capital investment was not less than the 1978 figure, but in fact exceeded it (increasing from 48,000 million yuan in 1978 to 50,000 million yuan in 1979). On the other hand, the income of the workers and peasants increased by 14,000 million yuan.

Social purchasing power has grown by large margins during these years. In this way, the income of both urban and rural people has risen greatly. Between 1970 and 1977, social purchasing power increased by an average of 8,400 million yuan a year, but it rose by 14,800 million yuan in 1978, and by 32,200 million yuan in 1979. The preliminary calculated increase for 1980 was 35,400 million yuan (about 24,000 million yuan after deducting the price rise). The increase in social purchasing power roughly equalled the increase in national income. In other words, almost all of the increased part of national income in the past three years went to improve the livelihood of the people. The average per capita income of Chinese peasants increased from 117 yuan in 1977 to 170 yuan in 1980 (a 45% increase over three years). The average wage of the workers increased from 620 yuan in 1977 to 781 yuan in 1980 (a 30% increase over three years). Last year, the workers in most of the enterprises received bonuses and subsidies amounting to two months basic pay, while office workers also received extra monthly pay in the form of bonuses. What the people are lining up for in front of the shops are no longer foodstuffs, but luxury goods. At the same time, bank savings deposits also went up greatly.

Which should serve as the universal index for a good or bad economic situation — the growth rate of production or improvement in the people's livelihood? It is true that improvement of the people's livelihood must be based on production growth, but in the past 30 years in China, attention was often paid to growth in the rate of production rather than improvement of the people's livelihood. Therefore, the principle mark for a good or bad economic situation should be the living conditions of the people, and especially the living conditions of the peasants who constitute the overwhelming majority of the

Chinese population. There were two periods in the past 30 years in which China's economy grew at a high rate:

The Period of Economic Rehabilitation. The first period was the three years of economic rehabilitation right after the founding of New China. During this period, industrial production grew at an average rate of 34.8% per year and agricultural production at 14.1% per year. However, this high growth was of a rehabilitative nature. After three years of rehabilitation, the national economy that had been wrecked by wars surpassed the previous record level. We had a very poor economic foundation at that time. Although the people's livelihood was considerably improved during those three years, there was a far cry between those levels and the present living standard. Ministers could not afford to buy a wristwatch in 1952 or a vacuum-tube radio set in 1954. Today, almost every worker has a wristwatch and most of their families have bought radio sets and some even have television sets. Production growth rates were also high during the First Five-Year Plan period (1953-1957). Industrial production grew at an annual rate of 18% and agricultural production at 4.5%, and the people's livelihood also improved notably. The superiority of socialism was clearly demonstrated and none of the Chinese people doubted it.

"The Three Years of the Great Leap Forward." Nevertheless, the second period of high-rate development failed. That was the so-called "three years of the great leap forward" beginning in 1958. During those years, heavy industry grew by 49% a year and light industry by 14%; but agricultural production dropped and the people's livelihood worsened. Of course, this was hardly an excellent situation, but rather a very bad situation. During the 20 years between 1957 and 1976 — excluding the period of readjustment (1961-1965) — the scale of capital construction became greater and greater due to the stress on a high growth rate. As a result, industrial production grew very quickly, but, again, the people's livelihood was not at all improved. It was stated each year that the situation was excellent but, in fact, it was not good in many of these years.

The Present Situation. Although the growth rate of industrial production in the two years just past was not as high as before, the people's livelihood improved considerably indeed, and especially that of the peasants, while the livelihood of low-paid workers also improved. In this sense, the present economic situation is truly an excellent

one and one rarely seen since the founding of New China. Of course, this is only the beginning, and the situation will become better and better.

Correction of "Left" Deviationist Mistakes. This excellent situation is not only manifested in production growth and the improvement of the people's livelihood but, even more important, in the fact that we have begun to correct the "Left" deviationist mistakes and are making efforts to eliminate the serious economic imbalance. The national economy was seriously out of balance in the past 20 years because we failed to build our economy on the basis of China's actual conditions. Rather, we blindly sought for higher growth rates. It is impossible to restore the normal balance among the different branches of the national economy in two or three years. Although it was already two years since the policy of readjusting the national economy was adopted, the results were not satisfactory because many comrades failed to understand the policy deeply or to implement it firmly. The old difficulties were not yet overcome and new difficulties emerged. A practical programme of further readjusting the national economy was adopted last year at the Working Meeting of the Central Committee of the Communist Party of China. It was pointed out that the scale of capital construction was still too big, the proportions among agriculture, light industry and heavy industry were not yet balanced, and energy production and transport capacity were still behind the present production and construction scale. It was pointed out that not only must the scale of capital construction continue to be reduced, but the growth rate of some industrial departments must also be kept down. Heavy industrial production must be limited and the production of agriculture and light industry would in turn be boosted. Owing to the large financial deficit and the resultant price increases, the improvement of the people's livelihood could not but be rigidly controlled. Otherwise, the whole plan for the further improvement of the people's livelihood would be of no avail. In short, we will still have to traverse a difficult and tortuous road in the course of economic readjustment. However, as long as we have a correct direction, we will be able to sail over the dangerous shoals and continue to move forward. Therefore, it is not enough to assess the excellent situation merely in terms of production growth and improvements in the people's livelihood during the past three years. What is more important is that we have become sober-minded, have begun to correct the "Left" deviationist mistakes and are regaining our initiative again. A truly bright future is unfolding before us.

II. There Are Grave Difficulties in This Excellent Situation

How do we account for our statement that the situation is excellent on the one hand and that there are grave difficulties on the other? The root cause for the difficulties, of course, is the "Left" deviationist mistakes that prevailed for 20 years. The ten years of calamity during the "cultural revolution" brought the national economy to the brink of collapse. We failed to correct the "Left" deviationist mistakes promptly after the Gang of Four was smashed. On the contrary, in 1977 we raised the slogan of achieving agricultural mechanization in the main by 1980, and in 1978 another industrial upsurge was started. Government appropriations for capital construction increased by more than 40% as compared with 1977 and many complete plants were purchased from abroad. This brought the economic imbalance further to the surface. The Third Plenary Session of the 11th Central Committee of the CPC held in the winter of 1978 and the Working Meeting of the CPC Central Committee held in the following spring adopted in good time the policy of readjusting, restructuring, consolidating and improving the national economy with emphasis on economic readjustment, and we began to correct the "Left" deviationist mistakes in an all-around way. The Working Meeting decided to cut back capital investment in 1979 from 45,000 million yuan to 36,000 million yuan and to spend the saved amount of money in raising the purchasing prices of agricultural produce and in increasing the workers' pay.

Problems of Financial Deficits and Price Stability. As the people's livelihood remained unimproved for 20 years, it was entirely necessary to raise the purchasing prices of agricultural produce and to increase the workers' pay by a relatively big margin. However, the question is as stated above: because many comrades failed to understand the necessity of readjusting the economy in face of the excellent economic situation (this was different from the economic readjustment of the early 1960's), the policy of readjustment was not firmly implemented and the scale of capital investment was not reduced as required; however, the improvement of the people's livelihood exceeded the planned quota. This resulted in a large financial deficit and it became impossible to keep prices stable in 1980.

Attention was drawn to this question in drawing up the 1980 economic plan. Planned capital investment was further cut back from 36,000 million yuan to 24,000 million yuan, but the predetermined goal was not reached. Because local

governments and enterprises had more money at their own disposal, capital investments not included in the plan increased considerably and a good number of small and new but unnecessary enterprises were built. Some 40% of the workers were supposed to receive pay increases in 1979, but increased pay was given to them retroactively in the summer or autumn of 1980. More bonuses and subsidies were issued, and the amount of bonuses in many enterprises was equivalent to a pay increase of one grade for all low-paid workers. The planned prices of agricultural produce were raised only a little, but many communes and their subdivisions reduced their base quotas for compulsory purchases by the state at planned prices and increased by 50% the quantity of grains sold at prices for "above-base quota purchases." Many communes and subdivisions sold grain and other agricultural products at even higher negotiable prices. In other words, the government had to pay 5,000 million yuan more for the same quantity of grain it purchased from the peasants. Although agricultural products were purchased at higher prices, their selling prices were not raised. As a result, price subsidies by the government rose to 20,000 million yuan. With their livelihood unimproved for 20 years, the people had many difficulties and the various departments paid more attention to the livelihood of the workers and peasants.

This was quite understandable. The question was that the purchasing power of the people rose by more than 30,000 million yuan a year for two successive years, not only exceeding the government's financial capability, but also exceeding production growth. In 1979, national income increased by 6.9% (calculated at constant prices) and the volume of retail sales of social commodities rose by 18.9% (12.2% after deducting the price rise), but social purchasing power rose by 20%. In 1980, the national income also increased by 6.9%, the same as in 1979. The financial deficit in 1980 was 12,000 million yuan, exceeding the planned quota. Therefore, commodity prices went up by 6% last year, 8.1% in urban areas and 4.4% in rural areas.

Reductions in Capital Expenditures and Investment. In order to get rid of the deficit, to control the issuance of currency and to keep the market prices stable, the Party Central Committee has decided to reduce capital investment for 1981 by all means and to reduce expenditures in all fields. A nationwide discussion is now under way on readjusted quotas for this year and it will be possible to hold down capital investments. The question is: Should the improvement of the people's livelihood also be properly controlled? Some comrades propose that the workers' wages

should continue to be raised and bonuses issued on a wider scale. Others say that to stimulate agricultural production, the purchasing prices of agricultural produce should be raised further. These suggestions are reasonable in a limited sense. But, in an overall sense, if we issue more bonuses (or subsidies) to offset price rises, the greater circulation of money might in turn work to stimulate price rises. If the purchasing prices of agricultural produce are further raised while selling prices remain the same, price subsidies from the government will rise even more quickly and the financial deficit will become even larger. This will make it even more difficult to control prices. If prices rise sharply, the benefits we gave to the people in the past two years will be lost once again. Therefore, treating the question in an overall way, we must adhere to the correct policy of eliminating the financial deficit and of stabilizing market prices. To achieve this, not only capital investment must be kept down, but growth in the people's purchasing power must be controlled.

The economic situation at present is quite different from that of the early 1960's: production has continued to grow steadily instead of dropping and the people have notably improved their livelihood rather than continuing to live in serious difficulties. What then is the real problem? It is that the accumulation of funds cannot be reduced according to plan while the growth of consumption funds surpasses planned targets. State expenditures, combining both accumulation funds and consumption funds, exceeded total national income. This accounted for the financial deficit. The imbalance between revenues and expenditures, between credit receipts and payments and between supply and demand has created difficulties in keeping market prices stable in the midst of an excellent economic situation. The measures that should be taken to overcome this difficulty are to continue to reduce capital investment and administrative expenses according to the plan of readjustment, to rigidly control the overgrowth of the people's purchasing power, to get rid of the serious waste in our economic work by various means and to increase economic results. If this is achieved, the financial deficit will be eliminated, market prices will remain stable and the potential danger will surely disappear.

Inflation Cannot Help China. Some Western economists and economic circles have found it difficult to understand why we have paid so much attention to the question of financial deficits and price increases. They say that according to Western experience, a minor degree of financial deficits, inflation and price rises, as long as they do not exceed given limits, offer more advantages than

disadvantages to economic growth. A very small number of economists in our country also hold to the same view. They do not understand that although both China and the Western countries may have economic difficulties, the difficulties are different in nature. Their difficulty is the shrinkage of demand arising from basic contradictions in the capitalist system (including investment and living standards) and to overproduction. A small rate of inflation can stimulate growth in demand, alleviate over-production and prevent economic recession. Our economic difficulty is the swelling of demand (over-investment and surplus purchasing power), and the fact that production of all commodities lags behind demand. The present supply of market commodities in China (including capital goods) is already short enough. If prices continue to rise, the people will rush to purchase all kinds of commodities (as in the early 1960's) and market prices might undergo utter confusion. Inflation can help capitalist countries out of economic difficulties temporarily under given conditions, but it cannot help China out of its economic difficulty. On the contrary, inflation will only aggravate our difficulties. The prescription of the Keynesians, which proved unsuccessful in the West, is not applicable in China.

III. By Earnestly Readjusting and Restructuring the National Economy, the Difficulty Can Be Overcome

The imbalance in China's national economy has existed for a long time. Before the Party Central Committee adopted the policy of economic readjustment, the supply of most capital goods and consumer goods was even shorter than it is today, causing great difficulties in production, construction and the people's livelihood. On the other hand, more and more unwanted goods were overstocked in warehouses and the national economy had already fallen into distress. After the economic readjustment began, the supply of both capital goods and consumer goods became better than in the early or mid-1970's as a result of the reduced scale of capital construction and the priority given to the development of agricultural and light industrial production. In the past, the market supply became shorter and shorter, but now it has improved year by year. The notable improvement in the livelihood of the people, and of the peasants in particular, is solid proof of the initial results achieved by the policy of readjustment.

Today, although the central government is encountering financial difficulties, the local governments have more money, and many enter-

prises in particular have funds at their own disposal. This makes it possible for them to arrange production by themselves to a certain extent, to encourage technical innovations and to improve the livelihood of their workers. Bank savings in urban and rural areas have greatly increased. Is this not a good thing that has rarely been seen since the founding of New China? It is a good thing, not a bad thing, that the enterprises and the people have more money in their hands. The problem is that managerial work has lagged behind. The local governments and enterprises have spent their money on the construction of unnecessary projects. The increased income of the workers and peasants has exceeded the possibility of market commodity supply to such an extent that even expensive goods have sold out in a rush. So unexpected grave difficulties emerged in the midst of the excellent situation. From an overall point of view, our economy has begun to improve. But from a partial point of view, energetic measures must be taken to quickly overcome financial and credit difficulties.

Strengthening the Planned Management of the Macroeconomy. The principal measure to overcome these difficulties is, first of all, to strengthen the planned management of the macroeconomy. The specific content of this is to further cut back capital investment, and especially to check the construction of unnecessary projects by local governments and the enterprises. The more than 300,000 existing industrial enterprises must be reorganized through integration to reduce redundancy and waste in production. At the same time, the improvement of the people's livelihood must also be controlled. In the past, Comrade Zhou Enlai and Comrade Chen Yun often paid attention to controlling total employment. As wage standards were constant at that time, total wages would not be exceeded as long as employment was controlled. Today, not only is employment not rigidly controlled, but wage standards are also out of control due to the excessive issuance of bonuses by some enterprises. The overissuance of bonuses has led to price rises, forcing government offices to give subsidies to their staffs. In order to raise the purchasing prices of farm products, the state paid out more than 8,000 million yuan in 1979 alone. Planned prices were not raised in 1980, but prices for above-quota purchases and negotiable prices were greatly increased.

Bonuses play an important role in enhancing the workers' enthusiasm in production, and we should not oppose them. But we must oppose the overissuance of bonuses. Negotiable prices have also played a beneficial role in increasing the market supply of farm products in the third cate-

gory, the cancellation of negotiable prices would again place the enlivened rural fairs into a corner, but we must prevent a drop in state purchase quotas just for the sake of raising negotiable prices. As regards bonuses and negotiable prices, we must strengthen our policy of management, but we must not take rash actions.

We must stop thinking of solely using administrative measures to solve such complicated questions. Instead, we must undertake intensive investigations and rely on the masses to help us with supervision and inspection. Once the difficulties of the government are explained clearly to the masses, they will help us to overcome them.

Eliminating the financial deficit, controlling the issuance of currency and keeping market prices stable are the urgent questions that must be solved at present. But our economic readjustment will not stop at this. We must go on to fundamentally restructure the economy, that is, to change the ratio among agriculture, light industry and heavy industry so as to meet actual conditions in China — we have 1,000 million people, including 800 million peasants, and their living standards are low. Our economic work must, first of all, ensure that the 1,000 million people — and the 800 million peasants in particular — have enough food and clothing and that they gradually improve their living standards as production increases. Today, most of the people have notably raised their level of consumption, gradually turning their attention from wristwatches, radio sets, bicycles and sewing machines to televisions, tape recorders, washing machines and electric fans. We must speed up the development of agriculture and light industry to satisfy the needs of the people. Every paper note issued must be guaranteed in kind.

In recent years, our agriculture has grown fast and, moreover, the growth of light industry has begun to surpass that of heavy industry. There is still great room for the development of agriculture and light industry and we must take various effective measures to speed up their growth. As to heavy industry, we must step up capital construction in the energy production and transport sectors and change their irrational internal proportions. As the scale of capital construction has been reduced, many machine-building plants are operating under capacity. They should be encouraged to help those existing factories with technical innovations instead of producing equipment for new plants. The machine-building industry should be readjusted, reorganized and restructured. From a long-term point of view, the purpose of the readjustment is not only to strike a balance between revenues and expenditures but, more important, to reorganize the whole economic structure rationally. It is obviously impossible to achieve the

healthy development of the national economy without this readjustment.

Changing the Economic Management System. If we look still farther, we will have to restructure the economic management system. Many economists point out that the chief characteristics of China's national economy are high growth rate and high accumulation, but low results and low consumption. The ultimate purpose of our economic construction is to gradually satisfy the growing needs of the material and cultural life of the people throughout the country. What's the point of our economic construction if the result of the high growth rate is low consumption? There are two root causes for this abnormal situation. One is the imbalance of the national economy as stated above and the other is that we adopted the over-centralized Soviet system of economic management — that is, centralized revenues and expenditures and monopoly purchases and sales of industrial products by the state, or what we often call "sharing porridge from the same pot." If we fail to establish a system of responsibility for accounting at all levels, but continue to "share porridge from the same pot," it will be impossible for us to get rid of the enormous wastes in production, distribution and economic construction, or to increase economic results. In the long run, if we do not change this situation, it will be impossible for our finances to get out of the current awkward situation. In this sense, the ultimate purposes of both readjustment and restructuring are identical and complementary to each other. It is short-sighted to think that restructuring the system would obstruct economic readjustment and create economic difficulties.

Of course, the principles guiding the restructuring of the system are correct, but if we do not handle it properly, it might produce a negative effect on the readjustment. We should exercise bi-level control over the revenues and expenditures of central and local governments, give more power to the enterprises in management and introduce a profit-sharing system so that local authorities and

enterprises have more funds for arranging their production and for increasing the livelihood of their workers. This is an entirely correct orientation. Generally speaking, local governments have too few reserve funds and most of the enterprises do not have sufficient reserve funds. However, state revenues are limited and revenues at the lower levels can only be increased gradually after the enterprises receive more power in management. If both the local governments and enterprises ask for more reserve funds than they deserve, it will inevitably affect state revenue. If the local governments and enterprises have more reserve funds at their own disposal and use them to build unnecessary projects instead of investing in projects most needed by the country, it will not only be detrimental to the readjustment but also place obstacles to the progress of readjustment. In the past two years, we neglected this tendency and failed to exercise tight control over capital construction, thus retarding the progress in readjustment. In order to correct this tendency, we have decided this year to concentrate the surplus funds of local governments and enterprises in the hands of the central government by issuing treasury bonds so that funds can be directed to the most needed projects. Ours is a socialist country. Even if revenues and expenditures are managed at different levels, they are owned by the whole people. Whenever necessary, decentralized revenues can be consolidated by the central government for use with compensation. Moreover, we must study how to improve the system of financial management at different levels so as to ensure that revenues and expenditures can be balanced at the central level. In short, to overcome economic difficulties in the end, we must completely change the present economic management system. This is essential to eliminating waste and to increasing economic results. This is also our strategic principle from a long-term point of view.

Our difficulty is a difficulty that has emerged in the course of our advance, and one which we are sure to overcome. All pessimistic views are unfounded.

2. ON CHINA'S NEW STRATEGY FOR ECONOMIC DEVELOPMENT

By Ma Hong

I. The Advancement of a New Strategy of Economic Development and Its Significance

The Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, held in the winter of 1978, rectified the prolonged "Left" mistakes in the party, eliminated the pernicious ideological political influence of Lin Biao and the Gang of Four in distorting and tampering with Marxism-Leninism-Mao Zedong Thought, and at the same time resolutely and clearly called for a shift of focus of party work to economic construction and to socialist modernization. This brought the party line back to the correct road of Marxism-Leninism.

In order to implement the resolutions adopted at the Third Plenary Session of the 11th Party Central Committee, to save the economy from collapse and to find a new way of developing the socialist economy in China in line with the four fundamental principles of upholding the socialist road, the dictatorship of the proletariat, the leadership of the Communist Party and Marxism-Leninism and Mao Zedong Thought, the Party Central Committee formulated the principle of "readjusting, restructuring, consolidating and improving" the economy, with the primary focus on readjustment. This is a great strategic change in the development of socialist economic construction in China and is therefore of great theoretical and practical significance.

We are very hopeful of finding a new road of developing the socialist economy in our country by readjusting, restructuring, consolidating and improving the economy. The practical experience in the past two years has shown us a bright prospect. We should be confident in this regard.

The Rationale for Readjustment. The advancement and implementation of the principle of economic readjustment represents a fundamental change in our prevailing ideology for economic work as a whole. This change has two aspects: a change in the strategic goal of economic development and a change in the road taken to reach this goal.

For a long time, our understanding of the basic economic laws of socialism was not deep. For many years, under the influence of "Left" mistakes, our economic work departed more or less from the purpose of socialist production. We

often said that the purpose of socialist production was to satisfy the needs of the people but, in fact, our actions failed in this regard with the result that there existed a certain tendency towards production for production's sake. The present economic readjustment and reform is meant to thoroughly correct the tendency of production for production's sake so that economic work as a whole will take the road of satisfying the material and cultural needs of the people.

Owing to mistakes in the selection of the strategic goal of economic development and owing to our failure to have a sober understanding of basic conditions in our country, we made many serious mistakes concerning the road of economic development, mostly "Left" mistakes.

1. In production and construction, we blindly sought high plan targets and high growth rates to the neglect of returns.

2. Undue emphasis was laid on the development of heavy industry to the neglect of agriculture and light industry.

3. We depended merely on the construction of new projects for expanded reproduction to the neglect of tapping potentials in existing enterprises.

4. Attention was paid only to the output of steel and other primary and intermediate products to the total neglect of the variety and quality of the products, and especially to the total neglect of the production of end-of-line consumer goods.

5. Undue emphasis was placed on the high accumulation rate to the neglect of the necessary consumption of the people.

6. We were overly anxious to bring about a transition in the relationships of production and blindly sought after bigness in size and completeness in socialist nature.

We were overanxious to make the transition from collective ownership to ownership by the whole people, prematurely negated the role of the individual economy in urban and rural areas and adopted an overconcentrated economic management system within the sector of ownership by the whole people. All these mistakes contributed to a vicious circle of "high growth rate, high accumula-

tion rate, low efficiency and low consumption level" in the economy.

Purpose of the Current Readjustment. The purpose of our current economic readjustment is to overcome the "Left" mistakes concerning the road of economic construction, to truly proceed from the basic conditions in China and to find a new road of developing its socialist economy simultaneously with the change in the strategic goal of economic development.

Such a change means that the fundamental purpose of China's socialist economic construction is to satisfy the needs of the people.

Such a change means that we are no longer blindly seeking a high growth rate to the neglect of returns. In other words, we will attach great importance to increasing economic returns. Only this approach can serve the purpose of satisfying the needs of the people.

Such a change means that we are no longer merely seeking to produce steel and other primary and intermediate products to the neglect of quality, variety and the production of end-of-line consumer goods. We must guide production according to the needs of consumers, the needs of the market and the needs of defending the fruits of socialism. In this way, we can more effectively satisfy the needs of the people and the needs of society, including the needs of national defence.

Such a change means that we will alter the erroneous practice of laying undue stress on the development of heavy industry, blindly seeking high growth rates and restricting the consumption of the people. Rather, we shall gradually build, through readjustment, a rational economic structure that suits basic conditions in China. Only in this way will it be possible to achieve high growth rates, more accumulation and better results, and thus still better satisfy the needs of the people.

Such a change means that we will gradually change the irrational economic system and build a rational economic system. We will give full play to the initiative and enthusiasm of enterprises and the working people, promote the development of productive forces and ensure that the rational needs of the people will be satisfied. Such a change also means that we will make the relations of production conform with the character and level of productive forces and allow a multiplicity of economic sectors and multiple modes of business operation to co-exist, all on the prerequisite that socialist public ownership is predominant.

Such a change means that we must do our economic work in accordance with objective economic laws. The principle of economic readjustment is precisely adopted to serve the requirements of socialist economic laws.

In short, through the implementation of the principle of readjustment, restructuring, consolidation and improvement, the Chinese economy will gradually begin to follow the model described recently by a leading comrade of the State Council: "an economy which will develop in a coordinated way, make steady progress, grow healthy, fully display the superiority of the socialist system and offer more benefits to the people."

It is thus obvious that our purpose of readjusting, restructuring, consolidating and improving the economy is to correct past mistakes committed in the strategic goal of economic development and the road of economic construction so that the socialist economic construction will develop along a new road, namely, the road of increasing economic results and serving the needs of the people. Therefore, this is a change of great theoretical and practical significance, a change of historical significance. We must fully understand the strategic significance of this change.

A Correct Strategy for Socialist Economic Construction. We are not unfamiliar with the question of strategy. By strategy we mean overall and fundamental questions of a perpetual character. Comrade Mao Zedong wrote a number of well-known articles, including "Problems of Strategy in China's Revolutionary War." They were of great importance to the victory in the Chinese revolutionary wars. We all know that the Chinese revolutionary wars suffered serious setbacks before the final victory was won. One of the fundamental reasons was the change from an erroneous strategy to a correct strategy. Without a correct strategy in a revolutionary war, it is impossible to win it. Likewise, without a correct strategy in socialist economic construction, it is impossible to achieve economic success.

In short, we should fully understand the significance of the period and principle of economic readjustment from the high plane of the strategy of economic development. If we approach the question this way, we will be able to understand how important the period of readjustment is and how important readjustment and restructuring are. Our party experienced several strategic changes of great historic significance during the periods of the revolutionary wars — one at the Zunyi meeting, one on the eve of the War of Resistance to Japanese aggression and one after the War of Liberation. We all know very well about the great victories of these strategic changes. The current change in economic development strategy is likewise of great historic significance and will lead to great victory.

In order to further raise our awareness of the importance of the principle of economic readjust-

ment, I now present my views for discussion.

A leading comrade of the State Council said recently: "We will gradually achieve a rational economic structure, a rational management system and a rational enterprise organization and break a new path in developing the economy of our country through readjustment and reforms and on the basis of stabilizing the economy." Here, I would like to deal separately with the questions relating to rational economic structure, rational management system and rational enterprise organization.

On the Readjustment and a Rational Economic Structure

The purpose of our economic readjustment, from a fundamental point of view, is to readjust the economic structure, thoroughly redress the serious imbalances among the major portions of the national economy and place the economy on the healthy road of planned and proportionate development so as to satisfy the needs of the people.

Problems in China's Economic Structure and the Requirements of Economic Readjustment

In order to deal with the necessity of readjusting the economic structure, to make readjustment work proceed step by step and to render the readjustment measures more effective, it is necessary to make an analysis of the existing economic structure and its problems.

For many years, our economic work fell under the influence of "Left" mistakes. Undue emphasis was laid on the development of heavy industry to the neglect of agriculture and light industry. Increases in total output value and in state revenues and an expansion of employment were achieved mainly by investing large funds, consuming large quantities of energy, expanding the scale of capital construction and constructing a large number of new factories. For this reason, industry was built, but it could not be integrated with agriculture into one unitary production system; heavy industry was built, but it could not be integrated with light industry into one unitary production system. On the question of the development of heavy industry, undue emphasis was laid on construction of the steel industry. In order to expand the iron and steel industry, large quantities of energy were consumed and a great part of transport facilities and large capital funds were used. This not only hampered the development of

agriculture and light industry, but also impeded the development of the energy industry and of communications. It resulted in an imbalanced development of heavy industry *per se*. Energy production and communications became weak links in the national economy and the iron and steel industry itself was not duly developed. As time passed, a lopsided economic structure took shape. Some branches of heavy industry were rapidly developed, but agriculture, light industry, energy, communications, construction, commerce and service trades remained underdeveloped. Moreover, the localities developed self-sufficient economic systems, and the ministries and enterprises also built all-embracing production systems. Therefore, economic imbalance, loose structure, ineffective mechanisms, low efficiency and great waste became the special features of this economic structure.

It is obvious that this method of economic construction required large-scale investments and high consumption. But it yielded less returns and gave fewer benefits to the people. Moreover, it often brings about a vicious circle in economic development. In the future, we must break a new path in developing China's economy that can make the best of existing economic resources and bring the national economy into the orbit of sound development.

Sound Development and Vicious Cycles. For the past 30 years, sound development and vicious cycles have alternated with each other in China's economic growth. During the First Five-Year Plan period, China achieved good returns. After the "Great Leap Forward," we took a road of "high growth rate, high accumulation rate, low efficiency and low consumption." We directed the strategic target of economic development at an impractical "high growth rate." In order to reach such impractical targets, it was necessary to set high plan targets in production, over-extended scales in capital construction and high accumulation rates in the distribution of the national income, which caused a serious imbalance between accumulation and consumption. No attention was paid to the returns from capital funds. Owing to high consumption of fuels and raw materials, a large proportion of these were wasted and no actual returns were obtained from the investment. As a result, the national income grew very slowly, the poverty and backwardness were not changed and the livelihood of the people was little improved. In order to remedy this backwardness, we were overly anxious to achieve success by seeking a high growth rate and by expanding the scale of capital construction. Therefore, high plan targets were set, a huge construction programme was drafted, the

accumulation rate was raised and wastage became even more serious. As this repeated itself in endless cycles, it led to a vicious circle in economic development.

Balancing the Relationship of Proportions. After 30 years of construction, the industrial scale is no longer small, nor is the growth rate of the total industrial output value very low — it now averages about 13% a year. However, neither the variety nor the quality of many products as yet meet the needs of consumers. There are more intermediate products, the proportion of final products is low and the quantities of consumer goods that can be used to meet the material and cultural needs of the people are limited, and for this the people have paid a very heavy cost. Moreover, the country remains poor and the people's livelihood has not been improved adequately.

The superiority of the socialist relations of production not only lies in the fact that it opens up the possibility of planned development of the national economy, but derives also from the fact that after an erroneous macroeconomic decision has led to an imbalance in the national economy, it is still possible to balance the relationship of proportions again through planned readjustment. The purpose of economic readjustment is to transform an irrational, dislocated and lopsided economic structure into a rational economic structure. Such a rational economic structure calls for a change from the guiding principle of building up heavy industry as the target to the target of increasing the production of final consumer goods, of producing final consumer goods according to the needs of the people's consumption and social consumption, and of producing intermediate products and primary products such as raw materials according to the needs of production of the final consumer goods. The changed focus includes the construction of a well-balanced economic structure, including industry and agriculture, with the production of final consumer goods as its target.

Once such an economic structure is established, the raw materials industries and the industries producing semi-finished goods both serve the final products, and every industry or every enterprise has a definite target to which it provides services. In this way, the products they manufacture become products needed in the course of reproduction so as to better gear the supply of social products to the social demand for such products. Thus, maximum returns will be obtained from the manpower, material power and financial power that society invests and thus the growing material and cultural needs of the people will be satisfied still better. Such an economic structure is one which can take greatest advantage of manpower,

material power and natural resources in China so as to facilitate well-coordinated development of the different divisions of the national economy (especially agriculture, light industry and heavy industry) and the different parts of social reproduction and thus achieve a sound development of the national economy.

Some Theoretical Questions Concerning the Readjustment of the National Economy

In line with the requirements dealt with in the preceding paragraphs, some theoretical questions on the readjustment of the national economy must be discussed. Apart from achieving a correct understanding of the purpose of socialist production and continuing the criticism of the erroneous tendencies of production for its own sake, some other theoretical questions are open to discussion.

For many years, we have regarded the priority of the development of heavy industry as a universal law in socialist construction and as a road to and a way of socialist industrialization. The prolonged undue emphasis on the priority of developing heavy industry in China has been closely related to this guiding ideology. In readjusting the national economy and establishing a rational economic structure, and in calling for a change from the target of building up heavy industry to the target of increasing the production of final consumer goods, we must make a reassessment of this guiding ideology.

The experience of many economically developed countries in the world shows that heavy industry was developed on the basis of the development of agriculture and light industry and to keep abreast of the demand of agriculture, light industry and other production sectors related to the means of production.

The General Relationship Between Production and Consumption. Some people argue, however, that this is the capitalist road of industrialization. This approach to the question does not conform with fact. The key to the question lies in the fact that the objective process of economic development is not necessarily connected with this particular relationship of production — or, capitalism. Rather, we would say that this relationship is a requirement of the universal law of development of modern industrial production. Marx once said: "Without consumption, there is no production . . . since in that case production would be useless." (Karl Marx, "A Contribution to the Critique of Political Economy," p. 196. Moscow: Progress Publishers, 1970). So far as the ultimate purpose is concerned, production in any society is for con-

sumption. This is the general relationship between production and consumption, the universal law of social production. As to the relation between the production of means of production and the production of means of consumption, this universal law finds its expression in the fact that the production of means of production always in the end serves the production of means of consumption. As for modern industrial production, this universal law finds expression in the fact that heavy industry, which mainly produces means of production, always ultimately serves agriculture, light industry, communications and transport, commerce and other service trades that mainly produce means of consumption.

It is worth mentioning that in his first section, "Development of Machinery," in Chapter 13 of "Das Capital," Marx made a detailed analysis of the expressions of these universal laws from the angle of the history of development of the modern machinery industry. In the past, however, people often regarded the development from light industry to heavy industry in the course of the capitalist industrial revolution described by Marx as the outcome of the operation of the capitalist law of surplus value. However, in this they neglected his analysis of the universal laws of modern industrial production. It is true that Marx, in describing the development of the modern machine-building industry, said: "Machinery is a means for producing surplus value." (Karl Marx, *Das Capital*, Vol. 1, p. 371. Moscow: Foreign Languages Publishing House, 1958). When he dealt with the development of modern industry (including light industry), calling for the development of modern machine-building industry, he also said that the machines produced by manual labour were dearer than those produced by the machine-building industry. But here he was mainly expounding the idea that "at certain stages of its development, Modern Industry became technologically incompatible with the basis furnished for it by handicraft and manufacture. . . . Modern Industry had therefore to take in hand itself the machine, the characteristic instrument of production, and to construct machines by machines. It was not till it did this, that it built up for itself a fitting technical foundation, and stood on its own feet." (Karl Marx, *Das Capital*, Vol. 1, p. 383-384. Moscow: Foreign Languages Publishing House, 1958.) This tells us that when modern light industry develops to a certain stage, it calls for the development of modern machine-building industry, the most important part of heavy industry. In other words, the latter is developed on the basis of the former and is developed to suit the needs of the former.

These theoretical analyses by Marx coincided completely with the historical course of modern

industrial development in England. If the invention and application of the steam engine marked the beginning of the industrial revolution, then modern light industry in England began to develop in the 1760's. In the words of Marx, however, it was not until the development of machinery in the early decades of the 19th century that the machine-building industry actually mastered the skills required for the construction of machine tools. It was only during the proceeding decade (the first volume of "Das Capital" was published at the end of the 1860's) that the construction of railways and ocean steamers on a stupendous scale called into existence the cyclopean machines now employed in the construction of primary movers.

In Vol. II, Part III, of "Das Capital," Marx again made an overall analysis of the expression of this universal law from the angle of the reproduction and circulation of aggregate social capital. In Vol. III of the same book, Marx summed up his analysis in these words: "As we have seen (Book II, Part III), continuous circulation takes place between constant capital and constant capital (even regardless of accelerated accumulation). It is at first independent of individual consumption because it never enters the latter. But this consumption definitely limits it nevertheless, since constant capital is never produced for its own sake but solely because more of it is needed in spheres of production whose products go into individual consumption." (Karl Marx, *Das Capital*, Vol. III, p. 299. Moscow: Foreign Languages Publishing House, 1958.) If "constant capital" as described by Marx is changed to "means of production," this principle is not only applicable to, but is most effective for socialism. This is because the direct purpose of socialist production is to satisfy the needs of the people.

It is thus obvious that the history of the development of modern industry as well as the general course of social reproduction both show that the production of means of production definitely serves the production of means of subsistence; and that, therefore, heavy industry must be developed on the basis of the development of agriculture, light industry and communications and so as to satisfy their demand for means of production. This is the requirement of the universal law of the development of modern industrial production. It is by no means different because of the social economic system being capitalist or socialist.

It is thus obvious that the economic readjustment, the establishment of a rational economic structure and the change from the building of heavy industry as the target to the increased production of final consumer goods not only coincide with the requirements of the basic economic laws

of socialism, but also correspond to the requirements of the universal law of the development of modern industrial production.

The Experience of the Soviet Union. However, some people argue that the Soviet Union persisted in giving priority to the development of heavy industry for a certain period and that the Soviet experience shows that priority given to the development of heavy industry is the socialist road of industrialization. It is true that the Soviet Union did do things that way. However, it should be noted that the Soviet Union was once the only socialist country in the world, surrounded and threatened by capitalism. The policy used at that time was actually a special measure adopted under particular historical conditions. It was not the universal law of socialist industrialization. Moreover, because the Soviet Union laid prolonged and undue emphasis on the development of heavy industry and went against the requirements of the universal law of the development of modern industrial production, it also inevitably suffered from the imbalance of its economic structure despite the important role it had played in the development of Soviet industry, and especially in the development of military strength for the defence against Hitler's fascism. It should be stressed that if we say that the Soviet Union had persisted in giving priority to the development of heavy industry for the sake of strengthening its economic independence and national defence capabilities during the Stalin era, then it must also be said that, after Khrushchev and Brezhnev came into power, its persistence in the economic strategy of giving priority to the development of heavy industry has been used merely as an important pillar in pursuing the social-imperialist military expansionist policy.

We should make clear the completely different social nature of this policy. The persistence in this economic strategy has already thrown the Soviet Union into a predicament of serious imbalance in its economy.

Priority for the Growth of Means of Production. Does this deny the law of priority given to the growth of means of production? Does the economic development target of increasing the production of final consumer goods contradict the law of giving priority to the growth of means of production? Evidently, it should not be understood that way because, firstly, what does priority to the growth of means of production mean? In Lenin's words, "the production of means of production increases faster than the production of means of consumption." (Lenin, *Collected Works*, Vol. I, p. 88, "On the So-called Market Ques-

tions". Moscow: Foreign Languages Publishing House, 1960). Speaking separately, "Growth in the production of means of production as means of production is the most rapid, then comes the production of means of production as means of consumption, and the lowest rate of growth is in the production of means of consumption." (*Ibid.*, p. 87).

But an increase of production of final consumer goods as the target of economic development requires the production of primary and intermediate products to serve the production of final consumer goods. It also requires the production of heavy industry that mainly supplies means of production to serve the production of agriculture, light industry and communications, which in turn mainly supply consumer goods. Both offer different implications.

Sticking to the latter does not necessarily lead to the negation of the former. In other words, given the prerequisite of increasing production of final consumer goods as the target of economic development, it is still possible to give priority to growth in the means of production. The question is whether the purpose of the development of heavy industry is to serve its own growth or to serve mainly the production of consumer goods. Furthermore, why should priority be given to the growth of the means of production? It is because under certain conditions of technological progress, the demand of society in expanded reproduction for additional means of production is faster than the demand for additional labour (and for additional means of consumption).

Lenin made the point very clear when he said: "The proposition that means of production grows faster is merely a paraphrase of this law [the law of the tendency of constant capital growing faster than variable capital — *translator's note*] as applied to social production as a whole." (Lenin, *Collected Works*, "On the So-called Market Questions", p. 87. Moscow: Foreign Languages Publishing House, 1960). However, faster growth of the production of means of production and of manufacturing means of consumption stemmed precisely from expanded reproduction in the sectors producing means of consumption under certain conditions of technological progress. Although faster growth in the production of means of production as means of production resulted directly from the production of means of production as means of consumption, in the final analysis it came from the production of means of consumption.

As a whole, therefore, faster growth in the production of means of production results from a growing demand for the production of means of consumption. Lenin put it correctly when he said: "It goes without saying that, in the last analysis,

productive consumption is always bound up with personal consumption." (Lenin, *Collected Works*, Vol. III, p. 55, "The Development of Capitalism in Russia." Moscow: Foreign Languages Publishing House, 1960). It is evident that insofar as the meaning of or the reason for giving priority to the growth of means of production is concerned, it does not necessarily contradict the increasing of the production of final consumer goods as the target of economic development.

It must be pointed out further that for a long time some people interpreted the law of giving priority to the growth of means of production in absolute terms — as if the development of modern social production must call for giving priority to the growth of means of production under any conditions. We cannot say that the prolonged undue emphasis on the development of heavy industry had nothing to do with this understanding. It is clear now that this approach to the question is by no means perfect.

Firstly, according to Marxist-Leninist theory, it is only under conditions of technological progress that expanded reproduction calls for priority to the growth of means of production, and expanded production in the absence of technological progress does not necessarily call for priority given to the growth of means of production. In his analysis of the accumulation of capital in "Das Capital" Vol. I, Marx first dealt with the accumulation of capital under the condition that the composition of capital did not change. He then dealt with the accumulation of capital on the condition that the composition of capital increased. This theoretical analysis of Marx spoke to the historical development of capitalism. Secondly, the history of technological progress in modern social production shows that certain kinds of technological progress, such as those related to biological measures in agriculture, do not necessarily call for giving priority to the growth of means of production; and that certain kinds of technological advances, such as the replacement of manual construction by modern machine-building industry, calls for giving priority to the growth of means of production. Clearly, it cannot be taken for granted that expanded reproduction under conditions of technological progress necessarily requires faster growth in means of production. Thirdly, even if technological advances called for the faster growth of means of production, the question of whether priority can be given to such growth depends on other conditions. In the early period of capitalist industrialization, rapid technological advances were made in light industry and its production also grew quickly. However, the machines used in light industry and its production also grew quickly. However, the machines used in light industry were

still built by hand and as a consequence the production of means of production did not grow rapidly. The shortage of capital funds needed in the development of heavy industry was an important factor in this respect.

So far as industrial development in China is concerned, it was necessary to give priority to the development of heavy industry for a certain period in the early years following the founding of New China, when appropriate conditions also existed for such development. In semi-colonial and semi-feudal old China, light industry was fairly well-developed, but heavy industry was in a very poor state. After nationwide liberation, with the change in the ownership of the means of production, both agriculture and light industry acquired great potential for further growth. Under such conditions, heavy industry could be developed at a properly higher rate. But in later years, heavy industry was developed to an extent that it departed from the foundation of agriculture and light industry. The prolonged undue emphasis on the development of heavy industry under such conditions went over to the opposite side and led to the serious imbalance of the economic structure. Clearly, the increase of production of final consumer goods as the target of economic development does not by itself contradict the principle of giving priority to the development of means of production. But giving additional priority to the growth of light industry as a strategic principle for economic development is also compatible with the principle of giving priority to the growth of means of production.

Heavy-Type and Light-Type Structures. But now some people are saying that in the past two years priority was given to the development of light industry and light industry grew at a higher rate than heavy industry. This year, the proportion of light industry to total industrial output value has surpassed that of heavy industry. Thus, it is now time to switch priority again to the development of heavy industry. This view is supported by another theoretical proposition that the irrational "heavy-type structure" should be gradually readjusted to a "light-type structure."

By "light-type structure," it means that agriculture and light industry account for more than 60% of the total industrial and agricultural output value and heavy industry for less than 40%. By "heavy-type structure," it means that heavy industry accounts for more than 40% of the total industrial and agricultural output value, and agriculture and light industry for less than 60%. The premise for undertaking this division is to rectify the serious imbalance among agriculture, light industry and heavy industry; indeed, it may play a certain positive role in changing the existing struc-

ture of underdeveloped agriculture. In fact, however, this view inevitably leads to the conclusion that we should stop giving priority to the development of light industry, especially since in 1980 agriculture and light industry already accounted for nearly 60% of the total industrial and agricultural output value, a proportion that will probably exceed 60% in 1981. This way of division is improper not only because the division between light and heavy industries is at best relative and is becoming more and more relative, but moreover because they do not include important economic sectors such as transportation, posts and telecommunications, commerce and service trades, as well as science, education and public health.

As to the question we are discussing, the main shortcomings are:

1. There are not now nor can there be fixed standard proportions for agriculture, light industry and heavy industry in the total industrial and agricultural output value so as to indicate in which proportions they would be well-coordinated. Such proportions are determined by the development of social productive forces, changes in the economic system, population growth and other complex factors. Even under present conditions in China, it cannot be said that the above-mentioned standards for the "light-type structure" correspond to actual conditions. The proportions of agriculture and light industry in total industrial and agricultural output value have already approached these standards, but the serious imbalance among agriculture, light industry and heavy industry has not yet been changed fundamentally.

2. The method of dividing the proportions of the economic structure merely according to their quantitative output cannot reflect the quality of that structure and therefore cannot show whether the structure is balanced. Theoretically, we can make two assumptions: at a given level of development of social productive forces, heavy industry may account for more than 40% of total industrial and agricultural output value. But heavy industry is built on the basis of the development of agriculture and light industry and exists to serve the development of agriculture and light industry; therefore, its relationship to agriculture and light industry is in balance. Under the same conditions of the productive forces, heavy industry may also account for more than 40% of the total industrial and agricultural output value, although to this extent it serves only its own growth. It shows that its relations with agriculture and light industry are not balanced. At present, although heavy industry in China accounts for 40%, its proportion to the total industrial and agricultural output value is still

too great and the extent to which heavy industry serves its own growth has not been changed notably. Therefore, the proportions of agriculture, light industry and heavy industry are still not balanced.

Of course, this does not deny the success achieved during the past two years in readjusting the national economy in China under the guidance of the party's policy of economic readjustment. The growth rate of light industry in the past two years has surpassed that of heavy industry; the slow development of agricultural production that had lasted for many years was notably changed; and new progress was made in the readjustment of the production of heavy industry. However, it is difficult for the prolonged serious imbalance among the proportional contributions of agriculture, light industry and heavy industry to be totally changed in one or two years. Moreover, some sectors did not implement the policy of economic readjustment effectively, and this further delayed progress of the readjustment to a certain extent. In short, in readjusting the industrial structure at present, we must not only strengthen agricultural production and continue to give priority to the development of light industry, but also readjust the service orientation of heavy industry and change the irrational self-propagation of heavy industry so as to rationalize the industrial structure step by step.

The Goal and Measures for the Readjustment of the Economic Structure

The question of the goal and measures for readjusting the economic structure is an important theoretical and practical question raised in the work of economic readjustment in China that calls for urgent solution. This question was discussed at the seminar on the theory and practice in restructuring the economic management system jointly held recently by the Industrial Economics Research Institute under the Chinese Academy of Social Sciences and the Sichuan Provincial Academy of Social Sciences. Based on the discussions at that seminar, I would like to present my tentative ideas about the goal and measures for the economic readjustment.

As a whole, the goal of the economic readjustment is to proceed from actual conditions in China and to establish an economic structure with relatively balanced proportions, relatively high economic returns and sound development.

The main components of this economic structure are:

1. A proportional relationship among the

different sectors of the national economy to the extent that the internal relationships of these sectors and the relationships among the different links of the social reproduction are roughly balanced.

2. Rational utilization of the manpower, material power and financial power of society.

3. The development of production and construction in ways closely bound up with the improvement of the people's livelihood. Once such an economic structure is established, we can achieve greater economic results and ensure that the material and cultural life of urban and rural residents can be improved as much and as steadily as possible within the limits permitted by the national power on the basis of the steady rise of national income.

The Three Stages of Readjustment. In order to reach the general goal stated above, the economic readjustment can be divided into three stages. The first stage is a stage of economic stabilization. Its main task is to strike a balance between revenues and expenditures, to stabilize prices and the economy, to make large efforts to develop the production of consumer goods, to expand commerce and service trades, to develop the collective and individual economy and to create more job opportunities for young people and to ensure that the livelihood of the people continues to be improved while maintaining present income levels. This stage will take about two years.

The second stage is a stage of further balancing the proportions of the two sectors. The main efforts will be made to readjust the proportional relationship among agriculture, light industry and heavy industry to the extent that the relationship between these two sectors of social production will be in the main coordinated and so that the livelihood of urban and rural people will continue to be improved. This stage will take about three years.

The emphasis in the third stage will be placed on solving the problem of underdevelopment of energy, transportation, posts, telecommunications and urban public utilities and on establishing relatively balanced relations among different segments of the national economy to the extent that economic returns will be markedly increased and so that the income of the people will grow faster and their livelihood will be improved markedly. This stage will take about five years.

These tentative ideas are to be tested, enriched, perfected and revised in further research.

The first two stages can be defined as periods of readjustment. When targets set for the second

stage are reached, the most fundamental proportional relationships in the national economy — the relationships among agriculture, light industry and heavy industry — will in the main be balanced. Therefore, the period that takes readjustment as its focus will end. The task for readjustment in the third stage can be fulfilled in the course of future normal economic development.

II. The Reform and Rationalization of the Economic Management System

In order to break a new path in developing the socialist economy in China it is necessary not only to rationalize the economic structure but also to rationalize the economic management system.

Why Must the Economic Management System Be Reformed?

The present economic management system in China is a system with a high degree of centralism, using administrative management as its main content. This system, in its basic form, was copied from the Soviet Union. That is, it is similar to the system adopted in the Soviet Union in the late years of Stalin.

China's practical experience in the past 30 years has shown that this system has many shortcomings. They can be summed up into four points:

1. The enterprises are regarded as appendages to administrative organs at various levels and their relative independence is denied. Our enterprises are treated like beads in the abacus which are pushed up and down by the central ministries and local industrial departments and bureaus while they themselves have no initiative. This is not because they do not want to possess initiative, but rather because our present system has hampered that initiative.

2. The economy is run according to the administrative networks and administrative regions; each forms an independent system, resulting in severance of the internal relations of the economy. For example, the Chinese enterprises are controlled by the central or local authorities in charge of them. Their interrelationships are mainly vertical — from top to bottom; they do not have horizontal relationships. This has given rise to many irrational phenomena.

3. There are too many directive plan quotas set by the high authorities for the enterprises and

their production has been too tightly controlled. Producers and consumers can never meet each other directly and relationships between those producing and those marketing and between the producers and the consumers are disjointed. Therefore, on the one hand, many products are overstocked in large quantities, while many others are in short supply.

4. As revenues and expenditures are controlled by the central government, the economic departments and enterprises all take "iron rice bowls" to "share food from the same pot." This means that they do not assume fiscal responsibility and pay no attention to economic returns that are the result of egalitarianism. Owing to these shortcomings, the present economic system inevitably deters the encouragement of initiative and creativity on the part of enterprises and their workers and staff members, and is detrimental to the effective control of economic life by the state and to the success of the four modernizations.

This economic system does not conform with the objective law of development of the socialist economy. It does not fit the requirements of the development of commodity economy, nor does it fit the constantly growing and changing needs of the people. This system, under which everything — from planning to distribution of commodities and from employment to state revenues and expenditures — is controlled by the state, inevitably leads to highly centralized management using mainly administrative rather than economic means to run the economy. This management system and its methods make it impossible for the socialist commodity economy to grow rapidly. An inactive economy with poor returns has much to do with the shortcomings of the present economic system.

The prolonged practice of this management system originates from our understanding of the character of the socialist economy. In concrete terms, it is because in the past we did not regard the socialist economy as a planned commodity economy, but a semi-natural economy. Today, when we are restructuring the economic system, we must have a correct understanding of the nature of the socialist economy in our country. This is a prerequisite for correctly solving the problems of orientation, principle, policy and ways of restructuring the economic system.

The Present Nature of the Socialist Economy in China. How should one understand the nature of the socialist economy in our country at the present stage? There still exist a variety of views on this question. The majority hold the view that the socialist economy in China at the present stage is a planned socialist commodity economy with

the public ownership of the means of production holding the dominant position. Of course, some people disagree. The main point at issue is whether or not commodities are defined as the means of production under the socialist system, and therefore whether or not the socialist economy is a commodity economy. This view once held the dominant position in China and some people still hold it today.

My personal view is that our economy at present is a planned socialist commodity economy with the public ownership of the means of production holding the dominant position. Of course, our commodity economy is different in nature from the commodity economy in a capitalist society. The capitalist commodity economy is built on the basis of capitalist private ownership and is unplanned. Our socialist commodity economy is built on the basis of public ownership of the means of production and is a planned commodity economy. They are different in nature.

To recognize the socialist economy as a commodity economy is a great advance in theory, a leap forward. We know that the question of socialist commodity production has been a question under discussion for the last century. There has been a debate among the Marxists. Comrades have all read Marx's "Critique of the Gotha Programme," written in 1875. In this book, Marx said that socialism is the primary stage of communism, under which there still exist the birthmarks of the old society. The birthmarks of the old society referred mainly to the principle of distribution to each according to his work. The socialism he pictured at that time would be built on the basis of highly-developed capitalism; no commodity-money relations would exist. Marx did not predict that countries whose capitalism was moderately developed — or even countries like ours where capitalism was only at the primary stage of development and natural economy was still predominant — could achieve socialist revolution and build socialism. Nor did he predict that countries like ours, with an underdeveloped economy, would have to make full use of the commodity and money categories in socialist construction. In other words, that the socialist economy must be a planned commodity economy.

There is another question for discussion: Can the highly developed capitalist countries abolish commodity production and money immediately after the working class wins political power and then build a socialist system? This question is now being considered by many Marxists. In recent years, I had opportunities to study in Japan, the United States and some other developed capitalist countries in Western Europe. A common view among members of our study group was that these

countries are no longer the same as what Marx described in his time. Marx did not foresee the great development of capitalism one hundred years later. From the time when Marx published his "Critique of the Gotha Programme" 105 years ago, productive forces in the developed capitalist countries have multiplied several dozens of times. But even at the present level of economic development, can these countries abolish commodity economy and money immediately after the proletariat win political power without hindering economic development and creating social disorder? Evidently not. If the name of money at that time is changed to labour certificates — whose function remains the same as that of money — what's the point of doing it? If money is really abolished, that means the commodity economy is also abolished, and that will give rise to a host of problems.

We saw a department store in Tokyo, called the Mitsukoshi Department Store. Although not as large as stores such as Macy's in New York, it sells more than 500,000 commodity items. The largest department store in China, the Shanghai No. 1 Department Store on Nanjing Road, sells more than 40,000 commodity items. The Wang-fujing Department Store in Beijing handles only 24,000 items. We saw a supermarket near San Francisco in the United States, in a small town with a population of 200,000. It deals in food-stuffs and handles more than 14,000 items. If commodity money is abolished, how will these goods be distributed effectively? It was only after tens of thousands of years following the birth of mankind and by repeated practice in life that money was invented. It has played a tremendous role in promoting the economic development of mankind. If it should be abolished now, something more rational must be found to replace it. This is not a simple matter. Evidently, the above-mentioned view of Marx's can only be regarded as a presumption which has to be tested through practice in the future generations. As long as social productive forces are not yet highly developed and as long as labour has not yet become the prime want of the people in their lives, it will not be practical to abolish the commodity economy and money.

In his book "The State and Revolution", written prior to the October Revolution, Lenin quoted Marx's words and expounded his views as dealt with in the "Critique of the Gotha Programme" and stood for the abolition of the commodity economy and money under socialism. After the victory of the October Revolution, the Soviet Union adopted the wartime communist economic system. Wartime communism was practised mainly because of imperialist intervention and the civil

war, but it had also something to do with the theory of the abolition of the commodity economy and money. The subsequent attempt to abolish the commodity economy and money during the wartime communist period failed. Lenin summed up the experience and put forth the new economic policy in line with the existence of five economic sectors, particularly the existence of a small commodity economy and of small-scale production in large quantities in the Soviet Union.

The new economic policy sought to use the commodity/money relationship as a means of developing commerce and promoting the restoration and development of the socialist economy. Unfortunately, Lenin died soon after that writing and did not witness the completion of the socialist transformation. After the socialist transformation was completed, the five economic sectors no longer co-existed and there was only one single socialist economic sector. Should a commodity economy exist under such circumstances? Lenin did not give an answer.

The question was put before Stalin. The socialist transformation in the Soviet Union was completed under the leadership of Stalin. After the completion of agricultural collectivization, Stalin said that since two modes of public ownership co-existed, namely the ownership by the whole people and the collective ownership, there must be two classes of workers and peasants and there must be exchange. However, Stalin did not clearly explain or confirm for a long time following agricultural collectivization in the Soviet Union whether the exchange between the two public ownerships would be commodity exchange, and whether the law of value would still operate. Therefore, the question remained under dispute in the Soviet Union during that period.

It was only in his later years, that is in 1952, that Stalin recognized the existence of commodity production and commodity exchange between the two modes of public ownership. This came in his book, "Economic Problems Of Socialism in the U.S.S.R.," in which he said that the law of value must be utilized. The conclusion was made in the Soviet Union after 20 years of dispute. During the previous 20 years, they did not make good use of the commodity/money relationship and the law of value in handling the relations between the two public ownerships.

Commodity/Money Relationships. In his "Economic Problems of Socialism in U.S.S.R.," Stalin admitted that commodity/money relationships existed between the two public ownerships, but he still held the view that the law of value did not operate as a regulator in the production of raw materials in agriculture. He once more stressed the

necessity of restricting commodity production and the function of the law of value. Therefore we can say that Stalin had never regarded the socialist economy completely as a commodity economy, but rather as a semi-natural economy. Based on this theory and understanding, the economic management system designed and practiced during the Stalin era was not instituted to suit the requirements of the commodity economy, but rather to suit the requirements of the semi-natural economy. It did not regard products as commodities for exchange at equal value but adopted the unitary directive plan, totally rejecting regulation through the market. It adopted highly-centralized administrative methods of management. The unitary directive plan treated the whole national economy as a factory. Indeed, Lenin spoke of all of society as a factory.

But, today, we find this question very complicated. If we take the whole society as a factory, many problems crop up. The highly centralized economic management system we adopted denied the enterprises their relative independence and also addressed the whole society as a factory. Are there not many problems when we do things this way? A leading comrade of the State Council said recently we have actually treated the whole country as a big enterprise in which the Ministry of Finance looks like its financial section and the other ministries and bureaus also function like their equivalent sections. It is impossible to run the national economy well in such a way. The experience of China and other countries shows that it is certainly impossible to run the economy well if the whole society is run as a factory.

Stalin's theory and practice exerted tremendous influence on socialist construction in our country. The economic management system model designed and adopted under his leadership also had a great influence on us. The economic management system which has been adopted and is still being adopted in our country is basically the Stalin model. Of course, some changes have been made. State control of planning, distribution, employment and budgeting forms the primary content of the Stalin model. To change this model, we must first of all remove the theoretical foundation for this model — that is to say, break down erroneous or outmoded conventions. If this is not done, it will be impossible for us to break down the old model that hinders economic development or to create a new model that promotes economic development.

Now we have broken down the model theoretically. We should say that this is an important result of emancipating our minds. Without the theoretical breakthrough, there would be no tentative ideas and practices for the reform now being

made in the system. We have learnt to understand that under the socialist system not only the means of subsistence are commodities, but the means of production are also commodities, and not only the exchange between the ownership by the whole people and the collective ownership is commodity exchange, but the exchange among the state-owned enterprises is also commodity exchange. Of course, other scholars hold to a different view and have had their articles published in the press. This is also a good thing, because the truth is clarified through debate. We should carry forward the spirit of letting different schools of thought contend.

Thanks to progress on the theoretical level, not only means of subsistence but also means of production are now sold at market. For example, the Anshan Iron and Steel Company has opened a retail shop selling its steel products — something which never happened before. Today, machines are also sold at market. In 1979, machines and electrical products sold through the market accounted for 20% of the total output value of the machine-building industry; that percentage was expected to go up in 1980. Some factories will sell as much as 70–80% of their products through the market. Some people object to this, but practical experience has shown that this trend has played a positive role in promoting economic development. The experience also demonstrates that the economic system must be changed.

Orientation in the Structuring of the Economic System

In restructuring the economic system, we must adhere to a correct orientation. In light of the theory that the socialist economy is a commodity economy, some tentative ideas exist for the orientation of the reform: change the monopoly control by the central authorities and hand down the decision-making power in micro-economy to the enterprises; change the unitary practice of regulating production through plan and give play, under the guidance of state plans, to the function of the market in production regulation; and change the practice of sole reliance on administrative means to run the economy, combine economic means with administrative intervention and use mainly economic levers and economic laws and regulations to manage the economy.

In line with the general orientation for the reform, we have formed a general picture of the reform: gradually separate the power of the party and government from that of the enterprise; hand down some of that power; expand the decision-making power of the enterprises and the power of the workers in democratic management; encourage

the establishment of all forms of economic combination; establish industrial organizations and re-organize the enterprises in a rational way; change the closed, single-outlet and multi-link commodity distribution system and establish a multi-outlet, minimal-link and open commodity distribution system; establish a wide variety of economic centers with the large and medium-sized cities as their backdrop and organize rational economic networks.

A number of reforms have to be made in planning, finance, taxation, pricing, banking, commerce, supply, foreign trade, labour and wages to supplement the restructuring of the economic management system. Obviously, the orientation and content of the restructuring must conform with the requirements of development of socialist commodity production and large-scale social production.

Recent Achievements in Restructuring Economic Management. A number of achievements have been made in the past two years in restructuring the economic management systems. We have extended the decision-making power of some factories; practiced the regulation of production through the market under the guidance of the state plans; promoted various forms of economic integration and coordination between urban and rural areas and among the different localities, industries and enterprises under guidance of the principle of making the best use of one's advantages while protecting competition and promoting integration; introduced the experiment of replacing government allocations by bank loans for investments in capital construction, technical innovations and technical transformation; combined industry with trade in promoting export business; and allowed multiple economic sectors and multiple modes of business operations to exist under the condition that public ownership of the means of production is absolutely predominant. Moreover, the experimental work of restructuring the industrial management system at the county level has been started. The experimental work of replacing profits with taxes and assuming sole responsibility for profits and losses as well as the experimental work of reforming the leadership system were also introduced in a limited number of enterprises.

Practical experience shows that the orientation for the reform in the past two years has been correct, marked achievements have been made, and the reform has played a positive role in inspiring the initiative of the people in all walks of life, in invigorating the economy and in increasing economic returns.

Some problems have also cropped up in the

course of the reform, including the construction of unnecessary projects, the plan-less production of unwanted goods and the overissuance of bonuses and subsidies. These problems can all be solved only if macroeconomic guidance is strengthened rather than inhibited.

Two Views to Be Discussed on the Question of the Orientation for the Reform in the Economic Management System

One view to be discussed is whether it is appropriate for state-owned enterprises based on manual labour and with limited organic composition to assume sole responsibility for profits and losses while it is inappropriate for those enterprises with a higher level of productive forces and greater organic composition to assume responsibilities for profits and losses — with the state assuming responsibility for their profits and losses.

There is no doubt that small state-owned enterprises based on manual labour and with smaller organic composition should assume responsibility for their profits and losses. Even their workers can contract to run these enterprises on the basis of assuming full responsibility for profits and losses. However, it is not correct to think that other state-owned enterprises do not have to assume the responsibility for their profits and losses. The essence of the question is whether or not the state-owned enterprises are to be considered as relatively independent commodity producers. If this point is accepted, it must be acknowledged in principle that all state-owned enterprises must assume the responsibility for their profits and losses. This is so because the assumption of this responsibility by enterprises for their profits and losses under the guidance of the state plans is a relatively good economic management system and one that reflects the economic status of the enterprises as relatively independent commodity producers. If this principle is negated, the economic status of the enterprises is in fact negated. Because in actual economic life, the economic status of the enterprises is manifested in the form of assuming responsibility for their profits and losses. This point is made quite clear by the explanation that the socialist economy is a planned commodity economy, and there is no need to say more on it.

Application of Marx's Socialist Nationalization to China. What does demand a detailed discussion is the following point of view:

As stated above, there are many shortcomings in the present economic management system in

China and an urgent reform is needed. But the point is to reform the concrete method of managing ownership in a socialist country, namely, under the present economic management system; the point is not to negate totally socialist state ownership proper. However, some people hold the view that the root cause for the shortcomings in our economic life is that the development of productive forces in China has not yet reached the level of practicing socialist state ownership. This view states that the way out is to reform state ownership itself and to retreat back to collective ownership.

Obviously, this view is not compatible with the Marxist theory of socialist nationalization, nor with the actual conditions in our country.

On what was the Marxist theory of socialist nationalization based? It was put forth in the light of the contradiction between social production and capitalist private ownership of the means of production in capitalist production, and was meant to solve this basic contradiction. This brilliant thesis was clearly dealt with by the founders of Marxism in the "Manifesto of the Communist Party," which marked the birth of scientific socialism. Later, Engels expounded it in his huge scientific work, "Anti-Duhring."

The present question is whether this Marxist principle applies to China. In semi-colonial and semi-feudal old China, the degree of development of capitalism was far behind that in Western capitalist countries. However, "China's modern industry, although the value of its output amounts to only about 10% of the total value of output of the national economy, is extremely concentrated; the largest and most important part of the capital is concentrated in the hands of the imperialists and their lackeys, the Chinese bureaucrat-capitalists." (*Selected Works of Mao Tse-tung*, Vol. IV, p. 369, "Report to the Second Plenary Session of the Seventh Central Committee of the C.P.C." Beijing: Foreign Languages Press, 1969). The basic contradictions of capitalism stood out sharply here. There is no doubt that after the state was established under the dictatorship of the proletariat, the socialist nationalization of these capitalist enterprises ought to be achieved through confiscation. In the national capitalist economy, the degree of social production was lower, but the basic capitalist contradictions existed. The proletarian state must, through peaceful transformation, change it into a socialist state-owned economy. In short, the Marxist theory about socialist nationalization applies to China in principle. Of course, because capitalism was not well developed in old China, the scope of socialist nationalization was narrower than it would be in the capitalist countries after the proletariat in

those countries win political power. But this is a question of the scope of socialist nationalization, not a question of inability to achieve socialist nationalization.

It should be pointed out further that since the founding of New China its economic development has met with serious setbacks under the influence of prolonged "Left" mistakes, especially owing to the counter-revolutionary disruption by Lin Biao, Jiang Qing and their ilk. However, the socialist industry has greatly developed and the degree of socialization of production as a whole has risen. How under such circumstances can socialist state ownership retreat back to collective ownership against the requirement of socialization of production? Of course, under the influence of "Left" mistakes there had emerged the erroneous tendency of overzealousness in bringing about the so-called "transition" from collective ownership to socialist state ownership (namely the ownership by the whole people) by turning large numbers of collectively-owned industrial enterprises in the urban areas into enterprises under quasi-ownership by the whole people and turning a number of small enterprises that, based on hand labour, should have become collectively owned into state-owned enterprises. Turning back enterprises that function under quasi-ownership by the whole people into truly collectively owned enterprises in the light of their productive forces seems superficially to be a "retreat," but in fact is a correction of the mistake. But this should be treated as a local question and not as an overall question. In other words, the issue is not that socialist nationalization should not be practiced, or that all socialist state-owned enterprises should be turned back into collectively-owned enterprises.

If, as some people propose, all of the socialist state-owned enterprises are changed into collective enterprises, how then shall the planned development of the national economy be ensured and the anarchy of social production be avoided? If socialist state ownership no longer existed, would it be possible for collective ownership to be consolidated and developed forever or could the state under the dictatorship of the proletariat be firmly built forever on the basis of the economy under the collective ownership? All these questions have to be treated earnestly and seriously.

III. On Readjustment, Restructuring, Consolidation and Improvement; Industrial Reorganization; and the Rationalization of Enterprise Organization

To achieve industrial reorganization and rationalize the organization of enterprises, the

primary and fundamental link is the reorganization of industry and the establishment of various forms of economic complexes for integrating enterprises on the principle of specialization, coordination and economic rationality.

Establish Various Forms of Economic Complexes for the Integration of Enterprises

The integration of enterprises is an objective requirement of the development of the productive forces of modern society, an objective requirement of technological progress. In the light of the experience in the development of capitalist production towards the end of the 19th century, Lenin pointed out: "Technical progress must entail the specialization of different parts of production, their socialization." (Lenin, *Collected Works*, Vol. I, 'On the So-called Market Questions', p. 101. Moscow: Foreign Languages Publishing House, 1960). Current technological progress has greatly pushed forward the specialization of products, of parts, of technologies, of production, of raw materials and of auxiliary production. This is one aspect of the matter. On the other hand, since social production as a whole is an organic whole, different sectors and different enterprises become more and more interdependent as a result of the increasing specialization. This calls for integration on a broad scale to suit the requirements of specialization and coordination. Lenin said that "A very important feature of capitalism in its highest stage of development is so-called combination of production, that is to say, the grouping in a single enterprise of different branches of industry." (Lenin, *Selected Works*, Vol. I, Part II, p. 445, "Imperialism, the Highest Stage of Capitalism." Moscow: Foreign Languages Publishing House, 1952). The growth of this combination, on the one hand, was the result of the development of modern capitalist relations of production and, on the other, of the development of modern social productive forces. In a general sense, this system of combination also applies to a socialist society.

Comparisons with Japan and the United States. The reality in China is that after 30 years of socialist construction, industrial production and technology have developed greatly as compared with the underdeveloped industry of semi-colonial and semi-feudal old China. This development called for the wide-scale expansion of specialization and coordination. The serious problem of establishing big and small all-embracing production systems is found widely throughout industrial organizations; their level of specialization and co-

ordination is very low. According to a 1978 investigation made by the First Ministry of Machine-Building Industry, only 162 of the 6,057 enterprises under the ministry were specialized cast-iron plants, producing only 18% of the total output; there were only 52 plants specialized in the production of forgings, producing only 9% of the total output of forgings. The cast-iron production of specialized plants in Japan accounts for more than 60% of total output and that of the forgings, 84%. About 70% of all engineering products made in the United States are produced by specialized factories in terms of the total value of sales; 1.2% of the factories produce castings and forgings for themselves and 4.46% have special equipment for heat treatment. Many of the large machine-building plants in Japan and the United States produce only the principal parts of the machinery; almost all of their raw materials, blanks and spare parts are produced by a wide production network established through economic integration. It is true that the level of productive forces in our country is still relatively low and it is impossible for the level of specialized production to reach the height of the United States and Japan, but the problem of the incompatibility of the low degree of specialization in our country with the needs of development of production has to be solved. The all-embracing production systems in many industrial enterprises is an important factor in the low productivity and poor returns in industry. Obviously, to modernize China's industry it will be essential to reorganize industrial production and to achieve the integration of enterprises on the principle of specialization and coordination.

Reorganization and Integration. The reorganization of industry and integration of enterprises is called for by the readjustment of the national economy. At present, the national economy in China is totally out of balance. Some of the departments and enterprises have excessive productive capacity while others are short of productive capacity. Experience shows that the integration of enterprises greatly helps to reduce overproduction of unwanted goods and to expand production of wanted goods. In this sense, it can well be said that integration means readjustment. Readjustment not only entails the integration of enterprises, but also the consolidation of enterprises resulting from readjustment, including the closing down, suspension, merging or transfer of part of the enterprises. In turn, this provides favourable conditions for the integration of enterprises, raising the management level and increasing economic returns.

The reorganization of industry and integration of enterprises is also called for by restructuring the

economic management system. The characteristics of the existing economic management system are high centralism and administrative control. Highly centralized leadership in fact means leadership of the economic departments at the central and provincial, municipal and autonomous regional levels. This kind of administrative control has severed economic ties among the different industries and localities. This is incompatible with the requirement of the development of the socialist commodity economy. The integration of enterprises, especially those in different industries and localities, helps break down barriers among different sectors and localities in a way that suits the needs of the development of socialist commodity production. In this sense, it can also be said that integration means reform. However, this reform not only calls for the integration of enterprises, but also promotes competition among the enterprises as a result of the extension of the decision-making powers of the enterprises and of regulation through the market under the guidance of the state plans. This, in turn, promotes the integration of enterprises.

In short, the reorganization of industry and integration of enterprises are requirements of expanding socialist construction in China and of implementing the principle of economic readjustment.

However, reorganization and integration must be in conformity with reality and may take different forms. To sum up, there are the following forms:

1. Combinations of producing, marketing and transporting enterprises.
2. Combinations of capital funds, technologies, manpower and materials.
3. Joint exploitation of resources, joint production and joint marketing, and agricultural-industrial-commercial complexes.
4. Mother-and-son companies — combinations of several factories and communes or their subdivisions through the pooling of capital funds, or combinations of several factories for joint production and marketing.
5. Combinations of state-owned enterprises, of state-owned enterprises and collective enterprises, of collective enterprises and of urban and rural enterprises.

How to Reorganize Industry and Integrate Enterprises. Shall this be done entirely by order from the higher authorities? Or entirely through

"free love"? The practical experience in recent years has shown that the correct way to achieve this is to observe objective economic laws, and combine consultation from bottom to top with necessary administrative intervention on the basis of the principle of voluntariness and mutual benefit. Especially at a time when administrative control by ministries and local authorities is still gravely hindering the industrial reorganization and integration of enterprises, it is all the more necessary for the state to use its authority to break down these restrictions and open the way for reorganization and integration. The industrial reorganization and integration of enterprises must suit local conditions and should not follow just one model. At the initial stage, the integration of enterprises should be started on a smaller scale; the number of items for joint production should be fewer; the degree of integration should be lower; and the units joining the integrated corporations should be near to each other. Of course, there are exceptions. For example, some enterprises already have a higher degree of socialization in production and more experience in management; it is both possible and necessary for them to form large national or regional economic combinations with unified supply, production and marketing systems. In short, the problems should be solved in a down-to-earth manner.

Whether in a capitalist or a socialist society, the development of modern productive forces gives rise to the tendency of integration of enterprises. But integration processes in the two societies are totally different in their social economic nature:

1. The combination and monopoly of capitalist enterprises proceeded on the basis of capitalist private ownership of the means of production. Therefore, after such combinations and monopolies are formed, they could restrict free competition but could not eliminate competition. The competition among monopoly enterprises, especially between the monopoly enterprises and other enterprises, would become even more acute. Dwelling on this point, Lenin said: "Here we no longer have competition between small and large, technically developed and backward enterprises. We see here the monopolists throttling those which do not submit to them, to their yoke, to their dictation." (Lenin, *Selected Works*, Vol. I, Part 2, 'Imperialism, the Highest Stage of Capitalism,' p. 455). The integration of socialist enterprises proceeds on the basis of public ownership of the means of production. Relationships among integrated enterprises or between the integrated and the unintegrated are relationships between the socialist enterprises. There is also competition

among them, but it is based on the identity of their fundamental interest and the difference of their local interests. Relationships between capitalist monopoly enterprises as the oppressors and non-monopoly enterprises as the oppressed no longer exist.

2. The integration and monopoly of capitalist enterprises was the result of the spontaneous action of capitalist economic laws. Once the combinations and monopolies were formed, it was still impossible to eliminate totally the anarchy of social production. Since World War II, the capitalist countries have strengthened their control over the combination and production of enterprises. But this control has not been able to affect spontaneous economic behaviour and therefore economic crises have broken out one after another. The integration of socialist enterprises is the result of the action of socialist economic laws and is developed under the guidance of state plans and in ways to accord with the requirements of the planned and proportionate development of the national economy. Therefore, the integration of enterprises should promote the balanced development of the national economy.

3. The development of the combination of capitalist enterprises is related to capitalist ownership only in form and is suited to the requirements of socialization in production to a certain extent. In essence, however, more and more capital is concentrated in the hands of a few capitalists and the basic contradictions of capitalism have become more and more acute.

Under the socialist system, the integration of enterprises is a requirement of the development of social production as well as a means to promote the socialization of production. The socialization of production coincides with the nature of socialist public ownership; that is, it lays the material foundation for the consolidation and strengthening of the socialist system. All of this demonstrates the superiority of socialist relations of production over capitalist relations of production.

Establish Industrial Associations for the Integration of Different Industries

To establish industrial associations for the integration of different industries is also an important part of the rationalization of industrial organizations.

China's present system of management over the enterprises is a system of administrative management by different industrial ministries set up on the basis of the division among the large

industries. The essential shortcomings in this management system are:

1. The enterprises are treated as appendages to the state administrative organs. This does not suit the requirement of the economic status of the enterprises as relatively independent commodity producers. Therefore, it gravely hampers the initiative of the enterprises.

2. Absolute control by different ministries has cut off horizontal economic ties among the enterprises. This is incompatible with the requirements of modern social production and commodity economy.

3. With the socialization of production, the division of labour is even more developed. The ministerial control of enterprises is increasingly incompatible with the requirements of development of industrial modernization.

4. Under the present industrial management system, a central industrial ministry can control only the enterprises directly under it but not the enterprises in the same industry or under other ministries and localities. It is responsible for the production of products made by enterprises under it, but not for the multiple use of natural resources. In fact, however, the production of any product by any industry is not the product of one industry, but a product of two or more industries. Therefore, the main problem in the present management system is not only that it has controlled what it should not but, even more important, it has not controlled what it should have. To change this, it is necessary to establish industrial associations for the integration of different industries in ways other than handing over the microeconomic decision-making power to the enterprises and integrating enterprises under the guidance of the state.

The nature and task of an industrial association can be described thus: It is a coordinating organ formed by enterprises in the same industry on a voluntary basis. It is an integration of management; namely, management under a council democratically elected by the enterprises joining the association. The association can define due rights and obligations for its member enterprises. The special feature of such an association is that it is not a state administrative organ but a semi-official or non-official organization under state guidance and endowed with certain administrative power. Although it is not an economic combination, it has certain economic functions. It operates as a bridge between the state and the enterprises or between enterprises. To the government, it represents the industries; to the enter-

prises, it represents the government in democratic consultation.

The functions of an industrial association are:

1. To draft plans for the development of that industry in accordance with state policies and plans; coordinate the activities of the enterprises in the same industry; provide liaison, guidance, services and consultation.

2. Develop the specifications and technical standards for the products produced by the industry.

3. Organize cooperation among the enterprises concerned.

4. Organize exchange of technical information among the enterprises of the same industry.

5. Provide assistance in the training of managerial and technical personnel.

To establish industrial associations for the integration of industries helps to implement state policies and plans; to meet the requirements of the readjustment of the national economy; to readjust the production of unwanted and wanted goods; to avoid construction of unnecessary plants and production of overstocked goods; to reorganize industry on the principle of specialization and coordination and to promote the integration of enterprises; and to break down absolute control by the ministries and blockades by the localities.

In these ways, the associations can replace the government for some functions in running the economy. All this shows that to establish industrial associations for the integration of industries is both a requirement of the readjustment and reform as well as an important way of achieving their objectives.

As an historical phenomenon, industrial associations or guilds were born as early as in feudal society when a commodity economy began to develop. In the developed capitalist countries of the present day, industrial associations have been widely developed. But the industrial associations which China is going to establish and develop are totally different in nature from guilds in feudal society or from industrial associations in capitalist countries. Guilds in feudal society were based on simple commodity production and were economic organizations of a feudal character; the purpose of guild activities were to serve the interests of those who joined them. Industrial associations in capitalist society are based on capitalist commodity production and are capitalist economic organizations; their purpose is to coordinate contradictions among the capitalists and to serve the interests of

the capitalists in increasing exploitation of the working class for greater profits. Industrial associations in socialist society are socialist organizations based on socialist commodity production; the purpose of their activities is to better develop socialist production and to improve the material and cultural life of the people on the basis of the development of production.

Establish Economic Centres for Integration of Regions

The establishment of economic centres for the integration of regions plays an important part in the rationalization of economic organizations.

As a whole, the economic centres are centres for social economic activities in a given sphere (or activities of social reproduction), namely, activities that include production, exchange, distribution and consumption. They operate within the setting of cities of considerable size and are products of the development of the commodity economy to a given stage. Economic centres appeared with the rise and growth of cities and with the growth of the commodity economy of the slave society and the feudal society. But the large economic centres, especially the national economic centres, took form along with the growth of the capitalist commodity economy. Obviously, the formation of the national economic centres was bound up with the formation of unified national markets; but the formation of unified national markets was the product of the development of capitalist commodity production. However, the development of economic centres in the modern sense is the outcome of the development of modern capitalist commodity production as well as of the development of modern industry and modern science and technology.

Socialist economic centres also depend on cities and are also products of the development of the commodity economy. They are totally different in social-economic character from preceding economic centres. That is to say, they are based not on the commodity economy under the private ownership of the means of production but on the commodity economy under ownership by the whole people. Therefore their formation and development, unlike that of the previous centres, were not products of the spontaneous development of the commodity economy but was achieved under the guidance of state plans. Relationships between the economic centres and the non-economic areas connected with the economic centres are not those of antagonistic interests as under the private ownership of means of production, but are relationships with an identity of fundamental interests and differences in their local interests.

The economic centres can be set up in this way: integration of regions with cities of considerable size as their centres. These are not economic complexes, although there will exist coordinating committees for the economic centres elected on a democratic basis by various economic organizations (such as enterprises, economic complexes of all forms and industrial associations) and these will take part in the activities of the economic centres. Such committees will coordinate the activities of the economic organizations under the guidance of state policies and plans. They are not administrative organs of the state, but they can gradually take up part of the functions of the state in running the economy under the guidance of the state.

In this way, the economic centres will become an important part of the whole socialist commodity economic system and an important factor for promoting the planned development of the commodity economy under the conditions of socialism. At present, the establishment of economic centres helps to promote the development of economic readjustment and to break down the absolute control by the ministries and localities, and therefore forms an important part of readjustment and reform.

Here we can see that under the socialist system the functions of the economic centres are totally different from previous economic centres. This is to say, they do not serve the exploiting classes but serve the purpose of developing the socialist commodity economy and, in the final analysis, the purpose of improving the material and cultural life of the people.

Learning from Some of the Experiences of Capitalist Countries. We have underlined the fundamental differences between the socialist and capitalist combinations of enterprises, industrial organizations and economic centres. But this does not mean that some of the concrete experiences in these respects in capitalist countries are useless to us. The point is that the socialist economic system is totally different from the capitalist one, although the combinations of enterprises, industrial organizations and economic centres under both social economic systems are the products of the development of the commodity economy with modern social production as its material basis. In this respect, they have something in common, and therefore we can also learn from some of the experiences of the capitalist countries. For example, the combination of modern capitalist enterprises is characterized by the tendency to form monopolies. However, capitalist countries as representatives of the interests of capital also pay attention to upholding the interests of com-

petition. Therefore, in the combination of enterprises, capitalist society also gives attention to opposing the tendency of monopoly. In view of this, when we are organizing united corporations we must not allow monopoly control or the elimination of competition. The capitalist combinations of enterprises also oppose the centralization of power among themselves. This also tells us that in organizing the corporations we must correctly handle relations between centralization and decentralization of power in the organization of the corporations at different levels. Moreover, we must correctly handle the relations of material interests among them.

Earmarks of a Rational Economic Organization

Based on the analyses made above, I think the earmarks of a rationalization of economic organization are as follows:

1. Gradual separation of government power from enterprise management so that the enterprises will become relatively independent commodity producers.
 2. Organization of economic complexes of various forms on the principle of specialization, coordination and economic rationality.
 3. Establishment of industrial organizations as an important link between the government and the enterprises.
 4. Establishment of a number of economic centres with industrially concentrated cities as their settings to organize economic integration on a nationwide or regional basis and exercise some managerial functions.
 5. Tightening of state control of the macro-economy while breaking down the multi-departmental and multi-level administrative management system.
- When all this is achieved, China's socialist commodity economic organizations can be integrated into a network. At the same time, some of the managerial functions of the administrative organs of the state will be exercised by economic organizations under the guidance of the state plans. In this way, the separation of administrative power from enterprise management — to make the enterprises relatively independent commodity producers — will materialize.

In short, as long as we unswervingly follow

the line adopted at the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, and implement the principle of economic readjustment in all economic fields and gradually rationalize the economic structure,

economic system and economic organizations, the future is bright for the great cause of socialist modernization in our country. And we should be confident of this!

3. CHINA'S ECONOMIC READJUSTMENT AND REORIENTATION

By Fang Weizhong

It has been more than two years since China started its economic readjustment. It is necessary now to clearly explain the reasons for the economic readjustment and to assess the work of the past two years, future tasks and prospects for the readjustment. The following discussion therefore attempts to present to our readers an outline of all these aspects.

I. The Dual Significance of Economic Readjustment

The policy of readjusting, restructuring, consolidating and improving the national economy was adopted on the basis of intensive studies and discussions by the Central Committee of the Communist Party of China and the State Council in March 1979. The Second Session of the Fifth National People's Congress, held in June of that year, discussed and approved the Report on the Work of the Government and decided to shift the emphasis in the work of the whole nation to the orbit of socialist construction and socialist modernization. It defined the implementation of the policy of readjusting, restructuring, consolidating and improving the national economy as the "first battle" for the four modernizations following the shift of the focus of our work. The formulation of this policy meant a new start for a down-to-earth approach to our economic work.

The fundamental cause for the readjustment of the national economy was a serious imbalance in economic growth, mainly manifested by three aspects:

1. *Over-extended capital construction and an excessively high rate of accumulation affected improvement of the people's livelihood and the balance of financial and material resources.*

This tendency was discernable in 1970, when total investment in capital construction in that year shot up to 29,500 million yuan from 17,100 million yuan in 1965 and 18,600 million yuan in 1969; it then made another climb to about 36,000 million yuan in 1976. Of the total investment in 1976, the portion covered by the national budget — excluding the investment put up by various enterprises, localities and departments — was 29,400 million yuan, as against a range of 15,400 million to 16,600 million yuan during the years 1965 to 1969, and as against 25,500 million yuan in 1970. With the growth of investment in capital construction and excessive expansion of liquid assets, the rate of accumulation in the national

income grew rapidly. The accumulation rate was 27.1% in 1965, and has remained above 30% since 1970.

Due to the interference and sabotage by Lin Biao and the Gang of Four, coupled with the excessive magnitude of capital construction and an excessively high rate of accumulation, little improvement was made in the people's livelihood during the period 1966 to 1976; in some areas, in fact, living standards fell. For peasants in the vast rural areas, per capita income from the collective economy averaged 62.8 yuan in 1976 as against 52.3 yuan in 1965, an increase of only 10.5 yuan over the entire 11 years. Thus, the annual increase of per capita income averaged less than 1 yuan. Because of inadequate supplies of food grain and very small amounts of cash payments — in some areas, even no cash payment — life was still very hard indeed for the peasants in many people's communes and production teams.

So far as the workers and staff in urban areas are concerned, the total wage bill somewhat increased due to the increase in the number of workers and staff. However, since the standard wage system had not been adjusted for a long period, the average per capita wage of the workers and staff somewhat decreased. The wages of workers and staff members in units owned by the whole people averaged 652 yuan in 1965, and declined to 605 yuan in 1976. Insufficient appropriations for urban construction led to acute housing shortages and other problems of people's livelihood. Yearly per capita consumption, both rural and urban, as calculated from consumption funds, was 161 yuan in 1976, as compared with 125 yuan in 1965, with an increase of only 2.2% a year if price factors are excluded. The growth of consumption levels in rural areas was slower than that in urban areas. Thus, improvement of the people's livelihood was not only a strong desire of the people, but also a serious political challenge.

Efforts to Restore the Disrupted Economy. After smashing the Gang of Four, the party and government made arduous efforts to restore and develop the disrupted national economy. That approach was absolutely correct. And remarkable achievements were made. The people also benefited from the restoration and development of production. However, because of our lack of careful analysis of the economic situation and our inadequate understanding of the serious disproportions between consumption and accumulation, as well as our impetuosity in the modernization drive, a Ten-

Year Plan with high production targets and an excessive range of capital construction was drafted.

This resulted in a further expansion of investment in capital construction and a rise of the proportion of accumulation in the national income, instead of proportionately reducing the scope of capital construction and rehabilitating the people's livelihood. Total investment in capital construction in 1978 reached 48,000 million yuan, of which state investment accounted for 39,600 million yuan, an increase of 10,200 million yuan over 1976. With an increase of accumulation in other areas, the accumulation rate reached 36.5% in 1978, a level rarely seen in the past. Owing to excessive expansion of capital construction and over-centralization of state finances, state revenues in 1978 accounted for 37.2% of national income, which was abnormally high. Yet, state revenues and expenditures were still difficult to balance. More than 8 million tons of rolled steel were imported in 1978, an increase of more than 60% over the previous year. However, steel was still in short supply. Thus, capital construction was over-expanded at the expense of consumption and markets, and this seriously affected the raising of people's living standards.

Furthermore, had the Ten-Year Plan not been called off, a great number of projects, including those built with imported equipment, would have to have been placed under construction, giving rise to further large increases in accumulation and appropriations for capital construction set aside both in national income and state revenue, thus leading to an even more serious imbalance between revenues and expenditures, and between supplies of and demands for materials. Under these circumstances, the people's standard of living would have been worsened instead of stabilized. This would eventually dampen the enthusiasm of the masses and bring great losses to the socialist modernization, albeit quickening its pace. That was an important reason for readjusting our national economy.

2. Too rapid growth of heavy industry and slow development of agriculture and light industry led to an irrational industrial structure.

Old China was extremely weak in heavy industry. In order to meet the demands for consumer goods and for national defence, it is definitely necessary to attach importance to heavy industry, the means of production. However, due to over-emphasis on heavy industry and corresponding neglect of agriculture and light industry, the ratio of agriculture and light industry to the gross output value of industry and agriculture declined rapidly. Calculated in constant prices, the proportion of agricultural output value to the gross out-

put value of industry and agriculture was trending down to 25.6% in 1978 — from 43.5% in 1957, 29.8% in 1965 and 28.8% in 1976. Meanwhile, the ratio of the output value of light industry to the total output value of industry declined to 42.7% in 1978 from 51.7% in 1957, 50.4% in 1965 and 43.7% in 1976. The slow development of agriculture and light industry thus slackened the pace to improve the people's livelihood.

In the pursuit of high-speed development of heavy industry, great efforts had to be made by heavy industry to supply its own needs. Particularly, in order to develop the iron and steel industry, the policy of "taking steel as the key link" was long over-emphasized. This policy required not only large funds to be set aside for the construction of the steel industry itself, but also for the construction of related industries such as fuel and power, chemicals and heavy machine-building. As a result, a huge amount of iron and steel was consumed in these respects. Therefore, despite the rapid growth of heavy industry and a considerable rise in iron and steel output, agriculture and light industry still could not get enough fuel and power, raw materials, machinery and equipment. Even the demand for rolled steel in making small farm tools was not adequately met. A variety of rolled steel products needed for light industry had to be imported.

Most of the targets in the Ten-Year Plan drafted in 1978 were set too high. For example, the plan called for 60 million tons of steel to be produced annually by 1985. In order to fulfill this target, tremendous financial and material resources would be allocated to the construction of heavy industry and to the iron and steel industry in particular. This would lead to further imbalances between agriculture, light industry and heavy industry. Here was another reason for economic readjustment.

3. Within heavy industry itself, fuel- and power-consuming industries and particularly processing industries developed far beyond the capacity for energy supply. On the other hand, a serious imbalance between extraction, tunnelling and recoverable reserves emerged in the fuel and power industries, and mainly in the petroleum and coal industries because of a long period of over-extraction. All this required readjusting the arrangements for production and construction.

In general, China's energy development has not been slow. Coal output increased to 618 million tons in 1978 as against 70 million tons in 1953; crude oil reached 104.05 million tons in 1978 as against 1.46 million tons in 1958. The total output of primary energy topped 600 million tons of standard coal, which was quite considerable. Dur-

ing this period, however, industrial enterprises which consumed excessive energy mushroomed across the nation. Coupled with heavy waste in the utilization of energy, this led to a serious energy shortage. As a result, many enterprises were under-utilized, some of them constantly suffering from partial or total shut-downs. In addition, several newly completed projects could not go into production because of insufficient fuel and power supplies.

The output of crude oil increased 4.8 times during the nine years from 1970 to 1978, averaging an increase of 9.15 million tons or 19% a year. Yet the growth of recoverable oil reserves lagged far behind that of production. Many oilfields found it difficult to continuously increase their output, and they faced the danger of destroying the wells by continued exploitation. Coal output increased 2.3 times in these nine years, realizing an average increase of 39 million tons or 9.8% per year. But due to backward techniques in extraction and tunnelling, a number of coal mines found it difficult to go on expanding their production, and some even ceased extraction entirely. Therefore it was necessary to readjust the national economy so as to bring about a harmonious proportion between extraction and recoverable reserves and between extraction and tunnelling in the petroleum and coal industries, and to bring the development of other sectors of the national economy into proportion with that of energy.

From the above-mentioned three aspects, it is apparent that the policy of readjusting the national economy put forward by the Central Committee of the Party and the State Council is absolutely necessary and completely correct. The immediate significance of the economic readjustment is to alter the serious imbalance in the national economy so as to surmount the difficulties before us. Otherwise, our socialist modernization programme cannot advance smoothly.

It should be noted that readjustment of the national economy is not only designed to solve current problems. It is of more profound significance for us to rectify our thinking in guiding economic work, to change our guiding principles and policies for economic development and to blaze a new trail suited to actual conditions in China for the growth of the national economy, and thereby bringing socialist modernization into an orbit of coordinated, steady and healthy development.

Past Achievements and Mistakes. Since Liberation in 1949, the Chinese people have, under the leadership of the party and the government; exerted every effort in large-scale socialist construction and made remarkable achievements. Following the

completion of socialist transformation, the system of exploitation was abolished and socialist public ownership has since held a dominant position in the economy as a whole. An independent and comparatively comprehensive system of industry and national economy has been established on the basis of the extremely backward economy of old China. Much progress has been made in science, education and culture. A series of new branches in science and technology has been established from scratch. Remarkable improvements have been made in the people's livelihood in both rural and urban areas as compared with the situation before Liberation. However, China is a big country with a backward economy and with varied conditions. Due to lack of experience in socialist construction and over-eagerness to change poverty and backwardness, we paid too much attention to the needs of economic development and neglected its possibilities. Coupled with many defects and mistakes in our guiding work, especially the "Left" mistakes of seeking hasty successes, our national economy suffered several major setbacks. Had we not managed our economy in this way, we would have achieved more.

In the past 31 years, we did a fairly good job during the Rehabilitation period (1950-1952) and the First Five-Year Plan period (1953-1957). Not only had the targets for recovering and developing the national economy been fulfilled on time, but the relationship between the growth of production, the improvement of the people's livelihood and the economy as a whole had been handled in a comparatively coordinated way.

During the 1958-1960 period, our economy became seriously imbalanced because of setting "high targets," stirring up a "communist wind" and being over-anxious to make achievements. This brought great difficulties to both production and construction and to the people's livelihood as well. In the latter half of 1960, the Party Central Committee and the State Council put forward the policy of readjusting, restructuring, consolidating and raising standards. Tremendous efforts were made and the national economy recovered and developed rapidly.

During the ten-year "cultural revolution" (1966-1976), the masses and the great majority of cadres, despite counter-revolutionary sabotage by Lin Biao and the Gang of Four, did their utmost to maintain and even develop production under extremely difficult circumstances. After 1970, however, we still sought after high quotas in guiding our economic work, and overextended the scope of capital construction. Coupled with the disrupted economic order, our national economy became seriously imbalanced once again. After smashing the Gang of Four, everybody wanted to

make up for lost time as quickly as possible. However, we underestimated the serious ravages of the previous ten years. Moreover, we did not fully sum up the positive and negative lessons and experiences in economic construction since the founding of New China. We were still over-eager to make greater achievements and put forward some excessively high and unrealistic targets, thus further expanding the scope of capital construction which had already been overextended. We correctly adopted the policy of using foreign funds and importing new technologies but, due to lack of experience, the magnitude of imported plants and equipment exceeded our capacity. This mistake of impetuosity and rash advance intensified economic disproportions, aggravated financial and economic difficulties and bred new danger in our economy.

The experience of the past 31 years proves that our party and government were working whole-heartedly for the well-being of the people and that they attained wide-ranging achievements. The reasons why we were anxious to make achievements in the past was that, in the main, we wished to make our country prosperous and powerful as soon as possible so that fundamental improvements could be made in the people's livelihood. However, the lack of intensive study of national conditions and the failure to carefully calculate the actual possibilities and effects resulted in "more haste, less speed." Therefore, in the current readjustment of the national economy, we must learn from the lessons and experiences gained in the past so that we can shake off the yoke of "Left" ideas and practices in our economic work. We must proceed from the fact that China has a population of nearly 1,000 million, 80% being peasants. We must run various undertakings according to our ability, proceed sequentially and advance systematically, and pay attention to actual results. Our great cause of socialist modernization should be closely integrated with gradual improvement of the people's livelihood. Our goal should be reached steadily. Major twists and turns in future economic construction should be avoided as far as possible. In this sense, the current readjustment of the national economy is not only an important step which will protect against possible difficulties. It is also the most far-reaching and fundamental reorientation in our economic reconstruction since the founding of New China.

II. Achievements and Problems in the First Stage of Economic Readjustment

Two years have elapsed since the beginning of economic readjustment. This two-year period (1979-1980) can be seen as the first stage in

economic readjustment.

During the past two years, economic readjustment was mainly undertaken in the following three aspects:

1. *Readjustment of the ratio between accumulation and consumption and raising the people's income in both rural and urban areas.*

With respect to the peasants, readjustment has come about mainly through an increase in purchasing prices of major farm and sideline products and through reducing or exempting from taxes the poorer communes and production teams. In 1977, the state raised the purchasing prices of such major farm and sideline products as grain, cotton, oil-bearing crops, sugarcane, sugarbeets, hogs, beef cattle, sheep, eggs, aquatic products and silkworm cocoons; and, in 1980, increases in the purchasing prices of some farm and sideline products such as cotton, sheep and goat skins, jute and ambary hemp, timber, raw lacquer and tung oil. As a result, the overall index of the purchasing prices of farm and sideline products increased by 22.1% in 1979, and by a further 7.1% in 1980. Thanks to the growth of agricultural production and to large increases in the purchasing prices of farm and sideline products, the sales of these products brought the peasants an additional 25,800 million yuan of income over two years. They further benefited by about 4,500 million yuan from the reduction and remission of agricultural taxes and taxes on industries run by the communes and production brigades. Altogether, the peasants gained 30,000 million yuan.

As for urban inhabitants, the major measures were to provide more jobs, to raise wages and salaries of part of the workers and staff, and to universally institute the bonus system. In 1979, 9.03 million jobs were provided in towns and cities throughout the country; an additional 9.05 million jobs were provided in 1980. Therefore, 18.08 million jobs were provided over these two years. In 1977, the average number of persons supported by a worker was 2.06 persons (including himself); this figure declined to 1.8 persons in 1980. Forty percent of the workers and staff received wage increases, and wage categories were adjusted in 1979. Coupled with the adoption of piece-work pay on a wider scale and the universal institution of a reward system as well as subsidies for price rises in non-staple foods, the total wage bill of workers and staff went up to 77,300 million yuan in 1980, as against 56,900 million yuan in 1978, an increase of 20,400 million yuan over two years, or a 13.6% increase for 1979 and a 19.5% increase for 1980, respectively. The annual per capita income of workers and staff in units owned by the whole people also increased from 644 yuan in 1978 to

803 yuan in 1980, an increase of 159 yuan in two years, or a 7.6% increase in 1979 and a 6% increase in 1980 if the factor of rising prices is deducted.

With the growth of people's income in both rural and urban areas, there was a considerable increase in the level of consumption. The nation's average level of per capita consumption increased to 224 yuan in 1980 from 174 yuan in 1978, an increase of 50 yuan in two years, or an increase of 25 yuan per annum — as against only 3 yuan for the entire period of 20 years from 1957 to 1977. Even if price increases in these two years are deducted, the increase of the nation's level of consumption was still much higher than that over the previous 20 years. Therefore, the achievements were significant.

In order to ensure an increase in the level of consumption in our country, the state reduced the amount of investment in capital construction in the state budget. Total budgeted investment in capital construction was slashed to 28,100 million yuan in 1980, down from 39,600 million yuan in 1978 and from 39,500 million yuan in 1979. In capital construction, expenditures on productive construction were reduced while the share of non-productive construction to meet the demands of the people's material and cultural life was increased from 17.4% in 1978, to 27% in 1979 and to 33.7% in 1980. Total floor space of urban residential buildings completed was less than 30 million square metres annually before 1977. It shot up to 62.56 million square metres in 1979, and made another climb to 82.30 million square metres in 1980.

As a result of these readjustments, accumulation funds of the national income increased by about 10,000 million yuan during the 1979-1980 period, while consumption funds soared to 58,000 million yuan. This led to a change in the ratio between accumulation and consumption.

	Share of Accumulation (%)	Share of Consumption (%)
1978	36.5	63.5
1979	34.6	65.4
1980	32.4	67.6

2. Readjustments in the proportions between agriculture, light industry and heavy industry, and accelerating the development of agriculture and light industry.

In developing agriculture, the state mainly adopted three important policies:

(1) To ensure the decision-making power of the people's communes, production brigades and teams in production, management and distribution, and to carry out and gradually institute and

perfect various systems of responsibility linking output with payment;

(2) To diversify the rural economy according to actual conditions and to encourage commune members to engage in household sideline occupations on the basis of the development of collective economy;

(3) To raise the purchasing prices for farm and sideline products by large margins and to open village fairs in a orderly manner.

All of these measures triggered the enthusiasm of the rural cadres and commune members for production. In 1979, China's agriculture witnessed a bumper harvest rarely seen since the founding of New China. Grain output reached an all-time high. We reaped another comparatively good harvest in 1980, despite serious drought in the north and serious flooding in the south, both of which were unprecedented in severity for several decades. The production of industrial crops, which had been stagnant for many years, also increased. Cotton output, which had declined to 2.17 million tons in 1978 from 2.34 million tons in 1966, increased to a record level of 2.707 million tons in 1980. The output of oil-bearing crops, which had been fluctuating for 20 years within a range of from 5.09 million tons in 1956 to 4.02 million tons in 1977, registered a considerable increase in 1980 to 7.691 million tons. The production of such industrial crops as sugar, jute and ambary hemp, silk-worm cocoons and tea all showed increases to varying degrees. A diversified economy in the people's communes, production brigades and teams as well as in household sideline occupations developed quite rapidly. A long sought-after situation, in which the rural economy is prosperous and the peasants are in high spirits, began to emerge at last in the vast countryside.

As for light industry, the state in its national planning gave priority to its development, allocated more loans to its construction and supplied more raw materials, fuel and power for its production. New channels were provided for the production of light industry and handicrafts. As a result, the growth rate of light industry surpassed that of heavy industry. In 1979, the growth rate of heavy industry was 7.7%, and light industry, 9.6%; in 1980, heavy industry grew by 1.4%, and light industry by 18.4%. Although the rate of growth of heavy industry slackened, new progress was made in readjusting the orientation of its products, in better serving agriculture and light industry, in increasing the variety of its products and improving their quality, and in reducing material consumption. Apart from the policy of readjusting the national economy, the reform of the system of

management, which was just begun on an experimental basis, also played a great role in the development of light and heavy industries.

Due to the more rapid development of light industry than of heavy industry, a change took place in the proportional shares of light and heavy industries in the gross output value of industry (calculated at 1970 constant prices):

	Light Industry (%)	Heavy Industry (%)
1978	42.7	57.3
1979	43.1	56.9
1980	46.9	53.1

On the basis of increased production of agriculture and light industry, the amount of commodities supplied for both rural and urban areas rose markedly. The total volume of retail sales increased by 6,800 million yuan per annum in the 1965-1978 period. It increased by 24,100 million yuan, or 12.4%, in 1979; by 3,400 million yuan, or 12.2%, in 1980 (in constant prices), exceeding growth rates during the preceding 20 years.

3. Readjustment of the production of crude oil and coal, speeding up geological exploration of crude oil and tunnelling in coal mines, and striving to conserve energy.

In order to improve the imbalance between extraction and reserves and between extraction and tunnelling, we stabilized or reduced the output of crude oil and coal in a planned way during the past two years. The output of crude oil almost levelled off, with 104.05 million tons produced in 1978, 106.15 million tons in 1979 and 105.95 million tons in 1980. Coal output declined to 620 million tons in 1980 from 635 million tons in 1979.

Measures were taken to increase oil reserves:

(1) Continuing geological exploration in the Northeast, North China and East China;

(2) Conducting geophysical surveys in cooperation with foreign oil companies over an area of 410,000 square kilometres in the South China Sea and the southern Yellow Sea, and preparing to start bidding for joint exploration and development in the immediate future; signing contracts with foreign oil companies to carry out exploration and development in parts of the Bohai Sea and Beibu Gulf, where progress was made in exploration;

(3) Conducting exploration in the continental sedimentary basins of Jungar, Qaidam, Tarim, Shaanxi-Gansu-Ningxia and Sichuan in the western and southwestern parts of China. Although these reserves will remain inaccessible in the near future, exploration was underway on a wide scale, and

turned out good indications for hopeful prospects.

In the exploitation of coal, the following measures were taken:

(1) Speeding up tunnelling and stripping of existing coal pits, and endeavouring to help those coal pits where extraction and tunnelling were out of balance in order to make up for their unfulfilled quotas;

(2) Taking measures to reduce the intensity of labour of the workers and staff in coal mines, and paying more attention to labour protection and safety facilities;

(3) Increasing expenditures for the maintenance of simple reproduction, and speeding up the tapping of potential of existing coal mines;

(4) Maintaining a certain level of capital construction in coal mines by budget appropriations, bank loans and foreign funds.

State Energy Policy. Concerning energy policy, the state laid equal stress on exploitation and economy. In the near future, priority will be given to energy conservation so as to maintain a certain growth rate of industrial production. The specific measures were:

(1) Gradually transforming the energy-consuming tendency of the industrial structure and product mix into a energy-saving one;

(2) Strengthening energy management, endeavouring to strike a balance in power and heat supply, and reducing energy consumption per unit of product;

(3) Speeding-up technological transformation of out-of-date equipment and backward technologies characterized by high energy consumption, introducing centralized supply of heating, and integrating power generation and heat supply;

(4) Gradually updating motorized machines and tools which consume too much energy;

(5) Placing rigid control over the use of oil as fuel, and actively promoting the use of coal in place of oil.

All these measures showed initial results. Total industrial output value in 1979 increased by 8.5% while energy production went up by only 3%. In 1980, although energy production dropped by 1.3%, the gross output value of industry increased by 8.7%. Today, the waste of energy is still enormous, so the potential for saving energy re-

mains huge. The fact that we could guarantee a given growth rate for industrial production under conditions of small increases or even slight declines in energy production in 1979 and 1980 has enhanced our confidence in increasing production by practicing economy.

I have touched upon three aspects of the readjustment of the national economy. Of course, they are not all-inclusive. Nevertheless, these facts show that much progress was made and great results attained in 1979 and 1980. The current excellent situation, which has not been seen during the past 20 years or so, finds full expression in the obvious improvement in living standards of the great majority of our nearly 1,000 million people; in the stability of social order in rural areas where 800 million live, in the great enthusiasm and initiative of the peasants for production, and in the vistas of prosperity and vitality in agriculture, which is the foundation of the national economy; in the initial changes in the industrial structure, a structure that has long been irrational, and in the gradual rise in economic efficiency and closer integration of industrial growth with the interests of the enterprises, the workers and staff. These facts also prove that the series of principles and policies adopted since the Third Plenary Session of the 11th Party Central Committee, as well as the policy of readjusting, restructuring, consolidating and improving the national economy, are correct.

Budget Deficits and Over-Issuance of Currency. Some new conditions and problems also emerged during the readjustment period. These were mainly budget deficits, over-issuance of currency and increases in market prices. In 1979, state finances were 17,000 million yuan in the red and, in 1980, 12,100 million yuan in deficit. Owing to the rise in financial deficits and to increased overdrafts from the People's Bank, an additional 2,600 million yuan of bank-notes beyond the plan were issued by the bank in 1979, and another 4,600 million yuan in 1980. The increase of paper money in circulation and the failure to increase consumer goods correspondingly led to an increase in the average index of retail prices by 1.9% in 1979 over that of 1978. The year 1980 saw another increase of 6% over the previous year, which reflected a rise of 8.1% in the cities and of 4.4% in the rural areas.

Why did this take place? Two major reasons may be cited:

1. While consumption expenditures for the improvement of the people's livelihood were greatly increased and the state revenues were decreased, appropriations for capital construction were not scaled down accordingly. What is more, other ex-

penditures continued to grow. This led to a situation in which the sum of investments in capital construction and all kinds of consumption expenditures covered by the state budget exceeded state revenues.

State financial resources set aside for raising the purchasing prices of farm and sideline products as well as for increasing wages and bonuses for workers and staff went up by 18,500 million yuan in 1979 over the previous year; there was another increase of 16,900 million yuan in 1980 over 1979. However, factors causing decreases in state revenues prevailed over those that increased state revenues during these two years. This led to a net decrease of 5,200 million yuan in state revenues (excluding foreign loans) in 1979 as compared with 1978, and in 1980, to another decrease of 3,200 million yuan as compared with 1979.

Investments in capital construction by the state totalled 36,000 million yuan in the readjusted national plan for 1979, a decrease of 3,500 million yuan from the previous year. Although these investments were already large, actual investments in capital construction completed in 1979 reached 39,500 million yuan. Total investments in capital construction in the 1980 national plan were 24,100 million yuan, yet actual investments completed in 1980 were 28,100 million yuan. That is to say, the actual scope of capital construction in 1979 was not scaled down, and it was not reduced sufficiently in 1980. In particular, owing to a big increase in capital construction funds raised by the localities and by departments and enterprises, the total investment jumped to 53,900 million yuan in 1980, a 7.8% increase over the previous year. The large increase of capital construction investment outside the state budget adversely affected the balance of state finances to a certain extent.

The total sum of expenditure on national defence, administrative expenses of the state organs and establishments and allocations for science, culture, education and health work increased by 8,900 million yuan in these two years. Of the total sum, some of the increases were necessary, while some were not.

Given the better performance of production during the past two years, we really did not expect such a large budget deficit. We were not firm enough in implementing the readjustment policy in some aspects, especially in reducing the scope of capital construction. Furthermore, certain additional expenditures were made during the implementation of the national plan which should not have been made at all. Many units also passed out bonuses in an indiscriminate way. All these actions exacerbated the imbalance between state revenues and expenditures.

2. Although we energetically speeded up the growth of agriculture and light industry and increased the supply of consumer goods, the supply of commodities still could not keep pace with the large increase in social purchasing power in both urban and rural areas. This circumstance was due to the constraints of objective conditions and to inadequate work.

As mentioned above, the total volume of retail sales increased by 58,000 million yuan during the 1979-1980 period, a level of increase that had never been experienced in the past. However, in the same period the level of social purchasing power increased by 67,600 million yuan, surpassing the supply of commodities. It is known to all that with more money in hand and with commodities in short supply, prices cannot be stabilized and will eventually go up.

It should be noted that there were some other abnormal factors behind these price increases besides the two basic ones — increase of money supply and inadequate supply of consumer goods. Some enterprises, both industrial and commercial as well as services, raised commodity prices at will in order to receive more bonuses. Some raised prices openly, while some did so in disguised forms. The scope of commodities selling at negotiated prices was for a time too broad because there were no stipulations about the variety of such commodities or about price ceilings. As a result, some commodities were sold at negotiated prices when they should not have been. Moreover, negotiated prices were much higher than list prices, a factor that also contributed to the rise in prices.

In 1979 and 1980, considerable financial deficits, over-issuance of currency and price hikes affected the livelihood of both urban and rural dwellers, especially those workers and staff members who received no bonuses. In these two years, a total of about 16,000 million yuan of people's income was thus offset by higher prices. And a danger looms that if no prompt and firm measures are taken to further readjust the national economy, state finances in 1981 will again experience a comparatively large deficit, the bank would continue to issue a large amount of banknotes and commodity prices would, no doubt, continue to shoot up. If so, not only the workers and staff but the peasants as well would gradually lose the economic benefits gained in the past two years. The consequences would be that it would not only be hard to stabilize the economy, but political stability would also be affected.

To sum up, remarkable results were achieved in the course of economic readjustment in both 1979 and 1980.

On the other hand, some new problems came

up. They are not the result of the readjustment; rather, they came to the fore simply because readjustment is still underway (it is, after all, impossible to complete economic readjustment within two years), and because certain readjustment jobs have not been done very well. It was absolutely necessary to increase the share of consumption funds in the past two years. Otherwise, it would not have been possible to realize such a good economic situation as is prevailing now. Nevertheless, in the same period the scope of capital construction was not resolutely scaled down by a large enough margin and expenditures were not resolutely cut down as they should have been. This shows that the influence of "Left" ideas in economic work has not been cleared up, nor has a real comprehensive balance been achieved, nor has the principle of acting according to our ability been earnestly pursued.

Latent Dangers Prior to Readjustment. Can it be said that there would be no financial deficits, inflation, price hikes and hidden dangers if we had not readjusted the national economy? As a matter of fact, there had been a latent danger long before. Just as mentioned in the first part of this article, the ten-year upheaval of the "cultural revolution" created a serious imbalance among the sectors of the national economy. The impetuosity and rash advance in 1978 resulted in immediate enlargement of the scope of capital construction, further aggravated the imbalance of economic relationships and intensified financial difficulties. A new economic danger thus lay hidden. In fact, there was a financial deficit in 1978. Although the state budget had a surplus of 1,000 million yuan in that year, the central government's finances had already registered a deficit of 4,500 million yuan due to excessive added investments in capital construction. And the state had to resort to overdrafts from the bank to make ends meet. In so doing, the imbalance of bank credits in 1979 was intensified and more bank notes had to be issued by the bank. Meanwhile, in order to link the targets put forward in the 1979 national plan which was worked out in 1978 with the declared targets set for 1985, some production targets were set too high and the scope of capital construction was too broad; furthermore, there was a large gap in the supply of material resources. Planned state revenues also included unrealistic and impractical factors. Therefore, even if the ratio between accumulation and consumption was not readjusted, the implementation of the original plan would bring about considerable deficits in state budgets and the bank would still be compelled to issue more banknotes. If we stuck to the originally drafted Ten-Year Plan, our national economy would have become

even more seriously imbalanced, budget deficits would have been more serious, and commodity prices would have risen more abruptly. If so, great losses rather than improvements would be brought about in the people's livelihood during these two years. It is thanks to the implementation of the readjustment policy since 1979 that such a trend was reversed and a possible outbreak of crises avoided. However, these long-nurtured adverse consequences and problems accumulated from the past could not be dealt with in a straightforward manner within the short span of two years. Therefore, it is safe to say that the current hidden dangers were in place a long time ago. Due to readjustment, the danger has been moderated. In the meantime, the good results gained through readjustment have provided favourable conditions for removing such dangers.

III. Tasks, Policies and Principles for the Second Stage of Economic Readjustment

Inasmuch as the current latent dangers consist of inflation and price rises caused by budget deficits and inadequate supplies of consumer goods, the tasks for the second stage of economic readjustment should be to stabilize the economy, readjust the structure, tap the potential and achieve better economic results.

1. Stabilize the economy. By stabilizing the economy we mean to strike a balance between state revenues and expenditures so as to wipe out budget deficits and, on this basis, to balance credits and debts. Further, market prices must be stabilized so that people's livelihood will not suffer any loss.

In order to strike a balance between state revenues and expenditures, financial income should, first and foremost, be increased. The proportionate share of state revenue to national income somewhat declined in the past two years. It accounted, generally speaking, for about one-third of the total in the previous 20 years, but declined to 28.7% in 1980, and could go down to 26.6% in 1981. It is necessary to reduce this proportion adequately so as to overcome the overcentralization of national finances. Nevertheless, it declined a little too much during the past two years, mainly due to a failure to collect profits and taxes that should have been collected and due to the decentralization of parts of state revenues that should not have been decentralized. In particular, business management in some enterprises was quite chaotic. And there existed many kinds of financial "leaks" and "loopholes." Such a state of affairs was not only harmful to the overall interests of the country, but gave the green light to

extravagance and waste and provided chances to gain advantages through profiteering and trickery. Therefore, it was necessary to take active measures to tap financial resources, to plug loopholes and to increase state revenues so as to strike a financial balance, support economic development and overcome financial difficulties. Meanwhile, spending on capital construction and on all kinds of administrative expenses should be reduced and consumption put under proper control.

The State Council has decided that total investment in capital construction in 1981, including all the funds raised by central authorities, localities and enterprises and all projects built with loans — both foreign and domestic — should be slashed to 30,000 million yuan from 53,900 million yuan in the previous year. Of the total sum, investments covered by the state budget should be cut to 17,000 million yuan from 28,100 million yuan in the previous year. The construction of non-feasible projects and of redundant projects which compete for raw materials, fuel and power with existing enterprises should be stopped. In so doing, some equipment will have to be stock-piled, and some construction projects will have to be held up. Losses, to a certain extent, have to be borne. Yet, such losses would be much smaller than those that might be caused by a long "war of attrition," and would be much preferable to having the national economy dragged to collapse by overextended economic burdens. Moreover, such a change would be favourable for concentrating investment on those projects and auxiliary facilities which are badly needed for current production and can be promptly put into production after their completion. It would also favour the construction of living quarters and urban public utilities, thus yielding economic results as quickly as possible. Not only in 1981 but also during the entire period of the Sixth Five-Year Plan, the scope of capital construction should be rigidly controlled. It should never happen again that the scope of capital construction should be so rigidly controlled. It should never occur again that the scope of capital construction expands rapidly whenever the national economy begins to take a turn for the better. With regard to expenditures on national defence and administration as well as on all other kinds of undertakings, the State Council has followed the same policy of contraction so that these expenditures can be brought into conformity as far as possible with the nation's capabilities.

To raise the level of the people's consumption is an important starting point in the readjustment of the national economy. In the past two years, we took big steps in raising the purchasing prices of farm and sideline products and in readjusting the wages of the workers and staff members. Great

efforts have been made by the party and the government and remarkable results have been attained. Currently, we are carrying out a further readjustment of the national economy to wipe out budget deficits and to stabilize commodity prices, so that the economic benefits gained by the people in the past two years will not be offset and so that the material conditions for further improvement of the people's livelihood can be created. In order to stabilize the economy, proper control should be placed over expenditures of consumption along with a reduction of investment in capital construction and all kinds of administrative spending. Without proper control, expenditures might exceed the nation's financial and material resources. That eventuality would intensify inflation, thereby doing harm rather than good to the people. We must not lose sight of the fact that ours is a country with a huge population, our economy had a weak foundation to start with, and the problems of living conditions of the people that have accumulated for many years can only be dealt with gradually on the basis of increased production. It is unrealistic to talk about the improvement of people's livelihood without taking the development of production into consideration. Nor can one be achieved without the other. Capital construction must be carried on according to the nation's strength. This principle also applies to consumption.

2. **Readjust Economic Structure.** It is necessary to readjust economic structure and to realize rationality of economic structure so as to overcome the inadequate supply of consumer goods as well as fuel and power.

First of all, due emphasis must be put on the development of agriculture. Agriculture is the foundation of our national economy and its development is vital to the growth of the national economy. We must further implement rural economic policies, continue to perfect various systems of responsibility in production and strive to achieve comparatively large growth in agriculture. In developing agriculture, we must continue to do a good job in grain production and never relax our efforts to bring about effective measures for the expansion of grain production. However, we must also actively diversify the rural economy so that a rational structure covering farming, forestry, animal husbandry, fishing and sideline occupations, covering the production of grain and cash crops and can be achieved. If so, our agriculture can supply more products and raw materials for the people's livelihood, industry and exports, thus accelerating the flourishing of our national economy.

Secondly, we must speed up the development

of light industry and make further changes in the ratio between heavy and light industries. With less capital, light industry can still yield quick returns and greater accumulation. A speedy development of light industry can help increase state revenues, withdraw excess currency from circulation, boost the market and stabilize commodity prices. At the same time, as light industry develops in vigorous strides, the state can support agriculture with increased financial resources and exchange, with the peasants using a more adequate supply of commodities, thus promoting the development of agriculture. In the immediate future, light industry should develop at a faster pace than heavy industry, so as to bring the supply of commodities into correspondence with purchasing power.

Thirdly, we must continue to do a good job in energy conservation and in energy exploitation. The growth rate of heavy industry during the period of the Sixth Five-Year Plan depends, to a great extent, on the development of energy production. We must continue to take more rigid and effective measures and strive to obtain greater results in energy conservation. However, attention to energy exploration and its exploitation must not be relaxed. While continuing to do a good job in oil exploration, priority must be given to the development of coal mines, especially to the development of mines in Shanxi and Guizhou provinces. Existing production capacity should be brought into fuller play and more efforts should be concentrated on expanding and updating some small and medium-sized coal pits. In so doing, not only more capital can be saved to avoid excessive additional burdens on state finances, but better results can be achieved in a comparatively quicker way. This will provide the energy conditions necessary for the quicker development of the national economy in the latter half of the 1980's.

Fourthly, the internal structure of heavy industry should be changed. In the past, owing to the lengthy pursuit of "taking steel as the key link," heavy industry developed lop-sidedly, with much of its produce serving the industry itself. The machine-building industry mainly served capital construction and suffered from excessive redundancy, duplication and disproportionate production capacities. Now that investment in capital construction has been greatly reduced, in order not to shrink the production of heavy industry — especially that of machine-building industry — it is necessary to readjust the internal structure of heavy industry so as to conform with the structural readjustment of the economy as a whole. Sectors of heavy industry such as metallurgy, chemicals and machine-building must be reoriented to the production of consumer goods, and be made to supply needed raw and semi-finished materials, machinery and equipment for the

production of consumer goods. In the machine-building industry, we must mainly convert its service to the technical transformation of the national economy, the domestic market, the expansion of exports and the modernization of national defence. Those enterprises which are operating below capacity and which have no future for development can be merged with enterprises in light industry and shifted to the manufacture of consumer goods, coordinate their production with other light industrial enterprises. Those enterprises which have turned out high-cost and low-quality goods or have long operated at a loss must be shut down, must suspend operations, or must be amalgamated or switched over to the manufacture of other products.

Last, but not least, new channels must be explored for employment, thus changing the structure of the labour force. Due to the reduction of investment in capital construction, we must, apart from the development of labour-intensive trades, depend on the development of various service trades, including commerce, services, banking, telecommunications, urban public utilities, entertainment, tourism, etc., so as to increase employment. All of these trades cannot only absorb a huge amount of labour power, but can promote the development of production and bring conveniences to the life of the people. On the other hand, since the income of many of these trades is in the nature of redistribution of wages, their expanded income does not require the expansion of state expenditures nor does it increase pressures on purchasing power. At present, many people are waiting for jobs and some of them are just idling along; on the other hand, the service trades are least developed and much can be done in this area. There should be significant development in this field in the expansion of various forms of collective and individual businesses.

3. Tap the potential. What will production depend on when the scope of capital construction is reduced? The answer lies in bringing the existing enterprises into fuller play and in tapping their potential.

After more than 30 years of socialist construction, China's industry has acquired a certain foundation. There are a total of 400,000 enterprises in industry and communications across the nation, with 50 million workers and staff and some 600,000 million yuan of fixed and liquid assets. Annual output of energy is equivalent to above 600 million tons of standard coal. At present, production capacity is far from being fully exploited and its potential is great. Henceforth, we must do our utmost to operate existing enterprises well, especially the several thousand

key enterprises, so that they can play a greater role in production.

The first measure is to do a good job of consolidating existing enterprises. We must earnestly attend to basic work in the management of enterprises, institute a strict system of technical responsibility in production, do a good job of economic accounting, implement the principle of "to each according to his work" and establish normal production procedures and rigid labour discipline. At present, business management is still in disarray in many enterprises where the system of responsibility in production has yet to be established, and huge waste has been incurred. Enterprise management must be put on the right track after consolidation. And this measure can, without any investment, increase production and income.

The second measure is to go on with the reorganization of the enterprises. All enterprises must be rationally reorganized according to the principle of specialization and coordination as well as of economic rationality. There are a great number of departments. Departments and administrative regions enforce rigid control over their own units independently and in their own way. Not only has a large amount of financial and material resources been wasted, but technological progress has been hindered. Doing a good job in inter-enterprise coalition and coordination is the only way to tap the potential of existing enterprises. Getting organized means tapping potential as well as increasing production capacity and speed.

The third measure is to update equipment in existing enterprises and carry out technological transformation in a planned way. With out-of-date equipment and backward technologies, many enterprises are still manufacturing products of low quality and at high cost. The initiative of the workers, technicians and cadres must be mobilized to carry out technical innovations from which new products, extra manpower and raw materials can be obtained. In the course of technological innovation and transformation, special attention must be given to energy conservation.

In order to tap the potential of existing enterprises, a system of education for the workers and staff must also be established, so that all of them can attend training courses to raise their political, cultural, technical and managerial levels. During the readjustment period, we must seize the opportunity to have the workers and staff trained in those enterprises which are operating below capacity. Even in enterprises that are running at full capacity, this must also be done whenever possible.

4. Achieve better economic results. The current financial difficulty lies, in the final analysis, in

poor economic results. If remarkable achievements can be made in raising economic results, we will be in a better position to surmount this difficulty.

A big defect in economic work is that for many years we did economic work without considering its results. Whenever we talked about the development of production, it meant the launching of new projects in capital construction. Moreover, we rushed into the construction of new projects before feasibility studies had been made, before geological conditions had been earnestly explored and their locations studiously selected. Further, we did not take into account the rational deployment of productive forces, the conditions for their construction and conditions for production after their completion. During construction, we did not pay enough attention to strengthening management. It took such a long period of construction to complete a project that some of new projects could not be put into operation for a long time. Even if some of them did start production, they could not run at full capacity, due either to lack of proper coordination of production capacity or to the inadequate supply of raw materials, fuel and power. All of these shortcomings led to tremendous losses. As for the enterprises completed, we often did not do our best to run and manage them well, nor to attach sufficient importance to the maintenance and updating of the equipment, nor to personnel training and improvement of their technical levels, nor to the management and utilization of funds. As a result, our production technology has long been stagnant, and even regressive in certain instances. With high costs and poor quality, waste was staggering. In production, undue emphasis on output value and output quotas, as well as neglect of market demands, led to a situation in which many products were not wanted on the market and production was divorced from marketing. Coupled with excessive links in the circulation of commodities and with ineffectiveness in the turnover of funds, large quantities of products had to be stockpiled in the course of distribution, thus causing great waste. This being the case in the three fields of production, construction and circulation, China's national economy was inevitably in a state of high accumulation, heavy waste, low results and low consumption. We paid a high price, yet got low results, and our people did not derive much benefit. We cannot and must not act in such a way any longer.

To increase economic results should be seen as an important target in our future economic work. Leading bodies at all levels and all economic units should shift their attention to economic accounting and economic results. By changing the guiding principles, consolidating and reorganizing the enterprises, carrying out technical transformation,

changing the industrial structure and restructuring the economic system, a new trail will be blazed along which our national economy will develop steadily on the basis of increased economic results. After these goals are accomplished, the economic situation in China will surely be greatly changed.

During the course of further readjustment of the national economy, some comrades are anxious that reductions in the scope of capital construction and the contraction of expenditures will, when coupled with the shortage of energy, bring about long-term shrinkage in production and financial imbalance, and that such readjustments would fail to steadily and gradually improve the people's livelihood. It should be recognized that there are in fact two possibilities ahead. Given the conditions that neither energy production nor the scope of capital construction will be expanded, if we still follow the old track and old methods, production would possibly decline, state revenues would go down and budget deficits go up. As a result, the people's living would not be stabilized and the economy as a whole would suffer from a vicious cycle. However, if we take to a new path and new methods — namely, the path of raising economic results — it is most likely that we can, working with less energy supplies and investment, maintain a steady growth of production and ensure a steady increase of state revenue. In this way, the people's living standards cannot only be gradually raised rather than lowered, but the economy as a whole will enter into a sound cycle. In order to realize the latter possibility, we should resort not only to economic readjustment but also to the reform of the economic system, integrating readjustment with reform in an organic way.

Integrating Our Efforts. To sum up, the above-mentioned four tasks, namely, stabilizing the economy, readjusting the economic structure, tapping potential and increasing the results, are closely interrelated. If our economy is not sufficiently stabilized and if we do not retreat enough in the areas where we should have retreated — especially in reducing investments in capital construction and all expenditures to within the scope of our nation's strength — neither inflation can be put under control nor can work in other fields be successfully undertaken. However, if we do not firmly press on in the areas where we should have pressed on and do not energetically yet prudently readjust the economic structure, tap the potential of existing enterprises and raise economic results, the problem of economic imbalance will not be solved, production will decline, and the economy as a whole will not be stabilized. Therefore, fulfillment of above tasks does not mean we can slacken our efforts. On the contrary, it requires that we

should do our work more creatively, more conscientiously and more actively. Raising economic results means, first of all, raising the efficiency of our work. We must continuously adhere to the principle of emancipating our minds, using our brains, seeking truth from facts and carrying forward the revolutionary spirit of plain living and hard struggle and working hard for the prosperity of the country. With several years of arduous efforts, we will cause our national economy to achieve remarkable improvements in levels of organization, business management and production technology. This is necessary to our modernization drive. This is where we place our hope.

During the readjustment period, the scope of importing equipment will be properly reduced owing to the reduction of investment in capital construction. Yet this does not mean a change in our foreign policy. Economic and technical co-operation and interchange between China and other countries will develop on the basis of equality and mutual benefit. This is our firm and unswerving principle. While mainly relying on our own efforts, we will continue to use funds from abroad, import new technologies which are beneficial and suitable to China's conditions, and apply them to the development of energy, communications and transportation, and to the transformation of existing enterprises. Meanwhile, we must endeavour to integrate both the use of foreign funds and the import of technologies with the domestic capacity for providing auxiliary equipment, the ability for repayment and for incorporation, so that real benefits can be reaped. With the progress of readjustment and the development of the national economy, economic cooperation and exchanges between China and foreign countries will be increasingly expanded. Therefore, doing a good job in the economy as a whole and raising the efficiency in our work are conducive to the expansion of our economic cooperation and technical interflow with foreign countries.

All these are the tasks we must fulfill during the second stage of economic readjustment.

Overcoming Sectoral Imbalances. As mentioned above, the fundamental task for economic readjustment is to overcome the imbalance among different sectors of our national economy. Because various kinds of problems were interwoven, it is difficult to put it right straight away, and time is needed. At the same time, it inevitably requires a process of thought to effect a fundamental change in the guidance of our economic work, to see that economic readjustment does not mean restoring the old order but blazing a new trail of development. Therefore, it should take more time to complete economic readjustment than the period of three years as originally planned.

When Will the Readjustment Be Completed?

When will the economic readjustment be completed? It depends on the progress of our work and on the extent of the results we will achieve. Anyway, as soon as we fulfill the tasks assigned for the second stage, stabilize the economy, gradually achieve rationality of economic structure and put the national economy on a sound cycle during the period of the Sixth Five-Year Plan, then we can say the tasks of readjustment of the national economy have, in the main, been fulfilled. In the long run, of course, economic structure will not remain unchanged. After fulfilling the tasks of the current readjustment, there will, however, be other tasks in the future, which are different from our present tasks of readjusting the serious imbalance in the national economy.

All in all, following the readjustment of the past two years, the overall economic situation is good. The series of policies and measures adopted by the party and the government enjoy the wide support of the masses across the nation and visible achievements have been made. So long as we resolutely carry the readjustment policy through to the end, we will be able to get rid of the latent danger and further develop the excellent situation, thus bringing our national economy onto a healthy and steady track. Our future is full of promise.

4. ON THE QUESTION OF THE RESTRUCTURING OF CHINA'S ECONOMIC SYSTEM

By Liao Jili

The socialist revolution and socialist construction in China has been carried out not on the basis of a very high level of development of the social productive forces or of a well-developed commodity economy, but rather on the basis of a very low level of development of socialist productive forces and an underdeveloped commodity economy. The kind of economic system that should be established in the world is also a question of the kind of socialist economy that should be developed across the Chinese land. This is a question of great national importance, a question to which not only the whole people of China have paid great attention, but which has also drawn wide attention outside of the country. To help our readers understand this question, I would offer some of my personal views.

I. Why Should the Economic System in China Be Restructured in All-Around Way?

Over the more than 30 years past, we have built independent and fairly comprehensive industrial and national economic systems. A fairly solid material foundation has been laid for the national economy and there exists great potential. We have made great achievements and it is entirely wrong to ignore these. However, our achievements are still insufficient when compared with the hard work performed by the people of the whole country and when compared with the superiority the socialist system should have demonstrated. As compared with the developed capitalist countries, economic and technical levels in China are still underdeveloped. Our country is still poor and the living standards of the people are still low. There are many causes for this, but an important cause is that we have adopted an economic system that is not suited to basic conditions in China.

China's economic system, which was established as early as in the First Five-Year Plan period, was based on the experience of the Soviet Union during the historical conditions that prevailed between the 1930's and 1950's. It is an economic system with a high degree of centralism and one that mainly uses administrative means to run the economy. It must be admitted that at a time when the national economy was seriously damaged, China had been divided by prolonged feudal separatist rule. Economic and technical levels were

low and the economic structure was simple. The new system did play an important role in concentrating material, financial and technical forces in China to ensure quick rehabilitation of the national economy. Successful fulfilment of targets in economic construction centered on 156 projects, and these efforts were rewarded with satisfactory results.

But the premise of this system lay in the restriction of commodity production and of the distribution of commodities. It rejected the law of value and restricted the function of the law of value. It was only because of the co-existence of several economic sectors that we were able to make use of the function of the market. Following the completion of the socialist transformation, we treated the socialist economy — a vast and complicated entity which is both close-knit and divided into multiple branches — merely as a big factory or a big machine: Greater emphasis was laid on centralism; the function of the market was rejected; undue attention was paid to administrative means; and state control over the economy became tighter and tighter. It was believed that only in this way could the machine operate and this was the only path of a socialist planned economy.

But circumstances proved just the opposite of this thinking. This system did not help to inspire the initiative and ingenuity of the enterprises and working people. Nor did it help the central government to maintain effective control over economic life. Rather, this system gravely obstructed economic development in our country. The defects of the system became more and more apparent to the people as time went by.

The Record of Previous Reforms. In the past 20 years, reforms of this economic system were attempted several times, but these were conducted within the limits of administrative management. The problem was never understood and solved once and for all. Especially under the influence of Lin Biao and the Gang of Four, the system became all the more rigid and incompatible with the development of productive forces.

The defects in this system are as follows:

1. The enterprises are treated as appendages to the administrative organs existing at different levels, and are not regarded as relatively independent commodity producers. This approach is incompatible with requirements for development of the socialist commodity economy.

2. The economy is controlled by the ministerial systems and administrative regions, with the effect of cutting off internal or natural relations among the industries and regions themselves, and between the ministries and administrative regions. This is incompatible with the requirement of modern socialist production.

3. Production is controlled too tightly and too rigidly by mandatory targets and fails to meet the actual needs of the market. This is incompatible with the complex and varying demands of society.

4. As all revenues and expenditures are controlled by the state, all localities and enterprises "share porridge from the same pot" and don't care about their own economic returns. This is incompatible with the requirement of using minimum labour to obtain maximum economic returns. This economic system has been accompanied by the setting up of more and more central ministries and regional departments, each controlling a number of enterprises and dividing their own spheres of influence. The multiple levels of administration, complicated formalities, sluggishness in handling matters and slow response have given rise to bureaucracy.

This economic system has been developed under the guidance of "Left" ideology, runs counter to the level of development of the productive forces at the present stage of socialism and is therefore also divorced from the corresponding relations of production. In some aspects, it has skipped over the present level of development of productive forces; in other aspects, it still falls behind the present level of development of productive forces. To a great extent, it has hampered the realization of the superiority of the socialist system.

The Onset of Socialist Modernization. After the Gang of Four was smashed, especially after the convening of the Third Plenary Session of the 11th Central Committee of the Communist Party of China, the focus of work was shifted to socialist modernization, calling for scientific management of the economy. This focus requires urgent restructuring of the economic system in an overall way.

On the other hand, there also exists a possibility for restructuring and perfecting the socialist economic system and for simultaneously placing on the agenda within this context the overall reform of the economic system. This possibility exists, firstly, because the mental shackles that used to restrict the people's thinking have been destroyed. Thus, it is possible for us to sum up the

experience of the past 30 years through both positive and negative examples in a realistic way and to restudy the objective laws of socialist society. Secondly, the seemingly endless succession of political movements have come to an end and political stability and unity has come to stay. This has made it possible for us to concentrate our strength on the restructuring of the economic system. Thirdly, as the national economy is being readjusted, the serious imbalance in the national economy has drawn the attention of the whole party and the people throughout the country. Effective measures are being taken to solve the problem and industrial and agricultural production is growing steadily. This has created conditions for the smooth restructuring of the economic system. Fourthly, as the closed-door policy has been changed, we can learn from the foreign experience in management and make use of it. These facts indicate that it will be possible to adapt the national economic system gradually to socialist modernization within a matter of ten years or so.

II. In What Direction Shall the Economic System Be Restructured?

As economic and social conditions vary from country to country, so will economic systems vary as well. Even in the different countries existing under the socialist system or within different periods in the same country, economic systems may also vary. There is not nor should there be a mechanical model. There have been no examples of success from merely copying foreign experiences mechanically.

The direction for the restructuring of the economic system in China should be determined on the basis of the present level of development of social productive forces in China and the characteristics of its socialist economy; it should be directed at the main problems in the existing system. Our direction for advance can only be determined on the basis of earnestly learning from experience at home and abroad.

China is a developing socialist country. It is a big country with a large population but a poor economic foundation. The degree of socialization of production is not high. Economic and technological development is not evenly balanced. Communications and telecommunications are still poor and the commodity economy is underdeveloped. When New China was founded, modern industry accounted for only 10% of economic output, while agriculture and handicrafts made up 90% of the total; nearly 90% of the population lived in the countryside. This situation inevitably gave rise to the co-existence of multiple economic sectors. After 30 years of socialist construction, modern

industry has grown considerably. With the infusion of some advanced technical equipment, it has formed an industrial system and a national economic system of considerable size. However, manual labour and self-supporting production still constitute a great part of agricultural production. A considerable part of the production in industry is also performed by hand or is semi-mechanized. The degree of socialization of production is not high; commodity production is not yet developed; the different regions have not developed evenly; and technological levels vary greatly from industry to industry and from enterprise to enterprise. In other words, social productive forces in China are still at a very low stage of development and therefore still exist as the productive forces of multiple layers.

This situation demonstrates that the socialist economy in China at the present stage ought to become a commodity economy, with public ownership of the means of production holding the dominant position. The economic system in China must be a system of multiple levels — that is, a system under which the state, the economic units and the working people jointly make decisions. It must be a system in which regulation by plan plays the main role and regulation by market is secondary. It must be a system that mainly depends on the economic organizations and upon economic means to run the economy. It must be a system that truly gives due consideration to the material interests of the state, the collective and individuals.

Guidelines for the New Reform. In line with this direction, our general ideas about the reform are:

1. *To extend the power of the enterprises and free them from the rigid control of the ministries and local governments.* In this way, they will become relatively independent economic units which, having paid all taxes, expenses and loans with interest, can then take maximum advantage of their own special abilities, actively develop their production and distribution, independently determine the activities of their management and business operations and adopt a system of independent accounting and responsibility for profits and losses on the condition that they do not violate the state plans and decrees. After paying income taxes, the enterprises can establish production development funds, welfare funds, bonus funds and reserve funds. While ensuring the fulfilment of the quotas set by the state, the enterprises can plan their own production and business activities according to the needs of society. They can themselves purchase the materials they require and sell what they produce. They also have the power to decide forms of

wages, employ workers and dismiss surplus workers.

2. *To organize national, regional and/or cross-provincial economic complexes according to the principles of specialization, coordination and economic rationality as well as the principle of mutual benefit under a unified plan.* Thus, we can alter the conditions of random alignment and mutual independence existing among the enterprises. The complexes should be organized both from top to bottom and from bottom to top and should take various forms. For example, complexes can be organized for the joint production of a well-known brand of commodity by merging factories that possess similar technical processes; some can be organized for the multiple use of raw materials and fuels; and some for integrating the elements of production, such as raw materials, labour power, capital funds and techniques. The complexes should adopt unified management and maintain unified accounting; but some may keep separate accounting, some may be structured as regional complexes and some as trans-provincial complexes.

3. *To open more outlets for the circulation of commodities and to establish unified commodity markets.* Both the means of production and the means of subsistence should be treated as commodities. Except for a few commodities that are vital to the national economy and to the people's livelihood and for which rationing should be used, all other commodities should be allowed to be sold or bought freely. More outlets should be opened for the distribution of commodities, intermediate links should be reduced, regional administrative barriers should be removed and distribution should be organized according to economic regionalization so as to establish systematically a wide variety of trade centres.

4. *To establish a variety of economic and trade centres based upon natural economic relationships for the purpose of strengthening these inter-relationships according to the needs of large-scale social production and to replace the existing organization of economic activities that is controlled solely by the ministries and localities.* A number of economic centres can be built in different parts of the country with industrially and commercially developed cities as their supports. Each large economic centre can be surrounded by a number of medium-sized or small economic centres with medium-sized and small cities as their main points of connection to other cities and towns and to the rural areas. The activities of each economic centre can be interwoven. But they should not be restric-

ted by administrative regionalization so as to impede their forming a flexible, organic economic network.

5. *To turn the planning system of setting mandatory quotas from top to bottom into a planning system of setting production quotas from bottom to top, combining both government guidance and directives.* The state gives guidance to the development of the national economy mainly through long-term and medium-term plans, which should cover the direction for the development of the national economy, the major ratios, the scale of capital construction, investment and major construction projects, and the range of improvements in the people's livelihood. As an executive plan, the annual plans should cover the balance between revenues and expenditures and between credit receipts and payments as well as the balance in supplies and the balance between foreign exchange receipts and payments. A mandatory planning system will be adopted only for a limited number of major enterprises that are vital to the national economy and for the people's livelihood, for the production and purchase of major industrial and agricultural products, for commercial and wholesale centres and for some major construction projects. A system of state guidance will be adopted for all other enterprises. The government will use mainly economic means to guide the business operations of the enterprises according to plan.

6. *To use prices, taxes, credit and other economic means to regulate economic activities and to replace the former practice of sole reliance on administrative measures to run the economy.* General product prices should be fixed on the basis of product cost and average profit rate, and readjusted periodically to keep up with the changes in product cost and in supply and demand. Price controls should be flexible and price forms should vary. Unified fixed prices should be adopted for major agricultural and sideline products, for raw materials, for fuels and for major consumer goods; floating prices should apply to certain agricultural and sideline products, to raw materials, to most processed goods and to consumer goods; market prices should be adopted for all other industrial and agricultural products. The present system of turning over profits should be changed to the system of paying taxes, and various taxes and tax rates should be adopted to regulate the profits of the enterprises. The banking system should make fullest use of its function to regulate and control capital funds. It is responsible for handling the settlements of accounts of the enterprises and public undertakings, absorbing idle capital and issuing both circulating funds and

capital construction loans. Apart from using economic means, the government can also use administrative means to intervene in economic activities according to law when necessary.

7. *Laws and disciplines must be observed strictly. Economic legislation, jurisdiction and supervision over economic work must be strengthened.* The state must enact civil laws, financial laws, banking laws, accounting laws, tax laws and price laws so that all economic activities can be governed by law. Economic tribunals should be established to try economic cases. At the same time, an economic supervision system should be set up at all levels and full play should be given to supervision by the statistical, financial, taxation, banking, price, industrial and commercial administrative departments.

8. *All party organizations and government departments at different levels should free themselves from trifling matters of economic management, and pay attention to principles and policies and to ideological and organizational work.* Concrete economic affairs should be handed over to the economic organizations existing at all levels, thus bringing an end to the situation in which the party and government meddled too much with concrete economic affairs.

9. *To change the overconcentration of power over economic work at the central level and to extend the power of local authorities in economic management through policy, planning and supervision.* Local governments should promote urban construction and service trades as well as cultural, educational and health work.

10. *To establish and perfect the system of workers' congresses under the leadership of the party committees, to give play to the role of the workers and staff members as masters of their enterprises; and to strengthen the democratic management of the enterprises while practicing the system of personal responsibility of factory directors under leadership of the party committees.*

The above points are interrelated, forming an organic whole. Implementation of these points in an all-around way will enable China's economic system to bring forth the advantages of the socialist planned economy and to give full play to the role of the market mechanism. As a result, our economy will benefit both from unified leadership and from flexible practices. There will be overall control without rigidity, and flexibility without chaos. This economic system will function in genuine harmony both with the level of development of productive forces in China at the present

stage and with the demands for expanding China's socialist commodity economy and its modernized mass production.

The total reform of the economic system is an important and complex job involving the readjustment of economic interests and the shifting of administrative authority in all quarters. It is in this sense a profound revolution in the economic base and superstructure. Experience in China and other countries shows that we must undertake full preparation in guidelines, planning, work methods and similar areas and that the necessary material conditions be created so that this reform can be carried out systematically. It is absolutely essential to guard against impetuosity, rashness and hasty mass action. Our two previous major reforms of the economic system — in 1958 and again in 1970 — fell through because we failed to undertake thoroughgoing deliberations, lacked circumspect planning and preparation, rushed the pace of decentralization, and hastily abandoned old practices while failing to introduce new ones to take their place. Past experience shows that, while cementing our determination to carry out the reform, we should choose the right direction, take steady strides, coordinate the efforts of all quarters, and proceed in an orderly and systematic way and, all the while, try to accelerate the pace of the reform.

III. Progress in Restructuring the Economic System Over the Last Two Years

Restructuring has been going on for two years in various localities and departments in line with the instructions of the Chinese Communist Party Central Committee and the State Council and on the basis of extensive investigations and study. On the whole, the measures that have been taken are experimental. The following are the major aspects of this reform:

1. *Experiments have been carried out in extending the decision-making power of enterprises in the areas of operation and management.* The 6,600 industrial enterprises chosen to carry out these experiments together account for 60% of the total production value and 70% of the profits of all state-owned industrial enterprises in China. These experimental enterprises — which now enjoy certain economic benefits, some powers of decision-making in production, supply of raw materials and sale of products, and certain economic conditions for self-expansion — have now become economic units with a degree of self-determination. This transition has lent tremendous impetus to arousing the enthusiasm of workers and staff, expansion of production and

improvement of operations and management. Preliminary statistics from 28 provinces, municipalities and autonomous regions show that 5,777 experimental enterprises registered a total value of industrial production of 165.3 billion yuan in 1980, which was 10.5 billion yuan, or 6.8%, more than in 1979. They realized a combined profit of 33.3 billion yuan, an increase of 3.5 billion yuan, or 11.8%, over 1979, and turned over to the state 2.9 billion yuan, an increase of 2 billion yuan, or 7.4%, over 1979.

2. *Market regulation has been practiced under the guidance of planning.* Capital goods have gradually entered the market as commodities, and many new sales outlets have been opened for consumer goods. Previously, however, all capital goods were produced and allocated according to plan; now such goods can be produced and sold by the enterprises themselves after they have met state quotas.

Last year, iron and steel enterprises sold on the market 2.91 million tons of rolled steel; which accounted for 11% of total national sales of rolled steel. Industrial enterprises under the First Ministry of Machine-Building sold on the open market 16 billion yuan's worth of products, accounting for 46% of the national total.

Most products controlled by the central ministries were produced according to plans drafted by the enterprises on the basis of orders received. Preliminary statistics show that 224 of the 256 categories of materials previously allocated by the state are now in ample supply on the open market. More than 600 companies and 60 exchange centres handling capital goods have been established in various places, and commission services in purchasing, marketing, processing and materials marketed by industrial enterprises themselves in 1980 came to a total value of 4.2 billion yuan. The production and marketing of consumer goods proceeded at an even brisker pace. Goods accounting for over 30% of total national retail sales last year were produced by enterprises on their own and in line with market demands.

3. *The financial system of "dividing revenues and expenditures between the central and local authorities and holding each responsible for its surplus and deficits" has been put into practice.* This two-tier system of financial management — plus the practice of allocating to the enterprises a share of excess (after quota) profits, allowing those who earn more to spend more, permitting all enterprises to retain their own savings and integrating rights and obligations — has inspired the enthusiasm and initiative of local authorities and enterprises to seek increased revenues and to

economize on operational expenses.

Local financial revenues in the country reached 77.6 billion yuan in 1980, an increase of 3.5% over 1979; local expenditures came to 56.4 billion yuan, down by 11%. A number of enterprises which had for long operated at a loss were ordered by local authorities to cease production or to switch to other lines, and to improve their financial management. These actions also help the economic readjustment.

4. *A number of enterprises have begun to organize themselves into specialized business companies, complexes or various other combinations.* A number of specialized companies and integrated enterprises have been established in some provinces and municipalities on the principle of cooperation along special lines and in conjunction with the readjustment of industry.

Statistics from 28 provinces, municipalities and autonomous regions show that 1,900 specialized companies and complexes had been formed by the end of 1980. Some 30% of the enterprises in the three municipalities of Beijing, Tianjin and Shanghai have now been merged into complexes or companies. In some cases, combinations of joint operations, joint ventures and compensation trade have been established between different localities, between state-owned and collective enterprises, or between urban enterprises and those run by rural communes or their subdivisions. These new establishments have improved economic performance since their structure enables the participating partners to turn their strong points to good account. In 1979, Shanghai's handicrafts industry established six complexes to produce athletic shoes, electric irons and other items. With different special lines working in cooperation, these complexes have increased production of athletic shoes by well over 50% and electric irons by 34%. More than 100 state farms in different parts of China have established joint enterprises involving farming, industry and commerce.

5. *Experiments have been carried out in changing the method for funding capital construction projects from state allocations to bank loans.* Over 550 construction projects in light industry, textiles, coal, electric power, petroleum, communications, building materials, distribution, tourism and other trades and industries have been selected for these experiments. The trades in light industry, textiles, railways, communications and other sectors have raised short and medium-term bank loans for the purpose of acquiring new equipment and tapping production potential, renovating and transforming enterprises. By the end of November 1980, these experimental units had

signed contracts to finance 690 construction projects through loans totalling 3.35 billion yuan. Under previous practice, funds for capital construction projects were all earmarked by the state and neither the construction units nor the project-owning departments shouldered any economic responsibilities. Various departments and local authorities often vied with one another for funds and projects but made scarcely any careful checking into the use of funds or their economic returns. The change-over to the use of bank loans has strengthened the sense of economic responsibility of these units, fully utilized the role of banks and improved economic results in general.

A good example is provided by the construction of a copper strip workshop with an annual capacity of 10,000 tons in Shanghai's non-ferrous metal rolling mill. The original plan called for purchase of a set of rolling equipment with an annual capacity of 40,000 tons through an appropriation of 6.85 million yuan. However, the capacity of the rolling equipment was four times that of the actual need. After the method of funding was changed, the management of the mill gave it second thought and began to worry that they might not be able to repay the loans. So they gave up the plan and decided to adopt technical measures to tap the mill's existing potential. In the end, they raised a loan of about 2 million yuan and succeeded in satisfying market demands.

6. *Diversified forms of operation are encouraged, and expanded and varying sectors of the economy are permitted to exist simultaneously.* More flexible policies have been implemented in many rural areas in light of their specific conditions, and the system of job responsibility with reference to production quotas has been generally adopted. Some production teams have taken on the practice of fixing farm output quotas for each subgroup (or even for each household in backward mountain areas). Individual economic activity is permitted. A number of collectively-run enterprises in handicrafts, retail sales, catering, repair, transport and construction have reappeared.

As a result, large numbers of jobless people have found employment and the market has been enlivened to the benefit of the people. Of the 9 million people who found jobs in 1979, 4 million, or 44% of the total, were recruited by collective enterprises. The comparable figures for 1980 were 7 million, 2 million and 32%, respectively. There were 8.8 million self-employed workers in the early days of the People's Republic. The figure was cut to 2 million by 1966, and further reduced to 150,000 by the end of 1978. It rose to 320,000 in 1979 and again in 1980 to between 800,000 and 900,000.

In short, these preliminary measures to restructure the economic system, which represent only a small beginning, are breaking through the bounds of the present economic system and stimulating the enthusiasm and initiative of local authorities, enterprises and workers for improving management, increasing production and economizing. Very good results have been obtained, the economy as a whole has been invigorated and an abundance of experience has been accumulated for the future all-round restructuring of the economic system. The direction is correct and the success is notable.

IV. Requirements for Reform of the Economic System During the Period of Readjustment

In order to tackle more thoroughly the country's long-standing and serious economic dislocation and the new problems arising from ineffective readjustment and the faults and errors in our economic work during the last two years, the Party Central Committee and the State Council have set forth the task of further readjusting the national economy. Generally speaking, our strategies for readjustment and reform are interrelated and they should support each other both for the present and in the long run. In some cases, they cannot be separated from each other; in others, measures for readjustment can be effective only if they are accompanied by corresponding measures for reform. On the other hand, we must also take note of contradictions between the two just as we do in the case of other matters.

During the course of the readjustment, our economic resources will remain very limited in capacity; we do not have adequate financial and material resources for carrying out an all-round reform of the economic system. Neither is it possible for the leaders of the country to devote their energies equally to the readjustment and to the reform at the same time. Both are gigantic tasks. This is why we must place the readjustment at the focal point, subordinate the reform to the readjustment, and make it serve the purposes of the readjustment.

To put it in more specific terms, we should actively carry out the reform in areas which help change the irrational structure in production; which help enliven production and distribution while ensuring the fulfilment of state plans; which help correctly handle relations between the state, the collective and the individual; and which inspire the enthusiasm of production and business units and of the workers. The reform must be slowed

down in those aspects that may be rational in the long run but contradict the readjustment at present. In my view, the reform can be carried out in the following respects during the period of the readjustment:

1. Consolidating and improving the restructuring of the system of enterprise management that has already been started.

An important aspect of the current reform is to coordinate as far as possible into an integral whole those preliminary steps that have already been taken. Our experiments in broadening the decision-making power of the enterprises have mainly focused on the sharing of above-quota profits. Now we should take steps to raise the managerial level of the experimental enterprises and grant them the necessary authority in making decisions for expanding lateral links between enterprises. At the same time, we should strive to carry out the reorganization and merger of existing enterprises, particularly in the machine-building industry, in conjunction with the economic readjustment.

On the other hand, we should continue encouraging collective and individual trades and services in areas such as handicrafts, commerce, catering and repair. We should also continue expanding outlets for distribution and adopt a variety of forms of distribution in the light of the importance of different commodities and their supply and demand, thus invigorating the market.

2. Making conscious use of the regulatory role of economic levers.

We should adopt appropriate measures to carry out systematically a small-scale readjustment of prices between different products and trades so as to resolve the problem of drastic differences in the sharing of above-quota profits arising from irrational pricing. We should ensure that this new practice will truly benefit market supplies and competition between enterprises. We should also undertake the necessary experiments in taxation by systematically changing the practice of collecting profits from state-owned enterprises to the collecting of income taxes. This practice will ensure that all enterprises can derive average levels of profits from their capital funds under normal production and reasonable operations and ensure further that national and local authorities will continue to receive regular financial revenues.

In the use of funds, we should in a planned way undertake a transition from state budgetary appropriations (including capital construction investments and circulating funds) to bank loans. The banks should charge interest on these loans as a reflection of their regulatory role. As for em-

ployment, we should combine recommendations by labour departments with the practice of job-seekers organizing themselves for employment or finding jobs on their own. Enterprises may also recruit workers through open examinations according to their own personnel plans.

3. *Strengthening the guiding role of planning.*

With the development of lateral economic links, the state must greatly strengthen the guiding role of planning so as to meet the needs of socialized mass production, ensure the proportionate growth of the national economy, and avoid blindness in production and construction. But the state should devote its main energies to maintaining an overall balance by taking satisfactory measures to accommodate the major objectives of economic development, of establishing key ratios of the people's livelihood, of the scale of capital construction and of major construction projects. Only in this way is it possible to demonstrate the guiding role of planning. While maintaining a balance of finances, credits, material supplies and foreign exchange, the state should enable the enterprises to draft their annual plans in line with the requirements of the national plans and of the contracts they have signed.

Plans should be formulated from bottom to top and go through the process of coordinating and balancing at each level, so that the requirements of the higher and lower levels can be integrated and so that the role of regulation by means of planning and by means of regulation through the market can be turned to full account.

4. *At the same time, comprehensive economic departments should be established systematically at various levels; information and prediction systems should be set up accordingly; and controlling organizations for planning, statistics, banking, taxation and prices should be improved and strengthened.*

Further steps should be taken to promulgate appropriate economic laws and regulations and to establish corresponding supervisory organs. A variety of measures should be adopted to improve workers' education and efforts should be made to train large numbers of specialists in economic construction.

In short, readjustment and restructuring are inseparable from each other. The better they are coordinated, the more favourable it will be for the steady and harmonious development of our national economy. This is why we should actively carry on with those aspects of the reform which are effective and conducive to the readjustment, all the while taking the readjustment as the centre of our work. We must not give up the reform halfway. Still less, we must not turn back to the old state of affairs in which flexibility meant chaos and overall control led to stagnation. It is my view that the orientation of the restructuring of our economic system is correct and the experiments have produced signal successes. So long as we carry on our theoretical study and make constant improvements in practice, surely we will be able to develop a Chinese economic system that is different from either the Soviet model or from the model of any other country.

5. THE ADVANCEMENT OF INDUSTRIAL ENTERPRISES AMIDST CONSOLIDATION

By Yuan Baohua

Consolidation of enterprises is important for China's industry. While marked successes in restructuring enterprises have been reported in recent years, continued efforts to consolidate our enterprises in accordance with the requirements of socialist modernization will surely play a bigger role in implementing the Party Central Committee's policy of further readjustment of the economy and achievement of greater political stability.

1. How Did the Question Arise?

After the smashing of the Gang of Four, the Chinese Communist Party Central Committee launched a policy of consolidating China's industrial enterprises, aimed at exposing and criticizing Lin Biao and the Gang of Four, setting things right, and restoring and establishing normal production order. At the end of 1978, the Third Plenary Session of the 11th Party Central Committee made a historic decision to shift the focus of the party's work to socialist modernization. Soon after, the Central Committee introduced a policy of readjusting, restructuring, consolidating and improving the national economy (the Eight-Character Policy), ushering in a new period for the consolidation of industrial enterprises in our country.

Consolidation means to improve management, raise economic output, tap the potential of the enterprises and, especially, shake up those enterprises where management is in chaos. It is an important component for carrying out the "Eight-Character Policy." In the past three decades or so, China has built more than 370,000 industrial enterprises, including over 4,000 better-equipped big and medium-sized key enterprises. Our four modernizations must rely resolutely on the existing enterprises. But the potential of the enterprises cannot be fully realized owing to China's irrational economic structure, management system, organization of enterprises, and backward management. Waste is common and serious, economic output is low.

To change such a condition in a fundamental way, readjustment and restructuring are necessary. We can surely blaze a new trail for economic development if we go all out to readjust the grave disproportions, reform the unreasonable economic structure and management system, rationally organize present enterprises, and gradually realize rationalization of economic structure, manage-

ment systems and enterprise organization. To achieve this, we should make unremitting efforts to shake up the enterprises.

Consolidation is the foundation. Without successful consolidation, there will be no reliable base for readjustment and restructuring, and improving economic results will be out of the question. In brief, the aim of readjustment, restructuring and consolidation is to liberate the productive forces and raise production levels, technical levels and management levels, so as better to meet the increasing material and cultural needs of the people. The four aspects of the "Eight-Character Policy" are interrelated and support each other. At present, the most important and urgent task before us is to shake up our enterprises, causing a readjustment which will tap their potential and seek better economic results through improved management.

2. A Review of History

We have been engaged in socialist construction and modern enterprise management for over 30 years. After Liberation, we confiscated bureaucrat-capitalist firms and turned them into socialist enterprises owned by the whole people. In these enterprises, we launched democratic reform and production improvement campaigns, eradicated the reactionary relations of production which exploited and enslaved the workers, and correspondingly established socialist enterprise management organs and systems, thus restoring and developing production rapidly. In 1952, our country victoriously accomplished the task of economic rehabilitation.

During the First Five-Year Plan period, the state concentrated efforts on building a number of key projects. At that time, we mainly gained experience from the Soviet Union and began to pay attention to employing scientific management systems and methods suitable for modern large-scale production. Through state plans, we integrated the production, technical and financial activities of enterprises in accordance with the demands for developing a socialist economy. Within the enterprises, we stressed the quality of products, business accounting, and intensified enterprise management. By so doing, industrial enterprise management in our country basically stepped onto the track of scientific management, and we obtained experience in managing socialist enterprises, trained large numbers of cadres, pushed

production forward, and guaranteed the victorious advance of large-scale economic construction.

In learning from Soviet experience in enterprise management, there was the problem of mechanically copying their practices in total disregard of our own concrete conditions — such as sole reliance on administrative orders to the neglect of democratic management, one-sided stress on material incentives to the neglect of ideological work, etc. In 1956, Comrade Mao Zedong, in his speech "On The Ten Major Relationships," criticized the wrong attitude of blindly copying and learning from others. After that, we began to explore and evaluate our own system and methods of managing modern industrial enterprises, and gained some more experience.

But owing to "Left" mistakes in economic work, harmful trends appeared in the 1958 "Great Leap Forward," such as not paying attention to objective laws, arbitrarily abrogating rules and regulations, pursuing high targets without paying proper attention to quality and economic results.

In 1960, Comrade Mao Zedong summed up our country's experience in industrial enterprise management. In a report on the situation of the Anshan Iron and Steel Company, he presented important instructions and put forward the principles for modern enterprises (called the Charter of the Anshan Iron and Steel Company), stressing the importance of:

- a) Keeping policies firmly in command;
- b) Strengthening party leadership;
- c) Launching vigorous mass movements;
- d) Instituting the system of cadre participation in productive labour and worker participation in management, of reform of irrational and outdated rules and regulations, and of close cooperation among cadres, workers and technicians; and
- e) Launching the technical revolution.

In 1961, in order to implement the policy of readjustment, consolidation, developing and raising standards as directed against the prevailing problems of enterprises at that time, the Party Central Committee formulated Regulations Concerning the Work in the State-Run Industrial Enterprises (Draft) (called "70-Point Document in Industry" for short). After several years of hard work, the party adopted a series of consolidation measures to change the chaotic management in many enterprises. As a result, economic results in enterprises improved markedly. The profit obtained per 100 yuan of investment in state-run enterprises rose from 8.5 yuan in 1962 to 24.2 yuan in 1966; labour productivity rose from 4,797 yuan in 1962 to 10,115 yuan in 1966, recording the highest level in history. During this period, the Daqing oil-field came to the limelight as an example of being self-reliant, hard-working and following our own

road of developing industry.

Answering Comrade Mao Zedong's call "in industry, learn from Daqing," and after further practice, the people on the industrial front gradually established a set of management systems and methods which integrated our country's revolutionary traditions with scientific management in modern large-scale production, thus promoting the development of socialist economic construction. At that time, our country's industrial enterprise management was basically suited to the growth of the productive forces. The basic content of this set of management systems and methods can be summarized as follows:

- To enforce the system of the factory director assuming responsibility under the leadership of the party committee, combining collective leadership with division of labour and individual responsibility, in accordance with the principle of democratic centralism;
- To set up the system of a workers' congress under the leadership of the party committee, ensuring that the workers and staff can practice their democratic rights of participating in the management and supervising the cadres, thus combining centralized leadership with democratic management;
- To institute the system of cadre participation in productive labour and worker participation in management, of reform of irrational and outdated rules and regulations, and of close cooperation among cadres, workers and technicians, so that they may jointly study and solve problems in production and management. This is an important system in following the mass line in enterprise management, correctly handling contradictions among the people and bringing into full play the initiative of the masses;
- To launch the mass movement of technical innovations and creating rational proposals, so as to bring into full play the workers' socialist enthusiasm, wisdom and creativeness;
- To set up various management systems with the job responsibility system as the centre, so that each worker has someone to look after, a special responsibility and a standard to follow, so that labour has a production quota. Special stress is put on establishing and perfecting the system of special responsibility in production techniques of the managerial personnel;
- To adhere to the principle of considering ideological work to be of prime importance, combining political-ideological education with material reward; this principle is the basic guarantee to mobilize the socialist enthusiasm of the masses to do better work in enterprises;
- To persist in the principle of running enter-

prizes industriously and thriftily, to establish the system of business accounting, and to unfold economic activities analyses and all kinds of mass activities to practice economy.

3. Two Stages of Enterprise Consolidation and Their Achievements

After the smashing of the Gang of Four, the consolidation of China's industrial enterprises in light of the contents and special features may be divided into two stages:

The first referred to the two years prior to the Third Plenary Session of the 11th Party Central Committee. In this period, consolidation was basically in the nature of rehabilitation, with the main targets of solving the chaotic situation caused by the disruption and sabotage by Lin Biao and the Gang of Four, restoring control over the leadership of some enterprises which had been usurped by the Gang's followers, and speedily resuming production.

The second stage referred to the period after the Third Plenary Session. Along with the shift of the focus of work of the whole country and in order to meet the needs of the four modernizations, the party put forward new requirements for enterprise consolidation.

The consolidation of a rehabilitative nature was meant to heal the wounds of the ten year upheaval. During the "cultural revolution," Lin Biao and the Gang of Four savagely pushed the ultra-"Left" line to stir up anarchism and negate enterprise management. They criticized the so-called "theory of productive forces," "profit in command," "material incentives," "control, check, oppression," etc., thus doing away with a set of regulations and methods in enterprise management which had taken shape through long years of practice, and causing confusion in theory, thinking and management. As a result, many enterprises were forced to cease all work and production. They incited bourgeois factionalism, split the ranks of the proletariat, created a "full-scale civil war," causing real losses to production and construction.

After the downfall of the Gang of Four, in accordance with the six standards of enterprise consolidation put forward in the Decisions on Some Questions Concerning the Acceleration of Industrial Development (Draft) (Called "30-Point Document," for short) issued by the Party Central Committee, we, in the mass movement of learning from Daqing in industry, consolidated the leading bodies of the enterprises, vigorously strengthened the ranks of workers and staff, resumed and established necessary rules and regulations, and shook up the enterprises group by group in a planned way. After these shake-ups, the enterprises took

on a new look, and outstanding results were made in enterprise management and production. Up to the end of 1979, 85% of the enterprises at the county level and above and 90% of the big and medium-sized enterprises had been consolidated. Taking the country as a whole, the task of consolidation of a rehabilitative nature was basically completed.

The Third Plenary Session of the 11th Party Central Committee pointed out: "Carrying out the four modernizations requires great growth in the productive forces, which in turn requires diverse changes in those aspects of the relations of production and the superstructure not in harmony with the growth of the productive forces, and requires changes in all methods of management, actions and thinking which stand in the way of such growth. Socialist modernization is therefore a profound and extensive revolution." The industrial departments conscientiously implemented the spirit of the Third Plenary Session, firmly carried out the principle of readjusting, restructuring, consolidating and improving the national economy.

From then on, the enterprise consolidation entered a second stage. Consolidation was carried out with production as the centre and the increase of economic results as the focus in an effort to raise the enterprises' levels of production, technology and management. While continuing enterprise consolidation, various areas and departments chose over 6,000 enterprises to experiment with in expanding decision-making power.

After the smashing of the Gang of Four, enterprise consolidation achieved the following remarkable successes:

- Leading enterprise bodies were readjusted and strengthened and the composition of leading enterprise cadres initially improved. According to incomplete statistics in Beijing, Tianjin, Shanghai, Liaoning, Sichuan and Hubei, the number of leading cadres in key enterprises who have a grasp of technique and are familiar with management increased from one-third to one-half; their average age was lowered, the percentage of middle-aged and young cadres increased; the power of the leading bodies was enhanced.
- Vigorous efforts were made to build up the ranks of workers and staff, thus increasing the workers' political consciousness and technical and professional level. Through political and ideological education, bourgeois factionalism was eradicated and proletarian ideological style was restored and carried forward. At the same time, in-service training was conducted. More than 328,000 leading cadres in the enterprises at the county level or above participated in training in rotation; 50% of the big

and medium-sized enterprises ran their own schools, with about 20% of the workers and staff attending.

- Basic work was strengthened. Many enterprises consolidated and strengthened the basic work of keeping original records, statistics, calculations, blueprints, technology, overhauls and technical standards. The enterprises under the First Ministry of Machine-Building Industry in the last few years persisted in strengthening the basic work in accordance with the 12 standards formulated by the ministry. By the end of 1980, 564 of the 597 key enterprises proved up to standards, accounting for 94.5% of the total.
- Overall business accounting and total quality control were implemented. Many enterprises, the experimental units in particular, introduced the accounting system at the three levels of factory, workshop and team; some tried out the internal system of settling accounts in accordance with the principle of combining rights, responsibilities and interests, therefore bringing into full play the enthusiasm of the workers and staff and achieving outstanding results. Total quality control was gradually spread across the nation from key units to areas. By the end of 1980, the number of experimental units grew to over 4,400, energetically promoting the improvement of the quality of products.
- Attention was being paid to enterprise operations. Many enterprises, under the guidance of state plans, made extensive use of the market, developed various forms of selling activities, attached importance to market investigations and forecasts, strengthened the sense of operations, marketing, competition and service, integrated production with demand and further linked up industrial production with the needs of the society. According to statistics, 46% of the 1980 total output value of the first Ministry of Machine-Building Industry was obtained through sales on the market.
- The economic results of enterprises were raised. In 1980, while energy production dropped by 1.3%, industrial production increased by 8.7% over the 1979 level. The variety and number of specific industrial products increased and their quality improved. A total of 255 civil industrial products won gold or silver medals awarded by the state. Consumption of raw materials, fuel and power dropped. Labour productivity in industrial enterprises owned by the whole people reached 12,031 yuan, increasing by one-third over the 9,134 yuan in 1976 and surpassing the best level in history. Profits per 100 yuan of

funding was 15.6 yuan, an increase of 27% over the 11.4 yuan of 1976. But other technical and economic targets did not reach the highest standard in history. The phenomenon of high consumption and big waste is still quite serious. This shows that our enterprises have great potential and that further consolidation and improvement are needed.

4. Basic Tasks of Enterprise Consolidation

Enterprise consolidation involves many aspects, so we must grasp the key points and concentrate our efforts on the outstanding weak links. At the same time, we must, in the light of the requirements of socialist modernization, make an overall plan, carry out constant shake-ups and make steady improvements. Judging from the practices in enterprise consolidation, we must pay attention to the following aspects:

1. To do a good job in the consolidation and building of the leading bodies of the enterprises.

This is the key to enterprise consolidation, and also the organizational guarantee for accomplishing the four modernizations. In the first stage of consolidation, around the work of exposing and criticizing Lin Biao and the Gang of Four, we put stress on solving the main problems in the leading bodies: to ferret out the factionalist set-up of Lin Biao and the Gang of Four in organization, to liquidate their pernicious influence, especially bourgeois factionalism, in ideology and style of work, to solve the problem of "weakness, laziness and aversion to discipline." By so doing, the majority of the enterprises each had a united and militant leading body.

The requirements for the second stage were to form a leading body that adhered to the four basic principles, resolutely carried out the party's line, principles and policies, and was capable of leading the workers to engage in the four modernizations with one heart and one mind; to solve in a planned way the problem of making the leading bodies "revolutionary, young, and with general and specialized knowledge." In order to open all avenues to recruiting people of talent, many areas and departments adopted the method of mass recommendations, examination by the higher authorities and coordination between higher and lower levels to choose and appoint capable persons. This method has gained good results.

2. In order to establish and perfect the scientific management system, attention must be paid to all basic work, to restoring and establishing the system of job responsibility and to tightening labour discipline.

After the first stage of consolidation, the

chaotic situation in management changed for the better, but the basic work was not done in a down-to-earth way.

So new measures have been taken during the past two years. For example, in taking concrete measures to ensure the fulfilment of the system of job responsibility, we reaffirmed the identity of rights, responsibility and interests, combined the three aspects — the system of job responsibility, the system of examination and the system of awards and penalties — establishing a direct link between the performance of the enterprise and the contribution of the individuals and material interests, thus bringing the initiative of the workers and staff into full play. In enterprise consolidation, we instituted total quality control and all-around business accounting and launched the nationwide movements of "high quality month," "safety month" and "energy conservation month," so that the basic work was further improved and advanced one step further towards the modernization of management.

3. To strengthen democratic management is an important link in enterprise consolidation.

The basic feature of socialist enterprise management is that the workers are masters of the enterprise and democratic management must be instituted; with progress in readjustment and restructuring, the workers become more and more concerned with the performance of the enterprise. In the experimental units for expanding decision-making power, workers can run their own affairs, enjoy more rights in democratic management and display greater socialist enthusiasm. After a few years of consolidation, we have restored and established various forms and systems of democratic management which had been undermined by Lin Biao and the Gang of Four, and set up and improved the system of workers' congresses which provides organizational and system guarantees for the workers' rights to participate in enterprise management and to supervise the cadres. Socialist democracy is further applied in the enterprises.

4. To take positive measures to improve operation and performance is important in enlivening the enterprises and the economy.

To carry out market regulation under the guidance of the state plan, it is necessary to put an end to the situation of paying attention only to production while neglecting sales, of grasping only management while ignoring business, to change from the method of stressing management inside the enterprise to the method of all-around management of integrating production and sales and initiatives both inside and outside the enterprise. Many enterprises have come to know that the key

to improving operations lies in decisions, while the foundation to making correct business decisions lies in market investigations and forecasts. Therefore we must gradually establish a set of management systems sensitive in mirroring the market situation, and put the basis of running enterprises onto the track of serving the consumers. This is a new direction for industrial enterprise management in China.

5. Implementation of the principle of distribution according to work, and restoration and establishment of a rational reward system are two effective measures to bring the enthusiasm of the workers and staff into full play and promote production.

In order to ensure that bonuses really play the role of rewarding labour performed above quota and encouraging the advanced, the departments concerned are trying to find out and perfect the method of distributing bonuses so that the results of production and business can be closely integrated with workers' contributions. On the basis of readjusting production quotas and strengthening management, we generally adopt the method of giving awards according to work points, while some enterprises may give awards on the basis of piece-work for collectives surpassing production quotas, or practice the piece-rate wage system. In implementing the award system, we attach importance to aspects of collective welfare, such as housing, canteens, nurseries, etc.

6. To devote major efforts to strengthening ideological and political work is an important guarantee for running an enterprise and for developing the economy.

One of our party's good traditions is to strengthen ideological and political work. But, for a time, some comrades slackened ideological and political work, and wrongly thought that ideological and political work was no longer important since the emphasis of our work was on material interests. After criticizing the fallacy of Lin Biao and the Gang of Four that "spirit is all powerful," some enterprises went from one extreme to the other, one-sidedly stressing material interests, and distributing bonuses indiscriminately. The Party Central Committee in good time corrected this wrong trend, and now things have changed. From practice we have come to know that after the shift of the focus of our work, ideological and political work is still the life-line of economic work. Only by combining political and ideological education with concern for workers' material interests can the initiative of the masses be brought into full play.

7. *To do a good job in workers' training is an important task in developing the intellect to suit modernization.*

In these years, we have restored training in the basic technical and professional skills among the workers, opened all kinds of schools and training centres, employed different forms of study, trained in turn leading cadres of the enterprises, specialized managerial personnel and workers by means of releasing them from work for study or on-the-job training. A systematic educational system and regulations for workers have gradually come into being so that the work of workers' training has entered a new stage.

Resolutely implementing the principles and policies adopted since the Third Plenary Session of the 11th Party Central Committee, continuously

working around the demands of improving management and raising economic results, our country's industrial enterprises are advancing victoriously on the course of consolidation. Our enterprises should operate in accord with the readjustment of the national economic structure and thus readjust product mix and service orientation under the guidance of state plans. It is necessary to reform various management systems within the enterprises in accordance with the demands of the reform of the economic system. The enterprises should be rationally organized in the light of the principle of cooperation between specialized units and rational economy. Thus we can manage our enterprises in a more scientific and modern way and make a greater contribution to the four modernizations.

6. WHAT TO DO AFTER WE HAVE DECIDED ON THE REFORM

By Yu Guangyuan

The economic structure must be reformed — this is a conclusion drawn from historical experiences and from lessons in China and other socialist countries. The Party Central Committee and the State Council are resolved to effect such a reform, and economic circles in China are identical in their views on the necessity of reform. The cadres and the masses, too, share the desire for reform. Of course, there are still some people who do not understand this necessity. That is why we have to elaborate and publicize it in detail. However, I am not going into that in this article. I'm going to discuss what should be done after we have resolved to effect a reform.

In my opinion, three problems should be solved properly, namely: 1. To clarify the orientation of the reform; 2. To create an overall design for the new economic structure; 3. To map out steps to enforce the reforms.

In clarifying the orientation, to my mind, our work has reached a stage where almost all questions to be considered have already been raised. Specifically, these are:

1. *The forms of socialist ownership that should be established and the rational structure of socialist ownership in China.*

This is the foundation of the socialist economic system. By socialist economic system, I mean the concrete form of the basic socialist economic system in a country.

2. *Policies towards the non-socialist economic sectors.*

At present, the socialist sector should not be the sole sector in our national economy. While some non-socialist economic sectors are not permitted to exist, some others — mainly the non-socialist individual economic sectors — should be allowed to exist and to properly expand on the condition that the socialist sector is predominant. The adoption of different policies towards different non-socialist economic sectors is a matter closely related to the socialist economic system, although it is not within the framework of the system itself.

3. *The economic function of the state and the means it employs to manage the national economy through planning.*

The economic function of the state comes within the framework of socialist ownership. What I am referring to is the role of the state only in

managing the national economy. The questions concerning the means used by the state in its planned management of the national economy include: Which means are the chief ones — administrative or economic? What is the significance and role of administrative and legislative means if the economic means become the main ones to apply? What is the relationship between economic means and administrative and legislative means? Etc.

4. *The commodity nature of the products of the socialist economy and the role of the market in regulating production and consumption.*

The problems involved are: Whether or not the means of production should be considered as a commodity? To what extent and within what framework should the means of production of merchandized? What are the nature and characteristics of the socialist market? All these warrant study.

5. *The distribution of power among the enterprises and local and central administrative organs.*

The present formulation is to enlarge the decision-making power of the enterprises, remove restrictions between the administrative regions and trades, and promote integration of the enterprises in accordance with economic principles. The formulation of enlarging the enterprises' decision-making power should be applied only when the enterprises have been given too little of such power. It cannot be taken as a long-term policy since some day the enterprises will have enough power, in which case it should not be expanded further. But the distribution of power among enterprises and local and central administrative organs and the removal of barriers between regions and trades with a view to promoting combination of enterprises are long-term policies.

6. *The status of labourers as masters of economic units.*

It will take a fairly long time for labourers to go through the transition from participating in the management of an economic unit to fully becoming its masters. We should take a positive attitude towards labourers becoming masters of economic units. It is necessary to study the concrete conditions of a given enterprise. A number of systems should be established in economic units to support and facilitate this reform and to create conditions for the gradual progress from labourers'

participation in management to management on their own.

7. Various forms of socialist economic units, including grassroots economic units, joint economic units, economic units of different trades, and economic units combining producers with consumers.

What should be their forms, status and roles?

8. The roles played by various social organizations — the party, the trade unions and other social organizations — in socialist economic management and socialist economic development.

In what manner should they do their work and carry out their activities?

There may still be other questions of orientation that have not been raised. But I think they are few.

To my mind, to put forward the above-mentioned questions is in itself an achievement in our work to reform the economic system. It has enlivened the people's thinking and has paved the way for reform.

On the question of the orientation of the reform, our weak points are that not much theoretical work has been done, that the fundamental issues concerning this reform have not been fully discussed, that more attention has been paid to a few problems while others have been barely touched upon. If my judgment is correct, what should be done in this respect is to devote ourselves to further study of the theoretical basis for the reform of China's economic system. This study is indispensable to clarifying and ensuring the orientation of the reform, to educating the cadres and the masses and to persuading those who are still sceptical about the reform.

Preparing a Blueprint for the New Structure.

As for the designing of the new economic structure, if we have a blueprint of the new structure our understanding of the orientation will become more distinct. Here I purposely apply the concept of engineering the design to the socialist economic structure, with a view to making people realize that before the reform is made, they must solve not only the question of orientation and principle but also many concrete problems. This will ensure that the proposed new economic structure is viable, that contradictions arising from the reform are foreseen, that methods to settle them are all at the ready, and that the new economic structure is a harmonious, integral one.

We all know that the various aspects of social economy — production, distribution, exchange and consumption — are closely interrelated as links in a chain. The direct production process is a

process in which many departments are closely linked one after another by variety, quantity, direction and time. On the other hand, socialist economic organization as a whole is the summation of numerous grassroots units, departments, local administrative organs and other economic bodies. Therefore, the proposed reform of the economic system must link up the parts to form the whole and an overall plan is needed to make the new economic structure viable. Of course, this does not mean that a separate part of the reform cannot be carried out entirely. What I mean is that a particular reform can be made only if it is a part of the overall reform and is coupled with the other reforms. Otherwise, we shall encounter insurmountable difficulties.

What stage have we reached in this respect? It seems that only some reforms have been initially designed. As for the overall structural reform, we are still in the stage of investigation and experimentation aimed at gathering data. It is vital for us to act in conformity with the law of the development of things. We still need some time before we can work out an overall plan. But in terms of engineering design, of course, such an overall plan still cannot extend to the blueprint stage. It can only reach the draft stage. Even in the draft stage, such preparations as collecting data, hard thinking and drawing sketches may not have been completed.

So the design of a new economic structure is not an easy task. It cannot be accomplished by a few persons in an office. One should not raise the unrealistic demand for quick results. To advance bit by bit is permissible. Yet, we must have a plan for the overall design. Since we lack both experience and qualified persons in designing a new economic structure in a planned and systematic way, we must ponder over what kind of knowledge those persons engaged in this job should acquire and how they can as soon as possible make up for any deficiencies.

Any design must be examined. As far as an engineering design is concerned, the designers and the examiners should work independently of each other. The examiners, of course, should also have the required knowledge. Unfortunately, our intellectual institutions are far too weak. It is imperative to strengthen them substantially.

With regard to the third problem — the mapping out of steps to enforce the reform — we can say that if the second problem is how to draw up a blueprint for the new economic structure (a structure which is the ultimate result of the reform), then the third problem is how to work out a timetable for those measures to be taken one after another in order to establish the new economic structure.

Our definite aim is to effect an all-around and deep-going reform. We will not be content with partial or limited reforms. However, as the existing economic structure has seriously hindered the development of China's economy, we should take actions immediately rather than wait for the completion of the design of the new economic structure by economic theoreticians and practical workers.

From now on, we should get down to business and advance step by step. Unlike Hungary, which has a population of a little over 10 million, China, with a population of more than 900 million, faces a much more complicated situation. It has far more difficulties than Hungary has in carrying out reforms. It is therefore necessary to make some experiments and to first carry out reforms in some local areas so as to gain the experience needed for a comprehensive reform. What is more, the ten-year "cultural revolution" caused serious damage to China's economic construction. So every effort must be made to avoid losses that may be caused by possible dislocations in the course of the reform and to ensure that every reform measure can promote production. For these reasons, the problem of working out steps and measures for the reform is of particular importance. If they are taken properly, the reform may go smoothly and even quickly. If they are not properly chosen, the result will be the opposite: We will encounter difficulties that ought to be avoided, or even suffer setbacks.

Examination of Conditions Before Implementation. To enforce a reform measure requires certain conditions. In essence, the study of the steps of reform means a careful examination of all the conditions required for each measure. If we fail to get a clear idea of these conditions, we can hardly take appropriate steps. We cannot achieve the expected results if we insist on making a reform in the absence of the required conditions. On the other hand, if we fail to make a reform when the conditions are ripe, we will lose the opportunity.

In pressing forward a reform measure, the economic situation is a condition that must be taken into consideration. For instance, there exists a close link between readjustment of the national economy and economic reform. It is very difficult to carry out a comprehensive reform of the economic structure under circumstances where there are serious disproportions between various sectors of the national economy and when the industrial structure is grossly irrational. The readjustment will not only affect the overall reform but also certain individual reforms. Under the present situation in China, to do a good job in the readjustment of the national economy is a more pressing task

than to carry out reforms, for the former will create a favourable condition for the latter.

Raising the Level of Organizational Work. To effect reforms, it is also necessary to raise the level of organizational work. We can take the rationalization of prices as an example. It is known to all that if the prices of products, raw materials and fuels are irrational, the net income and the profit rate can only reflect the ups-and-downs of the management level of an enterprise rather than the different levels of management of different trades. Consequently, the reform of enterprise production (e.g., to introduce planned management) by these economic means will be adversely affected. To effect such a reform measure, the improvement in our pricing work will become a prerequisite. Hungary took the establishment of a well-organized and dynamic pricing bureau as an important step in reforming the economic structure (of course, well-organized statistical work is also needed in this respect). As prices are very irrational and pricing work is poorly carried out in China, the adoption of the above-mentioned reform measures will meet many obstacles.

The Conditions for Reform. Some conditions required for taking a reform measure are not within the framework of reform. The economic situation and the organizational work mentioned above are two examples. However, some other reform measures themselves can serve as conditions for those reform measures which we are to study. That is why some reform measures should be carried out first, some should be enforced later and some should be adopted simultaneously.

We should also appreciate that some conditions required for taking a reform measure are quite complicated. For instance, as we plan to take net income and profit rates as means for introducing planned management of enterprises, whether or not the prices are rational becomes a criterion. But tax policy and credit policy may come up as a condition for employing these economic means. By way of reducing their taxes and extending credits to them at low interest rates, we can increase net incomes and raise the profit rates of those enterprises whose product prices are relatively low and whose costs are relatively high. As to those enterprises whose product prices are relatively high and costs relatively low, our approach may be just the opposite. This shows that pricing policy, tax policy and credit policy are complementary to each other. As a result, the "measure-condition" problem presents a greater complication.

The study of the stages of reform requires us not only to analyze the economic situation in

China and to follow its changes, but also to deepen our understanding of the law governing the economic movement. The two requirements can be taken as the first aspect. The second aspect is to sum up the experience in the course of reform. In the past few years we have, among other things, conducted experiments on expanding the decision-making power of enterprises. This measure has proved appropriate. It has promoted production

and has by practice changed the minds of those who were sceptical about the reform. Such experiments as promoting integration of enterprises are also of significance. Good work should be done in summing up the experience gained in taking measures of an experimental nature. In summing up experience, the study of the conditions for effecting a certain measure is one of the most important functions.

7. SOCIALIST ECONOMIC DEMOCRACY – THE ESSENCE OF RESTRUCTURING ECONOMIC MANAGEMENT

By Jiang Yiwei

I. What Is the Essence of Restructuring Economic Management?

A leading member of the central authorities said recently that the way out for China's economy lies in the improvement of economic performance. What are the ways to improve economic performance?

One is readjustment and the other is restructuring. "We should, by way of readjustment and restructuring, achieve step by step the rationalization of the economic structure, the rationalization of the system of management and the rationalization of the organization of enterprises so as to explore a new road for developing our economy." As I understand, the three rationalizations are interrelated. The rationalization of the economic structure is the central point of readjustment, the rationalization of the system of management is the central point of restructuring, while the rationalization of the organization of enterprises involves both readjustment and restructuring.

Both readjustment and restructuring have their short-, medium- and long-range objectives. I am going to discuss the ultimate objective of restructuring or, in other words, the criterion or principle for rationalization of the system of economic management. In my view, this ultimate objective, this criterion or principle, is the achievement of socialist economic democracy; or, in other words, the establishment of a socialist system of economic management on the principle of democratic centralism.

Drawbacks of the Present System. We all know that the present system of economic management in our country has many drawbacks. The ultimate objective of our restructuring of the system of management is to provide a solution to problems such as: In what form can the activity of the national economy be rationally organized? Along what lines shall enterprises organize themselves? Along what lines shall relations between enterprises be organized? How can the state exercise centralized leadership so as to bring the relations of production into harmony with the demands of the growing productive forces?

What will be the model of the future system of management after the restructuring is completed? This is a question we are all concerned about. Quite a few comrades are worrying that restructuring might lead to capitalism. Some

scholars and specialists abroad also view our restructuring in this light. As I see it, the restructuring we are now firmly carrying out is by no means oriented to capitalism. On the contrary, it is firmly oriented to socialism. What, after all, is the model for the system of management after this restructuring?

The tentative idea about combinations proposed by Marx and Engels in their early years provides a very good answer to this question. They said that an enterprise should be a combination of free and equal producers; the social economy should be a great alliance of all such combinations; and members of society should consciously engage in social labour in accordance with a common, rational plan. This tentative idea embodies both the democracy and the centralism as well as the unity of a socialist economy. Lenin also said that democratic centralism should be applied to the realm of the economy. I think it is in conformity with the four basic principles (adherence to the socialist road, Communist Party leadership, the dictatorship of the proletariat, and Marxism-Leninism-Mao Zedong Thought) to take these concepts as the guidelines as well as the objectives of our restructuring.

The achievement of socialist economic democracy is an inevitable demand raised by the development of the socialist economy. Economists in other countries define the Soviet Union's economic system as a model of the centralized type and that of Yugoslavia as a model of the decentralized type. The relationship between centralization and decentralization is essentially a relationship between democracy and centralism. It is a historical imperative, following the victory in socialist revolution, to transform the capitalist free economy into a unified socialist economy and to adopt the system of centralization for a certain period of time.

Lessons of the Soviet Union and Yugoslavia. China also adopted the Soviet model of centralization following the victory of the revolution. The development of the economy, however, laid bare the weaknesses of a system that stresses only centralization and thereby deprives the socialist economy of its vitality. Yugoslavia was the first country to tear itself away from this system and to strike out on its own path. But, in so doing, Yugoslavia's economy lapsed into over-decentralization, which also has shortcomings.

Drawing on the experience and lessons of both extremes, we should be able to blaze a new path by correctly handling the relationship between democracy and centralism and by practicing centralism on a foundation of democracy.

Viewed on a broader horizon, the issue of socialist democracy is also a fundamental problem in the current international Communist movement. Unless this problem is resolved, it will be very difficult to give full play to the superiority of the socialist system. Nor will it be possible to win ultimate victory over capitalism. Economic democracy constitutes the basis of political democracy; democratic reform of the economic system and the correct application of democratic centralism in the realm of the economy are objective demands raised by the development of socialism.

In view of the drawbacks of over-centralization, our restructuring must proceed from democracy, must take the enterprise as the basic unit, and must free it from present shackles. This emancipation, carried out on the basis of collectivism, is a historic action of great importance, while the establishment of a new socialist economic system based on democratic centralism is the essence of this restructuring.

II. The Enterprise Is a Combination of Free and Equal Producers

China's economy at the present stage is of necessity marked by the coexistence of various economic sectors. But the individual economy is not the principal component. The principal economic entities are the collectively operated enterprises. Despite distinctions in ownership, enterprises owned by the whole people and those run by collectives are all operations run by free and equal labourers collectively and all are basic units of the socialist economy.

To practice socialist economic democracy, it is essential first of all to emancipate the enterprises and recognize them as relatively independent commodity producers with relatively independent economic rights and interests. This is where our restructuring should and must start from. But our enterprises are, after all, different from capitalist enterprises in that there are no capitalists who own the means of production. This is why they ought to be regarded as combinations of free and equal producers. While capitalist economic democracy is based on individualist private ownership, socialist economic democracy is based on collectivist public ownership.

The Enterprises as Independent Commodity Producers. We can truly give full play to the

superiority of the socialist system only if we recognize the enterprises as relatively independent commodity producers. Under the present system, what we mean by the integration of the labourers and the means of production in enterprises owned by the whole people is viewed from the angle of taking the labouring class as a whole. When it comes to an individual enterprise, the labourers do not have the feeling that they are the owners of the means of production and may even feel that they are not much different from hired labourers. Herein lies the reason why the enthusiasm of the workers in enterprises owned by the whole people, which are more advanced in terms of the relations of production, is not so high as in collectively run enterprises.

Our recognition of enterprises as relatively independent commodity producers possessing the right to use the means of production and a certain amount of power to allocate their fruits of labour will help resolve this problem. I don't think it is necessary for enterprises owned by the whole people to backslide to collective ownership. It is equally possible to fuse the labourers with the means of production in enterprises owned by the whole people through the practice of collective operation and collective responsibility for the results of operation, all the while maintaining the system of ownership by the whole people. Ownership by the whole people of the means of production has tremendous advantages because it favours the state's exercise of unified leadership over the national economy.

So there are two systems of ownership existing side by side: One is ownership by the whole people with operation by the collective; which means the state entrusts the enterprise, a combination of free and equal producers, with the responsibility of joint operation and management. The other is ownership and operation by the collective. Although both are operated collectively, there will still be differences between these two types of enterprises owing to their different systems of ownership. These differences are primarily manifested in their responsibility for profits and losses. Collective enterprises should be completely responsible for their own profits and losses, whereas the enterprises owned by the whole people should share profits and losses with the state.

Now there arises one question worth studying: Should a limit be set for the amount of capital goods in enterprises owned by the whole people, by collectives and by individuals — so as to prevent them from enjoying all the differential earnings yielded by the means of production?

"Rights" and "Interests" of the Enterprises. The relative independence of enterprises is mainly

reflected in their possession of relatively independent rights and interests. What we call the power of decision, in effect, consists of two parts — "rights" and "interests." The issue of "rights" is the primary one. From the perspective of the entire social economy, the enterprises should be taken as the basic units and the state's centralized leadership should be built on the basis of democracy. As for the enterprise, it should likewise be organized on the principle of democratic centralism, with the entire staff exercising the enterprise's power of decision. We must not reform our system of management along the lines of the Soviet system of one-man leadership — by broadening the scope of the manager's authority only. This is why the reform of our system of management, while broadening the enterprise's power of decision, must further resolve the problem of democratic centralism within the enterprise. In reforming its system of management, the enterprise should take the workers' congress as the supreme organ of power and practice genuine democratic management, while enabling the director to give centralized guidance, so that a system of democratic centralism can be established by combining the two.

The second issue is that of "interests." The principle of material benefits should be implemented in an all-around way. First of all, the profits and losses of the enterprise should be shared rationally between the state and the enterprise, so that the enterprise receives benefits commensurate with contributions made in the form of labour by the enterprise as a whole. This, in essence, constitutes a distribution to the enterprise as a whole according to its work, and then this amount is again distributed among the small collectives and individuals in the enterprise according to their work. In this way, the workers' personal material interests will be linked up with the results of the enterprise's operation and management. The rational distribution of benefits among the state, the enterprise and the individual is an expression of the principle of democratic centralism in economic interests. Only in this way is it possible fully to arouse the enthusiasm of the labourers.

III. Combination of Enterprises and Great Alliances of Combinations

The social economy as a whole should move toward a democratic alliance with the enterprises as the basic units. Combination is an inevitable demand raised by the socialization of production. The question that needs to be studied in this connection is on what principle and in what form such combination should be achieved. To my

mind, such combination should be formed on the principle of democratic centralism.

1. Combination of enterprises.

The growth of the productive forces requires the organization of economic activities on the principle of cooperation between different specialized lines. In this sense, the reform of our system of management is directly linked with the restructuring of industry.

The organizational principle for the combination of enterprises should be democratic centralism. Combination under capitalism develops spontaneously through competition and by way of annexation. Socialism, on the other hand, is able to promote combination in conformity with objective laws. The experiences of 1979 and 1980 tell us that neither sole reliance on administrative orders nor sole reliance on voluntary participation in forming such combination will suffice. It is necessary to integrate the two: relying on administrative authority to promote combination while forming such combination in line with objective economic laws. Administrative intervention is necessary in forming such combination, but the main task of administrative intervention is to break the bounds of different departments and localities, otherwise it would be impossible to achieve such combination.

Combination should be formed on the basis of voluntary participation and mutual benefit and, at the same time, administrative authority should be used to promote it. This is a manifestation of the principle of democratic centralism. The same principle should also be applied within the combination. A loosely knit combination or joint company may adopt the system whereby the manager shoulders full responsibility under the leadership of the board of directors or the joint committee.

Such combination may take a variety of forms. The differences between several concepts should be made clear. Cooperation between different specialized lines is one thing and combination of different enterprises is another. Such cooperation does not have to take the form of a combination; a combination does not have to take the form of a company, still less of a highly centralized corporation such as a trust. The combination may be loosely or closely knit but, whichever form it takes, it should be in harmony with the level of development of the productive forces and should help to improve economic performance. Uniform rules should not be applied indiscriminately.

What we refer to as an "enterprise" means an economic entity which operates independently and has independent business accounting. A participant in a loosely knit combination remains an

enterprise and retains its own independent status. When a combination develops into an integrated company, it will do its business accounting independently and thus become an enterprise, and the subordinate factories will become its branches and cease to be independent enterprises. The company's organ of democratic management is the board of directors or management committee, and the organ of democratic management in a subordinate factory is the workers' congress. But a large company may also adopt the practice of exercising management at different levels. These are all applications of the principle of democratic centralism.

2. Combination of a whole trade.

To my mind, the combination of a whole trade is a kind of combination in management. This kind of organization is not an economic entity, be it called association or guild. It should be a democratic management body composed of the members and president of a council elected by the participating enterprises. The participants have both rights and obligations and should keep themselves within the confines of the rules and regulations of the trade. This body can take over part of the administrative power from the top on down and this helps break the bounds of different localities and departments. Each enterprise is free to join in or withdraw from an association of the trade, and may participate in one or several relevant associations at the same time.

An association plays the part of a bridge or link between different enterprises and between the enterprises on the one hand and the government on the other. Its functions are to draw up development programmes for the whole trade, make proposals to the administrative department in charge, stipulate through consultation the standards and prices of products and other common rules and regulations for the whole trade; organize inter-factory cooperation and hold consultations on economic benefits between different enterprises; arrange exchanges of technology and information and provide consulting services; and undertake cooperation in training personnel and introducing technologies.

There is a view that regards the administrative body of a trade as an economic entity which has the right to retain a share of the above-quota profits of the whole trade. This is open to question. If the body can regulate the earnings of its subordinate units, it becomes, in effect, a sort of company and ceases to be an organization of the above-mentioned character.

3. Economic centres — a regional combination.

An economic centre is a regional combination

formed around a city (or town) and covering different trades. Different from either an administrative division or a local administrative organ, it is yet another form of combination in management which should be established on the basis of combinations existing within various trades. It could take the form of a democratically elected economic committee with the participation of various trade associations. The congregation of different trade associations will naturally give rise to economic centres, each with its special characteristics and advantages. The functions of such centres are to handle common economic issues and coordinate relations among various economic combinations and among various trade associations. By handling common problems, these centres will be able to take over a still bigger part of the functions of the present administrative organs at various levels. They may also be a kind of semi-official organ for democratic management in the economic field.

Proceeding from the combination of enterprises and the combination of trades to the establishment of economic centres, we are able to form a network of economic organizations or, in other words, to weld all of the combinations into a great alliance. Founded on a democratic basis, this great alliance will embody the essence of socialist economic democracy.

With the establishment of trade associations and economic centres, the government can greatly simplify its organs of economic management and systematically separate administration from enterprise.

IV. The State's Unified Leadership Over the Socialist Economy

The achievement of socialist economic democracy does not mean sole concentration on democracy to the neglect of centralism; it means the establishment of the state's unified leadership over the socialist economy on the basis of democracy. This means strengthening control over the macro-economy while enlivening the micro-economy. The present reform of the system of management is only preliminary and control over the macro-economy has failed to keep pace with this reform. It is therefore no wonder that certain problems have emerged. What we should do is to study ways of bringing such control abreast of the reform. We should not retreat to old methods in the face of new problems.

Quite a few people see control over the macro-economy as regulation through planning and see this control as opposition to regulation through the market. Others equate regulation

through planning with the issuance of command plans. It follows that strengthening control over the macro-economy would seem to mean strengthening regulation through planning, and that strengthening regulation through planning would be equivalent to issuing command plans. These views are open to question. In my opinion, control over the macro-economy does not mean regulation through planning, still less the issuance of command plans. The content of control involves the whole process of the socialist economy and methods of control include those of an administrative and economic nature or a combination of both. So a single plan will be unable to solve all the problems.

The socialist economy is a planned economy. Management of the national economy through planning is a characteristic of the socialist economy. What we describe as management through planning consists of two functions: namely, planning and control. A plan is the objective of action; it is a tentative idea proposed in accordance with the objective economic laws. While a plan should be founded on scientific estimates, it is, after all, subjective. It follows that a plan, in its original sense, can only be a form of guideline. But it is entirely necessary for the state to act on behalf of all the labourers and to exercise unified leadership over the socialist economy; the state must draw up, after considering overall balance, a plan that accords more or less with the requirement for proportionate economic development as a unified objective for all labourers to work conscientiously to achieve.

As the expression of the will of the collective, a plan cannot materialize spontaneously. Its fulfilment or near fulfilment must depend on a requisite degree of regulation and control exercised by the state over the process of economic activities. But the drawing up of a plan and control over the macro-economy under the guidance of planning are two different matters. Such control should be exercised in a variety of ways and in many areas; it cannot be exercised merely by means of a plan. The command plan now being discussed is in essence a means of control through the management of material supplies. It is only one of a variety of control measures, although a very important one, and this measure alone cannot ensure the all-around fulfilment of the planned targets.

Control over the macro-economy should, at the very least, be instituted and systematized in the following respects:

1. Administration.

What we call separation of administration from enterprise does not mean that the govern-

ment will no longer take care of the economy or that administration is no longer necessary; it means that the government will no longer issue direct orders concerning the economic activities of enterprises. On the contrary, administration is an important measure in exercising control over the macro-economy. It at least contains the following elements:

A. Registration of enterprises: The establishment of new enterprises and major changes in the business lines of old ones should be submitted to the relevant department for examination and approval and then registered with the department in charge of industrial and commercial administration. This is an important link to ensure proportionate development of the economy.

B. Formulation of special rules and regulations: These include specific rules and regulations — for environmental protection, safety in production, labour protection, standardization, patent rights and market management — which are to be followed by all enterprises.

C. Organizational administration: There should be government departments in charge of trade associations, economic centres and other organizations of democratic management. These departments need to exercise control over such matters as examination of the opening of new enterprises and their business scopes, examination and authorization of plans for major technical renovation and expansion, pooling of plans and statistics, appointment of managers (or directors) and examination of their qualifications.

2. Legal control.

While the state needs to formulate various economic policies and carry them out via the administration, a number of long-range principles and policies need to be institutionalized in legal form so that legal control can be exercised. These include laws concerning enterprises, environmental protection, safety in production, taxation, and legal sanction against embezzlement, bribery, major accidents and serious cases of waste.

3. Key projects.

Key construction projects should not only be carried out according to plan but should be directly organized by the state and turned over upon completion to the workers who will be responsible for operating the enterprises.

4. Control of material supplies.

In order to ensure the fulfilment of the planned targets, it is necessary for the state to exercise

direct control over the manufacture and distribution of certain products. But the practice of the state in placing orders for goods should be adopted to replace the issue of so-called command plans. This practice is different from issuing command plans in that placing orders for goods is an economic activity in which the supply unit or commercial department, on behalf of the state, signs contracts with enterprises to define the economic responsibilities of either side in explicit terms. From the standpoint of the enterprises, fulfilling government and non-government orders and marketing their products directly or indirectly are all undertaken for the purpose of meeting market demands. The only difference is that government orders provide the most stable market and that giving priority to the fulfilment of government orders is the obligation of all socialist enterprises.

5. Control of capital.

All the capital of an enterprise owned by the whole people belongs to the whole people. It is illogical to say that the enterprise should have capital of its own. To strengthen unified control of capital and facilitate the separation of administration from enterprise, such capital may take the form of credits controlled by the state bank; the use of capital may be regulated by means of interest.

Here I would mention in passing the problem of handling certain categories of funds in an enterprise after the adoption of the practices of giving the enterprise a share of the above-quota profits and of the state collecting taxes instead of profits from the enterprise.

It is inappropriate to regard all those categories of funds of which the enterprise may keep a share for its own use as income belonging to the enterprise. These funds should be distinguished from one another according to their character and should be controlled by different methods.

Funds for expanding production have two different uses: one is for carrying out specific projects for better utilizing potential, for renovating or transforming the enterprise technologically, and for financing projects of scientific research and trial manufacture of new products. This portion of funds should be entered under production costs and does not have to be included under funds for expanding production. If necessary, such funds can be obtained from the bank in the form of a short-term loan. The other is for undertaking major technical transformation and expansion of the enterprise. This portion of funding is in the character of a state allocation of construction funds — funding which the enterprise has the right to use but does not own. If this portion of funding is not in use for the moment, it may be deposited

in the Construction Bank. It may also be used in advance and obtained from the bank in the form of a loan, to be repaid with shares of above-quota earnings at a later stage. This part of funds should be retermed as "funds for production and construction." Plans for using them need to go through the process of examination and approval. Upon their completion and commission, such projects will become fixed assets of the enterprise and thus belong to the whole people. In order to give enterprises greater flexibility, the standards for the value of fixed assets may be raised appropriately.

Funds for collective welfare amenities also fall into two categories. One is for direct consumption by the workers, such as various kinds of subsidies and odd expenditures on welfare. This portion of the funds should rather be defrayed out of bonus funds to be discussed later on. The other portion is for constructing housing, hospitals and other such welfare facilities. This part is in the nature of a state allocation of social welfare funds, which the enterprise is entitled to use but does not own, and methods for repayment should be worked out. This kind of funding should be retermed as "funds for construction of welfare facilities" so that they can be differentiated from welfare expenditures in general.

Funds for awards should be renamed "bonus funds." Further reform may place this kind of funding within the wage fund category as part of collective payment for labour in the enterprise. This kind of funding can be used for two purposes. One is to be distributed directly among the workers; the other is to cover expenditures of welfare facilities such as hospitals and nurseries. This item of funding constitutes the real earning of the enterprise and it belongs to the entire staff.

Only by clearly defining the nature of each of the above items of funding is it possible for the state to exercise control over accumulation and consumption in the enterprises at the grassroots level. The profits or losses of an enterprise are mainly reflected in the increases or decreases of its bonus funds or rebates at a given ratio, and the enterprise has to hold back part of such funds as reserves.

6. Control of labour.

The regulation of labour power is also one of the chief means for macro-economic control. It is necessary to establish labour companies and give full play to their role so that they become economic entities for the recruiting, supplying and training of the labour force. The staff of an enterprise may be divided into three categories: regular workers, contract workers, and temporary workers. The second and third categories are to be provided by labour companies. After observation

and testing over a given period of time, the enterprise may choose regular workers from among the contract and temporary workers. If and when the state is in a position to provide unemployment subsidies in the future, they may also be placed under the control of labour companies.

There are many other means of macro-economic control, such as price control and regulation through taxes, both of which are important methods. In content, they represent economic levers and, in form, they constitute administrative control via the price and tax authorities.

In short, the state plan represents the goal of economic development which is to be fulfilled or approximately fulfilled by way of the above-mentioned methods of control. The plan is an all-around programme, covering both production and circulation of materials directly under state

control and those not directly under such control. In the distribution of the national income, it covers both the portion directly under state control and the portion which the enterprise is entitled to allocate or to utilize directly. Likewise, this kind of control through planning embodies the principle under which there exists both centralism and democracy, both discipline and freedom. This is why the essence or ultimate objective of restructuring the system of management can be regarded as the achievement of socialist economic democracy or, in other words, is how the principle of democratic centralism is to be applied to the realm of economics. This new system of economic management, which fully embodies the principles of socialism, can be established only under the system of socialist public ownership.

8. REFORM OF THE INDUSTRIAL MANAGEMENT SYSTEM IN SICHUAN PROVINCE

By Lin Ling

Vice-President, Academy of Social Sciences, Sichuan Province

The 11th Central Committee of the Chinese Communist Party at its Third Plenary Session set forth the policy and task of restructuring China's economic management system. In line with this policy, experimental reforms have been extensively carried out in various economic sectors in Sichuan Province — in industry, agriculture, supplies, commerce, planning, finance, banking, etc. The experiment, which began in the last quarter of 1978, has caught the attention of many people at home and abroad. This article is meant to provide a preliminary examination of the successes as well as of the experiences and lessons gained from the Sichuan experiment as carried out during the past two or more years within the industrial sector of the province.

Overcoming Two Defects: Over-Concentration of Power and Stifling Initiative

There are two serious defects in the industrial management system in our country. One is over-concentration of power; the other is "all eating from the same pot with no regard for merit." Under the latter system, enterprises have become appendages of government organs, with all of their initiative bound in fetters. Therefore, any positive reform must start with an extension of their decision-making power so as to bring their initiative into full play. The same is true of the situation in Sichuan. Beginning with trial enlargement of decision-making power in six industrial enterprises, the reform in Sichuan Province has expanded steadily both in magnitude and in the variety of forms it takes. To date, the number of enterprises at provincial, prefectural and municipal levels involved in the experiment has increased to 417, accounting for 70% of the total output value of local industry, 80% of its profits and 90% of the profits turned over to the state. These figures indicate that success or failure of the movement is of pivotal importance for the future of industry in the province. In addition, the experimental extension of decision-making power has also been introduced in a number of enterprises operated in the province by various ministries and in most of the enterprises at the county level as well.

The aim of extending the autonomous power of enterprises is to free them from the fetters of

the existing management system and to transform them into true commodity producers enjoying relative independence. This objective can, however, by no means be achieved overnight but only through a process consisting of several stages.

The following is our scheme for Sichuan: At first, the enterprises involved will be allowed to retain a portion of their profits for themselves and be given correspondingly extended power over planning, marketing and expanded production; they will be allowed to keep separate accounts, contributing to the state by paying income tax instead of turning over their profits as previously, and assuming responsibility for profits and losses; finally, on the basis of thoroughgoing reforms in the financial and tax systems, the traditional departmental and regional affiliations of enterprises will be severed so as to make them still freer to the extent that they may manage their businesses independently, albeit under the guidance of the state plan.

At present, most of the enterprises involved in Sichuan are still in the first stage of the experiment and only ten are experimenting with the assumption of responsibility for profit and loss. Provided our plan is feasible, there will still be a long way to go before the enterprises can become veritable commodity producers enjoying relative independence.

Five Questions for the Reform

No sooner had the extension of decision-making power been attempted than a series of questions arose. These occurred mainly in five areas:

1. Should an enterprise be given certain powers over planning and, specifically, be allowed to organize production according to market needs under the guidance of the state plan?

2. Should an enterprise be given certain powers over marketing, and be allowed to market part of its products, including capital goods?

3. Should it be given certain economic interests of its own, and be allowed to retain as the enterprise fund a portion of its profits on its merits?

4. Should it be given certain powers over expanded production, and be allowed to use its own funds to engage in expanded production, tapping

its potential and undertaking innovation and transformation projects?

5. Should it be given certain power over personnel affairs, and be allowed, among other things, to promote managerial staff and to recruit or lay off employees?

Under the existing system, resolution of these problems by means of reforms will inevitably affect the powers presently enjoyed by the planning, financial, supplies, commercial, labour, personnel and other governmental branches — powers that in turn are governed by the policies, rules and regulations enforced by concerned departments of the central government. Hence, greater decision-making power for the enterprises is possible only when a change is made in the existing economic management system as a whole. Reforms must thus provide for the delegation of power to enterprises by the economic administrative departments concerned. In this sense, extension of the power of enterprises will add impetus from below to the introduction of reforms in the economic management system, and will objectively provide certain guidelines for the adoption of correct reforms.

During the past two years of experimentation in Sichuan, a series of important reforms have been introduced.

Under the former planning system, enterprises were required to adhere absolutely to production targets set for them by the state, which took the effect of commands. Today they are allowed to engage in extra production to satisfy market needs. They are also in a position to modify the state assignment with regard to the variety and specifications of the products to be turned out — in case they are found to be not well suited to market needs. Needless to say, this constitutes a major reform in the planning regime.

In the supplies field, the theory that capital goods are not to be regarded as commodities has been overturned. Exceptions exist for a limited number of items that bear upon the national economy and the people's livelihood, those that are in short supply, and dangerous articles such as explosives — the purchase and distribution of which still comes under unified state control. However, a greater part of capital goods are now allowed to enter into circulation. Such goods are made available either through supply contracts signed directly between enterprises, bypassing supplies departments, or through direct purchases on the market.

Commercially, diversified forms of purchasing and marketing (unified, selective, negotiated, etc.) and a variety of channels of distribution involving different forms of ownership (state, collective, individual and mixed) have replaced the conventional system of unified purchases, unified marketing

and monopoly operations. Enterprises are now allowed to market part of their products through their own outlets. Large stores may receive deliveries direct from factories without having to go through wholesale channels.

Financially, there is a break-away from the conventional system of unified collection of revenues and unified expenditures by the state under which "all eat from the same pot with no regard for merit." The relatively separate economic interests of individual enterprises are recognized, while priority is given to the interests of the state as usual. They are now allowed to retain a portion of their profits. The precise amount hinges on their merits. Such funds may be used for tapping the enterprise's potential and for undertaking innovation and expansion projects, for providing increased collective welfare to workers and staff members, and for increasing bonuses.

In the labour system, enterprises are now empowered to promote middle-level cadres and to approve overtime work. However, two rights that have been granted — the right to recruitment based on skill and proficiency, and to dismissal — are actually not being exercised in view of the current government policy to maximize job opportunities.

In short, through the above-mentioned reforms, enterprises now enjoy varying degrees of power to conduct part of their own planning, to market part of their own products, to retain a portion of their profits, to engage in expanded reproduction with their own funds, and manage portions of their own labour and personnel affairs. Those enterprises experimenting with the assumption of financial responsibility enjoy greater power than others and are held responsible for their losses. As a result, they are undergoing a profound change: They have ceased to be passive instruments, like an abacus waiting to be operated by higher authorities. Rather, they have become like an organic body which possesses exuberant vitality and dynamism and is able to propagate itself. This change in the nature of enterprises is of profound, far-reaching significance as it promises to enliven the entire economy.

Reform of the Management System

Our experience in Sichuan has shown that reform of the management system must be a multi-pronged operation. This is because in enlarging the decision-making power of enterprises, additional power must be delegated to them at the same time in a number of areas which are inseparably related to one another. For instance, at the same time an enterprise is given greater power over its finances, it should also be granted greater

power over its planning, marketing and expanded reproduction. Moreover, the management system of the national economy is an integral network composed of many lesser systems; what happens to the components is bound to affect the network as a whole. So reform of the financial system must be accompanied by corresponding reform of the planning, supplies, commercial, labour and other systems. Without orchestration, no band can possibly produce good music.

Here in Sichuan, reform is carried out through coordinated measures, although this is still at a low level. Further reforms will call for coordinated moves on a larger scale and at higher levels. It is beyond any doubt that when in future, overall reform of the management system of the national economy is undertaken, there has to be a comprehensive programme for coordination of work at high and low levels. In our view, those reforms aimed at extending the decision-making power of enterprises should call for coordinated moves on a small scale. Reforms such as those introduced in pricing and tax systems and in the removal of departmental and regional affiliations of enterprises to pave the way for their assuming of responsibility for profits and losses and for their embarking on a course of reorganization and integration — these should call for coordinated measures on a medium scale. The reform of the structure and leadership system of the national economy should call for coordinated moves on a large scale. This arrangement is made solely according to our tentative ideas, and practice is most likely to confront us with a situation much more complex than we think it is going to be. But one thing is certain: in a country as big as China, and in one with so uneven an economic development throughout its territory, no reform of the economic management system will succeed without the adoption of coordinated, synchronized measures within different spheres. But one should not refrain from an early start just because all of the required coordinative measures have not yet been organized.

The Regulatory Role of the Market

In the course of the experiment in Sichuan, an element which has always been considered as incompatible with the socialist economy — regulation through the market — has made its way into our economic life and has become a strong force in activating the economy.

The regulatory role of the market is notably visible in the following respects:

One long-standing theory has it that the law of value plays no regulatory role in the sphere of

production in our country. Now that by means of the reform enterprises are empowered to engage in production outside the state plan, changes in supply and demand begin to a certain extent to regulate the production and the use of funds in these enterprises, making them also work for meeting market needs instead of operating solely for fulfilling the state plan. This constitutes a radical change in the functioning of the enterprises and greatly eases the long-standing problem of inadequate linkage between production and needs. It speaks to the fact that the sphere of production is not supposed to be separate from market regulation.

The same theory, while recognizing the regulatory role of the law of value in the sphere of distribution, confines it to the distribution of consumer goods exclusive of capital goods. In fact, under the influence of this theory, even consumer goods were being distributed in a planned way. All this had led to a serious state of disconnection between supply and demand. At present, the reform also subjects a greater proportion of capital goods to market mechanisms, thereby giving fuller play to the regulatory role of the market in the sphere of distribution. As a result, the gap between supply and demand has been narrowed substantially.

In the final analysis, market regulation is a question of price. Although we have not attempted any reforms in our pricing structure, which remains basically a unitary system of planned pricing, this structure has in fact disintegrated under the impact of market regulation. The new price pattern in effect today is composed of:

1. *Fixed prices* — those involving basic means of production and livelihood as well as a considerable large portion of commodities still exchanged at prices fixed by the state.

2. *Floating prices* — those mainly involving capital goods in excessive supply — such as electrical and mechanical equipment — whose prices are allowed to fluctuate with their state-fixed prices as ceilings.

3. *Negotiated prices* — those mainly involving commodities in short supply, including both consumer and capital goods whose prices are fixed through negotiations between buyers and sellers.

4. *Free prices* — those prices offered at local market fairs which are automatically regulated by changes in supply and demand. This change in the pricing structure, while having resulted in price increases for a number of commodities, has helped reduce some of the more serious disparities between price and value and has paved the way for us to use price levers to promote production and to introduce additional reforms in the pricing structure.

Competition and Its Effects. The regulatory role of the market is having its most potent effects on those economic interests of enterprises which have begun to be determined by the competitiveness of their products on the market. As things stand today, the more competitive the products of an enterprise, the greater its economic gains; the less competitive its products, the smaller its economic gains. Thus, what has once been considered as one of the unique characteristics of capitalism — competition — has crept in among enterprises engaged in the same trade, apparently without being noticed. Market competition, like an invisible but powerful propeller, is driving our enterprises to exert their utmost to turn out fine, readily saleable products at low cost and to provide good services to customers in order to attain the best possible interests for themselves. Competition is constantly urging those lagging behind to catch up with the more advanced by improving their technical proficiency and management skills. Sichuan is one of the areas in China where industry is less developed. Its industrial products are far inferior in quality and variety to those produced in coastal areas. In the past, a protectionist policy was enforced in the interest of Sichuan's own industry to limit the entry of coastal products. The end result, however, was just the opposite, since it was backwardness that was being shielded.

Now, as protectionism has given way to competition and as large quantities of coastal goods are streaming in, people begin worrying again that local industry might be defeated in the keen competition. However, facts show that while on the one hand, competition does pose a serious threat to local industry, on the other it provides an impetus more vigorous than any administrative means can promote. It urges enterprises in the province to go all out to increase their technical proficiency and to improve their management. Today, more and more Sichuan products have found themselves to be in a good competitive position nationwide.

The emergence of competition among socialist enterprises owned by the whole people and the economic results it has yielded shows that even in the socialist mode of production there are objective conditions for the existence of competition. Where there is commodity economy, there is competition — with the only possible difference being in its character. Hence, socialism is not exclusive of competition but should "protect" it. The State Council decision on "protection of competition" is a breakthrough both in theory and in practice and will certainly have far-reaching effects on the development of our economy.

The four aspects mentioned above all testify to the regulatory role of the market. How then can

one best combine regulation through planning with regulation through the market? It must be admitted that this is a problem still awaiting proper solution in Sichuan. But it is equally true that the macro-economy has not gotten out of hand because of the presence of market regulation. The state has not ceased handing down mandatory production plans. Production based on market trends accounted for only 20% of total output in terms of value in 1980. This shows that production according to plan has remained dominant. In the same year, retail sales bypassing state channels accounted for only 17% of the total, with industrial goods marketed by enterprises themselves occupying only 6%. This shows state commerce has remained the main channel in the distribution of commodities. As for prices, those of principal capital goods, daily necessities, and of most other commodities remained under the control of the state plan. It is true that because of inadequate guidance by the state plan, there were instances of confusion in pricing. But they did not represent the main trend of development in the coexistence of regulation through planning and competition.

Cooperation and Integration. By enjoying greater decision-making power and by engaging in competition, enterprises begin to break through the confines of trade, region and ownership. Direct horizontal links have now been established between industrial enterprises, between industrial enterprises on the one hand and supplies and commercial enterprises on the other, between industrial and agricultural enterprises, and between industrial enterprises and scientific research institutes. A variety of new forms of cooperation and integration along specialized lines have developed at appropriate moments. There are associations of producers mainly devoted to the manufacture of the same product, associations of marketing, associations for producing complete sets of equipment through mutually complementary operations and production-research associations for developing new products and new technologies, as well as agriculture-industry, agriculture-commerce, and agriculture-industry-commerce complexes. At the end of 1980, there were 45 specialized companies, 8 combinations and 150 associates of all descriptions encompassing a total of 988 enterprises.

As specialized companies and economic associations came into being, a process of concentration of means of production and funds took place, resulting in the development of additional productive forces. For instance, the Zhongqing Clock and Watch Industrial Co., which acquired a yearly production capacity of 700,000 alarm clocks and 300,000 wristwatches with 17 million yuan of investment over 12 years, has boosted its output

of alarm clocks by 43% to 1 million and that of wristwatches by 66% to 500,000 within one year. The story is that since last year, when it assumed responsibility for its own profits and losses, the company has entered into partnership with 20 other enterprises.

Judging from the experience in Sichuan Province, the development of cooperation and integration along specialized lines is not at all an artificial process but one evolving from the intrinsic need of the enterprises in competition to acquire larger production capacities and to achieve better economic results. For this reason, to do a good job of extending the decision-making power of enterprises and to encourage competition among them will be of great importance in promoting such cooperation and integration. Any such cooperation and partnership must be based on the principle of equality and mutual benefit. One-sided emphasis on rationality in the division and coordination of work without paying due attention to the economic interests of the parties concerned would make integration impossible. In other words, a partnership will succeed only when it protects and advances the economic interests of all. The regional or departmental affiliation of enterprises constitutes the biggest barrier to their cooperation and integration, and must be removed in order to make them relatively independent. This means that other reforms must be introduced as well, including one by which enterprises contribute to the state by paying income tax instead of turning over profits as before.

Ours is a socialist planned economy. Cooperation and integration along specialized lines must be programmed as a whole from the higher levels so that it will be organized rationally and carried out in a systematic and planned way. To ensure plain sailing, the present "free combination" at the grassroots level must be lent a hand by state organs acting as promoters, organizers, coordinators and intercessors.

Formulas for the Distribution of Profits

In this experiment, our province, basing itself on the recognition that enterprises should have relatively separate interests of their own, has worked out and tried five formulas for the distribution of profits between the state and the enterprises and three formulas for the distribution of profits between the enterprise and individuals.

The five formulas are:

1. A sharing of the basic profits plus a sharing of the output.
2. A sharing of the whole of the profit.
3. The enterprise assumes chief responsibility

for its profit and loss.

4. The enterprise is held financially responsible only in case of losses or small surpluses.

5. A 4:3:3 (or 4:4:2) profit sharing ratio for enterprises at the county level.

All the five formulas are effective but with some defects.

The first provides reliability and security in revenue for both the state and the enterprise. But since the basic profit defined for each year is to be calculated on the basis of the previous year's actual profit, it tends to dampen the enthusiasm of the enterprise for tapping its potential in a big way.

The second one is easily applicable. But an improper ratio for the share-out would, to a certain degree, adversely affect the revenue of the state.

The third formula, under which the revenue of the state is guaranteed and the enterprise has some risk to run, proves markedly effective in bringing about better economic results. But as an income tax rate has thereby to be fixed for each enterprise, it is not easy to apply this formula extensively.

The fourth proves to be effectual as well. The Zhongqing Metallurgical Industry Bureau applied the formula on a trade-wide basis and achieved even better results.

The fifth is meant for small county-run enterprises, which, however, can be expected to attain still better economic results if switched to the system of bearing responsibility for profits and losses and of contributing to the state in income tax instead of turning over its profits.

Our experience in Sichuan shows that in distributing profits (after industrial and commercial taxes) between the state and the enterprise, a proper ratio must be set and a clear division must be made between expenses to be assumed by the state and those taken by the enterprise itself. Thus, the interests of the state, which should always come first, are ensured and those of the enterprise are kept up rationally. Any improper treatment would result in disputes between industrial and financial departments, or between the enterprise and financial departments concerned, and even lead to divergent appraisals of the reform itself.

The objective criterion for a proper approach is that the enterprise be made responsible for meeting expenses to be incurred in undertaking expanded reproduction (an undertaking closely linked to simple reproduction), for providing collective welfare for its workers and staff and for paying their wages and bonuses — since the enterprise as a more or less independent commodity producer held responsible for its profits and losses,

it now enjoys economic power in these three areas. Given that this criterion is correct, the proper ratio for the division of profit between the state and the enterprise should, as the experiment in Sichuan has identified, stand at 80% : 20%.

But the economic power delegated to the enterprise to make it into a relatively independent commodity producer is not the only factor to be taken into account in determining a proper ratio. The fiscal situation of the state also counts considerably. In view of the economic situation in recent months, the share of the profit to be retained by the enterprise should be limited to an amount which is potentially recoverable by the treasury from future growth in the enterprise's profits. This is because reform of the economic management system can go on healthily only when there is a steady growth in the state's financial revenues. If no increase is possible, then there should at least be a reduction in expenditures. Judging from the experience in Sichuan over the past two years, we believe 10% to be the proper rate for profit retention.

The three formulas for the distribution of profits between the enterprise and its workers and staff are:

1. When the division of profits between the state and the enterprise is based on a sharing of the basic profit plus a sharing of the output, the basic wages of the workers and staff, the officially prescribed bonus rates (equivalent to 12% of standard wages) and the collective welfare fund (equivalent to 11% of the total wage outlay) should both be handled as usual according to relevant state stipulations, but an additional sum should be appropriated from the retained profits for defraying collective welfare expenditures and new bonuses for individuals.

2. Where a sharing of the entire profit is practiced, basic wages should be handled as usual according to state stipulations, but all funds for collective welfare and for bonuses should be defrayed from the retained profits.

3. In an enterprise held responsible for profits and losses, basic wages, bonuses and collective welfare funds should all be appropriated from its after-tax profits.

These three formulas make enterprises different in their relationships to the economic interests of their workers and staff members. An enterprise adopting the third formula is closest to its employees while one using the second formula comes next. An enterprise operating under the first formula is believed to be least close to its employees. But even so, it is a formula much preferred to "eating from the same pot with no regard for merit." It is my view that the third formula should be applied wherever possible so as

to place the enterprise and its workers and staff all in the same boat. Before taking up that formula, it is advisable to take the first two formulas as the stepping stones.

The Question of Leadership in the Enterprises

By the time an enterprise has come to enjoy greater power in running its business, the question of who is to decide on important matters arises. Ours are socialist enterprises which theoretically are mastered by the workers. But as there was little decision-making power for the enterprises before. The workers, although nominally entitled to taking part in the management, found themselves in a position of being able only to fulfil tasks assigned to them from above, without being able to participate in the making of decisions on important matters.

Now that the enterprise enjoys powers of self-management, one of the most important things to do is to define the proper relationship between the director and the workers. In some socialist countries, the relationship between the director and the workers in an enterprise has turned out to be one of subordination of the latter to the former. Consequently, success or failure of the management depends largely on the decisions made by the director. In Yugoslavia, where a system of autonomy of the workers has been in effect for years, the director of a plant is responsible to the workers' committee. Under conditions existing in China, it is necessary to convert gradually the workers' congress into organs of power of the enterprises. The director, charged with the management of the enterprise as the representative of the workers and staff, should be elected by the workers' congress and be held responsible to it.

In the meantime, under the system of state ownership, the director is in charge of management as the representative of the state and should therefore be appointed by and held responsible to the state. All important matters concerning the enterprise should be decided by the workers' congress. The director should take part in the making of decisions from beginning to end and should execute the resolutions of the congress. In case of a resolution running counter to the interests or policies of the state, the director is entitled to request its reconsideration, to stay its execution and to report to higher authorities for an examination and ruling. Such a procedure of decision-making appears to better suit actual conditions in our country.

The reforms in Sichuan as cited above have enlivened its industry and agriculture to a degree

unheard of before. In the first year of the experiment, the total output value of the 84 enterprises involved rose by 14.9%, their profits by 33%, and their turned-over profits by 24.2%, as compared with the preceding year. All of these growth rates surpassed those achieved by comparable enterprises not involved in the experiment. In the second year, five enterprises experimenting with the assumption of responsibility for profit and loss manifested their newly acquired vitality with a 41.7% increase in total output value, an 80.7% rise in their profits and a 49.1% hike in their turned-over profits, as compared with 1979. Enterprises experimenting with the system of profit retention registered a lower rate of output growth than in 1979 because of serious below-capacity operations in those heavy industrial enterprises beset with energy shortages. Nevertheless, they made remarkable progress in achieving better economic results and in better meeting the needs of society by changing their product line-up and improving the quality and variety of their products and the serviceability of the enterprises. Collective welfare services in these enterprises, especially housing projects, improved in unprecedented proportions. The income of the workers increased considerably. Moreover, the effects of the reforms were felt far beyond the economic sphere. They have extended to the superstructure of the society, including the ideology of the people, in that the reforms have helped to remold some of the people's old conceptions and alter their cultural life. The reforms have opened the eyes of the people to where the hope of China's economic development lies, making them more confident in carrying forward the four modernizations. All this is of greater importance than mere economic gains.

New Problems Encountered in Course of the Reforms

On the other hand, the reform of the industrial management system in Sichuan has run up against some new problems. While trying to enliven the micro-economy, we did not provide adequate guidance for and exercise enough control over the macro-economy. We thereby experienced cases of failure to observe the state plan, of excessive and willful issuance of bonuses, and of unauthorized prolongation of the list of items for sale through an enterprise's own outlets. While giving scope to the regulatory role of the market, we failed to exercise adequate control and supervision over the market accordingly and to subject violations of law and discipline to timely sanctions and penalties. Some measures of reform did not prove appropriate enough, thereby affecting the

correct handling of the mutual interests of the state, the enterprise and the individual, and of those interests between the enterprises. Nevertheless, these are problems that have cropped up along the way of advance and we are capable of solving them by summing up our experience from time to time while carrying on with our reforms.

With regard to the reform now underway, there are questions on which views differ, and discussions are therefore needed:

1. Criterion for Assessing the Results of the Reform

A scientific criterion must be set up for assessing the results of the reform of the industrial system or of the economic system. In Sichuan, the rates of growth in output value, profit and turned-over profit are employed as yardsticks. This suggests that the higher the rates, the better the results of the reform; the lower the rates, the lesser the results. If the rates are down, the reform is believed to have gone wrong. In 1979, when growth rates achieved in the three areas were impressive, people generally applauded the reform as indispensable. In 1980, however, when rates were not so impressive and when some of the enterprises even experienced declines instead of growths, some people began to question the reform. The question is then whether or not the three indices should constitute the only scientific indicators of the success of a reform. The answer offered by our practice is — "not quite."

In 1979, thanks to an extension of decision-making power, the Chengdu Measuring and Cutting Tools Plant, as compared with the preceding year, scored an increase of 28.97% in output value, a rise of 25.97% in profit and a growth of 15.7% in the profit turned over to the state. But blindness in production in the same year resulted in stockpiles amounting to 14 million yuan, or 25% of total output. The following year the state assignment for the plant was two-thirds less than in 1979, with many of the items on the list being virtually unmarketable. Remembering the lesson of the preceding year, the plant coped with the situation by turning to market needs. It changed its product line-up and developed a number of new products on a trial basis; it succeeded in adding operations for mining, tanning, railway transport and other trades, apart from serving its traditional customer — the machine-building industry. It thereby greatly broadened its markets and enriched its technological resources. The result was that all of the products turned out by the plant in that year proved readily saleable. But viewed against the three indices, the plant declined by 16.82% in output value, by 11.23% in profit and by 8.27% in the turned-over profit as compared with 1979.

The same was true of the situation in the Chengdu Seamless Steel Tube Plant, the Ningjiang Machine Tool Plant and the Zigong Hard Alloy Smelter.

A question is then put to us: As far as social and economic results are concerned, shall we prefer to have high growth rates in the three indices together with huge stockpiles, or lesser or even negative growth rates accompanied by a high marketability of products? Needless to say, it would be best to achieve both high growth rates and high marketability at the same time. But if one has to choose between the two, the latter is more preferable because it means more social wealth has been created and people can benefit more from it, and this is the very objective we want to attain in readjusting our national economy and launching the reform of the economic management system.

Hence our conclusion: proper assessment of the results of a reform of the industrial system should in the main be based on how well social needs are met subsequently and not just based on the mere growth rates in output value, profits and turned-over profits. (By the way, evaluation based on the three indices is in itself not scientific enough during a period of overall economic readjustment, when the external conditions of an enterprise could be so changeable that many items are simply incomparable with what they were a year ago.)

2. Expanded Reproduction in an Enterprise With its Own Funds

Leaders of the State Council recently pointed out that from now on we must not develop our national economy chiefly by increasing capital construction projects but by giving fuller play to the role of our existing enterprises. This is a decision of paramount importance which will help us to get rid of the inveterate obsession for undertaking capital construction projects and establishing new enterprises. It will help us blaze a new trail towards steady development based on improved economic results of the existing enterprises. But how to do it remains a problem. Some economists are of the view that in giving fuller play to the role of the existing enterprises, the primary thing to do is to scrap the existing depreciation rate for fixed assets and return the depreciation funds almost in their entirety to the original enterprises for use in equipment renewal in consonance with scientific and technological progress. And expanded reproduction in the existing enterprises should be financed by new state investments.

In Sichuan, however, a different view and a new approach have developed through practices over the past two years or more. That is, in addition to being left with the major part of the de-

preciation funds for use in equipment renewal at its own discretion, the enterprise should be encouraged to engage in expanded reproduction, which is closely linked with simple reproduction, with its own funds and, when necessary, with loans from banks. The most distinct advantage of this formula is that it relates the transformation directly to the economic interests of the enterprise, thereby giving strong stimulus to the initiative of the enterprise and the workers. Under this formula, expansion projects will be carried out with careful calculation in the use of funds, materials, equipment and manpower and will take the shortest possible time to complete. In a word, this is a way to achieve greater, faster, better and more economical results than could possibly be achieved if the state were acting as the investor in an expansion project. It is estimated that in the past two years, expansion projects undertaken by the enterprises themselves cost almost 25% less than they would have if the state had been in charge.

Would dependence on enterprises or banks for funds in expansion projects lead to cases of overlapping in capital construction and production and result in too big a scope in capital construction? It is possible. But this situation can be averted if greater control is exercised on the macro-economy for an overall balance and if such expansion projects are made subject to authorization by government organs. As a matter of fact, whether or not a major project of expansion can come to fruition often depends on the availability of the required raw materials, energy supplies, equipment and semi-finished products and transportation means. Such elements are beyond the control of an individual enterprise and can be made available only through balance-conscious planning departments.

At present, since the serious disproportions in our national economy have not yet been corrected, enterprises should be given limited power over investment for expansion purposes and tighter control should be exercised over the macro-economy. But once the economy returns to a state of proportional balance, greater power can then be delegated so as to give fuller play to the initiative and the investment potential of the enterprises.

3. Activation and Control

Activating our economy is one of the objectives of our reform, a goal that is to be attained by extending the decision-making power of enterprises over planning, marketing, pricing, use of retained profits, expanded reproduction, etc. While the economy is livening up, disorder and even speculation and other violations of law and discipline may be expected to take place concomitantly. Our reform is based on the premise that ours is a socialist planned commodity

economy, and is aimed at giving full play to the regulatory role of the market and to greatly promoting commodity production and commodity exchange under the guidance of the state plan. Hence we must tackle those ills and defects typical of the commodity economy that have stemmed from our reforms. That is to say, while we try hard to enliven the micro-economy, we must put an end to disorder and violations of law and discipline by stepping up the work of planning, guidance and regulation of the macro-economy. This includes the use of sanctions where necessary. Efforts on these two tracks can be complementary and should go hand-in-hand.

Because of lax control, the reforms in Sichuan did give rise to a certain amount of disorder. Some people — without bothering to make specific analyses — blamed the disorder entirely on our effort to enliven the economy and advocated a return to rigid control over the economy. In truth, exercise of rigid control is one thing we are capable of and is an easy task to perform since we have a lots of administrative organs around. And it did happen that for a time in some places in Sichuan, while disorder was being brought under control, the economy lost its liveliness. Today more and more people have come to realize that the long-standing alternating state of disorder and inertia within the economy — caused by a stress on activation at one point and on rigid control at another — must be discontinued at any rate. Our policy should be one that ensures both liveliness and order. To activate our economy is the fundamental goal, and one for which support must be given. To bring an end to disorder is also necessary. But one must first correctly distinguish disorder from liveliness and then proceed to tackle those real problems by steering things into the right course with combined economic, administrative and legal means. As long as there is a commodity economy, there will be some sort of disorder. Hence, the assurance of both liveliness and order will be our task for a long time to come.

4. Protection of the Vested Interests of the Enterprises

Enterprises owned by the whole people should have relatively distinct interests of their own. This is what Sichuan has achieved through the reform of its industrial system. Once an enterprise has acquired economic interests of its own, it also gains an internal motivating force to actively manage its own economy. The question now, and one that Sichuan has not solved properly thus far, is how to correctly integrate the interests of the enterprises with those of the state, and how to make the interests of individual enterprises more or less identical with one another. The most con-

troversial issue involved is whether or not the vested interests of an enterprise should be preserved. In view of the changeableness of policy in the past, enterprises endowed with extended decision-making power now strongly demand that their interest be protected from possible equalitarian action at their expense or from any reversal of the present situation. This is only just. To deprive enterprises of their gains will only spell failure for the reform. So, whether or not the interests of enterprises should be protected is a matter of principle that affects whether or not the reform should be carried forward at all. Nevertheless, while many of the gains of the enterprises have been legitimate, others have not been. Legitimate gains are those derived from improved management, from higher labour productivity and from the better economic results yielded. Illegitimate gains are those derived from some excessive high prices fixed by the state, from advanced installations and equipment in place prior to the reform, and from ease of access to various resources. Only legitimate interests should be effectively protected. The illegitimate ones should be subject to readjustment and regulation in accordance with new policies to be worked out. In 1979, a very generalized slogan with no regard for legitimacy — "safeguard the vested interests of enterprises" — was followed in Sichuan. As a result, a number of enterprises were able to achieve part of their gains at the expense of the state; moreover, the imbalance of interests caused by the special advantages or handicaps of individual enterprises was allowed to persist. This should be taken as a lesson. But the solution to these problems must be approached gradually and should be based on reforms in the pricing and tax systems. Haste will only lead to new problems.

5. Assumption of Financial Responsibility by Enterprises Owned by the Whole People

Whether or not enterprises owned by the whole people can or should be allowed to assume responsibility for profits and losses remains a controversial issue among many theoreticians and within various administrative departments. Initial practice in Sichuan shows that an enterprise of such ownership should not always come under the scheme of profit retention within the reform if the goal is to have it become a relatively independent commodity producer. Although it remains true that an enterprise practicing the system of profit retention is better off than one in which the state is responsible for all its income and spending, such an enterprise will still find itself falling into the category in which "all eat from the same pot." Only in bearing the responsibility for its profits and losses can the role of an enterprise as a com-

modity producer be brought into full play. However, it must be pointed out that for state-owned enterprises, such a responsibility is assumed while the state remains in full control of its means of production, its production plans and the distribution of its profits. So it remains limited in its scope to a certain degree and is therefore responsible for profits and losses only in a relative sense. This is different from the system in practice within a capitalist enterprise in both character and dimension; it might therefore be called partial responsibility for profits and losses.

The five enterprises experimenting with the assumption of financial responsibility in this regard are both large and medium-sized and have generally achieved a fairly high level of socialization. Some of them had their capacities assigned to them by the state with their supply of the required raw and semi-finished materials and energy fully ensured and with the products planned for production readily marketable. Others, however, found themselves in a much less favourable condition inasmuch as state assignments placed only 17% to 40% of their capacities in operation. But all five succeeded in achieving good results, thanks to three measures that had the effect of holding them financially responsible and making their leadership and workers active in ensuring profits and averting losses.

These measures were:

1. The enterprise retains the whole of its after-tax profits;
2. All of its development funds, wage funds, reward funds, collective welfare funds and reserve funds are defrayed from the retained profits and the state grants no additional appropriations for these funds;
3. In case of a loss, the enterprise receives no state compensation and, when there is no adequate reserve fund to make up for the loss, it has to cut back the wages of its employees to offset the deficit.

Based on our experience, we are able to conclude that assumption of the responsibility for profit and loss is a logical development of the system of retaining a portion of the profits by the enterprise. But this is not to say this system is applicable without having to depend on certain conditions. A basically ensured supply of raw and semi-finished materials and basic marketability of the products are two fundamental conditions.

On the other hand, one should not refrain from starting until such point as all required conditions are in place. To assume responsibility for profits and losses implies that one has some risks to run. But it is those very risks that urge one to go all out. So it is simply meaningless for one to wait so as to undertake the responsibility in the

most favourable conditions and then to proceed in ease and comfort. At present, it is desirable to introduce this system gradually in enterprises such as consumer-goods manufacturers which are required to develop in this period of economic readjustment. Here, two types of enterprises are recommended. For those enterprises that are important enough to affect the national economy and the people's livelihood and are of a high level in socialization, assumption of partial responsibility for profit and loss is preferable; the other type are those smaller ones with a low level of socialization, whereby assumption of full responsibility is preferable and whereunder the operating collectives are held fully responsible for profits and losses, with their enterprises continuing to be owned by the whole people.

Conclusion

Now that our country is in a period of economic readjustment, the focus of our work should naturally be on the readjustment. But the reform should in no way be discontinued in those instances where it can serve the interests of the readjustment. Otherwise, we shall fall short of the objective of the readjustment. During the past two years, the reform work in Sichuan was primarily aimed at enlivening the micro-economy. While we are continuing our work in this respect, we must also improve the planning and guidance of the macro-economy. Only by coordinating our work on both tracks can we attain what we are aiming at through the reform. Improvement in the guidance of the macro-economy must be viewed in a broad perspective. It should include better guidance through mandatory and instructive plans, through economic levers and through economic information, economic legislation and economic supervision. In addition, administrative intervention is implied when necessary. The work to enliven the micro-economy should be primarily devoted to consolidating the gains already made through the extension of decision-making powers. Meanwhile, it is desirable to work out trade-wide programmes for readjusting the interests among the enterprises of the same trade, for tapping their potential, and for undertaking innovations and transformation projects within the enterprises. This is necessary because it will help correct the existing imbalance of interests among the enterprises and help overcome the defect of overlapping in capital construction. At the same time, it will help pave the way for industrial reorganization and integration.

Promotion of industrial reorganization and integration with the stress on key cities and on developing consumer goods production is the

focus of this year's work of readjustment and restructuring. Going hand in hand with it will be experimental reform of the tax system, without which it would be difficult to break the enterprises' regional or departmental affiliations — links which stand in the way of industrial reorganization and integration. We should blaze a new trail in our economic construction, one which gives fuller play to the role of our existing enterprises and yields

better economic results. Hence, it is imperative to streamline and reform the management system of our existing enterprises, especially at a time when energy is in short supply.

The restructuring of our economic management is where the hope of our four modernizations lies. Our experiments in Sichuan in this field shall continue to proceed firmly and steadily.

9. THE SYSTEM OF RESPONSIBILITY IN AGRICULTURAL PRODUCTION IN ANHUI PROVINCE

By Zhou Yueli

Deputy Director, Anhui Provincial Agricultural Commission

Changes Conforming to Actual Conditions

A system of responsibility in production was introduced to the rural areas of Anhui Province during the winter of 1977 on the basis of the implementation of the rural economic policy. At that time, a new Provincial Party Committee headed by Comrade Wan Li was set up on the instructions of the Central Committee of the Communist Party of China, and Regulations Concerning Some Questions on Present Rural Economic Policy were formulated. This gave great impetus to implementing the new rural economic policy and to stabilizing the situation in the rural areas by giving full play to the initiative of commune members — an initiative that had been suppressed as a result of sabotage of rural economic policy by Lin Biao and the Gang of Four.

In 1978, a terrible drought struck Anhui Province. Most parts of the province received no saturating rain for a ten-month period. Even during the normally rainy summer season, reservoirs were empty and rivers ran dry in quite a few areas. The Huaihe River, one of the five largest rivers in China, had a small flow of only 0.5 cubic metres per second. More than 60 million *mu* of cultivated land were heavily affected by the calamity, while an area with a population of 4 million fell short of water for its inhabitants as well as for its livestock. When the sowing season came in autumn, it was impossible to plant wheat and rape seeds, because there was insufficient moisture in the soil. Attending to the actual conditions, the Provincial Party Committee decided rather than to let the land lie waste, to lend those plots which the collective could not sow to commune members to grow wheat or rape individually. As a result, the enthusiasm of the commune members for production was raised, the autumn sowing was speeded up and seeding acreage was expanded. Specifically, additional acreage of more than two million *mu* was seeded with wheat in the hilly areas along the Huaihe and Changjiang rivers.

At that time, a nationwide discussion on the criteria of truth was going on. Encouraged by this excellent situation, the practice of fixing farm output quotas on the basis of groups was introduced in some localities. In a few communes, production brigades and production teams, output

quotas were fixed on a household basis on the initiative of the commune members themselves.

The Only Objective Criterion is Social Practice.

Cadres at various levels held differing attitudes towards such new forms of management created by the masses. Some kept silent for fear of taking risks since practices such as fixing output quotas on the basis of groups or households or giving material incentives had been criticized in the past and many comrades had suffered as a result. But there were those comrades who stood for letting the facts speak for themselves and for using practice as the criterion for showing what is right and what is wrong. They held that the party's correct lines, principles, policies and measures all come from practice, and the readjustment of agricultural policies is no exception.

For the sake of strengthening the management of the people's communes and boosting agricultural production, we collected the different opinions and reported them to Comrade Wan Li. He pointed out that these opinions were a reflection of two ideological lines on agriculture. He asked us to undertake a serious, comprehensive investigation and study of the problem and then hand in a written report. In so doing, Comrade Wan Li said that it was necessary to make concrete analysis of what had been criticized. Criticism is a subjective means of understanding things and should not be taken as the objective criterion for testing truth. It might be right and it might be wrong. The only objective criterion is social practice.

The Provincial Party Committee organized groups of cadres to cooperate with the Chuxian and Liu'an Prefectural Party Committees to investigate the various forms of the system of responsibility for production. These included the method of fixing work-points (units indicating the quantity and quality of labour performed and the amount of payment earned) according to the output and on the basis of production groups — as practiced in the Weiyang Production Team of Lai'an County; the method of fixing output quotas in cotton cultivation on a household basis, with extra pay for above-quota output — as practiced in Mahu Commune of Fengyang County and in Xinjie Commune of Tianchang County; the method of fixing output quotas for field crops on a household basis, with the households retaining any resultant surplus and paying for any resultant

losses as might occur — as practiced in the Shannan District of Feixi County; and methods of rewarding leaders of production brigades and production teams for good management and penalizing them for failure in fulfilling the planned targets — as practiced in Guangda Commune of Lai'an County.

These methods combined the gains of collective production with the personal material benefit of the labourers and, at the same time, eliminated careless and slipshod work in production and equalitarianism in distribution of profits. As a result, production developed enormously in these areas.

After studying these reports, Comrade Wan Li, basing himself on the doctrine that practice is the only criterion for testing truth, agreed to conduct experiments with these methods in various areas of the province. He said that even the method of fixing output quotas on a household basis as practiced in the Shannan District of Feixi County might be tried out; he felt that these methods should not be adopted rashly but should be introduced systematically after experiences had been summed up in the experiments.

In accordance with the instructions of leading comrades of the Provincial Party Committee, places were selected for the experiments. Experiences were then summed up by the Chuxian and Liu'an Prefectural Party Committees and by the Fengyang, Jiashan, Lai'an, Feixi and Xuancheng County Party Committees. In less than three months, following their examples, over 41,000 production teams, or 15.2% of the total number in the province, had adopted the system of responsibility of taking output into account. Even some communes and production teams that were not selected as experimental units began to practice this system on their own accord.

Affirming the System of Fixing Output Quotas on the Basis of Production Groups. In the spring of 1979, when the system of responsibility of taking output into account was being spread from the experimental units to the vast rural areas in the province, two documents on agriculture adopted by the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party were published. The documents affirmed the system of responsibility of fixing output quotas on the basis of production groups, with remuneration given according to output and rewards provided for overfulfilment of planned targets. Those comrades with apprehensions were put at ease. Those in favour of it took an active role in popularizing the system, and the commune members were elated. The responsibility system of taking output into account spread quickly, with various forms introduced extensively in different parts of the

province. These included the method of fixing output quotas on the basis of production groups; the method of giving work-points according to output; the method of full responsibility for all farm work; the method of fixing output quotas for one or more selected crops on a household basis; and the delimitation of "plots to grow ration grain." In areas where the system had not yet been adopted, measures of fixed-quota management and allotment of work-points through appraisal of the work done were implemented through discussions by commune members. Contracts for fixed output quotas on a household basis were adopted in some remote mountainous areas where transport connections are inconvenient and in areas where the production level is low and the people's life difficult. Different forms of the system of responsibility were adopted simultaneously within one county, one commune, one production brigade, or even within the same production team in order to demonstrate the relative superiority and vitality of one method over the other.

Affirming the System of Responsibility in Production of Taking Output into Account. In early 1980, the Provincial Party Committee convened a conference on agriculture to sum up and exchange experiences in practising the different forms of the system of responsibility in production. After repeated discussions and comparisons, the conference affirmed the system of responsibility in production of taking output into account. In particular, the conference recognized the method of fixing output quotas on a household basis as a form of the responsibility system because of that method's remarkable success in transforming poor and backward areas. It was clearly pointed out at the conference that no matter what forms of the responsibility system were adopted, they must be based on respect for the wishes of commune members and in accordance with actual local conditions. The party committees at various levels should give positive guidance to whatever forms were introduced so as to help improve them.

By the end of 1980, 29.5% of the production teams in Anhui Province had adopted a responsibility system that did not take output into account; meanwhile, fully 69.9% of the province's teams had begun to practice the system of responsibility of taking output into account. Of these, 53.9% adopted the system of fixing output quotas on a household basis. At present, 86.3% of all production teams in the province follow the system of responsibility of taking output into account; of these, more than 70% practice the method of fixing output quotas on a household basis. Indeed, this method has become the main

form of responsibility system in agricultural production currently in use in Anhui Province.

The extensive and rapid application of the system of responsibility in production of taking output into account and the form of fixing output quotas on a household basis in particular is determined by specific economic conditions or levels of development of productive forces in the rural areas of Anhui Province. Since 1955, when the cooperative transformation of agriculture was completed, agricultural production in the province has made significant advances in improving farming conditions and technical facilities. Up to 1977, the total capacity of agricultural machinery in the province reached 6,025,000 hp; the acreage irrigated by electric and mechanical facilities occupied 65.9% of total effectively irrigated land (which accounted for 51.6% of all farmland in the province, thanks to the construction of water conservancy projects); 27.3% of all cultivated land was ploughed by tractor; processing of farm products was in the main mechanized or semi-mechanized; engine-drawn transportation facilities took up 36% of the total transport work in agriculture; the average application of chemical fertilizers per *mu* was 16 kg, and every peasant maintained an average of 0.32 *mu* of land giving stable and high yields. However, agricultural production in the province still remained at a very low level because the peasants' enthusiasm for production was seriously dampened by mistakes and shortcomings in management measures, such as arbitrary directives, careless and slipshod farm work and equalitarianism in distribution.

In such circumstances, water conservancy and irrigation projects, agricultural machines and other production facilities could not be used effectively, the ability to resist natural disasters was weak, and most of farm work was done by hand or with animal power. Some areas of the province were acutely short of draught animals. During the period of the agricultural cooperatives, the province had 2,720,000 head of draught animals. But by 1977, the number was reduced to 2,020,000, a drop of 25.7%. In areas north of the Huaihe River, some commune members had to plough and harrow the fields by manual labour. Agricultural natural resources were far from being sufficiently utilized, with forestry, animal husbandry, sideline production and fisheries placed in a subordinate position. The labour force in the villages was thus mainly engaged in grain production. Therefore, the scope of management was narrow and both labour productivity and the commodity rate of production were at a very low level. The income of the peasants was low and in many places the peasants were inadequately fed or clothed.

In 1979, following two years of rehabilitation

that came after the downfall of the Gang of Four, this backward situation was still not much improved. The dislocation in agriculture remained quite serious. The output value of forestry, animal husbandry, sideline production and fisheries occupied only 23.4% of the total output value of agriculture — a proportion lower than both the national average and those of Anhui's six neighbouring provinces. Each person engaged in agricultural production produced an average of only 942 kg. of grain, only 80.5 kg. more than that produced in 1957, and representing an average annual increase of only 0.42%. The average per capita gain of major agricultural and sideline products (with the exceptions of grain and edible oil) were all below the national average. Per capita income from collective distribution was only about 70 yuan. The commune members in 33.7% of the production teams received an average per capita income of less than 50 yuan, while those in 47.1% of the production teams received 50-100 yuan. This means that both production levels and living conditions among most of production teams were difficult or comparatively difficult. Therefore, the present system of responsibility in production of taking output into account — particularly the form of fixing output quotas on a household basis — is beneficial to the development of production in most communes, production brigades and production teams.

A System Welcomed by the Commune Members

There are various forms of the system of responsibility in the rural areas of Anhui Province. However, they may be divided into two general types — those that take output into account and those that do not take output into account. The overwhelming majority of communes, production brigades and teams have adopted the first kind, inasmuch as its economic results are better than those of the latter, and as it closely links the labour of commune members with its ultimate fruit — output. Only a small number of communes, production brigades and teams now practice the latter form.

At present, the system of responsibility that does not take output into account mainly follows two forms:

1. Individuals or groups undertaking to fulfil certain norms in farm work; and

2. Allocating work-points by evaluating the work done. The form of allocating work-points by evaluating the work done can only reflect the working ability of a labourer, or his latent labour

power rather than the whole process of labour and the final result of labour. Therefore, it cannot exert influence on careless or sloppy habits in production, nor can it eliminate equalitarianism in remuneration for the work done. It cannot embody the principle of "to each according to his work." Commune members do not actually recognize it as a form of responsibility, and hence it was gradually being replaced by other forms.

The form of committing to fulfil certain norms in farm work is more advanced as it requires an allotment of labour norms that take into account the quantity and quality of certain forms of farm work that a normal labourer can fulfil in a set time. Reasonable standards for the amount of work-points to be allocated are worked out on the basis of fixed norms and according to requirements of skill, the intensity of labour the work demands and its importance within the overall process of production. Then the production team divides all of its labourers into a number of temporary or stable groups according to the requirements of different types of farm work. The team signs temporary, seasonal or annual contracts with these groups that specify fixed tasks, time limits, quality of work and work-points to be allocated. The production team checks the fulfilment of the contracts by the groups or individuals according to the requirements of the work undertaken, and on that basis determines the remuneration — the amount of work-points as stipulated in the contracts — along with rewards for overfulfilment and penalties for failure.

Compared with the form of allocating work-points by evaluating the work done, this method enhances the efficient organization of labour since it fixes norms for farm work and makes it easy to inspect the process of labour of the commune members. However, it still cannot guarantee the quality of farm work as it fails to link production with output. This, in addition to its complex methodology, adds to the difficulty of achieving satisfactory results.

In a talk in Handan in September 1961, Comrade Mao Zedong said that there were "37 processes, 49 percentages and 1,128 accounts" in financial matters. Similarly, this method requires a high level of management from the cadres. During the past two years, such methods have been practiced only in those communes, production brigades and teams in Anhui Province where conditions of production have been relatively good, where income is high, where the collective economy is relatively consolidated and where the cadres are competent in administration. However, there are still some aspects to be improved in practicing this type of responsibility system. For instance, an unnecessary amount of administrative

restrictions should not get in the way of giving commune members certain decision-making powers in production or of enabling them to engage in household sideline occupations and attend to their private plots, as long as they continue to do a good job in collective production. In particular, the implementation of the principle of "to each according to his work" within production groups should be dealt with satisfactorily.

Differences with the System of "The Fixed Quotas and One Reward." The system of responsibility of taking output into account that emerged after the Third Plenary Session of the 11th Central Committee of the Communist Party of China that is to be developed on the basis of the system of responsibility that does not take output into account is also a breakthrough in the latter respect. At the beginning, it took the form of fixing output quotas on the basis of groups. It then gradually developed to the point of fixing quotas on a household basis and further to fixing quotas on the basis of specialized groups, with remuneration paid according to output. Fixing quotas on the basis of groups is similar to the system of "three fixed quotas and one reward" practiced in the advanced agricultural producers' cooperatives. The only difference is that in the latter system the contract was drawn between the production brigade and the production team; now, it is between the production team and the groups.

The system of fixing output quotas on the basis of groups is generally practiced as follows: under unified accounting and distribution by the production team, the labourers are divided into a number of stable groups that are assigned fixed plots of land, draught animals and farm tools for their own use. Ownership, however, remains with the production team and, in some places, draught animals and farm tools remain under the unified control of the production team. The team signs contracts with groups for fixed quotas of output and for a fixed amount of work-points and expenditures, stipulating rewards for above-quota output and penalties for losses. The groups hand over to the production team their products in exchange for their work-points and receive remuneration from the team under unified distribution. In some places where this system is practiced, the production groups conduct distribution according to the unified distribution programme of the production team after delivering fixed amounts of agricultural and sideline products to the state and the collective. This system reduces the scope of labour organization and more directly links output to the economic benefits of commune members. Therefore, commune members have both a greater sense of responsibility and greater enthusiasm for pro-

duction. They pay attention both to the quantity and quality of their work, as well as to both work-points and output. As the phenomena of drifting along and poor organization in labour are reduced and as equalitarianism is to a certain extent overcome, this system can give great impetus to agricultural production.

The unprecedented bumper harvest reaped in Anhui Province in 1979 was directly related to the implementation of this responsibility system. However, problems still exist in this system, such as determining whether the allotment of work-points and quotas of work in the production groups are reasonable. Equalitarianism within the production team may be overcome but equalitarianism may still exist within the groups, since the distribution of products is conducted mainly according to the amount of work-points. That is why a number of production teams have instead adopted the system of fixing output quotas on a household basis.

Fixing Output Quotas on a Household Basis.

The system of fixing output quotas on a household basis is developed from the system used on a production-group basis. It retains the collective ownership of the means of production and collective economy, with the production team as its mainstay and the principle of "to each according to his work." At the same time, it overcomes various contradictions in practicing the system of responsibility on the basis of groups, particularly those that occur in the collective labour of the production team.

This system is generally practiced as follows: the production team concludes contracts with households — according to the number of people and the size of the labour force in each family — to undertake the farm work in certain plots of land set aside for them to manage individually. The contract stipulates fixed output quotas, the amount of work-points and expenditure, rewards for over-quota output and penalties for losses. Meanwhile, the team retains the power to make unified production plans, unified distribution and control of water sources, irrigation projects, draught animals, farm tools and other means of production owned by the collective. The team also retains the authority to operate the industries and sideline occupations of the production team. However, the complicated management of this form of the responsibility system is inconvenient both to the cadres and commune members. Moreover, factors of equalitarianism continue to prevail in distribution. Therefore, only a small number of teams have adopted this type.

In most places, the peasants opt for the system in which individual households assume full

responsibility for most of the farm work. This method is similar to the above-mentioned type in the utilization of land and in the control of the draught animals, farm tools and other means of production and ways of management. The difference lies in that while the former method provides for the handing over of products to the production team so that it may receive its stipulated amount of work-points and distribution from the team in a unified way, the latter method calls for distribution according to the economic contracts, thus changing the method of distribution solely according to the amount of work-points.

The economic contracts concluded between the production team and the individual households in this type of responsibility system clearly stipulate the output quotas (value) of different crops; the amount of farm and sideline products to be delivered to the state and the amount to be delivered to the collective for public accumulation; the means of production handed over at discount prices to the groups or individual households by the production team; the period of their use; the amount of depreciation charges; and rewards for overfulfilment of work quotas and penalties for failure, and other necessary provisions. The main advantage of this type of responsibility system is that it takes into consideration the interests of the state, the collective and the individual. It does away with the equalitarianism of unified distribution by the production team and dispenses with complicated management, particularly in financial control. It suits the cadres' level of management and at the same time is easily accepted by commune members to the extent that it is the best possible way to implement the principle of "from each according to his ability, to each according to his work" and "more work more pay." At present, more than half of the communes and production brigades and teams in Anhui Province which implement the system of responsibility in production of taking output into account adopt this simple and easily practicable method.

The Contract for Fixed Quotas. A promising form of the system of responsibility that takes output into account is the contract for fixed quotas (value) with remuneration given according to the output of specialized groups, households or individuals. This system provides that under the production team's unified leadership, a number of specialized groups, households or individuals are organized according to their special skills and techniques and according to requirements in farm work, forestry, animal husbandry, sideline production and fishing, and then enter into contracts and receive remuneration according to productive output (value). The main advantage of this form is

that it brings into full play the superiority of unified management and of sharing out the work. By coordinating units with one another, it stabilizes the collective economy, making the production team its mainstay by giving scope to the enthusiasm of commune members. It develops a diversified economy that can utilize fully the capability of labourers, land and resources. This form, however, requires certain material conditions as well as a high level of management. In Anhui Province, this form is adopted mainly by those communes, production brigades and teams that possess adequate conditions for specialization in production, and those that have developed diversified economies and competent cadres in management. With the development of agricultural productivity, the growth of a more diversified economy and the raising of the cadres' administrative level, such a form is bound to be adopted by more and more communes, production brigades and teams and will contribute to the promotion of China's agricultural production to higher stages of socialization and specialization. In those communes, production brigades and teams where conditions for adopting this form are not yet ripe, conditions should be created in a positive way so as to enable the gradual adoption of this form.

Besides the above-mentioned main forms of responsibility systems that take output into account, there are also other forms such as the method of responsibility in field management and remuneration according to output, with crops reaped by the production team in a unified manner and with the method of individual households assuming responsibility for producing a part of the crops on the basis of fixed quotas.

A Major Reform in China's Collective Agriculture. The emergence of various forms of the system of responsibility in production that take output into account marks a major reform in the management of China's collective agriculture. These forms link the remuneration of the commune members not only with the quantity and quality of their labour but also with their output — the final result of labour. The practice of these forms enables us to switch gradually from administrative to economic methods in the management of agriculture. Since the introduction of this system in Anhui Province, quite a few "Left" patterns that work against objective laws in the management of the agricultural economy have been broken through.

For example, the organization of labour by concentrating scores or even hundreds of labourers together is by this means replaced with a decentralized method of sharing out the work and with a system of coordination under unified planning in

production by means of which only a dozen or fewer labourers work together or even individual households are assigned to fulfil certain work.

This method results in a higher sense of responsibility on the part of labourers and in a higher quality of production. It effectively overcomes carelessness and sloppiness in labour. Arbitrary decisions by the production team leader in the management of production through administrative directives is replaced by the arrangement of production by commune members themselves according to the actual conditions and under the production team's unified leadership; this method guarantees the commune members' decision-making power in production. The method of allocating workpoints by evaluating the work done is replaced by a system of remuneration according to output; this makes commune members more concerned about output than about the amount of work-points, and overcomes the tendency of caring only about the quantity of work done and the amount of work-points while paying little attention to the quality of work and output. The distribution of remuneration solely according to the amount of work-points is replaced by remuneration determined by the contracts for fixed output quotas; this results in the implementation of the principle of "from each according to his ability, to each according to his work — more work, more pay" by completely eradicating equalitarianism in the distribution of products.

The practice of the various forms of the system of responsibility has brought about a series of major changes in the management of agricultural production and has ushered in an excellent situation in which the people in the vast rural areas have ease of mind, in which the economy is thriving and in which the market is brisk.

Notable Successes Following Introduction of the System of Responsibility

Implementation of the system of responsibility in agricultural production during the past two years shows that things are better with the practice of this system than without it; the form of the system of taking output into account is better than a system that does not take output into account; and, in some areas which long remained poor and backward, the form of fixing output quotas on a household basis is more effective than other forms in improving the economy.

By integrating more closely the results of collective production with the material benefits of individual commune members, the form that takes output into account embodies more directly the principle of "more work, more pay" in distri-

tion. Agricultural output increased markedly as commune members brought into full play their long-suppressed enthusiasm for production and showed concern for each production measure and for the overall quality of farm work.

In 1978, Anhui Province was hit by the worst drought in a century. Yet, total grain output of the province reached 14,800,000 tons, approaching that of a normal year. A bumper harvest was reaped in 1979 with a total output of 16,100,000 tons, an 8% increase over the previous year. The output in 5 prefectures and 31 counties surpassed the highest records in history for these areas. The province as a whole delivered 4 million tons of grains to the state, with a 23% commodity ratio. Even in the ten counties of Sixian, Wuhe, Lingbi, Guzhen in the plain north of the Huaihe River; in Dingyuan, Fengyang and Jiashan in the hilly areas along the Changjiang and Huaihe rivers; and in Xuancheng, Langxi and Guangde south of the Changjiang River — the three well-known backward regions of the province — grain output was increased by 32.9% and rapeseed by 59% compared with the previous year. This was thanks to the practice of various forms of the system of responsibility that took output into account in 58.4% of their production teams. Many of the production teams that used to depend on state relief for food grain, production and livelihood increased production and income and made greater contributions to the state.

In 1980, Anhui Province once again suffered heavy natural calamities in the form of floods, cold temperatures, unbroken spells of rainy weather, plant diseases and insect pests — all exceeded in severity only by those of 1954. A total of 32,050,000 *mu* of cultivated land was affected, with 21,560,000 *mu* adversely affected by the disasters and 3,940,000 *mu* left barren of any harvest. Total grain output decreased by 9.6% in 1980. Aside from natural calamities, another important factor in these losses was the failure in some areas of practicing the system of responsibility in production. Facts testify to the power of the form of fixing output quotas on a household basis in overcoming serious natural calamities. An annual report in 1980 shows that the proportion of production teams that adopted the form of fixing output quotas on a household basis was very high in those 20 counties of the province where output of grain increased. Outstanding among them were the seven counties in Chuxian Prefecture, where the method of fixing output quotas on a household basis was introduced earlier than in other areas and formed the largest proportion among the production teams. Combined output of grain in these seven counties, each of which increased production, registered a 13.6% increase

over the record output year of 1979. In the 13 counties where grain output decreased by large margins, the proportion of production teams adopting this form was very small. Even in the counties where output decreased, the few production teams implementing this form generally raised their output or at least greatly reduced the level of losses suffered by other teams working under the same conditions of natural calamity.

Increased Effectiveness in Combatting Poverty. The system of responsibility in production for fixed output quotas on a household basis has been shown to be more effective in areas badly in need of getting rid of their poverty, backwardness and decrease in farm output.

Take Fengyang County, for example. This county used to suffer from famine 9 years out of 10. In 1979, it introduced the system of fixing output quotas on the basis of groups in 70% of its production teams. It reaped a good harvest that year — 19.9% higher than its previous high. The amount of grain purchased by the state reached 43,500 tons for the first time and over 25,000 tons were delivered to supply other places; the latter amount surpassed the total amount delivered in the 26 years since the state monopoly purchasing and marketing began in 1953. Per capita income was 91 yuan, or 17 yuan higher than the previous best. In 1980, 95% of all production teams in the county began to adopt the method of contracts for fixed quotas on a household basis. Total output of grain that year once again saw a 14.2% increase over that of the previous year, with a per capita grain output of 534.5 kg. The state's purchase of grain amounted to 55,000 tons, which was higher than the total annual output of the early years of Liberation or of the three difficult years (1959-61). Per capita income was 114 yuan, an increase of 23 yuan over the previous year. A number of impoverished production teams and households managed to become well off within one year or even within one season.

Statistics show that the number of teams in Anhui Province with per capita income of more than 300 yuan grew from 1 production brigade and 13 teams in 1979 to 15 brigades and 212 teams in 1980, an increase of more than 10 fold. A survey of 510 households in different areas shows that only 4 households — or 0.78% of the total — had a per capita income above 300 yuan in 1978; the figure increased to 30 households, or 5.9% in 1979; and 46 households, or 9% in 1980.

Diversification of the economy and individual household sideline production took place at a faster pace in parallel with the popularization of the system of responsibility that takes output (value) into account. Take Fuyang Prefecture on

the plain north of the Huaihe River, for instance. With no mountains or rivers in the area, the prefecture had little in the way of natural resources for the development of a diversified economy. Poor natural resources and the hard life of its people made it difficult to raise adequate funds. However, the prefecture was able to achieve notable development of a diversified economy, together with a continuous increase in grain output only within two years after the system of responsibility that takes output (value) into account was introduced. Statistics show that income from the development of a diversified economy throughout the prefecture reached 784.8 million yuan in 1980, an increase of over 30% over 1979 and accounting for 43.9% of the total output value of agriculture. The output of rapeseed and peanuts and production of poultry and rabbits surpassed all previous records. State purchases of cotton, tobacco, hemp, honey, silkworm cocoons, aquatic products, products for foreign trade, livestock and other local agricultural and sideline products all increased by a wide margin over the previous year. The increase of 200,000 head of draught animals set the highest annual record since Liberation. Out of the net income of the rural commune members in the province, the proportion from household sideline production underwent the most rapid increase. A survey of 510 households in different areas showed that they received 24% of their net income from household sideline production in 1978. That percentage rose to 42% in 1979 and to 45.1% in 1980.

Thanks to the advance in production and to increases in personal income, the lives of commune members have improved greatly. In 1980, per capita expenditure for living costs of the above-mentioned 510 households was 162.9 yuan, an increase of 18.1 yuan or 12.5% over the previous year. In their daily food consumption in 1980, the intake of meat grew by 29.3%, eggs 21.5% and fish 32.2% over the previous year. In 1980, every ten households had an average of 1.56 bicycles, a 2.2% increase over previous year; 1.5 sewing machines, a 55.4% increase; 3.94 radio sets, a 64.9% increase; 3.8 clocks or watches, a 28.4% increase (2.5 of which were watches, an increase of 37.6%). The improvement of material life has also brought an upswing in cultural life. The commune members in some places have by joint efforts built simple cinemas, theatres and cultural centres for multi-purpose use.

Changes in Relationships Among the People. The practice of the various forms of the system of responsibility in production that takes output into account, particularly fixing output quotas on a household basis, has brought about a change in

relationships among the people. The phenomena of disputes — over the assignment of jobs, evaluation of the work done in allocating work-points and the distribution of money and grain that often occurred between the cadres and the commune members in the past — have disappeared. Cadres at the grassroots levels are universally of the opinion that work is now performed more easily. Free from the arduous work of urging people to undertake the ploughing, sowing, and delivering of grain to the state, they are now able to take an active part in productive labour as other commune members do. Commune members no longer have to accept the coercive, arbitrary and impractical direction in production that had existed in varying degrees for a long time. Overdrawn accounts and arrears, arbitrary transfers of resources, extravagance and the wanton borrowing that remained difficult problems for years in management have been completely solved. Unreasonable measures and unhealthy tendencies in management and administration in the communes have been done away with. Commune members are delighted over the excellent situation. Women are even more satisfied and happy with the contracts for fixed quotas on a household basis as now they can more freely arrange their time for both farm work and household chores and can also pay occasional visits to their relatives. No wonder they have the feeling of "emancipation for the second time."

New Divisions of Labour and New Integrated Economic Complexes. Apart from the use of contracts for fixed quotas on a household basis, one of the most encouraging new changes is the emergence of new forms of division of labour and of large numbers of new integrated economic complexes in the rural areas. Thanks to rising labour productivity, some commune members have become rich by virtue of ample grain, money and more surplus labour power which in turn result in a rapid development of household sideline production, a diversified economy and industries run by the communes, production brigades and teams. And there have also appeared large numbers of households engaged in both farm work and sideline and industrial production. In Liu'an and Chuxian prefectures, where contracts for fixed quotas on a household basis were practiced earlier than in other areas; large numbers of newly integrated economic complexes have emerged. Some of them are engaged in coordination of production centered on specialized skills and techniques such as growing tobacco; some, in the use of farm machinery, such as setting up tractor stations through the acquisition of tractors with joint funds; some, in the coordination of production by exploiting certain natural resources such as affores-

tation, fishing, quarrying and supplying sand for construction sites; some, in cooperating to meet the needs of certain production projects such as building small water conservancy works, roads and bridges; some, in coordination to render services to certain links of production such as collective elimination of plant pests and insects and nurturing of seedlings. These complexes are organized and managed according to the principle of voluntary participation and mutual benefit, breaking past the barriers of the production teams, brigades or communes that the partners may belong to. Their management is directly linked to the personal benefits of the participants — who are both producers and managers at the same time. Therefore, they are all run efficiently and democratically and with satisfactory economic results.

The emergence of such newly integrated economic complexes has not only given impetus to

production and rendered convenience to the people, but has also brought about extensive changes in the distribution of the rural labour force, the structure of production and the composition of the income of commune members. Since the introduction of the use of contracts for fixed quotas on a household basis in Bingzi Commune, Feixi County, 52.4% of its households, or 32.6% of its labour force, have become engaged in both contracted farm work and sideline and industrial production; they now earn 40.2% of their income from the latter. In the new development of rural areas, we can observe the embryo of specialization and socialization that agricultural production is gradually advancing to. China's socialist agriculture is bound to advance more rapidly so long as the correct line, principles and policies are adhered to along with a scrupulous observance of the natural laws governing the economy.

SECTION IV:

GENERAL SURVEY OF CHINA'S ECONOMY

1. CHINA'S ECONOMY IN 1980

By Wei Ligu

The History of Economic Development in New China

After the founding of New China in 1949, the Chinese people of all nationalities, under the leadership of the Communist Party of China and the People's Government, carried out extensive and thorough socialist transformation and large-scale economic construction on the ruins of semi-colonial and semi-feudal old China. In spite of repeated serious setbacks, we have accomplished tremendous gains never achieved in old China, and have brought about great changes in China's economy. We have eliminated the exploitation system, established the absolute predominance of socialist public ownership over the entire national economy, transformed a backward agricultural country into a fairly well-developed industrial - agricultural country, and built an independent and all-embracing industrial system and a national economic system, thus laying a material and technical foundation of considerable size for the great cause of socialist modernization in China.

The following are the major achievements in China's economic construction over the past 31 years:

1. *We have established an economy of public ownership.*

Both the economy of ownership by the whole people [i.e. "state" ownership - Ed.] and the economy of collective ownership have grown tremendously. The economy of ownership by the whole people has held a firm leading position in the national economy and has controlled the lifelines of the national economy. The proportion of output value of industry under ownership by the whole people to total industrial output value rose from 26% in 1949 to 79% in 1980; and the proportion of retail sales of the state-owned commercial establishments to the total volume of retail sales in China rose from 6.9% in 1950 to 85.4% in 1980. Industrial output value of the collective enterprises accounted for 20.6% of China's total industrial output value in 1980.

Collective agriculture has become the main component of agricultural production. In 1980, China had 54,000 people's communes, with a population of 810 million of whom 320 million were labourers. At present, given the condition that the economy of socialist public ownership has absolute predominance, some individual economy is allowed to exist and develop as an indispensable supplement to the socialist economy.

2. *Economic growth has been fairly rapid.*

Between 1949 and 1980, China's total industrial and agricultural output value rose from 46,000 million yuan to 661,900 million yuan, a 16.1-fold increase (calculated at comparable or constant prices), yielding an average annual increase of 9.4%. Total agricultural output value rose from 32,600 million yuan to 162,700 million yuan, a 3.8-fold increase, or an average annual increase of 4.4%. Total industrial output value rose from 14,000 million yuan to 499,200 million yuan, a 46.2-fold increase or an annual average increase of 13.2%.

National income (the net output value of the material producing departments including industry, agriculture, construction, communications and transport, and commerce) rose from 35,800 million yuan to 363,000 million yuan, an 8.8-fold increase, or an average annual increase of 7.3%. National revenues increased from 6,520 million yuan in 1950 to 106,610 million yuan in 1980, a 16.4-fold increase, or an average annual increase of 9.8%.

3. *Considerable progress has been made in material production capacity and in technological development.*

When China was liberated in 1949, national fixed industrial assets were estimated at about 12,800 million yuan. This was all that was left over from old China. After 31 years of construction, China now has nearly 400,000 industrial and transport enterprises. By the end of 1980, the fixed assets of state-owned enterprises in China amounted to more than 500,000 million yuan, including 370,000 million yuan of fixed industrial assets. In addition, there were about 330,000 million yuan of circulating funds.

China's industry has begun to make inroads in its technical backwardness and uneven development and has established an all-embracing and rationally distributed production system. New industries have sprung up having begun from scratch. Both productive and technical levels of old and new industries have been raised and a great number of new materials, new processes, new equipment and new technologies have been developed. Farmland and water conservancy construction has been carried out on a huge scale in the rural areas. In the past 31 years, the water supply in 17.3 million hectares of low-lying land formerly subject to water-logging has been brought under control; 13.3 million hectares of saline land and hillside land have been transformed; and 86,000 re-

servoirs, with a total capacity of more than 400,000 million cubic metres, have been built. Total irrigated farmland has been extended from 15.3 million hectares in 1950 to 44.6 million hectares in 1980, and now accounts for 45% of the country's total farmland.

Progress has also been made in agricultural mechanization. Before 1949, there was virtually no farm machinery in the Chinese countryside. By the end of 1980, China had 745,000 large and medium-sized tractors together with drainage and irrigation equipment with accumulated 74,650,000 horsepower. Tractor-ploughed land now accounts for 41.3% of total farmland. Almost no electricity was used in the rural areas before 1949. In 1980, 32,100 million kilowatt-hours of electricity were consumed in the countryside, about 7.5 times the annual rate during the early post-Liberation period.

4. Both domestic and foreign trade have grown considerably.

The total value of commodities purchased by commercial departments rose from 17,500 million yuan in 1952 to 226,300 million yuan in 1980, an increase of 12.9 times. The total value of retail sales (calculated at current prices) rose from 27,700 million yuan in 1952 to 214,000 million yuan in 1980, an increase of 7.7 times.

In foreign trade, total import and export value increased from 4,150 million yuan in 1952 to 56,300 million yuan in 1980, a rise of 13.6 times.

5. The livelihood of urban and rural people has improved fairly well.

Per capita consumption levels rose from 76 yuan in 1952 to 197 yuan in 1979, an increase of 160% (or an actual increase of 85%, after deducting price rises). The per capita consumption level of peasants rose from 62 yuan in 1952 to 152 yuan in 1979, an actual increase of 65.2%; and that of the wage-earners from 148 yuan to 406 yuan, an actual increase of 114.5%. Free medical service has been introduced for the personnel of enterprises under ownership by the whole people, of government departments and of public undertakings, as well as for students in institutions of higher learning. Public health centres have been set up in all people's communes and cooperative medical services have been introduced in the production brigades (subdivisions of the people's communes). Owing to improvements in medical services and living conditions, the average life expectancy of the Chinese people has nearly doubled and the mortality rate has dropped from 1.8 in 1950 to 0.62 in 1979.

6. A large contingent of workers and scienti-

fic and technical personnel has been trained, and scientific and educational work has expanded considerably.

By the end of 1980, the number of workers employed in state-owned and collective enterprises rose to 104,440,000. A great number of competent technicians and managerial personnel have been brought up through the ranks. In the past 31 years, 3.18 million students have been graduated from universities and colleges. The number of natural scientists and technicians working in units under ownership by the whole people totalled 5.3 million, 12 times the 1952 figure; the number of scientific research personnel in 1980 totalled more than 300,000, 40 times the 1952 figure. We have established a number of new divisions in science and technology. Successful nuclear testing, the launching and accurate recovery of a man-made earth satellite and test flights of carrier rockets in the Pacific Ocean conducted during the first half of 1980 all marked the relatively high level of China's scientific and technological achievements.

All these achievements spoke to the hard work done by the people of various nationalities in China. They also demonstrated powerfully that the socialist road is the only road that will enable China to eliminate poverty and backwardness and to gradually build a prosperous and strong country.

Of course, New China has had twists and turns in its economic development. The national economy grew rapidly and steadily in certain periods while in other periods, owing to mistakes, it suffered serious setbacks. The impetuous advance that began in 1958 led to a grave economic imbalance. As a result, we had to embark on a five-year period of readjustment in 1961. During the "cultural revolution" that began in 1966, there was another serious disruption to the national economy caused by the sabotage by Lin Biao and the Gang of Four and by the "Left" deviationist mistakes committed in economic construction. The national economy began to revive and grow after the Gang of Four was smashed in October 1976. However, we did not conduct a complete appraisal of the consequences of the ten-year disorder, nor did we do away with the mistakes of the impetuous advance in guiding thought over economic work. Instead, we were overeager to achieve success and raised a number of impractical slogans and targets, creating new difficulties in continued development of the national economy. In as much as "Left" deviationist mistakes in economic construction went uncorrected for a long period and because of the political turmoil that lasted for many years and the defects in the economic system, the proportional contribution of different branches of the

national economy were thrown seriously out of balance, while management of the enterprises and the people's communes and their subdivisions was disrupted and the rate of economic achievement decreased. All of these factors created tremendous waste in the national economy and hindered its realization of goals that otherwise could have been reached. Improvements in the people's livelihood also failed to reach levels that should have been attained.

In 1979, following the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, the party's Central Committee and the State Council adopted the policy of readjusting, restructuring, consolidating and improving the national economy in light of the development of China's national economy and of existing problems with a view to overcoming serious economic difficulties resulting from the "cultural revolution" and to correcting mistakes in economic work between 1977 and 1978.

Readjustment. Readjustment means to consciously readjust proportional relations in the economy that had for so long been dislocated; thus, all branches of the national economy can develop in a relatively coordinated manner and a rational ratio can be maintained between accumulation and consumption.

Restructuring. Restructuring means to restructure, both systematically and comprehensively, aspects of the existing economic management system that hamper the development of productive forces, with the result that the superiority of the socialist system can be fully brought out.

Consolidation. Consolidation means to consolidate and better run existing enterprises, especially those whose management was once disrupted, so that they will advance along the correct road and play a full part in China's modernization.

Improvement. Improvement means to significantly raise production levels, technical levels and management levels.

The adoption and implementation of this policy marks a fundamental change in the ideology guiding China's economic work. It shows that China's economic construction has begun to shake off the yoke of "Left" deviationist ideas and practices; it has begun to adhere to the principles of proceeding from actual conditions, of acting according to one's ability and of doing things step by step and seeking practical results; and has begun to develop along a road of steady and healthy development.

The Economic Situation in 1980

The year 1980 was the second year China had followed the policy of readjustment, restructuring, consolidating and improving the national economy. New progress was made in economic work through the strenuous efforts of the people of all nationalities throughout the country.

I. Economic Readjustment

Economic readjustment continued in 1980 in accordance with the policies, tasks and requirements of readjusting the national economy and, as a result, major proportional relations became more balanced.

Agriculture. Firstly, agricultural production was further improved and the situation in China's rural areas — which have a population of more than 800 million — became better and better. By implementing those documents of the Party Central Committee concerning agricultural development and by continuing to eradicate influences of "Left" deviationist mistakes in the rural areas, the government adopted the following policies and measures to aid agricultural production:

Earnestly ensure the power of rural communes and their subdivisions in the management of production and the distribution of income.

Conscientiously adhere to the distribution principle of "to each according to one's work" through the adoption of job responsibility systems in various forms.

Readjust the structure of the agricultural economy and encourage the development of diversified economies wherever local conditions permit.

Raise the purchasing prices of cotton, tung oil, resin and selected other farm and sideline products in 1980 (following the large increases in purchasing prices of 18 major agricultural and sideline products in 1979).

Encourage peasants to cultivate private plots and to plant private trees for the development of household sideline production, on the condition that the collective economy is well developed.

Open rural markets under the appropriate supervision.

All of these policies and measures further inspired the enthusiasm and initiative of rural cadres and peasants engaged in agricultural production. At the same time, communes and their subdivisions in many areas underwent consolidation.

Despite floods in the south and drought conditions in the north that were often the most severe in several decades, a relatively good harvest was produced. Although total grain output for

1980 fell 14 million tons short of the total in 1979, it still surpassed that of 1978 and was the second best harvest in 31 years.

Changes also took place in the structure of agricultural production. The one-sided emphasis on grain production was altered somewhat and the total area under industrial crops was expanded. The output of many industrial crops was increased considerably. The total output of cotton, oil-bearing crops, sugarcane, sugar beets, tea, jute and ambray hemp all set new records. New achievements were also made in forestry, animal husbandry, sideline production and fisheries. In short, agricultural production grew steadily and the rural economy improved.

Light Industry and Textiles. Secondly, the growth rate of light industry continued to exceed that of heavy industry and the industrial structure became more rational. In 1980, the Chinese government continued to follow policies and measures that encouraged the development of light industry. Planning departments at all levels gave priority to the production needs of light industry and textiles by granting increased loans for the construction of new projects and for supplies of raw materials, fuels and electricity and it opened more channels for the development of light and textile industries as well as handicrafts.

The total annual output value of light industry in 1980 came to 234,400 million yuan, 18.4% more than in 1979. The proportion of output value of light industry to total industrial output value rose from 43.1% in 1979 to 46.9% in 1980.

Mining and Heavy Industry. Although the growth rate of heavy industry slowed, its internal structure began to change for the better. The proportional share of mining and tunnelling within the mining industry were somewhat readjusted. For many years, the proportion of mining and tunnelling and the proportional shares of mining and stripping were seriously out of balance, while safety measures lagged far behind requirements. In 1980, tunnelling and stripping work in the coal mines and prospecting work for oil resources were strengthened.

The production of iron, steel, machines and chemicals was brought under control and the production of chemical fertilizers, plastics, cement and household electrical appliances was stepped up. The output of small-size shaped steel products, steel wires, sheet steel and welded tubes was 28.5% greater than in 1979; the proportion of these items to the total output of rolled steel rose from 44% in 1979 to 57% in 1980. The output of large-size shaped steel, medium-size and thick

plates, seamless tubes and high-quality shaped steels dropped by 13.7% as compared with 1979. The output of mining equipment, metallurgical equipment, power generating equipment and hand tractors dropped, while the production of engineering products required in the people's daily lives increased considerably.

Sectors producing building materials and chemicals also increased their production of products and raw materials so urgently needed by the country. Incomplete statistics show that in 1979 enterprises under the First Ministry of Machine-Building Industry produced only 23 products for light industry, with a total value of 650 million yuan. In 1980, they produced 93 items for light industry, with a total value of 4,000 million yuan. The value of products for civilian use manufactured by defence industries accounted for about 30% of the total output value of the defence industry in 1980, as against 20% in 1979. Statistics show that the output value of consumer goods produced by industries other than the light and textile industries were equivalent to 31% of the total output value of the country's light industry.

Consumption and Income Levels. Thirdly, the ratio between accumulation and consumption began to improve and the consumption level of the urban and rural populations was raised. In the past 20 years, the rate of accumulation in the distribution of national income was too high, thus holding down the consumption level. A focal point of the economic readjustment is to improve the ratio between accumulation and consumption and raise the consumption level of urban and rural people. In 1980, the government coordinated the proportional relationships between accumulation and consumption through controls over capital investments in the state budget, by reducing circulating funds and by increasing consumption funds. The proportion of accumulation funds to the national income dropped from 36.5% in 1978 to 32% in 1980; the proportion of consumption funds rose from 63.5% in 1978 to 68% in 1980.

State investments for capital construction in 1980 totalled 28,100 million yuan, or 11,400 million yuan less than in 1979. By the end of 1980, the number of large and medium-sized projects under construction dropped from 1,187 to 904. A greater part of investments in 1980 were made in light industry, energy production and development, communications and transport and other weak links in the national economy. The proportion of investment in industrial construction to total investment dropped from 51.4% in 1979 to 50.8% in 1980. The proportion of investment in light and textile industries to total investment rose from 6.4% in 1979 to 9.2% in 1980.

The proportion of investment in heavy industry to total investment dropped from 45% in 1979 to 41.6% in 1980. The proportions of investment in the chemical, machine-building and defence industries all dropped notably. The proportion of investment in workers' housing construction, cultural, educational and health work, and urban public utilities was raised from 17.4% in 1978 to 27% in 1979 and again to 33.7% in 1980. The investment in housing construction in 1980 increased by 3,400 million yuan as compared to 1979 and its proportion of the total investment rose from 14.8% in 1979 to 20% in 1980. Readjustment in the proportions of investment in capital construction will play an important role in systematically reducing the rate of accumulation to a level suited to current actual conditions in China and in further improving the production and distribution structure of the national economy.

The Chinese government made great efforts to raise the consumption level of the population, while the livelihood of most of the people in urban and rural areas continued to improve. Owing to good harvests and to increases in the purchasing prices of farm products, most peasant households increased their incomes. In 1980, Chinese peasants were able to increase their income from sales of farm products and from labour services by about 13,000 million yuan; average per capita income earned from the collective was 85.9 yuan, an increase of 2.5 yuan over 1979 and 11.9 yuan over 1978. This two-year increase greatly surpassed the accumulated increase of the 11-year period from 1965 to 1976. Individual incomes of peasant families also increased considerably.

Housing. The party and government also adopted forceful measures to support housing construction in rural areas. Beginning in 1980, planning departments in China at all levels incorporated into state plans the supply of building materials to rural areas. According to statistics, about 25 million peasant families built new houses or rebuilt their homes during the three years between 1978 and 1980; this group accounted for 14% of all peasant households in China.

Employment. In 1980, jobs were provided to 9 million people, including graduates from universities, colleges and secondary technical schools. A total of 28 million people in urban areas received jobs during the four-year period between 1977 and 1980. A number of conditions — including the enlarged workforce, the fact that 40% of all workers and staff members received increased wages as of November 1979, the readjustment of wage categories in some regions, the implementation of piece-work pay for workers, an in-

creased number of adoptions of the bonus system among enterprises and public undertakings, and the provision of subsidies for price increases of non-staple foods — the total wage bill for workers and staff members of units under ownership of the whole people and under collective ownership was 19.5% greater than in 1979, while average wages in these categories also increased notably. Wages of workers and staff members in units owned by the whole people averaged 803 yuan in 1980, 13.9% more than in 1979, or an actual increase of 6% after deducting the rise in the cost-of-living index.

As a result of growth in industrial and agricultural production and increased income of workers and peasants, social purchasing power rose greatly. Total purchasing power was 32,000 million yuan higher in 1979 than in 1978 and was 35,000 million yuan higher again in 1980 than in 1979. This was more than five times the average annual increase of 6,500 million yuan in the ten years leading up to 1977.

Intellectual Resources. Fourthly, attention began to be paid to the development of intellectual resources and readjustments were made in the relationships between economic construction and the development of scientific, cultural and educational work. In 1980, the financial strength of the government was not great and expenditures were greatly reduced in other fields. Nevertheless, not only was the proportion of capital investments in scientific, cultural and educational work to total state investment increased by a substantial margin, but operating expenses in these fields were also increased. This was done in order to accelerate the development of intellectual resources and gradually change the imbalance between economic construction and the development of scientific, cultural and educational work. Proportional relations among these departments were also readjusted.

In 1980, more than 2,600 major discoveries were made in scientific research, and 107 of them were acknowledged by the state as inventions. The dissemination of scientific knowledge was also strengthened. New facilities and other amenities were provided to the universities and colleges.

In 1980, school buildings with a total floor space of 3.2 million square metres were completed at universities and colleges throughout China, the highest rate since 1949. The number of students now in universities and colleges totalled 1.14 million, or 12.2% more than in 1979.

The educational level of primary and middle schools as well as that of universities and colleges was raised. Some changes were made in the structure of secondary education and more secondary technical schools were reopened. The use of tele-

vision, correspondence and night classes in higher education was expanded.

Medical Services. Medical and health institutions were being readjusted in ways to strengthen their scientific management and operation. The prevention and treatment of diseases were strengthened, and the quality of services in hospitals was improved. Literature, drama, cinema, ballet and fine arts began to prosper. Sports, broadcasting, television, publications and archaeology were also developed.

II. Restructuring of the Economic System

In 1980, experimental work to restructure the present economic system continued in line with the principle of taking a positive but prudent attitude while bringing about the economic readjustment. This work has invigorated the entire national economy.

1. *Experimental work to expand the power of the enterprises in self-management was extended.*

After the State Council issued relevant documents on restructuring the management system of the state-owned industrial enterprises in July 1979, experiments to expand the power of enterprises began one by one in different parts of the country. By the end of 1979, more than 4,000 enterprises had entered the experiment. In 1980, experimental work developed in depth and breadth. Except for the Tibet Autonomous Region, more than 6,000 industrial enterprises in 28 Chinese provinces, municipalities and autonomous regions on the mainland took up the experimental work. These enterprises make up 15% of the total number of industrial enterprises that contribute to the state budget; they produce 60% of goods in terms of output value and earn 70% of the total profits of industrial enterprises.

The content of the experiment also expanded. In 1979, enterprises that began the experiment had authority to retain only part of the profits they earned. But in 1980, they acquired authority in varying degrees to plan production, to purchase raw materials, to sell products, to develop new products, to use operating funds, to issue bonuses, to reduce or expand administrative structures, and to appoint or dismiss cadres at the middle level. Moreover, a limited number of enterprises were selected to pay taxes instead of turning over their profits to the state, to keep independent accounts and to assume responsibility for their own gains and losses. By the end of 1980, the city of Liu-

zhou in Guangxi, the Light Industry Machinery Corporation of Shanghai, and 80 other enterprises joined in this experiment, bringing the total number of enterprises that had begun the experiment at this level to more than 200.

Effects of the Reform on Economic Growth. The reform of expanding the power of enterprises in self-management produced a profound effect on economic growth in China. To a certain extent, this reform integrated in an organic way the economic responsibilities, economic results and economic interests of the enterprises. With more power over self-management, the economic interests of the enterprises and their workers and staff members are directly linked to the effectiveness of their operation. This enhanced the sense of responsibility on the part of workers and staff members as masters of their own enterprises, inspired their initiative and creativity in production and increased their awareness of business operations, markets, services and competition. The new spirit played a helpful role in invigorating the economy, improving management, tapping potential, and increasing production and income.

Preliminary figures from 5,777 enterprises (not including the 200 enterprises that started the experiment of paying taxes rather than turning over profits) showed that they produced 165,350 million yuan in value of output in 1980, which was 10,550 million yuan or 6.8% more than in 1979; they earned 33,360 million yuan in profits, or 3,520 million yuan (11.8%) more than in 1979; and they turned over 29,000 million yuan in profits to the state, 2,000 million yuan (7.4%) more than in 1979. In the distribution of the profits they earned, the interests of the state, the enterprise and its individual workers were all taken into consideration. In 1980, these 5,777 enterprises turned over 87% of their profits to the state and retained 10% of the profits for their own disposal. The remaining 3% was used to repay bank loans or relevant subsidies. In the case of a small number of enterprises that began the experiment, the results were not satisfactory as both the value of their output and profits declined. This was due to added factors placing pressure on profits, to overpayment of bank loans and to poor management and operations.

2. *Preliminary reforms were made in the planning, supply and commercial systems.*

The reforms that took place in conventional systems — under which all production quotas were set by higher authorities, capital goods were prohibited from entering the markets and all commodities were purchased by state purchasing agencies — began with experimentally expanding

the power of these enterprises in self-management and with limited use of the market as a means of regulating production under the guidance of planned economy. The main changes in this respect were:

A. Enterprises were allowed to produce more goods that were required by the market and consumers as long as they could assure fulfilment of targets set in the state plans and contracts they signed with customers. For example, the volume of goods produced on their own initiative to meet market demands by enterprises under the First Ministry of Machine-Building Industry accounted for 13.9% of the total output value of those enterprises in 1979, and for 46% in 1980. B. More and more commodities were supplied without limits or marketed freely. Of the 210 major items of capital goods distributed by the central government in 1980, 146, or 69%, were supplied without limitation. In the distribution of consumer goods, only 13 commodity items were controlled by state purchasing agencies. As to other commodities, enterprises were permitted to sell a portion of products produced in excess of quotas set in state plans and under contracts. C. More outlets were opened for the distribution of commodities. Departments of supply, commerce and foreign trade entered the purchasing and marketing businesses on a commission basis. The volume of these kinds of transactions amounted to 3,500 million yuan in 1979 and to 5,000 million yuan in 1980. More shops, stores and other commercial establishments were opened throughout the country. More than 600 capital goods service corporations were set up in 1980 and capital goods trade fairs were opened in 60 or more cities. More than 16,000 sales departments were set up by industrial and transport enterprises and some of these factories, communes and farms opened shops in cities or towns. More than 2,900 free markets selling agricultural produce were opened in Chinese cities and the number of rural fairs increased to 37,000. Many departments and localities held sales exhibitions and goods exchange fairs in various forms. The adoption of these systems and policies greatly helped to increase the supply of commodities. According to estimates, about 35% of retail sales were regulated through the market in 1979; during the first half of 1980, more than 30% of goods sold at retail were marketed in this way. Preliminary reforms in the planning, supply and commercial sectors aided economic readjustment and promoted production and construction.

3. Initial steps were made in changing the organizational structure of the economy.

In 1979, while implementing the policy of readjusting, restructuring, consolidating and im-

proving the national economy, some provinces, municipalities and autonomous regions, as well as industrial and transport ministries under the State Council, started the experimental work of reorganizing and readjusting industrial enterprises on the principle of specialization, coordination and economic rationality. They established a number of special corporations and general works and technical cooperation centers. In the first half of 1980, the central government put forth the policy of "making the best use of the advantages, protecting competition and promoting integration;" joint production, joint ventures and compensation trade were launched among various enterprises and localities, and between urban and rural areas. According to statistics from 28 provinces, municipalities and autonomous regions on the mainland (not including Tibet), 1,973 special corporations and general works centres had been set up by the end of 1980. These embraced 19,173 enterprises, or 5.38% of the total number of enterprises in these provinces, municipalities and autonomous regions. The three municipalities of Beijing, Shanghai and Tianjin had set up 278 special corporations and general works centres, embracing 4,548 enterprises, or 31% of all enterprises in those cities. The 28 provinces, municipalities and autonomous regions also formed more than 3,400 economic complexes. Some ministries also set up experimentally a limited number of joint operations between national corporations and localities. More than 570 state farms set up 194 agriculture-industry-commerce complexes. These included shops and factories processing farm produce and shops selling processed goods not derived from farming. They accounted for 28% of the farms under the Ministry of State Farms and Land Reclamation.

Initial progress was recorded in industrial reorganization and integration. This was manifested in the following ways:

A. They accelerated the readjustment.

Through integration, a factory that produced the same goods or had similar processes, or factories which operated over or under capacity, were reorganized into special corporations, general works centres or economic entities. In this way, their production was placed under a unified plan so as to restrict the production of unwanted goods and to expand the production of textiles and other consumer goods that were marketable both at home and abroad.

B. They promoted specialization and coordination among localities and enterprises. Through reorganization and integration, some localities and enterprises began to change the circumstances under which many enterprises were producing the same goods, and began to reorganize production

along specialized lines.

C. They saved capital investment and focused the use of previously scattered manpower, material power and financial power.

D. They promoted increases in production and technological levels as well as technological transformation.

E. They began to break through the existing management system and promoted economic integration among different localities and different industries, opening a road for further reforms in the economic system.

4. A multi-sector economy and multiple forms of business were restored and developed.

In the latter part of the 1950's, under the guidance of "Left" deviationist thinking and policies, the superiority of ownership by the whole people was made absolute; there was overemphasis on transition from collective ownership to ownership by the whole people, there was stress on the transition from small collective units to large collective units and on "cutting off the tails of capitalism" such as private plots; moreover, household sideline production, rural fairs and the rural individual economy were greatly restricted. In the urban areas, the individual economy was eliminated and the collective economy was reduced. Especially during the "cultural revolution," under the ultra-"Left" line pushed by Lin Biao and the Gang of Four, rural ownership by the production team as the basic unit in the communes was changed to the ownership by the production brigade or even by the commune, and both the diversified and individual economies were repudiated as "capitalist elements."

In the cities and towns, many service items which serve the needs of the masses were banned and the colorful styles and methods of business operations were simplified. As a result, diversified economy was constrained, growth of the collective economy slowed down and the individual economy was almost eliminated. As an example, there were 9 million self-employed labourers in urban areas in 1953, but the figure dropped to 1.56 million in 1966 and to 150,000 by the end of 1978. The number of commercial and service establishments was greatly reduced. Statistics showed that in the early 1950's there were about 100 cities with a ratio of 50 restaurant establishments for each 10,000 families; by 1980, however, only a few cities had 5 eating or drinking establishments for every 10,000 families.

The Growth of Economic Diversity. For the past two years, multiple ownership and a multi-sector economy have been allowed to coexist and to grow (on the condition that public ownership

is predominant), so as to keep pace with the present level of development of productive forces. In rural areas, uniformity is no longer imposed on farm production and the authority of production teams in management has begun to be respected. The practice of interfering with and restricting farm production has been altered and self-employed labourers are now permitted. In the cities and towns, a large number of collectively owned industries, transport services, construction enterprises, retail shops, catering and service units and repair stations have been set up and a number of self-employed labourers have been allowed to produce handicrafts, open restaurants and engage in repairs, mending and peddling. In 1979, the number of collective commercial establishments in the county towns and cities grew to 128,000, or 83% more than 1978. Last year, the number shot up to more than 1.3 million. The volume of retail sales by collective units accounted for 10% of the total volume of retail sales in China in 1980, as against 5% a year ago. By the end of 1980, there were 810,000 self-employed labourers in Chinese cities and towns, 490,000 more than in 1979. There were from 10,000 to 20,000 individuals or families doing business or running workshops on their own in cities such as Shanghai and Tianjin and in the provinces of Liaoning, Anhui and Jilin.

The restoration and expansion of the multi-sector economy and these multiple forms of doing business have promoted China's economic construction:

A. They have invigorated the economy, made things convenient for people and increased the wealth of society. In rural areas, the new policies have promoted the growth of the diversified economy and production. In the cities, most of the new economic units were set up in order to redress omissions and deficiencies. For this reason, they have become supplements to economic life. Apart from providing better services, they also produce goods badly needed in the market and some even make high-quality export items that increase national foreign-exchange earnings.

B. They make the best use of idle funds and of those idle people with good skills and local resources in order to expand production of farm produce and handicraft items.

C. They provide more jobs for jobless people in the cities and for surplus manpower in the countryside. In 1979, jobs were given to 9 million people in the cities and towns, of which about 4 million were in collective units. In addition, 7 million people found jobs in urban areas in 1980, of whom 4 million were in units under ownership

by the whole people and 2.6 million in collective units; 400,000 people were self-employed.

D. *It helped competition, urged enterprises to improve their management and benefitted the restructuring of the economic system.* Different economic forms have different forms of business operations and different management systems. The coexistence of the multiple economic sectors encouraged state-owned enterprises to change their conventional notions of doing business, to reassess the present practice of "sharing porridge from the same pot" and to overcome bureaucratic methods and styles. In short, the coexistence and development of different forms of economic activities and multiple economic sectors provides a good way of making the best use of labour power, materials and capital funds for the development of social productive forces.

5. *The start of a reform in the management system for capital construction.*

The State Council decided to gradually replace government allocations for capital investment with loans from the Construction Bank in August 1979. This represented a major reform in the management system for capital construction. For many years, capital investment was provided to units requiring construction in the form of government allocations, and for use without compensation. This system affected returns from the investment. On the principle of permitting capital investment to take the form of compensated bank loans, enterprises requiring construction must sign contracts with the Construction Bank for loans on specified terms; they are required to pay back the loans with interest and according to schedule. Those which pay back their loans ahead of schedule are to be rewarded and those which delay repayment shall be fined. This experimental reform was begun in eight projects in Shanghai, Jilin and Henan in 1979 and was extended to 4,400 projects in 1980. These projects belonged to more than a dozen industries covering power generation, light industry, coal mining, petroleum, communications and transport, construction materials, metallurgy, chemical engineering and commerce; they were located in all parts of China. The loans totalled 2,600 million yuan.

The Construction Bank and its offices at various levels also used bank deposits earmarked for capital construction to issue capital construction loans to 4,700 units requiring construction projects with a total value of 1,360 million yuan. Experimental work in the past year showed that the change from government allocations to bank loans had played a positive role in strengthening the management for capital con-

struction and increasing returns from investment by integrating economic responsibilities, economic rights and interests of the enterprises and by bringing into full play the functioning of economic organization and economic means under guidance of the state plan.

6. *A major reform was made in the financial and credit system.*

In the past, the purpose of China's financial management was to exercise absolute control by the central government over the revenues and expenditures. In order to meet the requirements of restructuring the economic management system and of modernization, the State Council decided to adopt new measures starting in 1980 on the basis of reforms made in the financial system in previous years. The basic principle is to specify the rights and responsibilities of the authorities at different levels while consolidating the unified leadership and unified planning of the central government and ensuring the necessary expenditures of the central government so that governments at all levels share the rights and responsibilities and so that the initiative of both central and local governments are brought into full play.

The main practices were as follows: A special system of fixed quotas was adopted for Guangdong and Fujian provinces; subsidies from the central government to the five autonomous regions of Xinjiang, Ningxia, Inner Mongolia, Tibet and Guangxi and to the three provinces of Yunnan, Guizhou and Qinghai would increase at an annual rate of 10%, while all previous special treatment for these regions and provinces were to be preserved; all other provinces and the three municipalities of Beijing, Tianjin and Shanghai would adopt the system of "dividing revenues and expenditures at different levels and holding the authorities responsible at each level for their own balances. This means that local governments can spend more if they have more revenues and can spend less if they have less revenues so as to balance their own budgets. The new measures prompted the initiative of local governments in handling their own financial matters. Consequently, local governments at all levels tried in every way to open more avenues for increased production, to find more sources of revenue and to reduce expenditures.

Reforms in Banking and Credit. The banking and credit systems was also reformed. The basic principle was to maximize the role of the banks in economic development under the guidance of state planning. The present credit system was formulated in the early 1950's on the basis of the Soviet experience. Its basic function is to issue only

short-term loans to industrial and commercial enterprises — in effect, to issue annual loans to cover operating expenses. This practice undoubtedly limits the functioning of bank credit as an economic lever. In 1980, the People's Bank of China began to issue short and medium-term loans (3-10 years) for purchasing new equipment; the loans so issued totalled 4,130 million yuan, including 1,500 million yuan for light industries and textiles. The credit system of the Agricultural Bank was also reformed in 1980. In rural areas, a new credit management system was introduced under unified planning, unified policy and a unified system. The system was also introduced in one or two provinces on a trial basis in 1980 for state-owned agricultural enterprises. Beginning in 1980, local banks can retain 75% of newly increased portions of workers' savings deposits from state-owned agricultural enterprises as a fund for credit loans to these enterprises. These measures helped local authorities to take the initiative in pooling local funds, as well as to manage and use them in a proper way.

7. Changes were also made in the foreign trade system.

For more than 20 years, all foreign trade in China was controlled by the Ministry of Foreign Trade. Under this monopoly system, industry had nothing to do with trade and producers never knew who the buyers of their products were, thus hampering the initiative of both industry and producers. In the second half of 1979, China began to make some changes in its foreign trade system. The main changes that took place were as follows:

A. Export commodities were controlled at different levels and local foreign trade departments were allowed to handle more commodity items.

B. The power of local authorities in foreign trade was expanded. All provinces, municipalities and autonomous regions had the right to set up their own special trade corporations to handle the export of local commodities or of certain special commodities and to control import business within their own localities. Ministries under the State Council were permitted to set up export corporations to handle the export of commodities produced by enterprises under their jurisdiction. By the end of 1980, the central government had approved the right of Shanghai, Tianjin, Beijing, Liaoning, Sichuan, Shandong and 18 ministries under the State Council to set up foreign trade corporations.

C. The power of industrial enterprises in foreign trade was also expanded. A limited number

of qualified industrial enterprises took a direct part in international trade activities or trade talks with foreign businessmen to obtain first-hand information so that they could arrange production according to the requirements and needs of their customers.

D. A system was adopted of allowing local governments and enterprises to retain part of the foreign exchange earned from their exports. Preferential customs duties were levied on goods imported for the manufacture of exports so as to encourage the expansion of export business.

E. Special policies and flexible measures were adopted in 1980 for Guangdong and Fujian provinces in economic activities with foreign countries and regions. With the approval of the Standing Committee of the National People's Congress and the State Council, parts of Shenzhen, Zhuhai and Shantou in Guangdong Province and Xiamen in Fujian Province were designated as special economic zones so as to foster better economic cooperation and technical exchange with other countries and regions.

For the past two years, China has also begun to pay attention to economic legislation. For many years past, the absence of economic laws, and especially the wanton sabotage of the socialist legal system by the Lin Biao and Jiang Qing counter-revolutionary cliques, caused unwarranted losses to China's economic work. In the course of strengthening the work of the socialist legal system, governments at all levels have paid close attention to economic legislation and have formulated or have begun to formulate a number of economic laws and regulations. Preliminary statistics showed that as of the end of October 1980, the Standing Committee of the National People's Congress, the State Council and the ministries had promulgated 210 economic laws, regulations and decrees during the period from 1977 to 1980, of which 86 were issued in 1980 alone.

Moreover, economic judicial work was also strengthened. Procuratorial work, supervision and arbitration systems were established in many parts of China. According to statistics from 28 provinces, municipalities and autonomous regions, more than 1,000 economic tribunals were set up and more than 6,000 economic cases handled in China in 1980. China in its economic life had begun to resort to law, to enforce laws strictly and to take legal action against violators of laws.

To summarize, all of these reforms were preliminary and some were made on a trial basis. However, China began to break away from the conventional system of overconcentration, regulating production only through plan and using mere

administrative means to manage the economy. It took a welcomed step forward in managing the economy according to the requirements of economic laws, thus accumulating experience for overall reform of the economic management system.

III. Improvement of Economic Performance

While readjusting the ratio among the different branches of the national economy and restructuring the economic system, progress was also made in the consolidation of existing enterprises. Many localities readjusted and strengthened the leadership of the enterprises, selected and promoted to leading posts a number of young cadres who were politically and ideologically sound, as well as vocationally and technically competent, and who knew how to manage enterprises; they relieved those cadres who had not demonstrated competence in leading positions. The practice of training cadres and workers was restored and developed. In 1979 and 1980, more than 1.19 million cadres were trained, including 330,000 leading cadres of enterprises run at the county level and above. Workers' schools and training classes of all types were established. By the end of 1980, about 50% of all large and medium-sized enterprises in China had set up spare-time, part-time or full-time schools and training courses, enrolling about 20% of all workers and staff members. On the basis of consolidation of enterprises, more than 4,400 enterprises adopted the "Thorough Quality Control" system and strengthened their economic accounting. The level of managerial work of many enterprises was improved.

Steady progress was made throughout the national economy in 1980 as a result of the effective work done. New achievements were scored in industrial and agricultural production, communications and transport, capital and technological development and culture and education; the targets set in the state plan for these fields were all reached satisfactorily. Total national industrial and agricultural output value surpassed the annual target by 3.2%, and exceeded the 1979 figure by 7.2%. Total industrial output value surpassed the annual target by 3.1% and exceeded the 1979 figure by 8.7%. And total agricultural output value surpassed the annual target by 3.3%, and improved on the 1979 figure by 2.7%. It must be stressed that economic performance in all fields improved to varying degrees.

Achievements in Energy Conservation.
Further achievements were made in saving energy.

In 1980, the party and government decided on the policy of giving equal stress to the development of energy resources, and to energy conservation and to giving priority to saving energy consumption in the next few years, while at the same time focusing major efforts on the technological transformation of existing equipment and changes in energy composition as a means of saving energy. All industrial departments and enterprises worked hard to save energy and, as a result, overfulfilled the annual national targets of saving 3% of electricity, 5% of coal and 10% of oil — thus, for example, the equivalent of 35 million tons of standard coal was gained. The drop in energy consumption greatly helped to ease the short supply of energy and to ensure fulfillment of the annual industrial production plan. In 1980, national primary output of coal and petroleum dropped by 1.3% as compared with 1979, while industrial production rose by 8.7%.

Upgrading Quality and Expanding Variety.
The quality of products in all industries as a whole was improved and the variety of products was also increased. Statistics from major enterprises in metallurgy, coal mining, petrochemicals, building materials, light industry and textiles showed that the quality of 57 of 66 major products had improved over previous year.

Of 74 quotas for the consumption of raw materials, 50 could be reduced. Many industrial departments and enterprises adopted positive measures to increase the production of new varieties and new products. Light industrial enterprises in China developed more than 7,000 new products and more than 100,000 new patterns and styles, and about half of these were put into serial production. The textile industry put more than 30,000 new products into production in 1980.

The machine-building industry also developed more and more new products as well as new specifications. Enterprises under the First Ministry of Machine-Building Industry alone trial-produced 730 new products; about 98.7% of their major products were up to prescribed standards, the best performance in recent years.

The consumption of raw materials and energy was also reduced. The utilization rate of rolled steel rose by 3.3% as compared with 1979 and the amount of operating funds used in producing every hundred yuan of value dropped by 5.5 yuan. In 1980, the per capita labour productivity of industrial enterprises under ownership of the whole people was 12,031 yuan, or 2% higher than in 1979. The amount of circulating funds possessed by state-owned industrial and commercial enterprises also dropped.

Productivity and Profits in Agriculture. For many years past, the disregard of economic results and of labour costs in agricultural production and construction resulted in unwarranted increases in the cost of agricultural production. While production increased in many places, income remained the same or even fell. During the past two years, this situation has been changed somewhat. The proportion of agricultural production costs to total agricultural income dropped from 32.3% in 1978 to 31.9% in 1980. Instead of suffering great losses as they had done for years running, state land reclamation enterprises earned 520 million yuan in profits in 1979 and profits of 400 million yuan in 1980, this despite increased pay for some of their workers as well as subsidies to all of their workers and for nonstaple foodstuffs totalling more than 600 million yuan. These profits also came about despite serious floods and droughts in many areas. Actual profits increased by 52.7% over 1979.

Outstanding Problems and Trends in Development

China's economic development in 1980 gave added proof that it is absolutely necessary and entirely correct for the party and government to adopt the policy of readjusting, restructuring, consolidating and improving the national economy as well as a series of other new economic policies. These policies have instilled new vigor in the Chinese economy and have already played and continue to play a tremendous and positive role in promoting the healthy development of the entire national economy. However, because it was impossible to alter the serious imbalance in the national economy in one or two years and because some measures for economic readjustment taken during the past two years were not as effective, potential dangers lurked within this excellent situation.

There were still many problems and difficulties in China's economic life, as manifested in the following respects:

1. *The scale of capital construction continued to be overextended.*

Capital investment included in the state budget in 1980 was reduced, but not enough, and those investments not included in the state budget increased considerably: a. Capital funds pooled by local governments and enterprises came to 16,400 million yuan, or 5,900 million yuan more than in 1979, and surpassing the state-controlled figure of 8,000 million yuan by over 100%. b. Investments

made through borrowing from other countries amounted to 5,400 million yuan, or 2,600 million yuan more than in 1979. Investment made by means of domestic borrowing amounted to 4,100 million yuan, or 3,600 million yuan more than in 1979. As a result, the total investment for capital construction was not reduced but expanded.

In 1980, 904 large and medium-sized projects were still under construction. The unfinished portions of these projects will require an additional expenditure of more than 100,000 million yuan from 1981 onwards, and will take five or six more years to complete at the 1980 level of investment — even if not a single new project is started during the period. It is obvious that the present scale of capital construction is not compatible with the present national capacity and this has become an important factor in economic instability.

2. *The battle line of industrial production was over-extended and progress in industrial reorganization and consolidation was not as quick as expected.*

In 1980, thousands of enterprises were closed, suspended, merged or shifted over to the production of other goods, while more than 20,000 new enterprises were built or put into operation. As a result of these developments, the total number of industrial enterprises by the end of 1980 was 22,000 more than had existed at the beginning of the year. Most of the new factories were small processing enterprises built without the supervision of the state plan. This resulted in the overproduction of unwanted goods and aggravated the contradictions between fuel, power and raw materials industries on the one hand and the processing industries on the other. The contradiction between the production of energy and raw materials and the demand for them became even more acute. Because of slow progress in industrial organization and consolidation, the economic results in industrial production and construction were not satisfactory. For example, the quality of 43% of the products made by industrial enterprises owned by the whole people and the unit consumption of 56% of these products failed to reach the previous best standards. About 23.3% of the enterprises still suffered losses of varying degrees and overstocking of some goods remained a serious problem. By the end of 1980, 19.54 million tons of rolled steel were stocked in warehouses, or 3.2% more than in the previous year.

3. *Large deficits continued to appear in the state budget and currency was overissued.*

Another budget deficit totalling 12,100 million yuan, approved in 1980, followed the 1979 deficit of 17,000 million yuan. The 1980

imbalance resulted from the overextended scale of capital construction and from increases in administrative and other expenses that exceeded state revenues. The central government was compelled to take an overdraft from the bank, leading to an over-issuance of currency. The bank had originally planned to issue 3,000 million yuan throughout the year, but it actually had to issue 7,800 million yuan, or 4,800 million yuan above the quota.

4. The price rise covered a considerably wide range of commodity items.

Prices of many commodities rose because more market money was in circulation; the production and supply of consumer goods, restricted by objective conditions and because of insufficient subjective efforts, were not able to meet the needs of the fast-growing purchasing power among urban and rural people; some enterprises arbitrarily raised the prices of their products for the sake of giving more bonuses to their workers; the range of commodity items sold at negotiated prices were too broad and market control was not tight.

In 1980, the total price index for retail sales throughout China (including official prices, negotiated prices and market prices) was 6% greater than in 1979 — 8.1% greater in the cities and 4.4% greater in rural areas. The index of official prices of state-owned shops rose by 4.4%, and food by 7.4% (nonstaple food, 13.8%). The price rise affected, to a certain extent, the livelihood of urban people, especially those workers and staff members who received no bonuses.

Post-1980 Readjustments. These facts showed that the serious imbalance in China's national economy had as yet to be totally righted and that the passive state of economic work had as yet to be changed. In view of this situation, the Party Central Committee and the State Council decided at the end of 1980 to further readjust the national economy on the basis of the readjustment made in the two previous years. The main target was, first of all, to strike a balance between revenues and expenditures in the course of readjusting the pro-

portions of different branches of the national economy and, on this basis, to strike a balance between credit receipts and payments, to stop the issuance of currency solely for financial reasons and to stabilize market prices. In the course of the readjustment, those that should retreat must retreat; capital investment, spending on national defence and war preparedness, and administrative expenses must be reduced to the extent allowed by the national interest; and enterprises that consume far more fuel and raw materials than they need, those that produce low-quality products and those that suffer great losses must be closed, suspended, merged or changed over to the production of other goods.

At the same time, those which should be developed must be developed: Production and construction tasks that are needed by society, allowed by objective conditions and that can be fulfilled through effort must all be fulfilled. During the next few years, readjustment of the economic structure should proceed in a planned and deep-going way so as to make the economic structure more rational. Great efforts must be made to develop the production of consumer goods so as to increase revenues, improve the livelihood of the people and allow the national economy to develop healthily and in a coordinated way. Achievements already made in the restructuring of the economic system must be consolidated and reforms that are beneficial to the readjustment will be actively continued. Industrial reorganization and consolidation will be developed in a down-to-earth manner so as to make the economic organizational set-up more rational and so as to raise the managerial level of the enterprises. At the same time, equipment in existing enterprises will be renewed systematically so as to raise technological and production levels in those enterprises.

We are confident that after these measures are adopted, difficulties confronted in the development of China's national economy will be gradually overcome and that China's socialist modernization will gradually take the road of steady development in accord with China's actual conditions.

2. CHINA'S AGRICULTURE IN 1980

By Zhang Siqian

*Institute of Agricultural Economics
Chinese Academy of Social Sciences*

I. The Development of Agriculture Since the Founding of New China

Agriculture in China before the founding of the People's Republic of China consisted of small-scale production, with feudalism ownership of land occupying the dominant position. Not long after the founding of New China, land reform was carried out and the goal of "land to the tiller" was realized. Soon afterwards, socialist transformation of agriculture was carried out and socialist collective ownership and ownership by the whole people were set up. As a result, there was large-scale development in production; this played an important role in the development of industry as well as throughout the national economy.

Generally speaking, socialist collective ownership was manifested in the form of mutual-aid teams in agricultural production, elementary agricultural producers' cooperatives, advanced agricultural producers' cooperatives and the people's communes. By the end of 1956, when China was at the high tide of agricultural collectivization, the transition from the peasant individual ownership to socialist collective ownership had been basically completed. And at the end of 1958, a further transformation from agricultural producers' cooperatives to people's communes took place. At present, the people's communes employ a system of integrating government administration with commune management. It consists of a three-level system of ownership of the means of production, with ownership by the production teams as the basic form. At the end of 1980, there were in the countryside 54,000 people's communes, 710,000 production brigades and 5.66 million production teams. There were 170 million rural households with a population of over 800 million, over 300 million labour personnel resided in the rural people's communes. People's communes are the main units of agricultural production in our country. The vast preponderance of principle agricultural products — such as grain, cotton, oil-bearing crops and so on — purchased by the state are from the people's communes.

Agriculture under ownership by the entire people in China [i.e., "State" ownership — Ed.] consists of various state-owned farms, forest farms, livestock farms and fish farms. The first lot of

such farms were set up as early as 1947. These were of two types: one were agricultural enterprises with economic accounting systems, whose main task was to set up a variety of commodity bases to develop agricultural production and to provide the state with marketable agricultural products and by-products; the other type consisted of undertakings whose main task was to pursue scientific experiments, to breed improved varieties of crops and livestock and to popularize advanced techniques. In 1980, there were 2,093 state farms with 4.92 million staff members and workers under the Ministry of State Farms and Reclamation. These farms covered an area of 66.82 million *mu* of cultivated land accounting for 4.5% of the country's total cultivated area. Although the state farms did not occupy a large proportion of agriculture, they achieved relatively high rates of labour productivity and commodity production. Commodity ratios accounted for by this sector in 1980 were as follows: grain, 39.8%; cotton, 89.8%; and oil-bearing crops, 49.6%.

China's agricultural sector provides for individual sideline occupations of commune members. This activity is attached to the socialist collective economy. It plays an important part in the development of the agricultural economy, in improvement of the lives of commune members, in food supply in cities and towns and in the development of economic construction of the country. In 1980, the output value of individual sideline occupations accounted for about 18.9% of the total agricultural output. Most pigs, poultry, eggs and other animal by-products purchased by the state, as well as most agricultural by-products in the rural markets, came from the individual sideline occupations of commune members.

During the last 30 years there has been a great improvement in the technical conditions of agricultural production, and various levels of increases in principal agricultural by-products. From 1979 to 1952, the utilization of chemical fertilizers was extended from 300,000 tons to 54.28 million tons, combined horsepower of agricultural machinery power grew from 250,000 hp to 181.91 million hp, electricity used in rural areas was extended from 50 million kwh to 28,300 million kwh and effective irrigated acreage of cultivated land was extended from 300 million *mu* to 670

million *mu*. The output of major products increased as follows: grain output doubled, cotton increased by 69% and vegetable oils increased by 53%. The output of sugar crops in 1979 was 3.2 times that of 1952, the output of meat was 3.1 times that of 1952 and the output of aquatic products was 2.6 times that of 1952. This was the result of hard work of millions of peasants under the leadership of the Communist Party of China and the Chinese government.

It has to be pointed out that the superiority of the socialist system has not been brought into full play as a result of "leftist" guiding thought. During the "cultural revolution" in particular, agriculture suffered great losses because of disruption and damage caused by the Gang of Four. After the smashing of the Gang of Four in October 1976, the "cultural revolution" came to an end. The Third Plenary Session of the 11th Party Congress, which was of great historical significance, was held in December 1978. The principles of emancipating one's mind, using one's brains, seeking truth from facts and of uniting as one to look ahead were put forth. Under such conditions, the confusion created by the Gang of Four began to be quickly cleared up. Some principles and policies which were not in accord with reality were changed or readjusted. That enabled our agriculture to advance again along the path of healthy development.

II. Agricultural Production and Peasant Life in 1980

The year 1980 witnessed a good harvest in our country despite severe natural calamities. The north suffered from extensive droughts, while the south suffered from serious flooding. Neither problem had been experienced to such a profound extent during the past dozens of years. The areas affected were large and some were at the centre of major grain-growing regions. The maximum extent of the drought during the hot season amounted to more than 200 million *mu*. Some regions in North China had rarely experienced such drought conditions in the past hundred years. Water dried up in many rivers, reservoirs and ponds. Seedlings died of drought over large areas. In vast areas of the south, there were continuous low temperatures and rainy weather with little sunshine continuing from spring to summer. During the summer, the rainy season in the middle and lower reaches of the Changjiang River was long and there were frequent storms. Extremely heavy floods occurred, exceeded only by those of 1954 and 1931. Great efforts were made to combat the flooding. Nevertheless, over 130 million *mu* of

farm land suffered from water-logging. Even so, except for grain output, other main agricultural products enjoyed large increases. Total grain output amounted to 318.22 million tons; although this was less than 1979, it was still the second highest yield since the founding of the People's Republic of China. Out of the 29 provinces, municipalities and autonomous regions, 13 increased their output. Of these, six had previously achieved high production levels: Sichuan, Guangdong, Guangxi, Fujian, Liaoning and Beijing; the remaining seven — Gansu, Ningxia, Qinghai, Yunnan, Guizhou, Henan and Tibet — were among those that frequently suffered from calamities and low output and were consistently short of grain, but in 1980 had actually scored better harvests. Nine suffered rather large-scale declines: Hebei, Shaanxi, Shanxi and Inner Mongolia in the north; Hubei, Jiangsu, Zhejiang, Anhui and Shanghai in the south. Seven retained the same level of output or experienced a slight reduction in crops: Heilongjiang, Jilin, Shandong, Xinjiang, Jiangxi, Hunan and Tianjin.

Industrial crops realized extremely good harvests. The total output of cotton was 2,707,000 tons, an increase of 22.7% over 1979. Of the 15 major cotton-growing provinces, municipalities and autonomous regions, 9 increased their output; of these, Shandong was outstanding. The cotton output increased from 167,000 tons in 1979 to 537,500 tons in 1980, representing a 3.2-fold increase. Hebei and Henan doubled that of the previous year. But those provinces and municipalities along the middle and lower reaches of the Changjiang River which used to have a high yield of cotton all suffered a decrease in production as a result of low temperatures and rainy weather. Oil-bearing crops in 1980 had an increase of 19.5% following a good harvest in 1979. Sugar crops scored a good harvest as well. Total output of these crops went up by 18.3% over the previous year. Heilongjiang and Jilin, the major regions for growing sugar beets, had striking increases of more than double those of the previous year. The output in Inner Mongolia increased by 65.7%.

Mulberry-feeding silk-worms increased by 20% and tea increased by 9.7%. The output of jute had a slight increase in production. Cured tobacco, fruits and vegetables underwent slight declines compared with 1979.

Afforested acreage throughout the country covered 4,552,000 hectares, an increase of 1.4% over the previous year. The output of rubber increased by 4.3% over 1979, walnuts by 31.7% and chestnuts by 41.8%. The output of raw lacquer and rapeseeds declined.

The output of animal husbandry continued to increase based on significant growth experienced

in 1979. The total output of pork, beef and mutton amounted to 12,055,000 tons, an increase of 13.5% over the previous year. Within this total, pork increased by 13.3%, beef by 17% and mutton by 17.1%. At the end of 1980, the population of draught animals increased by 0.7% and sheep by 2.3%. The pig population decreased by 4.5%, although the amount of pigs available for sale and slaughtering increased by 5.8%.

The output of aquatic products in 1980 was 4,497,000 tons, an increase of 4.5% over 1979. Among these, freshwater products increased by 11.1% and marine products by 2.1%.

The fine situation in agricultural production was also reflected strikingly in the rural markets. Activity in over 37,000 rural markets all over the country was very brisk. The quantity of agricultural products on the markets had risen by a large margin, with increased varieties and more stable prices. Some prices even went down a bit. According to statistics for 206 rural markets all over the country as provided by the Industrial and Commercial Administration Bureau, the value of agricultural and sideline products sold by peasants in 1980 at rural fairs amounted to 574.46 million yuan, representing an increase of 37.4% over the previous year. Compared with the same period in 1979, the combined level of commodity prices at the rural markets decreased by 1.6% as of the end of September, and by 1.8% as at the end of December. The gap between market prices and official prices set by the government was reduced by 3% as compared with 1979. Of the prices of ten major commodities, seven of them went down: those for rice, wheat, maize, edible oil, pork, Chinese cabbage and piglets. Three increased somewhat: tobacco, eggs and firewood.

The increase in production and brisk markets ensured increases in peasants' income and raising of consumer levels. The average monthly income each peasant received from basic collective accounting units was 85.9 yuan, or 2.5 yuan more than in 1979. The total income of rural commune members experienced a relatively sharp increase over the previous year owing to the fairly rapid development of individual sideline occupations and to state increases in the purchase prices of some agricultural products.

Purchasing power in rural area and consumption rates of the peasants were also undergoing change. Retail quantities of consumer goods throughout the rural areas increased by 27.7% over 1979. Moreover, retail quantities of agricultural means of production purchased by production teams and commune members increased by 6.8% over the previous year. Judging by the sale of consumer goods in the villages, there was a remarkable increase in the sale of clothing and other com-

modities of daily use. The demand for television sets, radios, bicycles, sewing machines and watches also increased rapidly. More and more new houses were built by the peasants. Some 5 million farm households rebuilt their houses or constructed new ones throughout the country in 1980. The total area amounted to over 300 million square metres, including offices built by communes and production teams. Newly built houses in the rural areas of Jilin Province alone covered an area of 5,910,000 square metres. Some 100,000 peasant households moved into new houses there. Newly built houses in the rural areas of Liaoning Province covered an area of 14,960,000 square metres. Over 280,000 households of commune members moved into new houses. In the rural areas of Zhejiang Province, there were even more new houses, amounting to 37 million square metres and accommodating 570,000 households.

Savings deposits in rural areas also showed a rapid increase. Deposits in rural areas for the entire year were about 14,800 million yuan, an increase of more than 49% over the previous year. Deposits by peasants totalled about 12,060 million yuan, an increase of 53.8% over 1979. There were record increases in deposits throughout the rural areas in 1980, with deposits throughout the rural areas. The pattern of sudden rises and falls in deposits that had prevailed in past years had clearly been changed.

It must be pointed out particularly that substantial changes occurred in many communes and production teams which had been poor and economically backward for many years. There were 43 poor counties which comprised over half the counties in Guizhou Province which had been described this way in the past: "No place has any level ground and no person has even a small amount of money." But in 1980, 32 of these counties increased both their production and income. According to the investigations conducted by the Statistical Bureau of the province, in 390 farm households in 13 counties the cash income of commune members belonging to poor production teams during the first quarter of 1980 increased by 39.1% over the corresponding period in 1979. Their growth rate was 12% higher than that of commune members in more prosperous teams. The ratio of poor production teams in Heilongjiang Province fell from 22.4% in 1979 to 13.3% in 1980. Some 6,753 poor production teams had begun to take on a new look. The income of commune members also increased as compared with 1979. In nearly 3,000 poor production teams, the average income per person had surpassed 90 yuan. In Liaoning district of Shandong Province, one of the poorest regions in the country, the average income per person in 1978 was 46 yuan; in

1979, the income went up to 54.8 yuan and in 1980, it went up further to 126 yuan which was 2.3 times as much as the previous year. The situation of "production relying on loans, grain rations relying on resold grain, and life relying on relief" had changed in many poor communes and production teams throughout the country. Both collective and individual incomes were much higher in 1980 than in the past.

III. Agricultural Reform and Readjustment in 1980

There were five main elements in the agricultural reform and readjustment of 1980:

1. *The reform of the system of agricultural administration by the state.*

The principal aspects were reform of the agricultural planning system, changes in the statistical targets of agricultural plans and popularization of the contract system.

A. *Reform of the agricultural planning system.*

Under the old agricultural planning system, all kinds of specific instructions, including crop varieties, output, areas planted to main products and numbers of livestock were usually issued from upper levels to lower ones. Production teams had to comply. In some places, it was not the production teams but higher authorities who fixed the plots, planting schedules and methods of sowing, manuring, irrigation and harvest. These procedures greatly restricted the decision-making power of the production teams. Some production teams had no power to make decisions at all. As a result, several absurd situations developed. For example, activities suited to local conditions that yielded high outputs and good economic results were not able to develop. In other cases, activities that were not suited to local conditions and that produced low outputs and poor economic results were forced to be taken on. Thus, maximum economic success could not be realized. Under the reformed agricultural planning system, production planning targets worked out by higher authorities were no longer issued to the lower levels in the form of commands, but rather as proposals made for their reference. However, targets for purchasing and allocating agricultural products as set by the state still took the nature of directives and production units were expected to meet them. The process of the reform varied according to local conditions.

In early 1980, the Sichuan provincial government stipulated that agricultural plans could be

worked out with the production team taken as the basic unit, with negotiations to take place between upper and lower-level authorities. Planned targets for planting were no longer set by the higher authorities, although targets for production were still set by them. In mid-1980, the Qinghai provincial government also stipulated that upper-level authorities would no longer give directives on the production plan to production teams; rather, they would set forth marketable targets for grain, edible oil and major animal products. In November of the same year, it was decided in Zhejiang Province that targets for crop acreage and output would not be issued by the upper authorities as directives. By the end of 1980, virtually no directives on targets for crop acreage were being issued by upper-level authorities anywhere in the country.

B. *Changes in statistical targets of the agricultural plan.*

In 1980, the State Planning Commission, the State Agricultural Commission, the Ministry of Agriculture and the State Statistical Bureau jointly issued a document which stated that in planning and statistical work "the per-mu output of farm land" and "the amount of livestock on hand at the end of a year" would no longer be regarded as targets for measuring the achievements of agricultural production. In future, whether or not grain production was high or low would be judged mainly by total output, by the volume of marketable products, by whether or not average output and consumption per person increased, by whether or not the cost of production decreased and by whether or not the income of farmers increased. Animal husbandry output would be judged by the quantity of animal products and production costs and by increases in the incomes of farmers and herdsmen. Targets for animal products varied according to the different uses of different animals. That was an important change.

There were a host of shortcomings in the two old methods for evaluating gains in the production of grain and livestock. Owing to the pressure exerted by higher authorities and to a quest for notoriety, some communes and production teams resorted to trickery — such as under-reporting areas under cultivation — and the practice of fraud was encouraged. Some production teams paid no attention to speeding up the turnover of livestock and the rate of selling and slaughtering domestic animals, focusing rather on increases of the amount of livestock on hand at the end of a year. Thus, the practical economic benefits of animal husbandry were reduced. These practices were quite disadvantageous to the development of agriculture. After the reform, the old targets were kept in the form of statistics so as to provide

reference data for the study of livestock production and land utilization.

C. Popularization of the contract system.

The system of developing economic relations between purchasing, supply and marketing departments and production units was tried out through implementation of the contract system in some places prior to initiating the reform of the agricultural planning system. For example, the system was tried out as early as in the winter of 1978 in Jin Xian County, Hebei Province. It was afterwards tried and popularized in many other places during 1980. Contracts varied in nature from comprehensive to simple. In Nantong district of Jiangsu Province, a major cotton growing region, a comprehensive contract that covered principal production jobs, purchasing, supplies and marketing began to be disseminated in 1980. The concrete method was: that departments of grain, supplies marketing, commerce and agriculture in the districts, counties and communes took the initiative to sign contracts separately with counties, communes and production teams (we shall call the former "Party B" and the latter "Party A"). The commitments of Party A were to fulfil the tasks of production and sales of grain, oil and pigs as set in the contract for a normal harvest year. The commitments of Party B were to ensure the supply of marketable grain, chemical fertilizers, agricultural chemicals and other means of production; to correctly carry out the price policy and the policy of compensation for sales. Contracts were made in some places only for purchasing and marketing of a single product — pigs, sugar-cane or oil-bearing crops. Quantity, quality and delivery dates were stipulated in the contract as responsibilities of the production unit. Moreover, the quantity, quality and supply dates for the means of production provided by the purchasing and marketing units and the means of providing compensation were stipulated in the contract. In many places, the method used prior to the "cultural revolution" for purchasing agricultural and sideline products of the third category by means of contract was restored and the practice adopted during the "cultural revolution" of giving directives for purchasing targets was abolished.

The above-mentioned reforms played an important part in protecting the right of production teams to act on their own. They also helped in the development of agricultural production through measures worked out to suit local conditions.

2. To continue the restoration and development of the job-responsibility system in agricultural production.

As early as the 1950's, the period of the

agricultural cooperatives, a job responsibility system for production and output, including the fixing of work and farm output quotas for each group, was already in use throughout the collective sector of the economy. The widely used practice of the time was referred to as "three contracts and one reward," and had been adopted in people's communes prior to the onset of the "cultural revolution." Moreover, in some places this method for fixing the farm output quotas for individual households was also in use although it was labelled as a manifestation of "capitalism and revisionism" and was severely criticized. So, after several ups and downs, there was no chance to put it into general practice. During the "cultural revolution," the method of fixing farm output quotas for each household was criticized again as were measures for fixing work quotas and farm output quotas for each group. Nearly all of the communes and production teams stopped enforcing the rule of job-responsibility. Only a few communes and teams maintained the rule on and off, but did so secretly. Because of the abolishment of the job responsibility system, production was often chaotic and the principle of distribution according to work was impossible to carry out. The result was that the enthusiasm of hundreds of millions of peasants was dampened.

Following the "cultural revolution," especially after the Third Plenary Session of the 11th Party Congress in 1978, the system of job responsibility in agricultural production was restored and began to develop progressively.

The first element to be restored was the system of fixing work for each group. The usual way of implementing the system was for the basic economic accounting unit — usually the production team, but in some cases the production brigade — to determine the amount of work to be done in a fixed period of time, as well as quality, quantity and the compensation for completing a given task while meeting the required level of quality. Work was fixed for each working group. The production team had the right to determine rewards or penalties for the contractor according to how the work was done. The system of fixing work was restored at a relatively rapid pace prior to 1980. Compared with the system of "working together and receiving equal payments," the job responsibility system was undoubtedly a great improvement and was welcomed by the majority of the peasants. By the end of 1980, some two-fifths of the production teams in the country had implemented the system of fixing work for each group.

The second element to be restored was the system of fixing farm output quotas for each group. The usual way of implementing the system was for the production team to fix certain produc-

tion tasks for each working group responsible for output (or production value). The distribution of products was carried out by the production team. The working group, having fulfilled the production task, could receive their pay according to the agreement. Reward was offered for the overfulfilment of the task, and penalties were given for reduced output that resulted from poor management. In addition, another measure was to fix the amount purchased by the state and the amount of accumulation funds and public welfare funds which the production team was due to receive, as well as those funds to be delivered to upper-level authorities. The remaining amount was distributed among members in the working group. Products turned out by the working group were not handed over to the production team for unified distribution. Owing to the "Left" influences, even after the Third Plenary Session of the Party Congress, the system of output responsibility was considered to be in conflict with socialism in some places. The system of fixing farm output quotas for each group, once thought to be a heresy, was restored only slowly. But by the summer of 1980, things began to take a turn for the better.

The reinstitution of the job responsibility system in agricultural production during 1980 represented a clear confirmation of measures to fix farm output quotas for each household and for each labour unit — measures which had never been allowed to take root since the transformation of the agricultural cooperative. Furthermore, the method of fixing payments for defined projects and of organizing production according to specialized professions was now widely encouraged.

The similarity between fixing farm output quotas for each household and fixing farm output for each group is as follows: Contractors are responsible for output (or production value). The difference between the two approaches is that the contractor of the former is a household and that of the latter is a working group. The basic characteristics of the household method are:

(1) The main means of production — which include land, irrigation facilities made or bought by the production team, draught animals, farm tools and machines — belong to the production team; while those suitable for decentralized management can be turned over to individual commune members to keep and use.

(2) The production team carries on unified management; and the commune members work with their own families.

(3) The output of products is counted by households. The output fixed for each household is distributed to commune members by the production team and extra output is given as a reward to the contracted commune members or is divided

between the production team and the contractor according to a fixed ratio. As the production teams differ from each other, so too does the range of fixing output quotas. Some teams fix only a part of the work for each household.

Another form is to divide up the work and assign a portion of it to each household.¹ The differences between this and fixing farm output quotas for each household are as follows: In the production of products, the production team only sets requirements for that portion which will be purchased by the state; commune members have the right to decide themselves what they will grow and how much they will grow to fill out the remainder of production. In the distribution of products, the commune members are responsible only for fulfilment of the state purchasing quota and for accumulation, public welfare and other funds that are to be handed over to the production team. Extra income belongs to the commune members and is for their use as well.

Fixing output quotas for each labour unit is similar to fixing quotas for each household. The difference is that the contractor of the former is a labour unit and that of the latter is a household.

In 1979, the system of fixing output quotas for each household and for each labour unit had already been carried out in some production teams; it had been carried out even earlier in some communes and production teams. Although the situation then was different from the one during the "cultural revolution" — when this method was criticized for being part of the "capitalist" and "revisionist" road, it was still seen as a means of "going it alone" or "a disguised form of going it alone" or "sliding onto the road of going it alone." In the end, it would lead to extremes and would harm agricultural production. In practice, results proved just the opposite. In places where fixing output quotas for each household and for each labour unit were carried out, the situation in agricultural production was extremely good. In the backward places in particular, production developed even faster, the collective economy stabilized and the lives of commune members were improved greatly. It held out a great appeal to those production teams that had similar productive conditions. In 1980, there was a substantial increase in the number of communes and production teams that carried out the system of fixing output quotas for each household or for each

¹ Strictly speaking, the way of dividing up the work and assigning a part to each household is not a form of job responsibility. Yet, it is widely used in some places and is playing an important part in the restoration and development of agriculture. It is introduced here because it has some similarities with the method of fixing output quotas for each household.

labour unit. In the latter half of the year, the Central Committee of the Party issued a document on the further strengthening and improvement of the system of job responsibility for agricultural production. Various job responsibility systems in agricultural production were reaffirmed and emphasis was placed on working in accord with reality and on trying to avoid being limited to only one method. Thus, fixing output quotas for each household or for each unit of labour power had acquired full legitimacy as did the system of assigning the work to each household.

The system of job responsibility in compensating for work and production according to use of specialized professional work is one form in the system of fixing output. It differs from the fixing of multiple production jobs in that the contractor is responsible for only one product. For example, some may make contracts on grain production, some on planting fruit trees, some on raising pigs and cows. Owing to varying conditions, the method of fixing output for each group can be used in some places, while the method of fixing output quotas for each household can be adopted in other places; and the method of fixing output quotas for each labour unit can be adopted in yet other places. Besides the advantages shared by other forms of fixing work, the system of responsibility of payment for fixing output and production according to specialized profession has some other advantages. It not only can be applied to presently backward areas, but can also be used to promote levels of agriculture specialization by raising productivity. In the past, very few communes and production teams adopted this method. It was not until the latter part of 1980 that these measures were encouraged to any large extent.

The restoration and development of various forms of job responsibility in agricultural production has been very important to the development of agriculture in our country. During the past 20 years, socialist superiority in agriculture had not been fully realized. One main reason was that we had for many years failed to adopt an effective method of management and had failed to apply various forms of the job responsibility system with methods that adhered to local conditions. In fact, these forms are consistent with the socialist road and incorporate methods of management that suit the requirements of the peasants. As a result, the enthusiasm of hundreds and millions of peasants has been brought into full play and the development of agricultural production has been promoted.

3. *Encourage and support individual sideline production by commune members.*

Under "Left" influences, the individual side-

line production of peasants had not been stressed for over 20 years. During the "cultural revolution," such production was criticized and abolished as the "tail of capitalism." In some places, it was completely banned and the production of some farm products fell sharply. The subsequent great decrease in the variety and quantity of goods had seriously affected the lives of the people both in urban and rural areas and hindered the country's socialist economic construction.

After the "cultural revolution," the party and government began to correct the past mistake of abolishing individual sideline production. It was decided that peasants could retain small private plots and engage in individual sideline production as long as the collective economy was assured to be in absolute predominance. This decision gave a big push to the restoration and development of individual sideline production. A new stipulation was made in the Decision on Several Questions Concerning the Acceleration of Agricultural Development, worked out at the Third Plenary Session of the 11th Party Congress. It provided that individual sideline production of the peasants should be encouraged and supported so long as the strengthening and development of the collective economy was assured. This stipulation, which is in accord with reality in our rural areas has given great impetus to the restoration and development of individual sideline production of the peasants.

In 1980, especially in the second half of the year, restrictions were further relaxed to varying degrees. Many unreasonable restrictions on individual sideline production of the peasants were abolished and the practice was encouraged and supported in the following respects:

A. *To expand private plots and forage plots.* According to old regulations, the acreage of private plots of the peasants was limited to a range of 5-7% of the total farmland of the production team. According to the local conditions in Sichuan Province, 3 million *mu* of farm land was given to commune members by the production teams to expand private plots and forage plots; by this means, the acreage of private plots of the peasants exceeded 10% of the total farmland. In Ningxia, the acreage of private plots was set at a maximum area of 12% of the total farmland. In Shaanxi, about one *mu* of forage plot was allotted in some places to a peasant who raised one draught animal; in addition, part of the collective wasteland could be given to the peasants for planting trees and grass. In southern Xingjiang, forage plots were allotted to peasants who raised cattle. In Guangdong, it was decided that production teams, where possible, could give a certain amount of land to the commune members as forage plots. In Heilong-

jiang and some other places, similar measures were adopted.

B. To allot private hillsides to commune members. In Jiangxi, it was decided to give to commune members a portion of waste hills and waste hillsides which the collective had not sufficient labour to cultivate or was not able to cultivate. Commune members were encouraged to plant trees there. Both the trees and all income from them belonged to those who had planted them. Experiments were made in some places to be systematically introduced on a wider scale. In Shaanxi, similar decisions were made. In Sichuan, it was decided that private hills allotted to commune members in the past would continue to belong to them. In addition, private hills could be allotted, if conditions permitted, by those communes which had never given any to their commune members.

C. To abolish the unreasonable restrictions on the range of individual sideline production by commune members.

In the past, it had been decided in some places that private plots must be used mainly for the production of grain and vegetables and for subsistence products, but not for commodity production. There were strict restrictions on the quantity and variety of livestock and poultry. In agricultural regions, sows and draught animals could not be raised, only pigs and sheep. In livestock regions, dairy cows could be raised, but not beef cattle. In some other places, it was even decided that income from individual sideline production of commune members could not exceed 30% of their total income. Before 1980, these restrictions had been abolished in Gansu Province and in a few other provinces. In 1980, new decisions were made in Heilongjiang, Shaanxi, Sichuan, Qinghai, Guangdong and some other provinces, municipalities and autonomous regions. The general idea was that commune members were free to grow, plant and do business in order to provide more products and raise income, so long as they took an active part in collective production and refrained from exploiting others or damaging state-owned resources.

D. To support individual sideline production of commune members with materials and technology.

Both the needs of the collective economy and the needs of individual sideline production were given unified consideration when the production team worked out its plans for production. Manure was given to commune members in proportion to these balanced needs. Some communes and production teams even provided commune members

with chemical fertilizer, seeds and water for irrigation in order to improve the production conditions of private plots. Aids were given to commune members who raised domestic animals and poultry. The usual measure adopted in Heilongjiang was that young animals were supplied to commune members for raising and production teams helped them with the breeding of cattle and sheep raised by them. Equal epidemic prevention treatment was given to domestic animals and poultry raised by the collective and by commune members themselves. Fairs to propagate domestic animals were held to facilitate the exchange of livestock among commune members who either had spare domestic animals or were short of them. Pasture areas were set aside for commune members to use for grazing; in other cases, a certain amount of fodder grass was allotted to commune members by the production teams. Similar measures were adopted in other regions.

E. To facilitate the raising of adequate funds by commune members for the management of individual sideline production.

In Shaanxi, it was decided that the state should give financial support to both the collectives and individuals who had difficulties in raising draught animals, pigs and sheep. In some counties of Jiangxi, interest-free loans were provided for individual planting and stock raising by commune members. In some communes in Heilongjiang, the four restrictions on providing loans (no loans for household sideline production; for raising oxen or donkeys; for raising hens, ducks, geese and rabbits; or for small-scale industry) were abolished. Many counties, communes and production brigades supplied funds for individual sideline production of the commune members.

F. To readjust the channels of distribution, prices and taxes.

In order to ensure the sale of individual sideline products of commune members, the departments of commerce, supply and marketing and foreign trade signed contracts for production and marketing with commune members through their communes and production teams. Thus, the sale of all products could be ensured. In some places, it was also stipulated that peasants could sell either locally or at long distance their individual sideline products as allowed by the state once they had fulfilled their task of selling to the state. In some provinces, municipalities and autonomous regions, prices and taxes were readjusted according to local conditions. In Xinjiang, it was decided that commune members could sell, tax-free, those oxen, horses, mules, donkeys, camels, pigs and sheep which were raised by themselves. Neither had they

to pay taxes if they slaughtered domestic animals for their own consumption. In Yili district, it was stipulated that the purchasing price of beef cattle raised by individuals could be 50% higher than the normal purchasing price.

4. Progressively readjust the structure and distribution of agricultural production in a planned way.

In China's agriculture, a big problem which has existed for many years has been the irrational structure and distribution of agricultural production. It found concentrated expression in the single-product economy which was becoming more and more predominant. In this case, the structure of production went against the principle of overall development. The production of industrial crops, forestry, animal husbandry, fishing and sideline production had been given far less attention than the production of grain had. In the production of grain crops, we grew more rice and corn than other food grains. The distribution of production went against the principle of working out measures suited to local conditions. The key link was grain, whether in forest regions, pastoral regions or fishery regions. In order to grow grain, people in many places blindly destroyed forests and grass lands so as to open up wasted land; and built dykes to reclaim land from lakes. Natural resources were seriously damaged and ecological distribution become unbalanced. The outcome was that conditions for the production of forestry products, animal husbandry, sideline products, fish and industrial crops were worsened; the function of helping each other progress in the various sectors of agriculture was not given full play; and grain production itself was unable to develop very quickly.

After the "cultural revolution," the party and government began to show great concern for the readjustment of the irrational structure and distribution of agricultural production. The recovery and development of agriculture was rated as an important matter. In the Decisions on Some Questions Concerning the Acceleration of Agricultural Development, the Central Committee of the Communist Party of China pointed out: "The present agricultural structure and food composition of the people must be readjusted progressively and in a planned way. The present situation of paying attention only to grain production but not to industrial crops, forestry, animal husbandry, sideline production and fishing must be changed." In 1980, the Central Committee further put forth the strategic policy of giving full play to favourable conditions and fostering strength and circumventing weaknesses. These policies all made clear how we should readjust our country's structure

and distribution with regard to agricultural production. The principal tasks of readjustment of the structure and distribution of agricultural production were as follows:

A. To further carry out the principle of working out measures suited to local conditions and readjust the proportion of the production of grain and industrial crops.

In 1980, the acreage under grain was 1,747.09 million *mu*, which was 41.85 million *mu*, or 2.4% less than in 1979. The acreage under industrial crops was 238.82 million *mu*, which was 17.31 million *mu* or 7.8% more than in 1979. The distribution of crops was tending towards consolidation. In Hunan, the production task of 300,000 *mu* of cotton fields scattered all over the western and southern parts of the province had been assigned to two other districts — Changde and Yueyang. Some readjustment had been made for cotton growing in other regions, making it possible for cotton-growing regions to expand by about 500,000 *mu*. In Jiangxi Province, more than 50 counties had in the past been requested to grow cotton, but now the task was given to 20 counties for the purpose of consolidation. The three districts in the Hexi corridor of Gansu Province was one of the main sugar-beet growing regions in China. In 1980, the acreage under sugar beets was extended to 70,000 *mu* or 48.9% more than that of the previous year. In 1980, some provinces decided to further readjust planting acreages and distribution. It was decided in Shaanxi to let Dali, Lintong and three other cotton-growing counties (municipalities) take over the production task of 290,000 *mu* of cotton fields in 13 other counties which were not fit for cotton growing and to increase the acreage under cotton in the five counties. The production of rape was concentrated to the counties in Baoji municipality and Hanzhong basin. There had been an increase of 300,000 *mu* of the acreage under rape in these areas.

B. Resources of production for forestry, animal husbandry, sideline production and fisheries should be protected and rationally utilized.

Different regions should develop according to local conditions. Those suited to farming should develop agriculture. Those suited to animal husbandry should develop husbandry and those suited to fishing should develop fisheries. The principles of making full use of local advantages and of giving full play to favourable conditions and superiority were accepted by increasing numbers of people. Instances of destroying forests and grasslands so as to open up waste land had been greatly reduced. In places where conditions permitted, land had been returned to forestry and animal husbandry.

For example, in Qinghai Province, 3 million *mu* of cultivated land had been returned to use as grassland. In Hunan Province, 560,000 *mu* of land was returned last spring for the growing of forests. But in quite a few places, the grave situation of destructive felling of forests still existed. To put up dykes to reclaim land from lakes was no longer encouraged in the provinces. Freshwater fish culture improved over the previous year. Over 80 counties in 11 provinces all over the country built 320,000 *mu* of fishing ground as bases suited to fish culture. Protection of resources had been given enough attention in offshore fishing. In the Yellow Sea and Bohai Sea waters, a fishing off-season was strictly implemented. The number of fishing boats was strictly controlled during the autumn shrimps-catching season. In the East China Sea waters, the off-season fishing period was extended from three to four months. The use of drift nets, purse seines, small hooks and other measures were adopted once again.

C. New centres for agricultural and sideline products should be set up and old ones consolidated and developed.

The State Council decided that agricultural mechanization should be promoted in the northeast. Centres for the production of marketable grain and beans are to be set up rapidly as one of the important projects of the state plan. This decision was beneficial to the speeding up of the building of centres for producing marketable grain and beans; to an increase in total output and commodity rates of grain and beans; to the support of the regions for industrial crops, tree farms, livestock farms and fishing farms in order to enable them to make full use of their favourable conditions; and to the readjustment of the structure and distribution of agricultural production of the country. The State Council further decided that Hainan Island should develop on a large-scale the production of tropical crops such as rubber, coconuts, coffee, cocoa, pepper, and aromatics, which were of high economic value, as well as commercial forests. An ecologically balanced environment and a new structure of agricultural production suited to Hainan Island would be built up progressively and Hainan Island would become one of China's production centres for tropical industrial crops and valuable tropical forests.

D. In other regions, centres of various agricultural and sideline products must be set up and strengthened.

In some regions, there has been a clearer direction in this development. Apart from centres for grain production, the building of centres for industrial crops, forestry, animal husbandry, sideline

production and fisheries had been given adequate attention in these regions. For example, 58 centres for industrial crops had been built up in Fujian by 1980. Out these, there were 13 sugarcane centres with a yearly output of over 10,000 tons, 5 tea centres with a yearly output of 2,500 tons, and 8 tea bases with a yearly output of 500 tons. Besides, there were 21 centres for fruit, 3 for jute and bluish dogbane and 2 each for cured tobacco, mulberry-feeding silkworms, rubber, sisal hemp. It was decided that oil-bearing-crop centres should be built up in three counties, such as Changling in the west of Jilin; sugar-beet centres should be established among some communes in 16 counties such as Nongan. It was also decided that centres for sunflower and castor-oil plants should be established in Baiquan and 10 other counties in Heilongjiang. Another 24 counties such as Anda should become sugarbeet centres. Guanzhong Plain in Shanxi should become a cotton growing centre. Most parts of the farmland in Qinghai was grassland. In the past, animal husbandry was not given enough attention because of a blind search for self-sufficiency in grain. It was decided in 1980 that Qinghai should be an animal husbandry base. Shaanxi also decided to transform the northern part of the province into a centre for forestry and animal husbandry. Animal husbandry centres all over the country were also developing. The Ministry of Agriculture had set up marketable beef cattle centres in 200 counties. Progress had been made in the fields of improved breeding, livestock raising and grassland improvement. One hundred and forty of these centres were put into production in 1980. Beef cattle purchased by the state were mainly provided by these centres. There were 157 counties which had centres for raising goats. Those centres had been jointly set up by the departments of supply and marketing, agriculture and foreign trade. Goat skins provided by these centres made up 60% of total purchases by the state. In addition, a great number of other production centres for fruits, dry fruits, edible fungus, mao bamboo, raw lacquer, day lily, palm reed and dozens of other native products had been set up.

Grain supply must be guaranteed during the course of the readjustment of structure and distribution. The State Council decided that the central government and Guangdong Province should provide Hainan Island with 500 million *jin* of grain during a period of five years beginning in 1981 in order to reduce the pressure of grain production and to promote the production of tropical industrial crops. The state would provide Shaanxi with 320 *jin* of grain every year from 1980 to 1985 to help cotton production there. The state has provided Fujian with 200 million *jin* of grain every year in recent years to solve the problem of low grain

rations for sugarcane growers. In Hunan Province, from 1979 to 1980, out of 800 million *jīn* of grain allocated by the provincial government, over 400 million *jīn* went to cotton-growing regions, over 200 million *jīn* to forestry regions, and over 100 million *jīn* to support the production of other industrial crops and animal husbandry. Some regions had adopted the policy of selling industrial crops and animal products instead of selling grain. In some major sugar-beet planting regions in Gansu, Inner Mongolia and Heilongjiang, it was stipulated that sugar beets could be sold to the state in place of the state purchasing quota for grain. In Gansu, one *jīn* of grain could be replaced by 10 *jīn* of sugar beets. In Inner Mongolia, one *jīn* of grain could be replaced by 8 *jīn* of sugar beets. As alternatives, the state could sell grain to the communes according to the same exchange rate or the state could reduce or exempt its grain-purchasing requirement. Shanxi Province provided that those communes and production teams burdened with production of forestry products, animal husbandry and oil-bearing products, could sell the products of those activities to the state in place of grain. A measure for exchanging those products and cotton for grain was adopted. Grain could be sold as a bonus to those communes who sold cotton or oil according to the proportion set by the government. In Jilin Province, it was stipulated that the amount of grain purchased by the state from forestry, animal husbandry and industrial-crop centres could be reduced. This regulation was to remain unchanged for a few years. It was stipulated for nearly all provinces that those communes and production teams which grew industrial crops, engaged in forestry or raised animals, should have grain rations not less than those in nearby grain-producing regions. Some regions had also adopted the measure of exchanging products. In Guanghan County, Sichuan Province, one *jīn* of rapeseed oil could be exchanged for 7 *jīn* of corn from other regions. Huaxian Farm in Guangdong Province exchanged 60,000 *jīn* of peanut oil with Zhujian Farm for 700,000 *jīn* of cereals. This method not only gave full play to favourable local conditions within regions, but also solved the grain problem.

E. To provide funds for the readjustment of structure and distribution in agriculture.

Both central and local governments gave help to many production projects and regions in matters of finance, credit and prices. In Fujian Province, the central and provincial governments invested over 7 million yuan to back the production of industrial crops from 1978 to 1980. In order to give full play to favourable conditions in mountainous regions, the transportation bureau in

Anhui Province gave 8.63 million yuan in subsidies for road repairs. Funds were also allocated by the forestry departments of the province, districts and counties for afforestation. Leading bodies in the province decided to increase subsidies for planting trees for use in construction, trees with economic value and trees for afforestation. For instance, subsidies for planting China fir were raised from 6 yuan per *mu* to 10 yuan per *mu*. Banks and credit cooperatives in many places offered loans to help diversify the economy. For example, supply and marketing co-ops in many places set up funds for the development of native products and provided communes with interest-free loans. As of November 1980, such funds had come to 730 million yuan. It was stipulated in some provinces that local governments should offer a certain amount of subsidies towards the purchase of certain products in addition to the increased purchasing price set by the state. Inner Mongolia's purchasing price for sugar beets was set at 75 yuan per ton as stipulated by the state, in addition to a subsidy of 15 yuan by the government of the autonomous region. In Heilongjiang, the subsidy was an additional 10 yuan. It was provided in the Shantou region of Guangdong Province that in addition to the purchasing prices per ton of sugar cane and jute as fixed by the state, a further allocation of funds in the form of subsidies was made out of local revenue and from the profits of rural processing factories and from supply and marketing and commercial departments. It was stipulated in Guangdong Province that beginning from the new sugar-cane pressing season in 1980, a part of the profits of the sugar factories would be given to sugar-cane planting communes. Similar decisions were made in Jilin Province in the form of sugar beets delivered to sugar refineries for processing by the communes. In Zhejiang Province, it was stipulated that the amount of tea purchased by the state in 1978 was to be taken as the base amount; and if more was delivered by the communes to the state-owned tea factories for pressing, 70% of the profits obtained were to be given back to the communes.

In addition, much work had been done in the supply of materials, technical guidance, cooperation between producing and marketing, communications, storing, processing and selling. This gave impetus to the production of industrial crops, forestry products, animal husbandry, sideline occupations and fishing.

5. Actively try out the policy of economic integration with the participation of the rural communes.

The collective economy of the rural people's communes in our country was organized according

to administrative divisions and different administrative levels. Economic cooperation beyond this limitation was not allowed. Plans for future development were to extend step by step, according to administrative divisions and levels. In other words, the basic accounting unit on the level of the production team could pass on to the level of the production brigade through integration. Then these brigades could undergo further transition to those basic accounting units on the level of the commune through further integration. In these two years, especially since 1980, the old method of transition through combination of levels one at a time has begun to be broken through. Cooperation among various levels of the economy has been under experiment. The main forms are:

A. Economic cooperation among the production teams within the same communes.

In September 1979, Xiangyang Commune in Guanghan County of Sichuan Province tried to launch joint enterprises using the investment of production teams and achieved remarkable results. These experiments were widely popularized throughout Guanghan County in 1980. The principle was that the teams participating in these joint enterprises were free to join or to withdraw. The management committee of the enterprises was set up by means of elections at a congress of the shareholders. The congress of shareholders or the management committee made decisions on the direction of operations, plans for production, financial expenditures, personnel arrangements and penalty and reward measures. The profits of the enterprise were divided according to the shares after deducting a portion for the expansion of production. Thus, the past system of commune-run enterprises set up with labour power and funds from the production teams was changed into one of joint enterprises run by share-holding production teams.

B. The integration of communes and production teams in different communes and regions.

Lili Commune in Wujian County of Jiangsu Province and Linghu Commune, known as "native place of water chestnuts," in Wuxing County, Zhejiang Province jointly managed the production of freshwater chestnuts. Lili Commune provided 20,000 mu of paddy fields and was responsible for management; Linghu Commune provided water chestnut seeds and was responsible for planting. Some communes and production teams in Wujian County and Huxing Commune in Jiading County, Shanghai worked together in the production of yellow grass (a kind of grass used by craftsmen). Shanghai provided seeds and manure and sent technicians to give instructions on planting; Wujian

County provided land and labour power. Some production teams in Jiading County provided ponds and worked together to cultivate pearls with the Yingbing Production Brigade, well-known for its pearl-cultivation, in Huangdi commune of Wuxian County, Jiangsu Province. The income gained by these joint enterprises was divided according to the shares. Contracts had been signed among the communes and production teams in Peng Xian County of Sichuan Province to provide each other with products and to create conditions for production. The communes and production teams in mountainous regions provided communes and production teams on flat lands with the seeds of potatoes, the rhizomes of *chuanxiong* and other crops. In return, the communes and production teams on flat lands provided rice seedlings and sweet-potato seedlings to the mountainous communes and brigades. Farm cattle and labour power were shared among them. In addition, they jointly opened up mines of asbestos and coal in mountainous regions and divided income according to their shares.

C. Rural communes undertook economic cooperation with state farms or more often with joint enterprises in agriculture, industry and commerce under the system of the state farms.

Cooperation between suburban communes in Chongqing, Sichuan Province and joint enterprises in agriculture, industry and commerce in the city of Changjiang was made up of 26 state farms, livestock farms and fish farms and had a representative character. In 1979, 50 production teams joined the cooperative venture and, in 1980, there were over 800 production teams involved in this cooperative effort. The main forms of joint enterprises were:

1. *The joint enterprises processed and sold products on behalf of the production teams.* Having fulfilled the task of selling products to the state, production teams sent their extra tea and oranges to the joint enterprises for processing and sales. A part of the profits were returned to the production teams.

2. *Production teams provided services or processed products to the joint enterprises which paid a certain amount of the expenses and offered some elements of support for production.* For example, the Changshou Lake fish farm, in a joint enterprise, left its weanling milk cows to the care of nearby production teams; the teams would take care of them for one year and earn 200 yuan per head. Condensed fodder and medical expenses for the young milk cows were provided by the enterprises.

3. *Both the joint enterprises and the production teams provided the conditions needed for production and ran the business together.* For example, the Changshou Lake fish farm provided ponds, fish fry and fish nets and sent technicians; while five nearby production teams provided labour power and bait. All participants jointly ran the business. Thirty percent of production went to the production teams, with 70% to be sold by the fish farm. Eighty percent of the profits in the business went to the production teams, while 20% went to the fish farm.

4. *Funds were collected and counted as shares, with the business run jointly.* For instance, in the orange management department, with the Baxian branch of the joint enterprise as the core, production, processing and sales of oranges were made into a coordinated process. Any production team with a yearly output of over 10,000 jin of oranges could apply for membership in the management department. Each share was valued at 200 yuan and the amount of shares was not limited. One portion of the profits of the department went to expansion, with the remainder divided among the production teams according to the amount and the quality of oranges each production team had provided. Even those teams with no shares could take part in the profits if they sold oranges to the department. Another portion of profits was divided according to the number of shares held. In addition, commercial departments and service centres maintained joint funds. This form of joint enterprise was also tried out in full or in part in Zhejiang, Hubei, Shenshi, Jilin and other provinces, municipalities and autonomous regions. Some other forms had come into being as well.

D. *The economic union between production teams and state-owned industry.*

For example, after fulfilling the task of selling to the state, those production teams could send their surplus rural products to the state-owned factories for processing. In 1980, over 1,000 production teams in Yushu County, Jilin Province, sold surplus grain to the state-owned brewery. Profits were divided according to the shares held. The same method was adopted between tea-growing communes and state-owned tea factories in Zhejiang, and between sugarcane-planting communes and state-owned sugar refineries in Guangdong Province. Moreover, some production teams undertook processing for state-owned industries. Factories were jointly run and profits were divided according to the shares.

E *Economic union between rural communes*

and commercial departments.

In 1980, there were about 700 such joint enterprises, including joint enterprises for production, processing and marketing in Foshan area, Guangdong Province. In Kaiping County of Foshan district, 1,600 commodity bases for oranges and tangerines, cows, sheep and rabbits were set up one after another through the use of joint enterprises. Because of the situation in the market, supply and marketing co-ops in Zhongshan County played an important role in helping the communes market some of their products. Profits of the joint enterprises were divided according to the proportion of the investment and products were divided according to a percentage agreed upon by all.

Rural communes now take part in various forms of economic cooperation, thus promoting the development of the national economy. They have activated the rural economy and have helped to increase the income of communes and production teams. They are beneficial to the state, to the collective and to commune members. This is a good way to develop the rural economy.

Some Existing Problems and Trends for Future Development

In 1980, there was great development in our country's agriculture. But backwardness left over by the old society had not been completely transformed and there were still many difficulties and problems in agriculture. The main problems were:

1. *The "Left" ideological influence which had been shaped over a long period was far from being eliminated.* In the leading administrative organs and rural communes and production teams, there was great unevenness in carrying out the lines, principles and policies worked out at the Third Plenary Session of the 11th Party Congress and afterwards. The peasants' enthusiasm in some parts of the regions, communes and production teams had not been fully aroused.

2. *The material and technical conditions for agricultural production were still relatively backwards.* In all of China, there was only an area of 340 million mu of land which gave stable, high yields irrespective of drought or water-logging. One-third of the cultivated land still consisted of unimproved saline-alkaline land, water-logged low-lying land, acid soil, cold water paddy fields (in mountainous regions, paddy fields are irrigated with mountain springs), poorly drained paddy fields, farmland on slopes which suffered serious water loss and soil erosion. There were not enough farm machines, their quality was not up to stan-

dard or they did not exist in complete sets. In some places, even the need for draught animals, animal-drawn farm implements and manually operated farm implements could not be fully met.

3. *Low public accumulation and shortages of production funds in communes and production teams.* The fixed assets of production teams throughout the country were on the average only somewhat over 100 yuan per capita in the rural areas. Many production teams found it difficult to ensure both an increase in fixed assets as well as the need for circulating funds. According to statistics from 3,602,000 production teams in 26 provinces, municipalities and autonomous regions, average circulating funds owned by the production teams themselves only covered about 15% of their actual needs.

4. *Levels of culture, technology and management in the field of agriculture were all very low.* Only 30% of all youngsters and middle-aged people in rural areas had an educational level above junior middle school; 40% of them had a primary-school level of education. In fact, there were only 250,000 people who were engaged in the work of science, technology and education in the field of agriculture. On the average, there was only one agro-technician for every six thousand mu of cultivated land (with a rural population of 3,200 people). According to investigations in some places, only one-third of cadres in rural area had some knowledge of management and administration; another one-third had little knowledge; the other one-third had no working experience in rural areas nor any knowledge of agricultural management.

5. *The proportional dislocation of the national economy had caused difficulties in the development of agriculture.* The supply of agricultural means of production was inadequate to meet the needs. Equipment for transportation, processing and storing of agricultural products was insufficient. Distribution channels were sometimes blocked.

Under such conditions, the level of agricultural production was low and unstable. As compared with some of the developed countries, there were large gaps in per-unit-area yield of agricultural crops, in the ratio of livestock for selling and slaughtering and in rural labour productivity. The average output of agricultural products per capita was even lower because of the rapid growth in population. In some areas, average per capita output was even lower than in 1957. The peasants' life in some regions was still relatively difficult. Persistent, hard efforts had to be made to completely put an end to the backwardness of agricul-

ture in China. But since the economy in our country had always been somewhat backward and because our state finances at present are undergoing substantial difficulties, the economic power of rural communes and production teams remains quite weak. Therefore, for a period of time to come, a large increase in investments cannot be looked to as a means of changing the condition of agricultural production. In order to achieve rapid development in agriculture and good results, the following principal measures should be adopted in order to make the best of the potential:

1. *To persistently carry out the spirit of the Third Plenary Session of the 11th Party Congress; to go on eliminating "Left" ideological influences; to ensure the implementation of a series of principles and policies worked out by the party and government; in particular, to work out measures suited to local conditions for carrying out various forms of the system of job responsibility for agricultural production; to further bring the enthusiasm of 800 million peasants into full play.*

These are the fundamental principles and preconditions for putting other measures into effect. Judged by the situation in 1980, development in this field in various parts of the country was quite uneven. A quick change of this situation will give great impetus to agricultural production.

2. *To proceed from the real situation in our rural areas, an economic structure with socialist collective ownership as the mainstay, with simultaneous existence of various sorts of economic components and with multiple levels of administration must be established after further readjustment and restructuring.*

The system of integrating government administration with commune management in the rural people's communes must be actively and stably reformed. Different forms of economic co-operation must be consolidated and developed. It goes without saying that the above-mentioned reforms will play an important part in promoting the development of the rural economy.

3. *To make full use of labour and natural resources in rural areas and to continue the readjustment of the rural production structure in order to make possible the large-scale development of a diversified economy in agriculture, together with good control of grain production.*

This will be beneficial to the full development of the functions of mutual reliance and mutual promotion among all rural departments, to increasing public accumulations of the communes and production teams and peasants' income and to

improving conditions for expanding agricultural production.

4. *To popularize in a significant way scientific and technical measures suited to the situation in our country and to combine traditional methods which are still effective with modern science and technology.* For example, improved seeds must be cultivated and popularized and manuring, irrigation, cultivating methods, etc. must be improved. These measures will achieve good results with less investment and have bright prospects. To further implement a series of principles and policies of the party and government will greatly inspire the initiative of millions of peasants to study and make use of science. The important role these measures will play in the development of agriculture should not be underestimated.

5. *To achieve better economic results from agricultural investment.* Although the state will not be able to make large increases in the amount of agricultural investments in the near future, good

results can be achieved by making rational use of the investments that are available. Terrible waste in the use of agricultural investments in the past was a big problem. In water conservancy construction, for example, there were severe losses and a great deal of abandoned projects and equipment. This was very often due to the fact that production installations and technical devices supplied were incomplete, or that the principal components of the projects and field drainage and irrigation systems were also incomplete so that those elements that had been put into operation lost much of their effect. In the field of agricultural mechanization, agricultural machines were of poor quality, were high in price and were also supplied in incomplete form. At the same time, they were not kept in good condition and their utilization ratio was quite low. Mechanized equipment was scattered extensively, which also reduced the effect of the investment. A better solution to existing problems and an increase in the economic results of investment will have the effect of an increase in investment.

3. CHINA'S STATE FARM AND LAND RECLAMATION SECTOR

By Guo Chunhua

National Institute of Agricultural Economy

I. Historical Department of the State Farm and Land Reclamation Sector

China's state farm and land reclamation programmes have had a history of more than 30 years since their establishment. As early as 1947, base areas in the Northeast and some inside Shanhai-guan (a pass of the Great Wall at its easternmost starting point) experimented with a system of local state farms whose main task then was to mass-produce and disseminate fine crop strains, to popularize advanced farming techniques, in the prevention and elimination of diseases and pests, in the collection and application of manure and in guidance of the peasants in improving farming techniques. The founding of the People's Republic of China prompted an acceleration in the development of state farms.

In December 1949, Comrade Mao Zedong approved for issuance the 1950 Directive on the Army's Participation in Production and Construction.

At the National Work Conference on Agriculture held by the Ministry of Agriculture in that year, it was pointed out: "We must take the People's Liberation Army as a great force in the country's production and construction, and enthusiastically help them to go in for production." A proposal for "experimental state farms and the cultivation of 3 million *mu* of land in 1950" was advanced.

A large number of PLA officers and soldiers were transferred to take part in agricultural production. A group of state farms was set up in Heilongjiang, Xinjiang, Jiangsu, Ningxia and Shandong provinces and autonomous regions. In 1952, rubber plantations were set up in Guangdong, Guangxi, Yunnan and Fujian. A host of local state-owned agricultural and pastoral farms or farms of indigenous products were established in succession on lakesides, hillsides and coastal areas in other provinces and autonomous regions and on the outskirts of municipalities.

The main task of the state farms as laid down by the state were: first, to produce large quantities of marketable grain, raw materials for industry and animal products for the state; second, to set an example for peasants with profitable economic results of high-yield and low-cost; third, to promote agricultural production by aiding peasants with fine strains, breeding stock, farm machinery

and advanced agricultural expertise; fourth, to demonstrate the superiority of mass collective production so that peasants would be prompted to become organized and take the road of collectivization. The state farms, at that time, did not only have the economic task of increasing production but also an important political mission in promoting agricultural collectivization.

The Production and Construction Corps of the Xinjiang Military Command was founded in July 1954. In August, the first group of officers and men of the railway corps went to Hulin Prefecture, Heilongjiang Province to reclaim land for the establishment of state farms. In June 1956, the Land Reclamation Administration of the Mishan Railway Corps was set up and at the end of the year, 10,000 demobilized officers and men of the railway corps marched into the Great Northern Wilderness. With these troops stationed to garrison the frontier and to open up wasteland, the state farms could shoulder the major military and political tasks of exploiting, constructing and safeguarding the border areas and of helping fraternal nationalities in their socialist construction.

Establishment of a Ministry. To meet the needs of the development of the state farms, the central authorities decided in 1956 to set up a Ministry of State Farms and Land Reclamation. Provinces, municipalities and autonomous regions correspondingly established managerial organizations for the state farms to strengthen their leadership in land cultivation.

A large number of former military men trooped into the Great Northern Wilderness in March 1958, and the large-scale reclamation of the Sanjiang Plain was underway. At the same time, a high tide of "going up mountains and going down to the countryside to open up waste-land" emerged in various places throughout the country. Fifty thousand cadres in Jiangxi set up some 80 state-owned agricultural and forestry farms in mountainous areas. One hundred thousand people in Hunan went out to develop mountainous areas. An upsurge of vigorous reclamation of wasteland was brought about in Hubei and Gansu. State farms throughout the country witnessed great development under this situation. A total of 10,450,000 *mu* of wasteland was cultivated in 1958, approximately equal to the total of the previous eight years since the founding of the PRC.

Development of Rubber. China's natural rubber also continued to develop during that period. In 1955, China's second natural rubber plantation centre was set up in Xishuanbanna and other places in Yunnan. After 1958, natural rubber centres based in Guangdong increased their cultivated land for rubber plantations. They summed up their relatively positive experiences as "taking hills and forests as the base" and "tree networks, terraced fields, fine strains and plant cover." These efforts made China the only country at that time to succeed in planting rubber trees on a large acreage north of 17°N.

Start farms took on a steady development after the implementation of the 1962 policy of "readjustment, consolidation, filling out and raising standards" for the national economy. By 1966, there were 1,940 state farms with an output of 8,090 million *jin* of grain (including soya beans) from a cultivated area of 47.84 million *mu*. They handed in to the state 2,820 million *jin* of grain and 775,000 tons of cotton. In 1966, they realized profits of 165 million yuan from an accumulated total of 2.5 million *mu* of rubber trees.

During the time of the "cultural revolution," state farms and land reclamation were seriously undermined by Lin Biao and the Gang of Four. In 1969, the Ministry of State Farms and Land Reclamation was abolished and most of its administrative units in various provinces, municipalities and autonomous regions were shut down. Some state farms were turned into people's communes. They suffered losses for years on end because the managerial system was turned upside down. No one was in charge of production and economic results were neglected.

Post-1977 Changes. After the smashing of the Gang of Four, the confusion was put right and the pernicious influence of Lin Biao and the Gang of Four was gradually wiped out. From late 1977 to early 1978, the State Council held a national state farms working conference. The conference recommended the consolidation of state farms and demanded that state farms be built into bases for marketable grain and industrial raw materials; that they become groceries for urban consumption and exportation; and that they play an exemplary leading role in agricultural modernization. In February 1978, the State Council approved the Minutes of the National Working Conference on State Farms, and decided to establish the General Bureau for Land Reclamation so as to strengthen the leadership and management of state farms throughout the country. It also decided that four reclamation areas in Heilongjiang, Xinjiang, Guangdong and Yunnan be placed under the dual leadership of

central and local authorities, with the provinces and autonomous regions as the mainstay. It demanded that authoritative and powerful administrative organizations be established in other provinces, municipalities and autonomous regions. The conference was followed by a readjustment of leading bodies, working forces, and management and by the restoration of necessary rules and regulations. These steps progressively restored production, improved management and cut down losses.

To further strengthen the leadership over state farms, the Central Committee decided, in 1979, to re-establish the Ministry of State Farms and Land Reclamation. State farms witnessed relatively good harvests in agricultural and pastoral production that year and changed the pattern of long-time losses.

1980 Statistical Summary. China's state farms and land reclamation have been developed and constructed over a wide scope during the past 30-odd years. By the end of 1980, there were a total of 2,093 state farms and 6,072 industrial enterprises (including farm-run workshops), with a population of 11,360,000 people and 4,920,000 workers. The farms held 66,820,000 *mu* of land under cultivation; 4,830,000 *mu* in rubber plantations; more than 1,600,000 *mu* in orchards, mulberry fields and tea plantations; 90 million *mu* in usable pastures and a population of 13 million domestic animals. The total horsepower of agricultural machinery was 8,790,000, with 54,600 large and medium-sized tractors, 16,200 combines, 21,600 trucks and 31,000 machines for irrigation and drainage.

For the past three decades, the state farms have initially established a network of centres for marketable grain, industrial crops, urban-oriented foodstuffs and commodities for export. These centres have supplied to the state large quantities of grain, soya-beans, cotton, rubber, oilseeds, sugar, meat, fur, tea, fruit, milk, and ginseng and antler, as well as small quantities of tropical cash crops such as sisal hemp, oil palm, coffee beans, spices, pepper, etc.

The development of the state farms and land reclamation has made an important contribution to the exploitation, construction and defence of the frontier, to the thriving of economy and culture in the border areas and to the enhancement of national unity. It has been an example for collective agriculture and has given it due support in areas of farming techniques, production, popularization of fine breeds and farm machinery. It has helped solve employment problems for demobilized officers and men, cadres going to the countryside for manual labour, educated youths

and migrants. A vast number of cadres and workers have acquired, through long practice, experience in managing and running agricultural enterprises and production, and have thus formed a mighty fighting force in developing the range and quality of production.

II. Development of State Farms in 1980

In 1980, state farms throughout the country conscientiously implemented the two documents concerning agricultural development issued by the Party Central Committee after its Third Plenum and carried out a series of policies, such as readjustment of the economy and enterprises, the practice of allotting financial responsibility, expansion of enterprises' decision-making power, the practice of personal responsibility for production, the upgrading and increase of wages and the increase of workers' income. Good results were achieved in production, construction, management and administration. This was due to the fact that the enthusiasm of workers and technicians was brought into play in popularizing advanced experiences and scientific research and through the application of science and technology to forestry, agricultural and pastoral production, and through the state farms' experiments with agricultural-industrial-commercial integrated enterprises and other forms of economic integration.

1. **Agricultural Production.** Although China's grain output decreased in 1980 because of serious natural disasters, the state farms in that year set records in fulfilling quotas. Thanks to arduous efforts on the part of the vast number of workers, the state farms — particularly those in Heilongjiang and Xinjiang which had increased production by large margins — surpassed the highest previous records for the five main categories of general-output quotas: per-mu yield, marketable grain sold to the state, value of industrial and agricultural output and profits. The state farms reaped an all-around increase in the production of grain, cotton, edible oils, sugar, tea, rubber, etc.

The total output of grain was 75,330 million *jin*, the highest level record in history and a 4.7% increase over that of 1979. A total of 6,100 million *jin* of grain was sold the state, 21.8% more than in 1979. The total output of cotton was 93,000 tons, an increase of 11.2% over 1979. The total output of oilseeds was 115,500 tons, 4.1% more than that in 1979.

The total output of sugarcane and sugar beets was 1,460,750 tons, a 28.7% increase over 1979.

As for animal husbandry, there were 200,000 head of cattle on state farms by the end of the

year and the year's total output of milk was 650 million *jin*, an increase of 8.7% over 1979. There were 6,995,000 sheep in the pens, an increase of 0.03% over 1979; 3,987,000 pigs in the pigsties, 18.4% less than that of 1979. Meat sold to the state totaled 274 million *jin*, or 21.8% more than that sold in 1979.

In the past few years, farms in various places gave stress to afforestation by increasing investments in forestry, organizing professional forestry units, systematically developing nurseries and implementing policies on afforestation. All state farms planted trees on a total of 890,000 *mu* of land, 300,000 *mu* more than in 1979.

The output of rubber was 103,000 tons, 3.6% more than in 1979. Guangdong's rubber plantations overfulfilled the plan even though two typhoons broke off or uprooted 9.6% of their tapped trees.

The main reasons for the rapid development of agriculture, forestry and animal husbandry in the past three years are as follows:

1. *Comparatively good economic results were achieved through the implementation of the readjustment policy and good overall arrangements to bring into play natural and economic advantages.* In Xinjiang, under the prerequisite of continuing increases in total grain output and fulfillment of the sale of marketable grain to the state, state farms managed their crops in a planned way by properly enlarging areas sown to cash crops such as cotton, oilseeds, sugar beets and hops. Some farms in northwest and north China planted sunflowers, rape and flax on arid and alkaline land not suited to grain. Some farms in the south planted tea and tangerines on hilly land. When typhoons and cold waves struck rubber plantations in Guangdong and Guangxi, many planted tea, sisal hemp and tropical cash crops. After the readjustment, the approach to production tended to be more rational and realized quite favourable economic results.

2. *The popularization of advanced technology helped to raise levels in scientific farming, animal husbandry and rubber-tree cultivation.* With regard to scientific farming, work has been carried out mainly in the following areas:

A. Great efforts have been made to stress production of specialized strains, mechanization in processing, standardization of quality and distribution of crops according to regional conditions. The establishment of regional centres focusing on specialized strains and the application of more than 1,000 seed selectors have generally improved the quality of plant varieties used in production.

Many regions have made use of general surveys and appraisals of seed varieties to resolve problems of multiple, confused or mixed varieties of seeds. This has created conditions for a more appropriate distribution of crop varieties in agricultural areas. As to the utilization of superior hybrids, in addition to the fact that crossbred maize and kaoling are commonly used in state farms, the use of hybrid rice has ranged from the south's indica rice to the north's japonica rice.

B. The application of fertilizer has been increased and techniques improved. The quantity of chemical fertilizer applied in the field jumped from 24 jin per mu in 1977 to 38 jin per mu in 1980. The technique of deep-spreading and side-spreading chemical fertilizer was widely adopted; moreover, the use of fertilizers was increasingly based on soil surveys, with importance attached to coordination of the three essential elements of fertilizers and to the rate of their utilization.

C. The adoption of chemical herbicides in combination with machine weeding has effectively prevented weeds from over-growing crops and has raised the level of field management. In 1980, China's state farms used herbicides on a combined area of more than 19,650,000 million mu, or about one-third of the total area under their cultivation.

D. The quality of machine operation has been improved to meet agricultural demands.

E. Advanced science and technology has been adopted, such as the development of sprinkling, aircraft operation, popularization of biological prevention and elimination of pests, the application of cycocel, the application of calcium chloride in seed-dressing, the spraying of ethylene in cotton fields for early ripening, etc. These techniques have produced notable results in increasing production in cases where proper measures were taken.

With regard to scientific animal husbandry, work has been carried out mainly in the following areas:

A. In order to upgrade the raising of cattle, endeavours were made to improve the breeding of dairy cows and cattle. These efforts met with impressive results.

B. The technique of using frozen semen for artificial insemination was stressed. As a result, the utilization of frozen semen accounted for over 95% of breeding activities in suburban dairy farms and for more than 30% among cattle-breeding stations.

C. Pastoral areas placed emphasis on the production and preservation of fodder while state farms in suburbs stressed the expansion of cultivated land for producing cattle fodder.

D. Some pastoral farms in Inner Mongolia, Xinjiang and Heilongjiang popularized the technique of fattening lambs to reduce the death rate and to raise the production rate for mutton; their more frugal use of fodder brought improved results.

With regard to scientific rubber plantations, the stress was placed mainly on rubber plantation management techniques such as using grass coverings along forest belts, green dressing and fertilizer spreading. Some farms pruned saplings and undertook transplanting and bud-grafting on a large scale in order to transform underdeveloped forests. They took conscientious action to coordinate management, planting and tapping so as to achieve the dual function of increasing both production and tree planting.

3. Construction of water conservancy projects for farmlands was intensified, and efforts were made to acquire complete complements of agricultural machinery so as to improve conditions for production.

Many water conservancy projects on state farms in Xinjiang which had not been maintained for years and whose irrigation networks had not been completed did not have an adequate soil-water balance. This condition affected the development of agricultural production. The goal of constructing water conservancy projects for farmland was firmly undertaken between 1978 and 1980. The reinforcement and maintenance of reservoirs, the prevention of seepage in canals, the completion of wells, the transformation of diversion works and the levelling of land — all of these measures created favourable conditions for the resumption and development of production.

Farms in Jiangsu have taken highly effective measures in pursuing water conservancy during the past few years. Some of the disaster-struck farms with low yields in northern Jiangsu realized great improvements in production. The Panjin farms in Liaoning and the coastal farms in Hebei all undertook water conservancy projects so as to ensure stable and high yields even in circumstances of drought or excessive rainfall.

The supply of a more complete range of farm machinery also helped to improve production conditions. The supply of urgently-needed combines, large-scale sprayers, seed selectors and transport vehicles played a dramatic role in guaranteeing timely fulfilment of tasks while maintaining high

quality, increasing output and reducing loss and waste.

2. **Industrial Production.** Industrial activity on state farms was first set up in border areas to meet needs for agricultural machinery repairs and maintenance and for the processing of farm produce. Along with the development of the farms and their production, industry that had the aim of serving agriculture and workers' daily life has been developed gradually. Suburban and inland farms have also developed industries that serve larger industry, supply cities and increase exports. Industries on state farms have developed through the year a certain foundation and scale. Up to 1980, the state farms had 6,072 factories with a total output value of 3,820 million yuan. Industrial activity was distributed as follows (in terms of output value for some main industries): food processing accounted for 30.2% of the total; textile industries, 13.1%; chemical industries, 8.2%; machinery industries, 17.5%; construction materials, 7%; petrochemicals and petroleum, 5.8%; paper-making, 2.9%; and coal, 2.1%. Industries on state farms produced over 1,000 categories of products.

Those state farm industries that were guided by the state plan and adjusted by the market made great headway in 1980. The value of industrial products in that year was 3,820 million yuan, comprising 44.4% of total industrial and agricultural output. This was an increase of 8.3% over 1979 (calculated at constant prices). A total of 98 major products were supplied to the state in 1980. These included coal, 4.14 million tons; generated energy, 498 million kwh; cotton cloth, 116 million metres; chemical fertilizers, 98,000 tons; farm chemicals, 900 tons; cement, 490,000 tons; bricks and tiles, 4,350 million units; paper, 77,000 tons; sugar, 153,000 tons; spirits, 54,000 tons; vegetable cooking oils, 43,600 tons; dairy products, 21,000 tons; tea, 14,300 tons; and farm tools and machinery, 5.3 million units. Quality was improved and varieties increased. A number of products were selected for their particularly fine quality. In 1980, departments at various levels took hold of the following principles for industry:

1. Readjustment in Industry:

A. *They placed emphasis in industrial development on processing and on those light and textile industries whose raw materials came from cultivation.* The proportional size of light and textile industries within total state farm industry increased overall. Take Shanhai and Xinjiang for example: Shanghai's light industry made up 64.7% of the total, while Xinjiang's made up 70.4%.

B. *Factories which turned out low-quality products at high cost and with poor sales results, or which were without sources of raw materials or which had suffered losses over a long period of time were closed down, suspended, integrated or shifted over to the production of other products.* According to statistics of Heilongjiang, Xinjiang, Hebei, Shaanxi, Liaoning, Jilin, Hubei and Jiangsu provinces and autonomous regions, a total of 120 enterprises were either closed down, suspended, integrated or transformed; in Heilongjiang, 13 were closed down or suspended, thus saving losses of more than 3 million yuan.

C. *The relationships between industry and agriculture in the distribution of profits were adjusted.* Quite a few factories returned part of their profits to the production units that supplied them with raw materials. This ensured an adequate supply of needed raw materials and gave impetus to the suppliers. Second, the "Report on the Intensification of the Management of Industrial Planning in State Farms," as endorsed by the State Planning Commission, State Economic Commission and State Agricultural Commission, was implemented. Concerned departments in many provinces, municipalities and autonomous regions opened accounts for industries in state farms and gave support and assistance to their plans, provided material supplies and offered business guidance. Third, administrative departments of state farms at various levels and of industrial enterprises themselves took on the following work to enliven industrial production:

Breaking paths for the sales of their products through agricultural-industrial-commercial integrated enterprises, through contract negotiations or by means of exhibitions, etc.

Adopted the practice of assumption of responsibility for production by means of "stipulations, contracts and bonuses" in industrial enterprises.

Encouraged enterprises to pursue many kinds of integration so as to use each unit's special advantages in overcoming difficulties in technology, funding and equipment. Fourth, industrial enterprises took hold of the concepts of innovation, reform and tapping potential. For example, the reform of eight small sugar mills in Hunan boosted their combined processing capacity of 2,200 tons of sugarcane per day to 4,300 tons daily, thus saving 60% of their funds for the establishment of a new plant. The chemical fertilizer plant of Baigezhuang Farm in Hebei Province lowered its per-ton consumption of coal and costs

of ammonium by a large margin through reform, innovation and tapping potential. It earned profits of more than 600,000 yuan, and changed a pattern of 12 years of losses.

2. *Diversified Economy.* "Taking one item of cultivation as the main thing while engaging in a diversified economy" is the central policy of business activity for state farms.

At the initial stage, state farms engaged only in monoculture, or agriculture; this policy led to low yields, high costs and big losses. Afterwards, historical experiences were summed up, leading to the discovery of the importance of a diversified economy. The past 30 years witnessed to a certain degree the development of a diversified economy in the state farms. This was mainly manifested in the following respects:

A. *Different kinds of farms were set up according to different business principles.*

In 1980 there were 2,093 state farms, of which 48% were mainly engaged in grain and cash-crop production; 21% in animal husbandry; 8% in rubber and tropical crops; and 14% in fruit and tea production. Ginseng and antler farms comprised 4% of the total, while 5% were engaged in other activities.

B. *These different farms developed agriculture, forestry, animal husbandry, industry, sideline occupations and fisheries according to their own characteristics.*

The total value of agricultural and industrial output for 1980 was 8,600 million yuan — 55.6% from agriculture and 44.4% from industry. Of the total value of agricultural production, crops accounted for 59%; animal husbandry, 12.6%; fisheries, 0.4%; rubber, 13.8%; forestry, 2.6%; and sideline occupations, 11%.

C. *Grain was taken as the main crop and cash crops were grown secondarily according to local conditions.*

In 1980, grain (including soyabbeans) took up 76.4% of the total sown area, with soyabbeans taking up 14.9%. Of the total sown area of main cash crops, 4.7% went to oil-bearing crops (including peanuts, rapeseeds and sesame); 3.6% went to cotton and jute; 1.4% to sugarcane and sugar beets; and 2.6% to vegetables.

D. *In animal husbandry and poultry, the rearing of meat-producing animals was taken as the main activity followed by animal-raising for milk, eggs and fur; and by raising as draught animals, and for special purposes and aquatic production.*

Pigs were made predominant in the raising of

animals for meat followed by the raising of cattle and sheep; milk cows were stressed as the main source for milk followed by milk goats; sheep were the main fur animals followed by hares, martens and muskrats; chickens were the main egg producers followed by ducks, geese and quail; oxen, horses, donkeys and mules were the main draught animals along with a small number of camels; deer were the main animals for special purposes; fish was taken as the main aquatic product followed by prawns, crabs, tortoises and turtles, while bees were taken as the focus of major activity among other animals.

E. *In forestry, natural jungles and man-made forests were given the major stress, with orchards, mulberry and tea plantations given the minor part.*

F. *In rubber and tropical crops, rubber was taken as the major plant, followed by tropical and subtropical crops such as sisal hemp, oil palm, spices, coffee, pepper and coconut trees.*

G. *In industry, 98 products were stressed, including iron, steel, coal, electricity, gasoline, diesel fuel, chemical fertilizers, farm chemicals, motor vehicles, hand tractors, combines, farm tools, cement, bricks, cotton cloth, knitting wool, paper, sugar and edible oil.*

H. *With respect to communications and transportation, most state farms are situated in border areas where conditions for communications are far from ideal. In the early years, many farms relied on themselves for building roads and bridges for transportation. Farms on rivers and lake shores or in coastal areas purchased boats or ships. Therefore, state farms have come to possess a considerable quantity of motor vehicles, trailers, motorized junks, horse carts, wheel-barrows and other means of transportation.*

I. *In construction, all but a few state farms have their own construction teams that take up construction by themselves. After the experiment in agricultural-commercial-industrial enterprises, some units established construction companies.*

J. *In trades and services, many stage farms maintained commercial networks to provide services for the daily life of their workers. After the establishment of agricultural-industrial-commercial enterprises on a trial basis, these networks were extended and spread far and wide. Some units also set up supply and marketing companies.*

3. Agricultural-Industrial-Commercial Integra-

ted Enterprises. Since fall 1978, when leading comrades of the State Council called for the experiment of agricultural-industrial-commercial integrated enterprises in China, 20 provinces, municipalities and autonomous regions have established general companies of agricultural-industrial-commercial integrated enterprises ran by state farms. By 1980, there were 209 state-farm-run integrated enterprises throughout the country. Altogether 936 state farms, 44% of the total, have joined integrated enterprises at various levels.

The organizational forms of current experimental joint enterprises fall mainly into the following four categories:

1. Integration among state farms:

A. Departments in charge of state farms in some provinces, municipalities and autonomous regions or in prefectures, cities and counties have set up agricultural-industrial-commercial enterprises by merging their subordinate agricultural and pastoral farms; this has taken place in Beijing, Tianjin, Shanghai, Shihezi in Xinjiang and East and West Lakes in Wuhan.

B. A single agricultural farm operates a company consisting of integrated enterprises. The state farm in the Huanghe River inundated area of Henan and the Liming Farm of Yunnan are cases in point.

C. Farms and factories have been merged. An example is the merger of sugarcane farms with sugar refineries in Guangdong.

D. Specialized companies are organized according to their products, such as milk companies in Beijing, Tianjin and Shanghai; a salt company in Jiangsu, a pearl company in Dawa Prefecture, Liaoning; and ginseng and anther companies in Jilin.

2. *Economic alliances have been set up between state-owned and state-farm-run integrated enterprises and rural communes and production teams.* For instance, 26 agricultural, forestry, pastoral farms, fisheries and tea plantations under the Changjiang Agricultural-Industrial-Commercial Integrated Enterprises Company in Chongqing jointly operate the production, processing and sale of tea, fruit and milk together with over 800 production teams in the vicinity.

3. *The trans-specialization and trans-regional economic integration of the integrated enterprises of state farms with other economic departments or localities.* For example, the Huguang Agricultural-

Industrial-Commercial Integrated Enterprises Company of Zhanjiang, Guangdong jointly manages the manufacture and sale of furniture and timber production with the Changxindian Furniture Workshop in Beijing; it jointly sells its products with the Xinjiekou Street Neighbourhood Committee in Beijing.

4. The agricultural-industrial-commercial integrated enterprises of state farms have begun to undertake joint ventures with foreign firms in processing agricultural produce and in agricultural and pastoral production. As an example, the Tianjin Agricultural-Industrial-Commercial Integrated Enterprises Company and a French firm jointly operate a winery.

Since the experiment of integrated enterprises began two years ago, achievements have been realized in the following areas:

1. *The experiment has increased the production and income of enterprises on state farms and has translated losses into profits.*

The practice of agricultural-industrial-commercial integrated economy returns part of the industrial and commercial profits to those agricultural units which supply raw materials for the development of agricultural and pastoral production. In return, the units further the development of industrial and commercial production with supplies of raw materials. Enthusiasm in agriculture, industry and commerce is brought into play in this way as a means of increasing income and profits. In light of recent investigations into the economic effects of 48 integrated enterprises of state farms that have had a relatively long period of experimentation in 1980, participants realized increases of 14.9% in the total value of agricultural and industrial production as compared with 1979; this rate was 3.2% higher than the rate of increase of all state farms. Those taking part in the experiment had a 68.6% increase in tax payments over 1979. The great majority of state farms achieved large increases in profits in 1980 over 1979; the exception were a few farms whose profits were affected by reduced production caused by natural disasters.

2. *The experiment has accelerated the rate of accumulation of funds relative to the rate of expansion of reproduction.*

The processing and direct sales of portions of the produce and animal products by integrated enterprises have reduced the intermediate links, lowered the cost of products and increased the income of the enterprises. By maintaining the momentum of increases in their accumulative funds, these enterprises have been able to expand produc-

tion with an emphasis on agricultural development. For an example, in 1979 the General Chang Cheng Agricultural-Industrial-Commercial Integrated Enterprises Company of Beijing, by practicing the method of partial refunds of profits, was able to set aside some funds for the development of milk production in 1980 (these funds were in addition to money obtained from the adjustment of milk prices). That year saw a 15% increase in milk production over 1979.

3. The experiment has opened wide avenues of production, has provided surplus labour, and has improved the standard of living of the workers.

A common and serious problem at present is that of surplus labour power in the enterprises of state farms. Joint enterprises may transfer surplus labour resources to processing, selling, servicing and construction departments within the enterprise. According to incomplete statistics by the departments of farms administration in Shanghai, Chongqing, Jiangsu, Liaoning, and Beijing, a large quantity of surplus labour-power has been placed in jobs since the onset of the experiment of integrated enterprises.

The emergence of integrated enterprises has stepped up the tempo of production and has increased their income and profits, thus in turn increasing workers' income and improving their welfare.

4. The experiment has played a positive role in enlivening markets and in making things more convenient for the masses.

From the inception of the experiment in agricultural-industrial-commercial integrated enterprises until October 1980, some 2,200 commercial establishments had been set up. These realized a turn-over of 270 million yuan during the first half of 1980. Because they sold their products themselves they were able to generate a ready supply of fresh products at cheap prices. As a result, purchases were more convenient for the masses and demands of the markets were met.

The agricultural-industrial-commercial integrated enterprises of all of China's state farms held a sales exhibition in Beijing in October 1980, with 5,000 products worth approximately 10 million yuan on display. Visitors to the exhibition totalled half of a million during somewhat more than a month's time. The total value of retail sales reached 10 million yuan, while the total value of all business conducted amounted to 30 million yuan. The sales exhibition had a strong impact throughout the whole country.

5. Scientific Research, Education and Public Health

1. Scientific Research Institutions and Research Achievements. In 1980, there were three scientific research institutions throughout the country for land reclamation within the state farm and land reclamation system. One of these is the South China Research Institute for Tropical Crops, a subsidiary of the Ministry of State Farms and Land Reclamation; the two others are reclamation research institute subordinate to provinces or autonomous regions. There were also 66 provincial or regional scientific research institutes and over 1,400 experimental stations. According to incomplete statistics, the number of scientific and technical personnel working in reclamation departments totals over 50,000. Of these, more than 8,000 are involved in scientific research work. One-third are assistant researchers, agronomists and engineers — the backbone of the scientific and technological contingents. Since 1978, as a result of the restoration of research institutions and their initial adjustment and development, the party's policies have been implemented, the scientific and technological contingent has been strengthened and the enthusiasm of the scientific and technical personnel has been mobilized. Thus, scientific research was carried out and propagated with relative ease. Some significant achievements were made. During the past two years, 33 major scientific and technological projects at the ministry level and 143 studies have been carried out, among which seven were classified as major national projects. According to incomplete statistics, since 1978, of those research projects that the provinces, municipalities or autonomous regions chose to take up voluntarily, more than 750 have realized positive results and more than one-third have won awards from leading departments at various levels. By the end of 1980, upon the approval of the Committee of Science and Technology of the Ministry of State Farms and Land Reclamation, 51 projects won first prizes, 22 won second prizes, and 16 won third prizes. Some research results have achieved outstanding levels at home and abroad. Some have been applied to production with positive economic results. For example, the Wen Chang Research Institute in Guangdong Province has bred a new species of rubber tree, "Hai Ken No. 1," which is wind-resistant, high-yielding and asexual. It grows well and produces a high yield in an area generally characterized by strong winds and poor soil. Therefore, this breed has become very popular. The Research Institute of the Reclamation Bureau in the Bazhou area of Xinjiang Autonomous Region has succeeded in

mastering the technology of planting "Hu Yang" trees (a kind of poplar), thus solving the long-term problem of afforestation in Xinjiang's saline-alkaline regions. In recent years, over 5,000 *mu* have been planted in "Hu Yang." In 1980, more than 70 kg of tree seeds were supplied to other provinces. Since 1973, the Shuguang Farm in Heilongjiang Province has developed a composite technology for improving white clay. For the past six years, the yield has increased annually and profits have risen with each passing year. The organic composition of the soil has increased by about 2%. This technology has been carried to other areas of the province. The Reclamation Research Institute of Hebei Province bred an improved variety of rice, "Kenfeng No. 5." The yield per *mu* averages 1,000 jin, while the maximum yield can run as high as 14,000 jin per *mu*. It has now been disseminated over one million *mu* throughout the country. In cooperation with the Virus Department of the Chinese Academy of Sciences, the Jian Hu Farm in Hubei Province has succeeded in developing and making an insecticide to counter the bollworm virus. The prevention effect is as good as or better than the highly efficient chemical insecticide used locally. This kind of insecticide increases cotton output and is safe to use.

2. Education. In 1980, state farms had 14,147 schools of various types. Of this total, five were colleges (one was a college of tropical crops in South China, attached to the ministry; four were run by provinces or autonomous regions). Of the five colleges, three were agricultural science colleges, and one a medical college. There were 25 technical secondary schools, 15 polytechnical schools, 44 vocational schools, 2,184 regular middle schools, 11,383 primary schools and 491 schools offering both primary and secondary school education.

In 1980 there were 2.84 million students at these schools; staff numbered 200,000, of whom 161,000 were teachers. Most state farms are located in border areas and are far from cities; therefore, schools are mainly run by the workers themselves. In the major reclamation areas, eight years of secondary education has been made universal.

Training of workers and staff. In 1980, cadre schools and several training classes were set up in the reclamation departments; 121,000 cadres and 197,000 workers were trained. In the course of their training, cadres and workers had the chance to attend specialized courses on a regular basis. Their scientific and technological levels were raised. This has played a role to a certain extent in promoting production and improving management and administration.

3. Public Health. In 1980, there were a total of 14,000 medical service units on state farms and in land reclamation departments; of these, 30 were hospitals run by administrative bureaus of localities, 1,631 were hospitals run by farms or factories and 13,000 were clinics run by branch farms or production teams. These medical service units had a total of 48,000 hospital beds and 65,000 medical workers and their families and in promoting birthals have played an active role in providing medical treatment, in ensuring the good health of the workers and their families and in promoting both control.

6. Wages on State Farms

For over 30 years, the state farms have practiced various wage systems and have undertaken some wage-system reforms. Before 1952, following the war-time practice, the farms practiced the supply system. After 1952, in line with the wage system reform made throughout the country, they pursued a grade/wage system. Afterwards, workers and staff who merged into state farms from co-ops continued to receive their pay on the basis of the work-point system used by the agricultural cooperatives. In 1956, the state farms began to variously practice a piece-rate wage system, a three-contract wage system (involving a production contract, a job contract, and a cost contract) and the "three fixed, one award" wage system. But these systems were only practiced in some reclamation areas or on some farms. All were suspended shortly after the "cultural revolution" broke out. In 1973, according to instructions of the late Premier Zhou Enlai, some farms tried to change the supply/wage system and grade/wage system to the work-point wage system. (Some educated youths working in production and construction received their pay through the supply system). At present, of the 4.8 million workers and staff in reclamation enterprises, about 80% receive their pay through the grade/wage system and 20%, through the work-point wage system. The grade/wage system is something like the "iron rice bowl" along with "sharing meals from a cauldron." It is unfavourable to mobilizing the initiative of the enterprises, workers and staff. The work-point system requires recording the work-points earned by workers and calculating their pay according to quantity. Since the quantity and quality of work in agricultural production are more difficult to estimate than they are in industry, this wage system also has some weak points.

For the past two years, many state farms have begun reforms and improvements to overcome

weaknesses in the existing wage system. Since 1980, the Party Central Committee has called on the people to implement the system of job responsibility in production. Many farms have combined the system of personal production responsibility with salaries and rewards. They have practiced the wage system in which workers and staff receive their pay and bonuses on the basis of how well and how much they have done. This system takes different forms: Some farms which pursue the grade/wage system divide their pay into two parts. Part of the wage is calculated according to the grade; the other part is calculated according to how much a person has worked, thus resulting in a system of grade-plus-output. For farms which pursue the work-point wage system, some may distribute pay according to net profit. Workers receive bonuses by getting a share of the profits they have produced. Some receive their bonuses by dividing up all profits made (that is, where there is profit, there is a bonus). So far, there are no unified regulations as to which wage or reward system should be pursued at present.

7. Profits and Losses of State Farm Operations

In the early 1950's, losses were incurred on many farms due to lack of experience, the practice of unitary agriculture and the existence of wide gaps between industrial and agricultural products. From 1953 to 1960, because the art of managing farms had been improved and economic accounting implemented, profits were realized in all years but one. In reclamation units such as the Xinjiang Production and Construction Corps, industrial enterprises and commercial service centers were set up to make up losses incurred in agriculture. They were able to realize profits for 12 years running — from 1955 to 1966 — averaging 84.17 million yuan per year. State farms all over the country were making profits before 1966, except during the period 1961-1963, when losses were incurred as a result of natural disasters which lasted for three years. For an overall period of 18 years (1949-1966), state farms made profits for 11 of those years and incurred losses for 7 years. Profits balanced losses, yielding a net profit of 700 million yuan for the period.

During the "cultural revolution," great losses were incurred by the state farms. From 1967 to 1976, losses totalled 3,196 million yuan, or an average of 320 million yuan per year.

After the downfall of the Gang of Four, state farms were reorganized and their management strengthened. Losses began to decrease yearly, falling from over 400 million yuan in 1977 to 93

million yuan in 1978. In 1979, a radical change occurred. Heavy losses that had previously been incurred for a number of years were turned into profits of 390 million yuan. In 1980, profits of over 600 million yuan were realized even though natural calamities had occurred in many areas and expenditures had been increased by about 600 million yuan for pay raises, non-staple food subsidies and so on.

III. Major Current Problems and Trends for Future Development

In light of the principle established by the Central Committee of implementing further readjustments in the economy and bringing about stability in politics, the main problem in the reclamation departments is how to make adjustments so that agricultural production and a diversified economy will be further developed, so that skills of management will be improved, and so that productivity and commodity rates will develop in an all-around way.

1. Readjusting Operation Principles. At present there are still some state farms whose principles of operation are either not clearly defined or are in a great state of flux. Principles should be established in accord with local natural conditions, economic conditions and natural resources. Formerly unreasonable principles must be regulated and crop distribution readjusted at the same time in order to lay a solid foundation for building a rational economic structure.

2. Regulating the Economic Structure and Developing a Diversified Economy. "Taking one trade as the principal line and developing a diversified economy" is the guiding principle for state farms. At present, their economic structure is quite irrational. The problem is mainly that forestry, animal husbandry, sideline occupations and fisheries take up a small proportion consisting of one-third of total agricultural output value. State farms are rich in national resources. They possess fertile land, vast grasslands, forests and water resources which have not been fully utilized. A diversified economy that includes forestry, animal husbandry and fisheries should be developed in accord with local conditions. Cereals and oil crops can be grown on hilly land in order that natural resources will be fully and rationally exploited and used, and an ecological environment should be developed in ways that will benefit human life.

3. Developing a Stratified Economic Struc-

ture. The ownership of state farms is primarily ownership by the people. Since the people's communes were set up, some communes and production brigades have merged into the farms. In 1980, there were 44 communes, 777 production brigades and 3,712 production teams included in the state farms. The ownership of these units remains collective ownership. From the point of view of developing a diversified economy, so long as state farms occupy a dominant position in socialist public ownership, the workers are allowed to develop family sideline occupations and their family members can organize to develop collective production and service trades. In a word, three types of ownership (ownership by the whole people, collective ownership and private ownership) should be allowed to exist side by side, a situation that will help speed up development of the reclamation economy.

4. Paying Close Attention to Grain Production and Developing Cash Crops. Farms may develop cash crops in line with natural local conditions and on the premise that grain output will continue to increase and the task of turning over grain to the higher authorities can be fulfilled. Cultivated land not suitable for grain should be approved for growing other crops. In the south, tea and fruit can be grown on hilly land. In the rubber-producing reclamation areas, so long as rubber production is guaranteed, tropical or subtropical crops may be grown on land where rubber trees cannot be grown.

5. Causing Production to Become Specialized and Socialized in a Step-by-Step Way. At present, the production systems of state farms are basically "large and comprehensive" or "small and comprehensive." As the agricultural economic structure is readjusted, these systems should be changed, with production systematically becoming specialized and socialized.

Specialization of production teams should be carried out first according to geographic sections within state farms; afterwards, the specialization of the farms themselves should take place. Finally, specialized farm complexes or a number of specialized production areas should be established within a large reclamation area. At the same time, socialization in services should also be considered.

6. Active, Steady Development of Agricultural-Industrial-Commercial Integrated Enterprises. State farms should implement farming-industry-commerce joint management and administration and should progressively develop into enterprise complexes. It is an important strategic measure to speed up agricultural modernization

and to narrow down the three differences (differences between town and country, between physical labour and mental work and between workers and peasants). Enterprise complexes are now in the trial stage. They should be positively developed, gradually and in a planned way. After consolidation, strengthening, improvement and summing up of experiences, all state farms should be turned into enterprise complexes.

7. Developing Reclamation Industry in the Course of Readjustment. State farms should mainly develop processing industries which use their own agricultural and animal products as raw materials. Textile and construction industries, along with other labour-intensive industries, should be developed as long as there is no duplication in the building of factories and no competition for raw materials with larger factories. However, such development should keep to the principles of mutual cooperation, national distribution and overall planning.

8. Speeding Up the Modernization of State Farms. Reclamation enterprises should employ modern scientific techniques and be allocated modern equipment. In this respect, it is very important to strengthen capital construction of fields and to progressively bring about agricultural mechanization. It is also very important to adopt advanced scientific techniques and to run reclamation enterprises with modern management in order to raise land and labour productivity and commodity rates, and to attain a higher level of fund accumulation for the country as a whole.

9. Strengthening Education in Scientific Research, Exploiting Mental Resources and Fostering Talented Persons. Scientific research should be conducted in accord with the characteristics of reclamation enterprises and should be centred on grain production and a diversified economy that includes cash crops, animal husbandry and local products. Research should be carried out in the problem areas of technological economy and modernized management — two areas which are in dire need of improvement. We should pay attention to the effective operation of reclamation colleges, popularizing secondary education and improving its structure, strengthening the training of cadres and workers, and raising the levels of both scientific and general knowledge of farm cadres, workers and their families in order to meet the needs of the four modernizations.

10. Improving the Material and Cultural Life of Workers. On the basis of developing production, we should improve the material and cultural life of

the workers. On state farms, residential communities gradually will be built into modern, small towns, providing conditions exist.

The general objective is to build state farms into agricultural-industrial-commercial integrated enterprises which take one trade as the principal line, practice diversified economy and combine modern agriculture with labour-intensive industry that possesses the characteristics of high utilization

of natural resources, high yields, high labour productivity and high commodity rates — all at less expenditure, with low costs and good economic effects.

[*Author's note:* The percentage figures of 1980, when compared with those of 1979, are worked out according to the comparable figures for 1979.]

4. CHINA'S WATER CONSERVANCY

By the Editorial Office of "Water Conservancy in China"

Water conservancy in China entered a new stage in 1980. During that year, a majority of water conservancy workers analysed the characteristics of water resources in China and studied China's history of floods and droughts. They drew lessons and conclusions from the experience of New China's water conservancy work. They also looked into the role water conservation could play in the program of the four modernizations. They set tasks and made proposals for the further improvement of water conservancy work during the period of national economic readjustment. Under the unified national plan, great progress has been made in water conservancy.

I. General Introduction to China's Water Resources

China is a vast country with numerous rivers. The total length of all large and small rivers in the country is about 420,000 kilometres (km.) There are more than 5,000 rivers which have a drainage area of over 100 square kilometres (sq. km.) each. Of these, 1,500 have a drainage area of over 1,000 sq. km. There are, in addition, more than 2,000 large and small lakes, of which 130 have an area greater than 100 sq. km.

Main Features of China's Water Resources.

1. *Although China has a plentiful supply of water, per capita supply is low.* China's yearly precipitation averages 630 millimetres (mm.). Total yearly precipitation amounts to 6,000,000 million cubic metres (cu. m.), which is about 5% of the total that falls on the land surface of the entire earth. The average yearly runoff of the rivers in China amounts to 2,700,000 million cu. m., which is 5.5% of the world's total (47,000,000 million cu. m.) China's surface water (total runoff) is less than that of Brazil, the Soviet Union, Canada and the United States, and therefore ranks fifth in the world. The water available on a per capita basis, however, is only 2,700 cu. m., which is one-fourth of the world's per capita total and lower than the per capita amount in most countries of the world. This is approximately the same as the 1975 per capita water consumption level of the United States (2,528 cu. m.).

2. *Uneven geographic distribution of water resources.*

About half of China has insufficient rainfall. The southern part of China has an abundance of water while the north is scarce of it. Along the southeast coast, the normal yearly rainfall is over 1,600 mm., while in the region south of the Qinling Mountains and the Huaihe River, it is more than 800 mm. However, in most parts of northern China, the normal yearly rainfall is only 400 to 800 mm., while in the vast northwestern region it is less than 250 mm. About half of China's land area is short of rainfall. Eighty percent of China's total runoff comes from the Changjiang (Yangtze River) Valley and the areas south of the river, yet less than 5% of the national total comes from rivers north of the Changjiang — the Haihe, the Huaihe and the Huanghe (Yellow River). Nevertheless, the north has over one-third of the total cultivated land of the whole country. Although there is an average of 2,643 cu. m. of water available for each mu of cultivated land in the Changjiang River basin, there is only 188 cu. m. in the Haihe River basin, 214 cu. m. in the Liaohe River basin, 281 cu. m. in the Huaihe River basin and 286 cu. m. in the Huanghe River basin. China's hydro-electric power potential is estimated to be 680 million kilowatts (kw), of which 70% is in the southwest and 30% is scattered over the rest of the country.

3. *Seasonal and annual precipitation varies greatly.* Most parts of China have less rainfall in winter and spring, and more in summer and autumn. In the high water season, the rainfall is so concentrated that there is flooding, while in the other seasons water shortages occur constantly. Rainfall during the flood season in the north is 70–80% of annual precipitation, while in the south it constitutes 50–60% of the yearly total. Annual precipitation also differs greatly between wet and dry years.

4. *Rainfall in China is heavily influenced by the monsoons.* China has so many mountains and hills with so few plains that, whenever rain storms occur, there are high floods in the middle and lower reaches of the rivers.

These features explain why water conservation in China is bound to be a difficult, complex and protracted undertaking.

China is a country where the disasters of flood and drought occur frequently. According to incomplete statistics there were 1,092 major floods

and 1,056 major droughts during the period from 206 B.C. to 1949 A.D., or an average of almost one major flood or drought in every year.

The Huanghe (Yellow River). During the past 2,000 years and more, dykes along the lower section of the Huanghe were breached 1,500 times and its main course changed 26 times. Roughly speaking, that means the dykes were breached twice every three years and the river changed its course once every hundred years. Areas affected totalled 250,000 sq. km. and stretched from the city of Tianjin in the north to the areas between the Changjiang and Huaihe rivers in the south. In the year 1117 (the 7th year of the Zhenghe Period, under the rule of the Emperor Huizong, Song Dynasty), a breach of the dyke resulted in more than one million casualties. In 1642 (the 15th year under the Emperor Chongzhen, Ming Dynasty), the bursting of the dyke flooded Kaifeng City, drowning 340,000 of its 370,000 inhabitants. In 1933, the main dyke along the lower reaches broke at 54 places. As a result, 3,600,000 people in 67 counties in Henan, Hebei, Shandong and Jiangsu provinces were affected and 18,000 died.

The Changjiang. Over 200 floods have occurred in the more than 1,300 years since the Tang Dynasty. The great flood of 1931, at its peak, reached a flow of 63,000 cu. m. per second (at Yichang). All of the cities along the Changjiang from Shashi down to Shanghai were flooded. Over 50 million mu of farmland and more than 28,550,000 people were affected by the disaster, in which 145,000 people died. During the 1935 Hanjiang flood, 22,640,000 mu of farmland, including portions of the Changjiang basin, were flooded. The flood affected 10,030,000 persons, of whom 142,000 drowned.

The Huaihe. During the past 500 years, following the time when the Huanghe changed its own course into the Huaihe, the Huaihe has flooded 350 times. In 1921 and 1931, two extraordinary floods occurred covering the entire river basin. In 1931, the Changjiang and the Huaihe flooded simultaneously, sending water into Bengbu City and inundating the Tianjin-Pukou Railway. Seventy-seven million mu of farmland were flooded, and 75,000 people were drowned. In the Lixiahe River area of northern Jiangsu Province, more than 10 counties were inundated.

The Haihe. During the 580 years before Liberation, 387 floods occurred. In 1917, 6,350,000 people suffered when the waters of the Haihe flowed over 25 million mu of farmland,

reaching Tianjin City. In 1939, 50 million mu of farmland were inundated, 8 million people became victims, 160 km. of railway were damaged and Tianjin City was again flooded.

The Zhujiang. In 1915, the Beijing and Xijiang tributaries of the Zhujiang flooded simultaneously. The dykes were breached, the city of Guangzhou was flooded for seven days and boats had to be used for transportation within the city. The Zhujiang River Delta became one vast sea, with 4.5 million mu of farmland under water and 3 million people affected.

The Songhuajiang. The major flood in 1932 submerged not only large areas of farmland along the river but also the city of Harbin. There were 380,000 people in the city, of whom 240,000 were affected, including 120,000 who were left homeless.

The four worst droughts in modern Chinese history occurred in 1920, 1921, 1928 and 1934. The 1928 drought affected 13 provinces in north, northwest and southwest China. Hundreds of miles of scorched land were strewn with the corpses of starved people. Victims totalled 120 million.

History tells us that flood and drought have been serious threats to the existence and development of the Chinese nation. Thus, due to both natural and social conditions, water conservancy work has always held a very special position in Chinese history. It has become and will continue to be an essential factor in the future development of the country as a whole, and in the further improvement of the people's living standards in particular.

II. Water Conservancy Work During the Past 30 Years

In the very early years after the founding of New China, the Central Committee of the Communist Party of China, led by Chairman Mao Zedong and Premier Zhou Enlai, gave great stress to water conservancy work as they summed up the historical experience of the country. Since then, a lot has been accomplished through efforts made by party committees and government organizations at all levels, as well as by the masses. In the course of the past 30 years, the state has invested 49,000 million yuan in water conservation work, with an additional 29,000 million applied as operating expenses. In addition, an estimated 58,000 million yuan was contributed by communes and brigades in cash and labour. The grand total came to 136,000 million yuan.

Through these investments, China built and equipped many large flood control and irrigation systems, power generating stations, water drainage projects, etc. Specifically, 165,000 km. of dykes, protective embankments in lakeside areas and seawalls were repaired or built. Drainage channels were dredged and renovated, and flood diversion canals were dug for the Hai and Huai rivers. Two hundred and forty-one large sluices and more than 86,000 reservoirs of various sizes were built. An additional 6.4 million smaller water-retaining dykes for creating ponds and pools were built. (There were only 23 big and medium-sized reservoirs and 10 to 15 sluices in the whole country before Liberation.) All this provided a total water storage capacity of 400,000 million cu. m. More than 5,200 irrigated districts with an irrigated area of over 10,000 *mu* each were completed.

The total capacity of mechanically and electrically-operated pumping facilities increased from something over 90,000 hp just after Liberation to more than 74 million hp. Starting from scratch, we developed 2,090,000 mechanical and power-operated wells. Generating units installed for producing electricity had a total capacity of 9 million kw, of which over 6.3 million kw were in small hydroelectric stations. The projects and facilities mentioned above represent 100,000 million yuan in fixed assets, of which over 40,000 million yuan is managed by the state.

The benefits resulting from these projects are evident:

A. With the initial control of floods and water-logging, development of industrial and agricultural production and the safety of the cities and the countryside have been assured. With respect to river control, 31 years of tranquility has been won on the Huanghe. Rivers like the Changjiang, Huaihe, Haihe, Liaohe, Songhuajiang and Zhujiang have also been preliminarily stabilized.

B. The development of irrigation, the elimination of water-logging and the control of saline-alkaline soil have provided favourable conditions for increasing agricultural production. China's total irrigated area has increased from something over 200 million *mu* in the early post-Liberation years to the present level of 670 million *mu*. Out of 340 million *mu* of farmland formerly subject to water-logging, initial progress has been made in controlling 260 million *mu* (76% of the total). Initial gains have also been achieved on 62 million *mu* (56%) of the country's 110 million *mu* of saline-alkaline land.

C. Cities and industries have been provided

with sufficient water supplies. Important industrial cities like Beijing, Tianjin, Changchun, Shenyang and Fushun now receive an average annual supply of some 10,000 million cu. m. At the same time, in remote mountainous areas where there were endemic water shortages, drinking water has been provided to over 40 million people and 20 million head of livestock.

D. Comprehensive utilization of water resources has provided a great deal of electricity. In addition to large and medium-sized hydroelectric stations, small hydroelectric power stations all over the country generated 12,700 million kwh of electricity in 1980, accounting for one-third of the nation's power consumption in rural areas. There are currently 720 counties which in the main depend on small hydroelectric stations for electricity. These stations have become an important source of electricity in the countryside. They have played a remarkable role in transforming mountainous areas and in developing local industry and enterprises run by communes and brigades as well as in improving the material and cultural life of the people. Moreover, 19 million *mu* of 30 million *mu* of reservoir water surface has been utilized for fish culture.

It should be pointed out that the nation's population has nearly doubled in the past 30 years. Total grain output increased from more than 110,000 million kg. to over 330,000 million kg. This represents an increase in per capita grain production from 253 kg. to 408 kg. for the rural population. Water conservation played an important role in making these increases possible.

As for the water conservation work itself over the past 30 years, there were tremendous achievements, rich experiences and profound lessons. The most fundamental lesson is that it is important to respect science, to act in accordance with both natural and economic laws, to think carefully so as to achieve maximum economic results at minimum cost and, when making plans, to prevent any foreseeable negative effects. Lessons and experiences can be summed up as follows:

1. *We should be strictly scientific; we should constantly develop the understanding of natural law; and we should try in every way possible to avoid being subjective and giving arbitrary and impractical directions.*

Water conservancy work is a struggle waged by human beings to change nature. The natural world is complex with dialectical relationships. What is harmful can be developed into something beneficial, and vice versa. This change is crucial to water control work where, at any one time, it is necessary to see not only the favourable but also the unfavourable aspects.

Experience of the past 30 years in areas of work such as hydrology, geology, overall planning, design and scientific research, has shown that whenever a strictly scientific attitude was stressed and used there were remarkable results.

2. We should constantly study the laws of socialist economic construction and attach great importance to the economic results of our work.

In any project undertaken, in addition to studying the scientific nature of the relevant techniques, it is also necessary to study whether the project is economically feasible. We must not build any project without taking account of its economic returns.

3. In water conservancy we should work according to our ability and not be overanxious for quick results.

In making plans and deciding what projects to undertake, the work will be expedited if consideration is given to the actual conditions (including manpower, financial resources, available materials and technical capability) and if leeway for adjustment is provided.

If, conversely, consideration is given only to what is needed with no regard to practical conditions, the result is bound to be "haste makes waste."

4. We should promote democracy in technical work and let engineers, technicians and professional departments play a full role.

It is true that during the last 30 years much has been accomplished in water conservancy work due to the special attention paid by party committees and government organizations at all levels as well as the personal participation and backing of many leading comrades. Nevertheless, correct decisions can only be made by developing democracy in technical work, by fully utilizing the abilities of the professionals, by making comparisons and by pooling the wisdom of the masses.

5. We should have well-publicized policies, well-defined systems of procedures and a reasonable body of laws.

In carrying out water conservation work, not only must relationships between the state, the collective and individuals be handled properly, but so must relationships between the present and the future and between the whole and the parts. Therefore, laws, policies and systems are needed to coordinate activities.

6. We should strengthen the management of water conservation facilities, since only then can these facilities be fully utilized.

7. We should strengthen the technical and professional education of water conservancy personnel, raising their scientific level to meet the needs of the four modernizations.

At present, improvements are needed in the scientific and technical levels of staff, in basic work such as surveying, geological investigation, planning and engineering, and in education and training work in water conservancy. In order to reduce and avoid losses, waste and errors in water work, it is necessary to pay more attention to education and research work and to spend more money in these areas.

III. The Role of Water Conservancy in the Four Modernizations

In the course of modernization, we should be prepared strategically for two things: to deal with war and to cope with natural disasters, especially large-scale flooding. Water is a crucial element in both strategies.

During the last 30 years, natural disasters occurred quite a few times in China. According to available statistics, an average of about 400 million mu farmland were affected by floods and/or droughts every year, out of which some 100 million mu were treated as disaster areas. Floods, droughts and water-logging are great threats to the Chinese people. In the process of modernization, not only the development and prosperity of agriculture, but also the development of the national economy require reliable water conservation work. Both goals require a dependable flood control system, an adequate supply of clean water, a good scientific system for coordinating water conservancy work and a sensible and comprehensive plan for the proper use of water. As time passes, modernization will demand more and more from water conservation workers. If water conservancy work is unprepared to meet these requirements, the result will be to impede the four modernizations.

1. China's capacity for flood control is still very low.

Besides the seven big rivers — the Changjiang, Huanghe, Huaihe, Haihe, Zhujiang, Songhuajiang and the Liaohe — there are many medium-size and small rivers which have not been brought under complete control. On most large rivers in particular, existing flood control systems still cannot withstand large-scale floods such as those that have occurred since Liberation. In China, areas threatened by floods tend to be densely populated and

economically well-developed. Flood control is a prerequisite for ensuring the welfare of society and the orderly implementation of the four modernizations. We must not treat it lightly.

2. *It is especially important to develop water conservancy projects and increase the capacity to resist natural disasters.*

Agriculture is the foundation of the national economy of China. It is necessary to speed up the development of agriculture in order to stabilize the present economic situation and to carry out the four modernizations. Without effective water conservation work, it will not only be difficult to modernize agriculture but impossible even to carry on regular agricultural production.

At present, the nation's irrigated area totals only a little more than 670 million *mu* and more than half of the farmland still has no irrigation facilities. Even in areas that have irrigation facilities, the efficiency level of irrigation is not very high. Areas where some amount of irrigation is assured total only 500 million *mu*, while areas where crops can be assured regardless of drought or water-logging total just over 300 million *mu*. Every year China loses some 5,000 million kg. of grain because of natural disasters, so there is an urgent need to raise the capability of combatting natural calamities.

3. *Water conservation is the lifeline of not only agriculture but also of industry.*

As the four modernizations proceed, the tasks undertaken by water conservation will become more numerous and more difficult with respect to protecting industry, cities and railways, and to providing water for industrial and domestic use.

At present, China has more than 160,000 km. of embankments and 80,000 large, medium-size and small reservoirs. These projects protect not only 400 million *mu* of farmland and vast stretches of rural areas, but also several dozen key cities and many small and medium-sized towns, mines, industrial enterprises, railways and highways. At the same time, water is supplied to urban mines, industrial enterprises and populations.

4. *Out of the 3,400 million *mu* of usable grassland, only somewhat over 5 million *mu* are irrigated.*

Yet, due to inadequate rainfall and water supply, the pastures have been deteriorating and grazing capacity is low. If animal husbandry is to be developed seriously, something must be done about water conservation on the grasslands with the aim of solving the problem of drinking water for people and animals and developing the places where little or no water is now available.

5. *Water conservancy is needed in order to develop the forest industry.*

It is especially necessary in the arid northwest area where annual precipitation is less than 200–300 mm. and in some areas is even below 100 mm. Obviously, trees have to be planted in such areas. Since water is scarce, the survival rate is low. Even with many trees planted every year, they never grow into forests. On the other hand, where water is plentiful there are forests, trees grow and crops flourish. This shows that forestry and water conservation complement each other.

6. *Building hydroelectric stations requires centralized planning that takes into consideration multipurpose utilization and all-around benefits.*

Hydroelectric construction is just one part of water conservation work. In river control work, plans should be made in such a way that minimum investments will yield maximum economic results. We should build more projects which can simultaneously serve flood control, irrigation, navigation and power generation. We should avoid building single-purpose projects.

IV. Principles and Tasks for Water Conservation Work During the Period of Readjustment

At present, one of the most favourable conditions in the field of water conservancy stems from the fact that many major projects have been completed. During the readjustment period, the main tasks in water conservation are to improve the management performance of existing projects and to make sound preparations for future development by doing good basic work, particularly in planning. The guidelines for water conservancy work during the readjustment period, as set forth in October 1980, are: to continue the construction of existing projects and their adjuncts; to strengthen management and seek practical results; to lay all the necessary groundwork and to raise scientific levels to prepare for future development.

The main work which needs to be done is as follows: to improve the management and the performance of the existing facilities; strive to get through the flood season safely at reservoirs and on major rivers so as to ensure normal production in industry and agriculture; to work out plans and do the work well in the pre-planning stages; to make readjustments and reduce the scope of capital construction and to make every effort to get immediate results from each project; to complete the auxiliary work to ensure increases in agricultural production; to build more small water

conservation projects suited to local conditions and to carry out farmland construction; to strengthen the work in preventing loss of water and soil erosion; to continue to build more small hydroelectric stations; to protect water resources; to develop the science and technology of water conservancy and promote education; to ensure a good supply of materials for water conservation work; and to formulate laws and regulations concerning water conservancy.

Another important task in water conservancy during the period of readjustment is reorganization. At present, careful studies should be made and pilot projects conducted in the following areas:

1. *In river control, it is necessary to break down the old geopolitical administrative limits and shift to a management system with authority over an entire river basin.*

Water conservation agencies of this kind have been established on the Changjiang, Huanghe, Haihe, Huaihe, Zhujiang and other rivers. Active preparations should be made to set up such water conservancy commissions on the Liaohe and Songhuajiang rivers. These commissions should have effective administrative organs to handle the overall planning and day-to-day management of the entire river basin under their jurisdiction. Major tributaries and projects which involve two or more provinces, cities or prefectures should be placed under the direct control of these commissions. Each province, prefecture and county should act in this spirit and manage and regulate the rivers in their areas.

2. *Management of capital funds should be improved so as to achieve the greatest possible gains from the investments made in water conservancy.*

The deployment of water conservation funds for investment should be decided at the central and provincial levels of government and not at lower levels. The provincial government should control local funds for water conservancy, and these funds should be designated for specific purposes and not used for other things. Decisions regarding funding should be jointly studied and made known by the State Planning Commission, the Ministry of Finance and the Ministry of Water Conservancy.

3. *The wage scale for labourers engaged in water conservancy work should be studied and restructured.*

Strict distinctions should be made between wages for people who come from areas which will benefit from the given project and those who do not. Differences in wages should be set in accord

with the degree of benefit received, so that no financial loss (either in cash or in grain) will be borne by communes or brigades which provide labourers but do not benefit from that specific project.

4. *Policies for resettlement necessitated by construction of reservoirs should be studied and improved.*

5. *Policies regarding fees charged for water supply should be studied and improved.*

V. Progress in Water Conservancy During 1980

During the past year, the cadres and workers engaged in the water conservancy work — implementing the party's line, principles and policies set forth since the Third Plenary Session of the 11th Party Central Committee — did a great deal of work and achieved new successes.

1. *Affirming achievements and defining the orientation.*

As a result of the discussions held among water conservancy workers and cadres at the National Water Conservancy Conference, an official paper has been prepared on the basic experience in water conservancy over the past 30 years and suggestions for future work. The report received a good response from all over the country. Most provinces summed up their experience in water conservancy in a similar manner.

2. *Ensuring victory in the struggle against flood and drought.*

During 1980, droughts occurred in the north and floods in the south. These conditions put China's water conservancy projects to the test. The flood peak recorded at Hankou Hydrological Station on the Changjiang was slightly smaller than those of 1954 or 1931. Nevertheless there were no breaches of the main dykes and protection embankments, and thus this work had ensured the safety of the cities and plains along the river. During the flood period, the discharge capacity of the pumping facilities in Hubei Province came to more than 3,000 cu. m. per second, and the volume of water pumped into the river totalled over 16,000 million cu. m. Although more than 19 million mu of land were flooded, only 6.4 million mu were declared a disaster area thanks to the presence of effective drainage facilities. In the area of the Dongting Lake and the lower reaches of four tributaries of the Changjiang in Hunan

Province, the water-logged area totalled 4.24 million *mu*, but the disaster area was reduced to 1.01 million *mu*. 950,000 tons of grain were harvested thanks to the timely draining of water by the pumping stations. In Jiangxi Province, 770,000 *mu* of land along the Yangtze River and in the Boyang Lake area were water-logged, although only some 300,000 *mu* were seriously affected; in Anhui Province, out of 9 million *mu* of flooded area, 1.96 million *mu* of land suffered from crop failures; and 1.36 million *mu* were flooded, with 600,000 *mu* seriously affected in Suzhou and the Taihu Lake area of Jiangsu Province. The decrease in the flood-stricken area clearly illustrated the enormous role of pumping facilities and projects along the river. The economic returns were thus remarkable.

In 1980, the Danjiangkou water control project successfully held back the peak-flow of more than 10,000 cu. m. per second six times, ensuring safety along the downstream areas of the Hanjiang River. The project thus prevented damage from flood-diversion. It lightened the burden of the Changjiang in flood-control by retaining a water volume of 17,400 million cu. m. Moreover, it gave rise to conditions for power generation and irrigation during the winter and spring of 1981.

Comparatively large floods also occurred on the upper and middle reaches of the Huaihe River. There, the existing five large reservoirs of Anhui Province played a remarkable role in flood control during 1980.

In the nine provinces, municipalities and autonomous regions hit by serious drought in northern China, the role of water conservancy was plainly obvious in the struggle against drought. Were they not able to draw water from the Guanting and Miyun reservoirs during the severe drought of 1980, Beijing and Tianjin would have suffered unimaginable effects on their populations and on their industrial production.

3. Closing the main channel of the Changjiang at the site of the Gezhouba project and construction of other major projects.

In July 1979, the Ministry of Water Conservancy held a meeting on reviewing the design of closure work of the Gezhouba project, and decided to carry out this project during the dry season of 1980 — one year ahead of the planned schedule. After a period of intensive construction work and preparation for closure, a ceremony for the intermediate approval of the first stage of the project was held by the State Capital Construction Commission; the construction schedule of the closure was approved by the State Council in October 1980. The upper and lower openings to be closed were reached respectively on November 27 and

December 14 of 1980. In accordance with the hydrological features and diversion conditions, the upper cofferdam began to advance forward at 7:30 a.m. on January 3, 1981. The closure, taking 36 hours and 23 minutes in all, was successfully completed at 19:53 on January 4, 1981. The total advanced distance of closure work was 203 m. and the total volume of dumped rubble and other materials came to 106,000 cu. m., with daily intensity of 72,000 cu. m. at an average rate of 3,000 cu. m./hour. The observed discharge was 4,400–4,800 cu. m. The maximum velocity of flow during the closure was more than 7 m./second. It was an unparalleled feat in the history of Chinese water conservancy and hydroelectric construction.

In October 1980, at the same time the Gezhouba project was progressing smoothly, the Guxian reservoir project on Luohe River dammed up the cofferdam; the first generating unit was installed at Panjiakou project; and rock-plug blasting was successfully carried out at the spill tunnel for the Miyun reservoir. Construction work for diverting water from the Luanhe River as well as the supplementary works on the Miyun and Yuecheng reservoirs were under way. The total capacity of small hydroelectric power stations completed this year came to 800,000 kw. A meeting to exchange experiences on provincial capital construction and management was held at Biliuhe Reservoir.

4. The legal system was improved.

Official papers were issued on Temporary Rules and Regulations on Diverting Water for Irrigation from the Lower Reaches of the Yellow River; Some Rules and Regulations Regarding Safety on Farmland Construction Works; Management of Small Hydroelectric Power Generation; Temporary Regulations on Management of Construction Equipment; Estimated Costs for the Design of Water Conservancy and Hydroelectric Power Projects; Trial Implementation of Bonuses for Outstanding Results in Research on Water Conservancy; and Management of Materials and Products for the Ministry of Water Conservancy. In addition, a number of laws, regulations, rules and specifications were drafted and revised.

5. A corporation for diversified operation and management of water conservancy projects was founded to improve the management and administration of these projects.

Due to the strengthening of financial management, annual profits exceeded the planned figure by 176%, while the cost of capital construction decreased by 8.7% over 1979. Some 52,219 staff members in the water conservancy field were promoted.

6. Basic work was strengthened.

Meetings on overall planning for the Haihe, Changjiang and Zhujiang rivers were held. A national zoning grid for water conservancy was drawn up, water resources were appraised and a compilation of flood investigations was made. Scientific research organizations in the field were strengthened. New techniques, such as remote sensing with aircraft on the Yellow, Haihe and Zhujiang rivers, were adopted. Professional books on 96 subjects within the field of water conservancy, totalling more than 2 million copies, were published.

7. The training of staff members was strengthened.

During 1980, more than 4,000 cadres were trained. Persons trained in the capital construction field came to 20,000.

8. International technical-exchange activities were intensified.

An International Symposium on River Sedimentation was held in Beijing in March 1980. An

International Flood Control Workshop was held in Zhengzhou in October 1980; and a UNIDO Workshop/Study Tour on MHG Technology Transfer was held in Hangzhou in October 1980.

The Hydraulic Engineering Corporation of China was founded for the purpose of extending water conservancy services abroad. Up to 1980, 23 projects in 14 countries have been undertaken by the ministry and its affiliated organizations. In addition, many delegations were sent abroad in 1980 for the purpose of studying other experiences in water conservancy.

The construction of water conservancy projects that will relieve China from the ravages of floods, that will benefit current and future generations and that will create a favourable ecological environment for mankind and all other creatures — these are protected and arduous tasks. Natural conditions impel us to pursue water conservancy. By working under the leadership of the Communist Party of China and the people's government and by relying on the joint efforts of the Chinese people and the hard struggle of the water conservancy workers, steady progress will be made in water conservancy.

5. CHINA'S FORESTRY IN 1980

By the Propaganda Bureau, Ministry of Forestry

I. General Survey of China's Forestry Sector

China has a vast expanse of land. With its southern provinces located in the tropical and sub-tropical zones and its northern provinces near to the frigid zone, China is well-situated geographically, with natural conditions suitable for the growth of trees of all kinds. China's 9.6 million square kilometres of land include extensive stretches of barren hills and wastelands fit for afforestation. Moreover, tree-planting is carried out in a major way around homes and villages and along roads and ditches. Thus, land availability is relatively adequate for the development of forestry.

Principal Species. At present there are more than 2,800 varieties of arbor species. Those native to China include *Metasequoia glyptostroboides*, *Cathaya argyronhyla*, *Pseudolarix amabilis*, *Glyptostrobus pensilis*, *Taiwania cryptomerioides*, *Fokienia hodginsii*, *Keteleeria fortunei* and *Cunninghamia lanceolata*. Important economic tree species include *Aleurites fordii*, *Camellia oleifera*, *Sapium sobiferum*, *Rhus verniciflua*, *Hevea brasiliensis* and *Eucommia ulmoides*, while valuable industrial species include *Fraxinus mandshurica*, *Juglans mandshurica*, *Cinnamomum camphora*, *Fhoebe bournei* and *Swietenia mahoganii*.

Afforestation. Since the founding of the People's Republic of China in 1949, the Communist Party of China and the people's government have placed great stress on forestry development, drawing up a series of principles, policies and laws to this end. During the last 30 years, areas set aside for afforestation throughout the country amount to more than 400 million mu. More than 3,900 state forest farms and over 200,000 commune- and brigade-run forest farms have been set up. Today, there are more than 119.78 million hectares of forests in China covering 12.57% of its total land area and constituting a forest volume of 9,350 million cubic metres.

Forest Industry. Forest industries have undergone a parallel development. Since 1949, 186 large and medium-sized enterprises for tree-felling and timber transportation along with more than 2,200 commune- and brigade-run afforestation enterprises have been established. Over 10,000 km. of railways and nearly 100,000 km. of highways have been built in the forest areas. Timber output has been

raised from 5.67 million cubic metres annually during the early years following Liberation to 53.59 million cubic metres at present; sawn timber production has increased from 3.44 million cubic metres to 13.69 million cubic metres. At present there are 209 timber processing factories, 244 "three-board" (fibre-board, plywood and particle-board) enterprises and 259 resin factories; annual production of the "three boards" is 690,000 cubic metres and that of resin, 290,000 tons.

The development of forestry plays an important role in improving natural resources in China, in enhancing the production of agriculture and animal husbandry and in raising the living standards of the people. Furthermore, it has created and tempered an army of more than 2 million forest workers while accumulating experience in production and administration, raising scientific and technological levels and laying an impressive foundation for capital construction, mechanization and scientific education and research.

Impediments to Forestry Development. Despite China's achievements in the expansion of forestry, forestry development continues to move at a slow pace; afforestation is lacking in quality and sharp contradictions exist between supply and demand. Indiscriminate felling has become a serious problem due to erratic changes in policy, overlapping leadership, chaotic administration and structure, and insufficient funds for the management of forests. At present, the national per capita forest area is less than 2 mu, and per capita forest volume less than 10 cubic metres. As far as the per capita forest coverage is concerned, China ranks 120th among the 160 countries in the world. Thus, there remains a long and arduous task ahead in protecting forests, in developing forestry, and in transforming the situation of not enough forests and insufficient timber.

II. Progress Amidst Readjustment

The year 1980 was the second year of implementation of the principle of readjustment, restructuring, consolidation and improvement in the national economy in China. The Communist Party Central Committee and the State Council have taken a series of measures to strengthen leadership over the forestry construction. On March 3, 1980, the Central Committee of the CPC and the State Council issued the Directive on Afforestation, in

which the goal for developing forestry was put forward in a major way, and the principles and policies for forestry construction during the period of readjustment were worked out. The directive emphasized that agriculture, forestry and animal husbandry were dependent upon one another and should be placed on an equal footing; it was requested that party committees and people's governments at various levels place forestry construction on their agendas, mobilizing people of all nationalities throughout the country to pursue afforestation in a major way.

On December 5, the State Council again issued an Urgent Notice on Banning Indiscriminate Felling of Trees in which it was decided that protective measures should be taken for the existing forests and that centralized and unified administration should be implemented with regard to timber and bamboo *phyllostachys pubescens*. This series of important decisions provided vital guarantees for the forestry development in China.

In order to mobilize people from all walks of life, the broad masses of the people and youngsters to answer the call of the party and government, to take part in the afforestation campaign, and to install throughout society the habit of loving and protecting trees, the Ministry of Forestry, the State Administration of Urban Construction, the General Political Department of the People's Liberation Army, the Central Committee of the Communist Youth League and the Beijing Municipal People's Government on March 10 jointly held a Mobilization Meeting on Afforestation. Based on thorough investigations and research, the Ministry of Forestry held a succession of special meetings throughout the collectively-owned forest areas in southern China, in state-owned forest areas and among the scientific research and education community at which concrete plans for readjustment were put forward. In accordance with the demands for readjustment, cadres and workers on the forest front increased production, practiced economy, and accomplished all assigned tasks in afforestation, commercial forestry and capital construction. Their achievements in forestry development included the following:

1. Continuous Progress and Steady Development in Afforestation Work. During 1980, the policy formulated by the Central Committee and the State Council of relying mainly on the communes and brigades to build forests, of vigorously expanding the number of state-owned forests and of encouraging commune members to grow trees was adhered to throughout the whole country. With the economic interests of the masses taken into consideration, an encouraging situation was brought about wherein the state, the collectives

and individuals joined forces in the promotion of forestry.

In 1980, 68.28 million *mu* of land were afforested, registering an increase of 1.4% over the previous year. In that year, earnest efforts were also made to eliminate the ideological influence of "Left" mistakes in previous afforestation work. A great number of specific programmes were undertaken in the implementation of forest policies, yielding marked results:

- A. In those brigades with large areas of barren hills and wasteland, the policy was implemented of giving a certain amount of such land to commune members for their own private use. Whoever plants trees will be entitled to own them. This policy will earn people's trust and encourage them further to plant trees.

- B. In the state-owned and commune-and brigade-run forest farms, the responsibility system in forest production was popularized, with tree planting and tending carried out on a contract basis. Contracts would be signed and compensation paid according to survival rates and timber-production rates, thus using economic means to encourage the masses to plant trees and protect forests.

- C. In state-owned forest areas, local people should be accepted for participation in regenerating, cutting and protecting the forests of the state farms, and in maintaining roads and performing other productive activities. They would be paid directly by the forest departments concerned or share out profits according to their contract. The development of mountainous areas and fulfilling the immediate interest of the masses should be linked together; i.e., to rely on, to cultivate and to earn a livelihood from the mountains and, likewise, to rely on, to protect and to gain profits from the forests.

- D. Joint afforestation was to be attempted in sectors such as railways, communications, coal mining and light industry. Efforts were to be made to encourage people of all trades and professions to engage in forestry in different ways and means.

These methods have effectively mobilized the enthusiasm of the broad masses of the people in planting trees and served as a motivating force in the accomplishment of the tasks of afforestation in 1980.

In 1980, important achievements were also recorded in key programmes such as state construction of shelterbelts in northwest, north and northeast China, the planting of farmland shelterbelts on the plains; the construction of fast-

growing industrial timber sites in the south; and the regeneration of overcut areas in the Northeast. In planting soil and water conservation shelterbelts, windbreaks and sandbreaks in northwest, north and northeast China, a mixed planting of trees, bushes and grass was employed. In 1980, a total of 7.78 million *mu* of farmland shelterbelts, soil and water conservation shelterbelts, windbreaks and sandbreaks and pasture shelterbelts were afforested.

In the course of planting trees, the people in various places gave heed to the laws of nature, advocated scientific afforestation and took care to apply their own special skills to afforestation. They made it a point that timber forests, economic forests, firewood forests and shelterbelts should be arranged in a unified way so that the layout is rational. And efforts were made to ensure that the right trees were planted in the right places and at the right times, utilizing proper densities and conscientious tending so as to improve the survival rate. In 1980, the forestry departments of various localities, together with parks administration bureaus, advocated the planting of trees, flowers and grass in large and medium-sized cities and taught young people and urban residents to take up the habit of loving trees, flowers and grass.

2. Certain Achievements Have Been Made in the Selection of Superior Tree Species and in the Nursing of Seedlings. In the spring of 1980, the Central Committee and the State Council advanced the suggestion that superior tree species be selected, sturdy seedlings be nursed, and seed-producing sites be set up. These steps would help achieve the goals of specialization, of seed standardization, of quality and of dissemination of superior tree species. In accordance with these requirements, most provinces, municipalities and autonomous regions have restored or established corresponding administrative bodies and have held special meetings to strengthen their organizations, to rectify administration of seedling nurseries and to establish and strengthen various regulations and methodologies.

Measures were taken in various places to support the nursing of seedlings by communes and production brigades and lend support to state tree nurseries. Individual commune members and people of all trades and professions were encouraged to devise their own means for nursing seedlings. Special funds to support communes and brigades in the nursing of seedlings were obtained from state afforestation subsidies or from local finances; chemical fertilizers and subsidy grains were set aside for this purpose. Communes and brigades were helped in funding, materials and technical support so as to help them efficiently

operate their key seedling nurseries and to develop small-sized seedling nurseries.

In 1980, conditions at 357 sites for planting superior tree species were adjusted or completed, and seedling gardens with a total area of 130,000 *mu* and seed-bearing forests of 650,000 *mu* were established. In the 15 provinces, municipalities and autonomous regions of north China, mechanized nursing of seedlings was tried out and ten low-temperature seeds storage stations were set up with a combined area of over 5,400 square metres. By the last quarter of 1980, there were 1,946 state seedling nurseries throughout the country with a total area of more than 1.6 million *mu*. Owing to the mutual cooperation and development of the commune- and brigade-run seedling nurseries and the state seedling nurseries, the total seedling nursing area reached 5.89 million *mu*, basically meeting the needs of national afforestation.

3. To Control Felling, Strengthen Regeneration of Overcut Areas, and Readjust Imbalanced Relationships Within Forestry. Timber production quotas set by the state plan in 1980 were reduced to about 51 million cubic metres from some 54 million cubic metres in 1979 — a cut of 7.6%. This measure enabled forestry bureaus that had suffered from excess felling to undertake rehabilitation.

National forestry industrial enterprises and the commune- and brigade-run forest farms earnestly implemented the principle of "taking forestry as the leading factor in pursuing a diversified economy, and developing those trees which yield quick profits alongside those which yield slow profits so that the quick-profitting could support the slow-profitting." These units did a good job in economic accounting, tried their best to develop their resources while regulating exploitation and utilization, and steadily improved management. The above-mentioned measures effectively raised economic results in forestry industry production. In 1980, national profits from forestry industries registered an increase of 30% over the level of 1978, thus making a good beginning for national readjustment work in forestry.

We should develop comprehensive utilization of timber and try our best to increase the utility of timber. In order to pursue comprehensive use of timber and diversification in the forest areas, the national forestry industries, beginning from 1980, tried to alter the product structure by manufacturing articles according to the size of the timber being used, and thus increasing the variety of products. In addition, they pursued reforms in the use of fuels as a further means of conserving timber. Efforts were made to increase the quantity of and to improve the quality of the "three boards." In the meantime, efforts were made to board the

production of articles made from small-sized timber, and to develop the production of by-products such as mushrooms, fungi, honey and herbal medicines, thus achieving simultaneous development of timber, the "three boards" and forest by-products.

4. Strengthening of Forest Protection. In 1980, indiscriminate felling still occurred in a number of places, further damaging forest resources. To protect forest resources, the State Council on December 5, 1980 issued an Urgent Notice on Banning Indiscriminate Felling of Forests. And the party committees and people's governments in the provinces, municipalities and autonomous regions rapidly took measures to propagate and implement the spirit of this notice. In 13 provinces and autonomous regions including Fujian, Jiangxi and Sichuan, unified purchasing and selling was adopted for timber and bamboo so as to strengthen control over the felling and transportation of timber within the forest areas. This step succeeded in freezing indiscriminate and wanton purchases and sales of timber.

Timber inspection stations were set up in the forest areas in various places; markets trading in timber and bamboo were closed; forest protection organizations and networks were set up and strengthened; local police stations and procuratorates were set up and forest police brigades were formed to clear up accumulated cases of damaging forests and thus cracking down on a batch of criminals. Today, indiscriminate felling throughout the country has been mainly stopped. Normal procedures have been restored throughout the vast forest areas and there now exists a situation of security and stability.

Forest-Fire Prevention. In 1980, all departments in the forest areas drew earnestly from the serious lesson of forest fires during the ten years of chaos [i.e., the "cultural revolution"] and took the prevention of forest fires as a matter of major importance. They conducted frequent publicity campaigns, timely inspections and programmes for long-term prevention; they established and strengthened the responsibility system in the prevention of forest fires and formulated regulations for rewards and penalties. In the principal forest areas, aeronautical forest protection was practiced, air-borne fire brigades were set up and anti-fire roads were constructed. According to incomplete statistics, the outbreaks of forest fires in 1980 were cut down by 40% as compared with 1979 and the extent of ravaged areas fell by 60%. During the fall season of the fire-prevention period, virtually no major fires broke out in the forests.

The work of detection and control of forest

pests and diseases was also carried out widely in various provinces, municipalities and autonomous regions. Prevention areas covered 32% of all infected forests. In order to strengthen the protection of the wild flora and fauna, the forestry departments, in collaboration with the related organs, strengthened the management and construction of natural preserves. By the end of 1980, China had 75 natural preserves covering a total area of 1.7 million *mu*.

In 1980, a considerable amount of work was done in research and education on the forest front, including the conducting of scientific and technological research, publicising scientific and technological achievements, improving educational levels in forestry colleges and schools and strengthening the training of cadres and workers in forestry departments. Considerable achievements have been recorded in this regard. In 1980, more than 100 scientific and technological achievements were reported in the forestry field; 27 of these came from the State Scientific Commission and the Ministry of Forestry. These research achievements attained high standards and have proved to be of great practical value. In 1980, 1,323 cadres and 1,956 technicians were trained in forestry methods.

III. 1980 Prospects for Speeding Up Forestry Development in China

1. Stabilizing Ownership of the Mountains and Forests. If ownership is clearly established, an ownership certificate for the forest should be issued to guarantee that status. If ownership is under dispute, the relevant government bureau should seek resolution by consulting the parties concerned.

2. Further Implementing the Responsibility System in Production. On state forest farms, commune- and brigade-run forest farms and afforestation farms, the job responsibility system should be practiced earnestly in light of the characteristics of forest production; responsibility and pay, as well as collective interests and individual interests, should be closely linked. In collectively owned forest enterprises such as commune- and brigade-run farms, special contracts and payments according to production should be popularized. Such methods may also be practiced on a basis of teams, households or individuals.

3. Practicing Centralized and Unified Control over Timber. In accordance with the principle that the consumption rate of timber should be lower than its growth rate, it is imperative to continue to place felling under strict control. Timber assigned

by the state, locally used timber and timber used by state forestry units and other departments should be consolidated into unified cutting plans. There should be only "one account" throughout the entire country.

4. Increasing State Economic Assistance to Forestry. It is essential for all localities to try their utmost to earmark part of their local financial funds for the support of forestry. It is necessary also to set up a state forestry fund system.

5. Developing in a Major Way the Comprehensive Use of Timber and Economical Substitutes. Timber processing and comprehensive uses for timber should be developed systematically in the forest areas. Emphasis should be on tapping potential, innovation and reform of existing timber mills and factories so as to raise productivity and improve product quality. At the same time, means for conserving timber and the development of wood substitutes should be pursued actively.

6. Adhering to the Policy of Relying Mainly on the Communes and Brigades for Planting Forests, Vigorously Expanding State-Owned Forests and Encouraging Commune Members to Grow Trees. It is necessary to mobilize the broad masses of the people from all walks of life in the cities as well as in the countryside to plant trees with an enthusiastic spirit, to quickly work and put into practice a five-year plan for planting trees and expanding forest coverage and to put forward 10 and 20-year targets to speed up the afforestation of the motherland.

To develop forestry and to afforest the motherland — these are great causes suited to the present period and beneficial to future generations. As long as we earnestly implement the lines, principles and policies laid down by the party since the Third Plenum of the 11th Central Committee, and work in a down-to-earth spirit, forestry in China will have a bright future and the grand goal of afforesting the motherland will certainly be attained.

6. CHINA'S FISHERIES

By Jin Shui

State Administration of Aquatic Products

The fishing industry forms an important component of agriculture. Its development plays a key role in providing variety in the domestic market and in helping to meet the daily needs of the people as well as in increasing exports. It helps towards diversifying the agricultural structure and promoting the overall economic development of the countryside. It provides a useful channel for promoting rapid prosperity for the fishermen and peasants. China's fisheries in 1980 made progress in line with the implementation of the national economic readjustment according to the spirit of the Third Plenary Session of the 11th Central Committee of the Communist Party of China.

I. Recent Achievements and Development

In February 1979, the State Administration of Aquatic Products, a division under the State Council, held a nationwide work forum on aquatic products. Summarizing lessons learned from past experience, the forum studied adjustments in aquaculture work. Policies laid down for the near future included the following provisions: protection of resources, development of breeding, readjustments to inshore fishing, opening up deep-sea fishing grounds, incorporating modern technology, strengthening scientific management, raising product quality and improving market supplies.

Accordingly, three key areas for readjustment were underscored: 1. Protection and reasonable use of resources, with emphasis on limiting inshore fishing so as to prevent overfishing and to allow resources to restock. 2. Making better and fuller use of water surfaces and actively developing aquaculture; the aim is to strive to make use of all existing freshwater surface areas and at least half of the available sea surface area during the decade of the 1980's. These developments are to form the main sources of increased yields in the near future. 3. The provision of equipment to maintain fish at optimum freshness for processing and solving the problem of obsolete methods in this work. This will provide better quality fish.

Readjustments during the past two years have brought about preliminary results which became evident in all aspects of fishery work during 1980. In that year, the total output of aquatic products was 4,497,000 tons, an increase of 4.5% over 1979.

Output of Freshwater Fish. There was still a sharp increase in the output of freshwater products despite heavy flooding of the Changjiang River, spring frosts in the Zhujiang River delta and drought in the northern provinces. The freshwater figure of 1,240,000 tons broke the 1959 record of 1,230,000 tons. An important factor in increasing output was the establishment of supply centres for freshwater fishing, set up with state support. In 1980, more than 80 counties in 11 provinces had established concentrated and integrated centres of this type, creating an area of 320,000 *mu* suitable for intensive aquaculture. Of this area, 250,000 *mu* began producing fish in 1980. The 15,000 tons in output equalled the accumulated 20-year total of annual increases in the breeding of freshwater fish. Of the 1980 total, 5,000 tons were supplied to the state, double the amount in 1979.

Fishing policies have been relaxed, the right to use water surfaces for fishing has been assured and various responsibility systems have been set up. As a result, there was considerable growth in the number of communes and production teams taking up fish farming. In addition, many commune members' families have made fish breeding into a sideline occupation. Record fish outputs were achieved by communes and production teams in Jiangsu, Zhejiang, Hubei, Sichuan, Guizhou, Shaanxi, Shanxi, Hunan, Guangdong, Fujian, Jiangxi, Liaoning, Shanghai, Tianjin and Beijing. The situation has not been as good since the co-operative movement of the 1950's and well illustrates the momentum of the party's policies.

Output of Marine Aquaculture. In 1980, readjustments in marine aquaculture were mainly made in variety. Different districts developed varieties according to local conditions. There was a 4.5% increase of water surface utilized in 1980 as compared to 1979. The area devoted to the cultivation of clams, razor clams, scallops, fish, prawns and laver increased. In 1980, output of marine products increased by 6.8% over 1979. The total volume of 444,000 tons consisted of 250,000 tons of kelp, or 56%; 60 tons of mussels, or 13.5%; and 57,000 tons of razor clams, or 12.8%. Output of prawns increased at the fastest rate during the last two years, doubling its yield each year.

By the end of 1980, 43 commercial sea farms had been established or were being set up, with a combined area of about 200,000 *mu*. At the same time, six new centres were set up for producing

marine delicacies: three for abalone and three for trepang and scallops.

Output of Deep-Sea Fishing. In 1980, work on deep-sea fishing was centred on the protection of marine resources and adjustments in work in that field. In coastal waters off the Yellow Sea and the Bohai Gulf, the use of fixed nets during the off season was forbidden. There were strict limits on the number of boats under licence allowed out during the prawn-fishing season. In the East China Sea, an off season for fish was declared for the four-month period of July through October. Steps were taken to restore fishing by use of dragnets, encircling nets and small hooks and lines. During 1980, the problem of dwindling resources for hairtail fish in the East China Sea took a turn for the better, and the proportion of large and medium-size fish increased.

Progress in Research. Scientific work in aquaculture registered over 60 achievements. Most important were improved breeding methods for freshwater products, improved varieties of cross-bred carp and popularization of a variety of methods, including use of high-yield fish in pond farming, fish rearing in paddy fields, and artificial breeding of prawns and scallop larvae. Other important achievements were the popularization and use of insulated holds in motor and sail-powered fishing boats. Six million African crucian carp (*tilapia mossambica*) were reproduced during the year, and these fish are now being bred in more than a dozen provinces. These fish can reach weights of 450-600 grams in four months and are ready for marketing within one year. More than 1.2 million pond shrimps are now being propagated and experiments are being made in Guangxi and Shanghai to breed them productively. Three different species of carp have been cross-bred. Heyuan carp, Yu carp and Furong carp; these have been introduced to 13 provinces and municipalities. Progress has also been made in the artificial rearing of prawn and scallop larvae and good production results have been achieved. In 1980, 800 motorized and sail-powered fishing boats belonging to collective fish farms had installed insulated holds. This meant that fish could be held at temperatures of 3-4°C lower and that boats could stay at sea 2-3 days longer.

Research into the country's natural fish resources and into the division of work in the fishing areas have resulted in pilot projects being started in key bodies of water and regions; scientific collaboration groups were set up to study resources in continental shelf waters and in important inland water systems; six of these groups were set up for the Yellow Sea, East China

Sea, South China Sea, Heilongjiang River system, Zhujiang River and Huanghe River systems. Each group has drawn up study plans and all are starting to carry out their tasks. Some provinces and municipalities have also started to carry out research work.

Improved Processing Methods. In the area of ensuring fresh processing and improving quality, efforts have been concentrated on retaining freshness at the initial point — at sea. Past measures which have proved effective have been restored, including washing, sorting, packing in boxes and adding ice. Now about half the catch is packed in boxes. Of the 1980 hauls made at sea, about 1.3 million tons of fish were chilled fresh, 500,000 tons frozen and 200,000 tons made into fish meal, canned fish and other processed products. Quite a large proportion is salted and dried. Fish-processing factories in Shanghai use black scraper fish for canning, fish sausages, fish cakes and fish-liver oil for veterinary use; they are finding growing markets for their products.

Improved Management. Improved management has cut down losses and increased profits. In 1980, profits reached 28.65 million yuan. For many years, the country's marine and freshwater fishery enterprises had been run at a loss, a trend that was reversed for the first time in 1980.

More channels were opened up for supply and marketing, producers were able to contact consumers, restrictions on country fairs were removed so that sales of aquatic products livened up considerably. Statistics show that in 1980 about 635,000 tons of marine and freshwater products went on sale in urban and rural markets throughout the country. This did much towards balancing the supply of aquatic products between urban and rural outlets. Furthermore, increasing foreign revenues have been earned from exports of aquatic products. This total rose from US\$160 million in 1977, to US\$250 million in 1978, to US\$340 million in 1979 and to US\$356 in 1980.

Progress made in readjustment and in carrying out economic policies resulted in more accumulation and income for most fishing communes and brigades. Figures from 17 provinces and municipalities showed an increase in accumulation in 1979 of 16% over 1978; and an average per capita increase of 35%, or from 93 to 126 yuan. These increases continued in 1980.

II. Resources and Problems

China has rich aquatic resources. It has a

coastline of 18,000 km. on the south and east. Its continental shelf consists of 430,000 square miles of 200-metre-deep fishing grounds. About 1,500 different kinds of fish are found in China's waters, of which about a dozen have great economic importance. The coastal shore is wide and provides an area of 7,400,000 *mu* suitable for raising seafoods such as molluscs, sea algae, fish and prawns, as well as delicacies like abalone and trepang. Inland rivers, lakes, ponds and reservoirs provide 75 million *mu* of water surface suitable for fish-breeding. The wide latitudes pass through frigid, temperate and tropical zones and provide suitable conditions for developing the aquatic products industry.

Historical Development of the Aquatic Products Industry. China has been active in the aquatic products industry for thousands of years and has generations of valuable experience. The world's first book on fish culture, written by Fan Li, appeared in 460 B.C. Summarizing experiences of that time, the "Canon on Fish Culture" pointed out that aquaculture was one of the five methods of culture. China is in the world's front ranks in fish-breeding techniques and has always led in freshwater fish farming. In recent years China has trained 140 experts in fish farming for the United Nations — an activity that has earned the appreciation of participant countries.

In the 30 years since the founding of the People's Republic of China, yields in aquatic products have risen from 910,000 tons in 1950 to 4.3 million tons by 1979, taking third place in the world behind Japan and the USSR. Aquatic products account for 1.4% of the total value of agricultural output.

Developments in China's aquatic products industry can be divided into four stages:

1. From 1949 to 1957. Because of lingering disruption left from the war years, this period was mainly one of rehabilitation and development. At that time, natural resources were very rich so, with the liberation of productive forces by democratic and socialist reform, yields rose steadily. During these eight years production rose from 450,000 tons to 3.12 million tons — a seven-fold increase. Quality was also good.

2. From 1958 to 1969. During this period, aquaculture came under the influence of the "Left" ideology — first, the wind of communitization; then, the wind of exaggeration in reporting yield figures; and finally, the wind of blind direction that swept the whole country, culminating in the "cultural revolution," when aquaculture suffered from sabotage by Lin Biao and

the Gang of Four. Thus, despite the fact that many deep-sea fishing boats were added during this period, yields were uneven and there was no significant increase.

3. From 1970 to 1978. During this period, the number of motorized fishing boats were increased rashly and yields were the highest ever recorded — reaching 4.7 million tons in 1977. Overfishing did not give natural resources the chance to replenish themselves. Immature fish, low-value fish, molluscs and algae accounted for more than 50% of the catch. The damage done caused catches and quality to decline drastically.

4. Since 1979. Since 1979, agriculture has been brought into line with readjustments in the national economy. Under the policy of readjustment, restructuring, consolidation and improvement, the aquatic products industry started to improve.

The experiences of the past 30 years have taught us much. We now recognize that in order to develop the aquatic products industry, scientific and objective laws must be observed. Proceeding from actual conditions, we must keep within our capabilities and strive for solid economic results. It was because these laws were ignored for so long in the past that the aquatic products industry found itself mired in difficulties from which it could not readily break free. The most serious of these were as follows:

1. **Damage to Resources.** For a long time in the past, we were influenced by "Left" ideology and did not realize the importance of protecting and making rational use of aquatic resources. In this respect, we lacked basic scientific knowledge and pressed forward subjectively with no thought for natural laws governing the replenishing of resources. It was erroneously believed that where there was water there must be fish; we had only to increase our fishing fleet to make bigger catches — the immense stretches of sea providing limitless resources. So we blindly added boats and nets, with the result that we overfished our natural resources. In fact, the fishermen were encouraged to get a good haul during the slack season and to do even better during the peak season. We did our best to double our catches, fishing for big as well as small fish and never giving nature a chance to recoup. The painful consequences were that commercial fish (apart from prawns and shrimps) have mostly disappeared from the seas around the Bohai Gulf. There was no longer any fishing season for hairtail fish and small yellow croaker in the Yellow Sea. The damage done to the big yellow croaker off the coast of the East China Sea was

just as bad. The fish caught off the coast in the South China Sea were mostly the young fry of commercial fish. Catches for big yellow croaker dropped from the record figure of 190,000 tons to only 80,000-90,000 tons a year. Catches for small yellow croaker dropped from 160,000 tons to 20,000-30,000 tons a year. The catch for hairtail fish, which had once peaked at 570,000 tons, dropped to 470,000 tons a year.

The damage done to inland freshwater resources was even worse. Blindly filling in lakes to create more farmland and building barriers and dams not only greatly reduced the water surface but also did great harm to spawning grounds by cutting access to them by the fish. Environmental pollution helped to wipe out natural resources too. Since the end of the 1950's, catches from freshwater lakes and ponds have been dropping sharply. The yearly figure of 500,000 tons fell to 400,000 tons annually during the 1960's and to 300,000 tons in the 1970's. All of this was the result of "Left" ideology.

2. **Advantages of the Breeding Industry Have Not Been Fully Utilized.** For many years, the policy of overall development of agriculture, forestry, animal husbandry and fisheries has not been conscientiously carried out. At all levels throughout the country there was a one-sided emphasis on grain as the key link. Because of this, every idle *mu* of land had to be accounted for. Meanwhile, no one cast so much as a glance at unused water areas even though these totalled tens of thousands of *mu*. The situation was exacerbated by the fishery departments, which tended to pay more attention to the size of catches than to the need for replenishing stocks. With the economic policy not being carried out and no scientific measures being taken, the excellent advantages existing for fish rearing were not fully utilized. Today, only slightly more than half of China's water surface is utilized and unit-area yields are highly uneven. The national average yield per *mu* is only 40 catties, with high yields reaching 400-500 catties and sometimes 1,000 catties. Most of the shallow waters around the coastal areas are still not fully used. We have not solved the problem of building processing facilities for products such as kelp and mussels, in which we are specialized. Transportation and marketing difficulties still exist. Many economic policies are unreasonable and dampen the enthusiasm of the fishermen and peasants in fish breeding. Fish-raising, like pig-raising, requires feed, but right up to the present there is no clear policy about the supply of feed; this severely restricts the growth of the aquaculture industry.

3. **Problems of Few Varieties, Low Quality and Losses Through Waste.** The aquatic products industry embodies industry and agriculture, it is an agricultural side-line which is also multi-faceted. Another special feature is that the products of this industry are most fresh when alive, yet spoil easily. China ranks third among the world's fishing nations, yet per capita fish consumption is recorded as less than 9.2 catties — one-fourth the world average of 34 catties per capita, putting China well below 100th place in world per capita consumption of fish.

Because we did not give special attention to these facts and did not fully acknowledge the situation, the quality of fish was bad and the wastage rate was high. This was caused by poor management and irrational pricing, together with too much bureaucracy and backward processing and storage facilities. Apart from about one million tons of fish salted and dried every year, much of the remaining catch became spoiled because of delayed processing and transportation difficulties, so that it could be used only as animal feed or fertilizer. For this reason, the actual consumption of fish per capita fell even lower.

III. Policies and Measures for Readjustment

In accordance with the spirit of the Party Central Committee that we should break free of our mental shackles, relax policies and enliven the economy, steps were taken in 1980 to revise plans for the aquatic products industry. However, the many difficulties accumulated over the years were firmly entrenched and hard to eradicate with one stroke. For instance, the coastal population had increased, which meant that as time passed there were more people coming onto the labour market for whom jobs had to be planned. But this contradicted the necessity to protect resources by limiting fishing. The resources protection issue had already been an urgent one many years back, but because the fishermen needed to fish for their livelihood, a quick solution was impossible. Also, the people wanted to eat fish and public opinion pressed for increased market supplies at the same time the fishing industry was faced with the choice to reduce its catches. Revisions in fishery plans had to take the whole situation into account and make plans from a practical point of view to be carried out over an extended period of time.

In 1980, the following measures were taken with a view to reviving the aquatic products industry:

1. *Legislation, arbitration and coordination were used to carry out scientific management in fishing.*

Restricted fishing in offshore waters and rational use of resources have been implemented for two years, but because legislation is as yet incomplete and supervisory measures are inadequate, the results have not been great and work is progressing very slowly. Some forward steps include coordination in arranging fishing grounds, regulations for fishing licences, for prohibited fishing grounds and for off seasons, as well as work to study the proportion of immature fish. Regulations have also been worked out to require the issuance of permits before new fishing boats can be built or imported. At present, work is underway for formulating fishery regulations.

2. *Different techniques have been adopted to speed up the time required for rearing fish.*

In order to make the most of different conditions in different places, we have advocated the relaxing of regulations and used various means to mobilize enthusiasm everywhere to bring in everyone — from the state, collectives and individuals — to increase speed. Apart from establishing supply centres and encouraging suburban fish farming, we are encouraging communes and production teams to raise fish wherever conditions are favourable and have solved problems on the policy level of fish feed, purchasing of products, pricing, etc.

For instance, Guangdong Province has laid down the policy that fish raising bases have their tasks, purchases and allocations to the state fixed for three years; for areas not specializing in fishing no assignments are made — communes and brigades are allowed to sell their produce at country fairs; the allowance of bonus feed grain has been increased: an equal weight of fish can be exchanged for an equal weight of grain. Diversified forms of fixing yield outputs and award systems encourage fish farming by commune families. This policy is getting good results.

In aquaculture we have also encouraged joint associations such as those between the state and provinces, localities or counties; province and province; county and county; production area and sales area; the state and collectives; and between aquaculture and other industries. These different methods can all be tried.

3. *We should open up more means of production and change the habit of practicing monoculture or a single-product economy.*

While carrying out fishing as its main occupation, a fishing brigade can pursue other occupations and other forms of production. To the extent permitted by local conditions, they can create conditions for the development of pro-

cessing and integrated industries. They can also engage in agriculture, livestock, transportation and other sideline activities. Areas with suitable conditions can start pilot projects and gradually develop in the direction of fishing, industrial and trade complexes.

4. *The relaxation of economic policies has mobilized the enthusiasm of producers.*

The two key areas are easing the policy for products processing and adjusting the relationship between the state and the collective. In the past, the state set most of the assignments and quotas; management by individuals was controlled too rigidly. Furthermore, as far as prices and materials were concerned, there could not be exchange at equal value. Thus, by reducing the planned quotas for sale to the state, by lowering the proportion going to the state and by allowing for reasonable price fluctuation, the fishermen obtained more say in handling their products. State purchasing quotas should be established as much as possible by taking into consideration the relationship between fish and other market products and by basing contracts on exchange at equal values. This policy should be strictly enforced. Some assigned quotas should remain fixed for several years, and some areas should be given a free hand with their produce, with only certain products being sold to the state under the state plan. Purchases of products under the state plan are mainly intended for the supply of large cities, key mining and forest regions and troops stationed in border regions.

As for the policy regarding planned state purchases, apart from stipulating a reasonable amount for commodity bases established or newly established with state aid, other areas should not be obliged to sell their produce to the state once they have met their agreed quotas for state purchase plans. They should be allowed to dispose of the surplus themselves whether they be collectively owned units or state-managed units. This policy should extend to processing, transport and marketing of produce in the cities. Units should be free to make direct contact with factories, mines, hotels and restaurants; to enter cooperative arrangements with them; or to sell to them at mutually agreed prices. When Guangzhou city carried out a policy of fixed quotas at relatively low prices, the production brigades had no encouragement to raise fish yields. Thus, the market was always short of fish, despite the fact that the state encouraged suburban fish farming and despite many meetings and the granting of material incentives.

However, when policies were relaxed in 1980, a good response came in the form of a 17% increase in yields of pond fish, providing a better

market supply. Another effective policy was giving the basic accounting unit more responsibility for fixing quotas and awards, so that the people received more real benefits from the policy of distribution according to work. Because there are more risks in deep-sea fishing and because more capital is needed, the economic accounting unit for this activity should not be too small. In distribution it should be recognized that there are differences in the work of different units and suitable arrangements should be made. Fish breeding could be assigned to a special production team, unit, family or group of workers within the planned scope of the collective and compensation based on production results. More remotely situated fish ponds not easily managed by the collective can be assigned to individual commune members to manage by themselves.

5. *Living up supply and marketing.*

It is necessary to correct the past practice of unified purchasing and sales by the state. This practice has led to high costs, poor results and frequent wastage due to fish spoilage and has placed greater burdens on the consumer. From now onward fish for villages and small towns should be supplied locally through increased production. Important provincial, municipal and autonomous region markets should have their supply problems resolved through provincial planning. The needs of a few cities like Beijing and those of some mining and forest regions and of border-based military

forces as well as of other special places should be met by direct arrangements with production areas under a uniform plan and by using various methods.

Supply and marketing enterprises should make more use of economic measures to promote production and stabilize market supplies in the service of consumers. Special stress should be placed on collaboration between producers and marketing stations, on arranging sales and marketing agents and on processing, freezing, warehousing and other services. Support should be given to trial fishery-industry-commerce joint ventures.

6. *More education in science and technology and the training of large numbers of skilled personnel.*

We must rely on the correct policies and scientific methods if production is to increase. During 1980, studies of resources and regional plans were undertaken. Scientific achievements were popularized. All this has served to improve production practices. It has also brought excellent results in the protection of our natural resources and in promoting the breeding and production of marine and freshwater products.

A Tang Dynasty poet, Liu Yuxi, wrote: "By the sunken wreck a thousand sails pass; Beside the withered tree countless saplings mass." This period of readjustment shows there is a great future for the development of China's fisheries.

7. CHINA'S ANIMAL HUSBANDRY

By Zheng Xingjie

State Bureau of Animal Husbandry, Ministry of Agriculture

I. Developments Since the Founding of New China

Although animal husbandry has undergone ups and downs since the founding of the People's Republic of China, generally speaking it has undergone substantial development. The total population of domestic animals increased 3.7-fold, from 160 million in 1949 to 588 million in 1980. Pig-raising developed the fastest with the total jumping from 57 million to 305 million, an increase of more than 5-fold; sheep went from 42 million to 187 million, also increasing 5-fold; draught animals increased from 60 million to 95 million, a growth of 1.6-fold.

In recent years, owing to steady development in animal husbandry, China has come to account for a considerable proportion of the world's livestock total and meat output. Pig-breeding is an important family stock-breeding activity among Chinese peasants. Nearly every peasant household breeds pigs. Pork accounts for over 90% of China's total meat output. During the past few years, China has ranked first in the world in both number of pigs and pork output, as well as in numbers and output for horses, mules, goats and rabbits. In 1979, the total number of pigs, cattle and sheep in China constituted one-seventh of world totals; the total amount of pork, beef and mutton produced in China surpassed 10 million tons, making up 10% of the world's total output of 107,284 million tons.

Thanks to the steady development of China's livestock breeding, prevailing meat and egg shortages during the last decade have recently begun to decline. Except for a few areas, state-run stores in urban areas throughout the country are able to supply adequate quantities of pork and fresh eggs during peak periods. The amount of meat on sale in markets and the turnover of meat in rural trade fairs have been increasing yearly. Market sales of pork and eggs during the first half of 1980 increased by 52% and 24%, respectively, compared with the same period in 1979.

Owing to well-stocked supplies on the domestic market, labour productivity and capacity utilization rates in related light and textile industries have been raised to new levels. Woolen textiles, pigskin and meat processing industries are growing rapidly.

II. Achievements in 1980

China's animal husbandry in 1980 continued to advance in stride with 1979's rapid growth rates. In 1980, party committees and people's governments at all levels — further implementing the spirit of the Third Plenary Session of the 11th Party Central Committee — readjusted various economic policies concerning the development of livestock breeding in rural and pastoral areas, and abolished stipulations forbidding or restricting commune members from raising and butchering livestock.

During March 1980, the State Council successively approved the Ministry of Agriculture's Report on Speedy Development of Animal Husbandry and a report submitted jointly by the ministries of agriculture, commerce and food — An Emergency Report on the Current Conditions of Pig Production. In the process of carrying out these policies, several provinces, municipalities and autonomous regions set forth concrete policies suitable to local conditions. The road of development in animal husbandry grows wider and wider.

Combating Natural Disasters. With the further mobilization of positive factors on every front, the peasants and herdsmen in 1980 effectively combated the most serious drought of the past three decades in the northern pastoral areas. Despite this and other natural calamities such as extended low temperatures in agricultural areas, water-logging in the south and declining forage yields, animal husbandry has developed steadily.

Increasing Pig Output. In 1980, the number of marketable pigs increased by a large margin. In most areas, pork is in unlimited supply. In order to protect the peasants' initiative in pig breeding, the Central Committee and the State Council propitiously drew up the policy of reducing prices to promote sales, providing financial subsidies and stabilizing pig breeding. This policy has achieved tangible results. By the end of 1980, the number of pigs put up for sale was about 200 million, increasing by 10 million over 1979. The number of pigs purchased by the state in that year was 133 million, an increase of 3 million over 1979; and

the number of pigs sold was 131 million, an increase of 9.8 million.

Draught Animals. In addition, the number of draught animals had a slight increase, thus putting an end to three years of waning. The number of sheep and goats was 187 million, reaching the highest record in history.

Apiculture and Poultry. The output of honey in 1979 was 110,000 tons. It fell to 96,000 tons in 1980, although this quantity, accounting for one-seventh of total world output, ranked China first in the world, surpassing the United States for the first time. With the emergence of full-time households engaged in domestic fowl farming, the production of poultry also advanced.

Breeding Herbivorous Animals. In order to speed up further development of livestock breeding, it is necessary to take effective measures to solve livestock problems in pastoral areas, where the pattern has often been "well-fed in summer, fat in autumn, lean in winter and dead in spring." We must take full account of the advantages offered by mountainous and hilly districts to breed herbivorous animals. We must continue to eliminate "Left" influences so as to prevent the reappearance of such practices as forbidding or restricting peasants and herdsmen to raise and butcher livestock on their own. It is necessary to clear distribution channels for live animals and animal products so as to facilitate production and consumption.

The following are key aspects of the development of China's animal husbandry sector in 1980:

1. *Positive measures were taken to readjust the internal structure of animal husbandry.*

There were notable changes in the internal structure of animal husbandry in 1980. Improvements were realized in livestock variety, breeding and in age and sex proportions within livestock herds. These achievements fully proved the correctness of the line, principles and policies formulated since the Third Plenary Session of the 11th Party Central Committee. They have inspired peasants and herdsmen to speed up the development of livestock breeding and to lay stress on quality and scientific breeding. Today, peasants in some areas place stress on good breeds and the use of proper proportions of pig feed in pig-breeding. The sales rate for pigs in 1980 was raised to 62%, putting an end to unreasonable livestock herd structures.

On the question of livestock variety, while the Third Plenary Session's resolution on the development of agriculture did much to stabilize pig

raising during the past year, much attention was also paid to increasing the number of herbivorous animals — cattle, sheep, rabbits and bees. The breeding of more herbivorous animals has a great future. It allows making full use of China's numerous hilly districts and large grassland areas. This has become one of the focal points in speeding up China's livestock breeding. Many provinces, municipalities and autonomous regions have issued announcements to encourage commune members and collective units to breed more herbivorous animals such as cattle, sheep, rabbits and bees. The proportion of herbivorous animals within the overall livestock population has increased. Of the total number of livestock in 1980, the percentage of draught animals and sheep was 48%, an increase from 46.4% in 1979. According to the 1980 growth rate, it is estimated that by the end of 1982, herbivorous animals will make up 50% of the total livestock population. This is a good beginning in gradually changing the present state of affairs wherein grain is the staple food and pork is the principal meat.

Several regions in 1980 worked to improve livestock herd structure and increase the proportion of lambs. To increase output from herd livestock, pastoral areas in Xinjiang, Inner Mongolia, Gansu and Sichuan have carried out the method of fattening and slaughtering lambs during their first year; and fattening and slaughtering veal calves at 18 months.

This measure has already achieved initial results. Over one million lambs have been put on the market. Notable results were achieved when big-tail lambs in Xinjiang were fattened and slaughtered in the year they were born: the number of lambs slaughtered in Xinjiang in 1977 was 75,000; the figure rose to 100,000 in 1978; to 170,000 in 1979; and to 300,000 in 1980. This method was also applied to fine-wool Xinjiang sheep, of which 340,000 were fattened and slaughtered last year. The proportion of ewes of slaughtering age has increased from 56% in 1956 to 65% in 1980.

In summer and autumn, forage grass grows quickly, making these seasons suitable for breeding and fattening livestock. To make full use of these characteristics, new methods have been found to economically and effectively utilize our country's rich grassland and livestock herd resources.

2. *The construction of livestock breeding centres in 1980.*

The construction of livestock breeding centres is a reliable means of raising the output and commodity quantities of livestock products. The building of grass-feeder centres began in 1978. After two-three years of effort, centres for breeding commodity cattle, milk goats and lambs have

begun to take shape and to supply commodities to the market.

In the last two years or more, 140 commodity-cattle centres in 22 provinces, municipalities and autonomous regions have begun to supply the market with meat, milk and skins. Production capacities have been established as the result of a variety of measures such as improving mating techniques, clearing pasture land and altering modes of production. In 1980, the total number of breeding cattle surpassed one million, increasing by one-third over the 1979 total of 680,000; cross-bred cattle in stock were 1.4 million.

Raising milk goats has become an increasingly important livestock activity in China. The establishment of centres for raising milk goats has gone on in Shaanxi, Shandong, Henan, Hebei, Shanxi, Zhejiang, Jiangsu, Jiangxi, Sichuan and other provinces. Fuping County of Shaanxi Province was the first county centre for milk goats in China. Milk goats and milk-goat products have developed at a high speed. At the end of 1975, the number of milk goats in the country was 74,000 and output of dairy products was 455 tons; in 1979, the population had risen to 100,000 with output of dairy products at 1,000 tons — 50% more than the total national output of dairy products during the early years of the People's Republic.

Experience gained in many base counties has shown that in raising one milk goat with an annual yield of 500 kg. of milk, if one invests 1 yuan, then one may recover 4 yuan in that same year. The method generally practiced is for each household to raise one milk goat; its yearly income of 100 yuan will suffice the family's purchases of daily necessities and clothing, as well as pay tuition fees. Further, the sale of the milk from one milk goat to a dairy products processing factory can provide the state with 68 yuan in taxes and profits per year. Cadres and masses in milk-goat base counties consider the development of milk goats to be a livestock breeding activity of small investment and great benefit to the people, the state and the collective. Milk-goat centres have expanded steadily. There are now over 2 million milk goats, double the total at the end of 1978.

3. Experiments in modernization of livestock breeding have achieved results.

During the past two years, in order to gain experience in modernizing livestock breeding the feeding of herbivorous animals in pastoral and mountain areas, the Ministry of Agriculture, in collaboration with 8 provinces and regions, has carried out three types of experiments in 17 counties with different types of grazing con-

ditions: (1) modernization of grasslands; (2) comprehensive experiments in the modernization of livestock breeding (including grasslands construction, scientific breeding of livestock, mechanization of animal husbandry and prevention and cure of animal diseases); (3) experiments in integrated complexes that combine animal husbandry, industry and commerce.

These experiments involved 710 key communes, farms and production brigades. At present, most of these experimental projects have taken shape, have established a certain production capacity, have begun to play a part in production and have set examples for dissemination of results of the experiment. By 1980, a total of 4 million *mu* of grassland were enclosed with fencing; about 300,000 *mu* were seeded by aircraft; and 600,000 *mu* were planted with seeds of prime forage grass. In 1980, 615 million kg. of grass were in stock, an increase of 60% over 1977 (before the experiment).

Following its reorganization, the integrated complex of animal husbandry, industry and commerce of Ruergai County, Aba Tibetan Autonomous Prefecture, Sichuan Province, bred more cattle and sheep, contributed more to commerce, received more dividends, accumulated more for the collective and earned more income for its commune members. The per capita income in 1980 was 200 yuan, an increase of 58 yuan compared with that prior to the experiment. The four categories of animal products under state plan have all overfulfilled the state-set allocation target. The prefecture committee set an allocation plan of 500,000 kg. of wool in 1980, and the integrated complexes supplied the five major wool-product factories in Sichuan with 590,000 kg. of wool. The output of beef, mutton, cowhide and sheepskin have all surpassed the state-fixed plans, a result that was gratifying to the state, management units and individuals.

4. Initial work on grassland protection, utilization and construction.

China is rich in natural grazing grounds. The total area of grasslands and grassy shoreline is 5,300 million *mu*, making up one-third of the country's total territory. Of this, 4,300 million *mu* consist of grasslands in pastoral areas; 1,000 million *mu* are grassy hills and slopes in agricultural areas; 40 million *mu* are sea beach grasslands. About 4,000 million *mu* of the grassland total can be utilized for animal husbandry.

After Liberation, feudalist ownership was abolished, mutual-aid and co-operative movements were carried out, and the policy of "protecting grasslands to develop stock-raising" was implemented. As a result, stock-raising in pastoral areas

lept forward. During recent decades, however, due to an enormous increase in livestock numbers, a falling off in grassland management and construction, and disruption and sabotage by Lin Piao and the Gang of Four, we have experienced the phenomena of fertile pasturelands degenerating into wasteland and of alkaline content in soil becoming increasingly serious. Pastureland yields have been reduced by 30-50% and stock-raising for long suffered from slow growth, low quality and instability.

Since the Third Plenary Session of the 11th Party Central Committee, the party and government have stressed grassland management and construction; combining the protection and rational utilization of natural grazing grounds with the construction of large-scale man-made grasslands; putting equal stress on enclosing, building and managing lands for livestock breeding; and taking suitable measures to fit the local conditions. The party and government have placed emphasis on rotation grazing and the adequate storage of forage grass to tide over livestock during seasonal winter and spring shortages. They have systematically established forage grass centres to bring about stability, good quality and high output in animal husbandry. Up to the end of 1980, a total of 70 million *mu* of grassland had been enclosed, playing a positive role in fighting natural calamities and protecting domestic animals. At the same time, a survey of grassland resources was begun. Experimental stations for introducing and breeding superior varieties of forage grass were set up. In order to improve management of grasslands, the state started formulating a "grassland law."

Artificial grass planting has grown rapidly in recent years. In the northern provinces there are large areas under forage grass; their varieties have steadily increased and their quality has improved. Acreage in the region has increased from 5.2 million *mu* in 1976 to 6.4 million *mu* in 1977, 8.9 million *mu* in 1978 and 12 million *mu* in 1979; the average annual increase over the four years was more than 22%. According to incomplete statistics, total acreage under forage grass was about 13 million *mu* in 1980.

In 1979 and 1980, China sought to open up new channels to large-scale transformation of grassland by carrying out experiments in aerial seeding. Initial results were recorded in 14 counties (or banners) in eight provinces and autonomous regions: Inner Mongolia, Ningxia, Xinjiang, Guangxi, Hunan, Guizhou, Jilin, Shaanxi and in Beijing. In 1979, about 192,000 *mu* were seeded by plane, with the cost per *mu* coming to 0.23 yuan. The acreage under full stands of seedlings was 61,000 *mu*, making up 31.8% of the total area seeded by this method. In 1980, about

370,000 *mu* were seeded by plane. The average per-*mu* charge was 0.24 yuan. The acreage under full stands of seedlings was 156,000 *mu*, making up 42.1% of the total area seeded by plane.

5. Improvement of forage grass seeds.

The establishment of a system for breeding good strains of forage grass seed is an important aspect of capital investment in livestock breeding. Before 1977, wild forage grass seed collected by individuals and collectives made up the greatest proportion, while artificially cultivated grass seed only accounted for a small amount. Beginning in 1978, about 30 forage grass seed centres were set up in Inner Mongolia, Qinghai, Xinjiang, Heilongjiang, Jilin, Shaanxi, Gansu, Hebei and Henan to plant forage grasses. In 1980, while consolidating these centres, additional new seed centres were built to assist livestock breeding in the southern mountainous areas of Hunan, Hubei, Guangxi, Jiangxi, Fujian, Sichuan, Yunnan, Guizhou, Zhejiang and Jiangsu. Up to the end of 1980, state-run forage grass seed farms planted 290,000 *mu* and turned out 4 million kg. of grass seed. The total annual yield of forage grass seed was 15 million kg., not including seeds collected by individuals and collectives.

Since 1979, the State Bureau of Animal Husbandry of the Ministry of Agriculture has organized 14 agricultural and stock-raising research institutes and units to study and domesticate local and foreign grass breeds. Successful results have been achieved in some categories.

In November 1980, the State Bureau of Animal Husbandry convened a meeting on the work of growing forage grass seeds. The meeting summed up production experiences in this field and issued several documents: the National Forage Grass Seed Regional Plan (trial draft); Forage Grass Seeds Check-Up Regulations (draft); Standard for Grading Forage Grass Seeds (trial method); and Trial Prices for Several Kinds of Major Forage Grass Seeds. The meeting put forward future tasks for the planting of forage grass seeds: to consolidate and raise the level of existing work, to develop and intensify research work and to perform tasks in accord with local conditions. Such tasks would lead to the establishment of a first-rate forage grass seed breeding system that would satisfy the needs of our country's stock raising.

III. Survey of Experiences in Livestock Breeding During the Last Three Decades

Under the leadership of the Communist Party and the People's Government, the Chinese people

have removed the three mountainous burdens on the heads of the Chinese peasants. In pastoral areas, they carried out policies beneficial both to herdsmen and herd owners, they implemented economic rehabilitation in both the countryside and pastoral areas; and they brought every positive factor into play in the development of livestock breeding. Cattle plague, which had prevailed in old China for many years, was eliminated in 1955, while other prevailing animal epidemics were brought under control. The first positive stage in the development of livestock rearing was completed in September 1957 with the culmination of China's First Five-Year Plan. In 1956, the sheep population had surpassed that of pigs. During the three years of recovery (1949 to 1951), the numbers of pigs, sheep and draught animals increased at annual average rates of 15.8%, 8.4% and 13.4%, respectively. During the period of the First Five-Year Plan, the average rates were 10.2%, 1.9% and 9.8%, respectively. In 1956, the State Council adopted a pig-raising policy of "private ownership and breeding with public assistance," and raised by 15% the purchasing price of live pigs. Within 1956, peasants bred an additional 60 million pigs, an increase of 70%. Thus, in 1956 the number of live pigs increased at the highest rate recorded in the three decades of New China.

During 1963-1966, the country carried out the policy of "readjustment, consolidation, filling out and raising standards," and issued a Revised Draft on People's Communes in the Rural Areas. The state took measures to stop the rash advance in agriculture and animal husbandry, implemented the pig-raising policy of "collective and individual pig-breeding, with stress on the latter." The central government adopted the "Resolution on Developing Draught Animals" and implemented the policy of rewards for hard-working stockmen. In some areas, if stockmen propagated livestock in excess of the set quota, they would receive extra payments as rewards in addition to their earned work-points. In 1965, thanks to the rapid development of animal husbandry, eggs and meat piled up in the markets. People's lives were improved by a large margin, and the physical well-being of the younger generation was enhanced. The average baby's birth-weight in Beijing increased from 2.6 kg. in 1951 to 3.1 kg. in 1965. This constituted the second period of accomplishment.

At the end of the 1970's, following the smashing of the Gang of Four and especially after the Third Plenary Session of the 11th Party Central Committee, livestock breeding leapt forward as a result of correct policies that relaxed restrictions in the countryside and pastoral areas and shook off "Left" ideological trammels. Thus there

emerged an excellent situation in livestock breeding which had not been known since the founding of the People's Republic.

We should sum up these experiences in order to draw useful lessons.

IV. Development Trends and Policies in Animal Husbandry

1. To increase households, groups, and brigades engaged in specialized breeding and to provide them with superior breeds and advanced techniques.

At present, 90% of the meat and eggs available in the market are supplied by peasant families. The conditions of household livestock breeding directly determine both supply conditions in the market and the production situation in animal husbandry. There is great potential here for further development. A good procedure is to transform household sideline production into livestock raising by special households. At present, there are over 30,000 households in Shenyang raising pigs, accounting for one-fifth of the peasant population but supplying one-third of the city's total live-pig requirements.

At present, general problems in livestock breeding include large expenses, high costs and poor economic results. These problems should be addressed by attending to existing conditions, by focusing on management and by taking a long-range view. The ideal circumstance should be the simultaneous development of small, medium-sized and large enterprises, with emphasis on the smaller ones. In means of production, the emphasis should be on a combination of mechanization, semi-mechanization and manual operation, with primary stress on manual operation. On the system of responsibility in production, methods should be many and varied, with priority given to "specialized households." Since "specialized households" will probably, in the long run, become basic production units in livestock breeding, the state should take appropriate measures to set up comprehensive service companies. These should provide high-quality breeds, fodders mixed for different needs, measures for prevention of epidemics and other techniques. The centres can in this way encourage "specialized households" to join hands so as to bring about socialization in livestock breeding and to steadily increase social productivity.

The above measures have already been carried out in Lanzhou, Shenyang, Tianjin and other large cities. It is expected that this approach will bring about an increase in the volume of animal products supplied by the specialized households.

2. To develop herbivorous animals, especially cattle, sheep, rabbits and bees.

Furs of herbivorous animals are in short supply in the market. Woolen goods were often sold in the domestic market during 1980. In that year, the wool textile industry in China turned out 100 million metres of woolen goods, of which 80% were supplied to the home market. In addition, 100 million metres of chemical fibres were imported. Nevertheless, these quantities were far from adequate in meeting the people's demands. If each metre of cloth is estimated to sell at 20 yuan, then the state could recover 4,000 million yuan from the increased sales volume. Recently, the Ministry of Textiles decided to cease construction projects for cotton textiles and to concentrate on the expansion of woolen textiles. The goal is to double woolen textile production capacity by 1985. There are also increased needs for hides and skin by-products. This makes it imperative to increase the population of those herbivorous animals that supply raw materials for textiles and light industries.

3. Livestock breeding can reap huge export profits.

Rabbit fur and bird feathers are two large foreign exchange earners. Due to temporary shortages, we have occasionally been unable to meet orders from foreign traders. This situation is certain to stimulate growth in rabbits, sheep and feather-producing poultry.

It can be concluded that the rapid development of animal husbandry depends mainly on correct policies, scientific methods and flexible management. We should stick to set policies that are beneficial to the development of animal husbandry. We should at the appropriate time readjust the low prices for some animal products. In the management of livestock products, we should open up more channels and reduce unnecessary bureaucracy so as to enhance production and consumption.

Integration among agriculture, forestry and animal husbandry is the correct road to agricultural modernization in keeping with conditions in China. By following this road, all three sectors can help one another, develop together and achieve common prosperity.

8. CHINA'S INDUSTRY IN 1980

By Wang Haibo and Wu Jiajun

*Institute of Industrial Economics,
Chinese Academy of Social Sciences*

The place of modern industry in the national economy was very small in old China. Under the rule of the imperialists, feudalists and bureaucrat-capitalists, industrial techniques and enterprise management fell far behind levels elsewhere in the world. After the founding of socialist New China and through 30 years of arduous struggle, the extremely backward industrial outlook that had characterized the economy of old China was fundamentally changed.

After the founding of the People's Republic, bureaucrat-capitalist industries were confiscated and industries of national capitalists and individuals were transformed. Thus, socialist industry came to occupy a dominant position. China's industrial construction achieved great progress on the basis of socialist public ownership. Industrial investments during the 1952-79 period totaled 384,450 million yuan, while newly added industrial fixed assets totalled 251,111 million yuan.

With the development of industrial construction, industrial production also developed rapidly. In 1979, the total output value (calculated at 1970 constant prices) of China's industry registered 459,100 million yuan, an increase of 42.5 times compared with 1949. In the course of improving old industries, many new and developing industrial sectors — such as petrochemicals, electronics, atomic energy and space navigation — have been or are in the process of being established. The application of science and technology in the most advanced branches of China's industry — such as electronics, atomic energy, automation and lasers — has already begun. Successful experiments in nuclear detonation and in the launching and recovery of man-made earth satellites are clear indications of our attainments of new levels in science and technology. In short, during the past 30 years of construction, China has built up an independent and fairly comprehensive industrial system with relatively complete categories, considerable production capacity and a certain level of technology.

Along with the growth of industry, the number of industrial workers increased from 12.46 million in 1952 to 53.40 million in 1979. The number of workers and staff employed in industries owned by the whole people [i.e., state-owned — Ed.] increased from 5.1 million to 31.09 million, while engineers and technicians increased

from 164,000 to 166,690. The rate of fixed assets per worker was 2,101.9 yuan in 1952 and 10,577.3 yuan in 1979, an increase of more than 400%. Overall labour productivity (calculated according to 1970 constant prices) was 3,004 yuan in 1949 and 11,790 yuan in 1979, an increase of 292.5%.

On the basis of developing industrial production, the wage earnings of workers have risen remarkably. The average annual wage of workers and staff members in industries owned by the whole people was 515 yuan in 1952; this figure rose to 758 yuan in 1979, an increase of 47.2%. During the same period, the general cost-of-living index for workers and staff had increased by only 22.9%. Therefore, even when deducting factors of price increases, the average wages of workers and staff still increased. The increased earnings of workers and staff is further manifested in the rise in welfare funds for labour protection and in different kinds of allowances. Welfare funds for labour protection in units owned by the whole people totalled 952 million yuan in 1952, comprising 14.1% of total wages. These funds rose to 6,691 million yuan in 1978, corresponding to 15.7% of total wages. According to calculations by relevant departments, welfare funds and various types of state allowances received by workers and staff in enterprises owned by the whole people averaged 526.7 yuan per capita in 1978, corresponding to 81.71% of the average wage paid in that year. All of these figures indicate that the livelihood of China's industrial workers and staff has improved considerably when compared with the early period after Liberation.

The development of China's industry and improvements in the livelihood of its workers and staff as indicated above clearly demonstrates the superiority of the socialist system.

I. Problems Facing China's Industrial Development in 1980

The development of China's industry in 1980 proceeded on the basis of the great successes that had been achieved during the 30 years since the founding of the People's Republic. China's industrial development in 1980, however, also faced a number of problems.

First, an irrational structure in production was

manifested by several instances of serious disproportion:

1. *The development of industry and agriculture is not well-coordinated, with agriculture seriously lagging behind industry, a fact hindering development of the national economy.*

During 1950-79, the total output value of industry increased by an annual average of 13.3%, while the total output value of agriculture increased only by 4.5% yearly.

2. *The growth of heavy industry was too fast, while light industry seriously lagged behind and was unable to satisfy the necessities of people's lives.*

During 1950-79, the output value of heavy industry increased by a yearly average of 16.5%, while the output value of light industry increased only by 11%; the proportion of output value of heavy industry in total industrial output value rose from 29.3% to 56.3%, while the proportion of output value of light industry decreased from 70.7% to 43.7%.

3. *Industries producing fuel, power and raw and semi-finished materials fell behind, while processing industries developed too quickly; as a result, the former could not satisfy the demands of economic development, while the latter's productive capacity was excessive.*

During 1953-79, the output value of excavating industries and raw and semi-finished materials industries increased by a yearly average of 10.4% and 12.4%, respectively, while the growth rate in output value of manufacturing industries reached 15%. In 1952, the share of the former two industries in the total output value of heavy industry accounted for 15.3% and 42.8%, respectively, while the output value of manufacturing took up 41.9%. By 1979, the proportion of the former two had dropped to 11.5% and 36.9%, respectively, while the latter went up to 51.6%.

During 1953-79, China's total industrial output value increased by a yearly average of 11.1%, while energy output only increased by 10%; this factor, plus serious wastage in energy consumption, caused energy to become a serious problem in the present-day economy. Today, China's capacity for producing machine tools is 3-4 times higher than the supply of steel products. Moreover, despite the existence of a large quantity of machine tools, the proportion of machine tools with capacities for rough machining is very high compared to the number of machine tools for finish machining — a condition ill-suited to demands for technological reforms of the national economy.

4. *The backwardness of the building materials industry is not suited to the needs of economic development.*

During 1953-79, the building materials industry grew by a yearly average of 11.6%, a rate just slightly higher than industry, which increased by 11.1% yearly during the same period. However, the building materials rate was lower than that of heavy industry, which grew by 13.4%.

5. *Heavy industry mainly served its own development, and not that of light industry and agriculture.*

Although the proportion occupied by steel used for agriculture and agricultural machinery within the consumption pattern for steel production increased from 6.7% in 1953 to 15% in 1979 (this proportion is not large considering the fact that China's agricultural population is enormous and the proportion of agriculture in the national economy is fairly big), steel consumption by light industry dropped from 22.5% to 12%, while that of machinery manufacturing increased from 24.6% to 29.3%. Moreover, although the proportion of electricity consumed by rural areas within overall electricity consumption of all sectors increased from 0.5% in 1952 to 11.8% in 1979 (this proportion is not large either), while the proportion of electricity used by light industry fell from 28% to 12.8%, and while the share of urban consumers dropped from 14.6% to 5.3%, the share of electricity used by heavy industry increased from 35.6% to 54%. In addition, utter discord prevailed in the ratios among various departments within heavy industry (such as the relationships between extraction and tunnelling in the oil and coal industries and between mining and smelting as well as smelting and steel rolling) and in the ratios between "bone" and "flesh" in industrial construction.

Second, the conditions of "big and all-embracing" or "small but all-embracing" were relatively prevalent in the organization of industrial production in China, while the level of specialized cooperation was very low. According to studies by the First Ministry of Machine-Building in 1978, of its 6,057 enterprises, those factories that specialized in cast iron numbered only 162; the value of cast iron was only 18% of total iron output (as compared to more than 60% in Japan). Factories specialized in forging numbered only 52, with the value of forgings comprising only 9% of total output (84% in Japan).

Third, the technical level of industrial products was very low. Referring again to the initial analysis by the First Ministry of Machine-Building of the technical levels of its machinery and electrical products, more than 60% of present products

were at the technical level of the 1940's and 1950's; more than 30% were at the level of the 1960's; and less than 5% were at the level of the 1970's.

Fourth, the cultural, technical and management level of workers and staff was low, while the proportion of technical personnel was too small. According to a survey of 20 million workers and staff at the end of 1979, 80% did not reach the cultural level of junior middle school; 7.8% of them were illiterate or semi-literate. Moreover, the technical level of workers was low, with most of their technical grades below the third grade. The majority of management personnel lacked management knowledge of modern enterprises. Technical personnel in industrial departments made up only 2.8% of the total number of workers and staff, many of them never having received higher education.

Fifth, the economic results of industrial construction and production were very poor. The amount of investment required for every yuan added to the national income during the period of the First Five-Year Plan was 1.68 yuan; during the period of the Fourth Five-Year Plan it was 3.76 yuan, an increase of more than 100%. The profits realized for every 100 yuan of expenditures by state-owned industries and enterprises with independent accounting during the period of the First Five-Year Plan were 22.86 yuan; in the period of the Fourth Five-Year Plan, the proportion was 16.12 yuan, a decrease of nearly 30%.

The causes for the problems mentioned above were:

1. The "Left" error long prevailing in the guidance of economic work, mainly manifested in the blind pursuit of high targets in production, unusually high targets in heavy industry, and especially high targets in the steel industry. This relegated to second place the sectors of agriculture, light industry, urban construction, scientific research and education, while heavy industry was reduced to serving its own development. This sort of error had taken place in 1958 and again in 1970; and in 1978, inasmuch as "Left" guiding thought had not yet been eradicated, the same error took place once again.

2. China's economic management system is marked by a high degree of centralization of state power. This system gives priority to administrative management, under which enterprises become the accessories of state administrative organs, thus seriously hampering the initiative of the enterprises.

3. China's enterprise-management level,

which was in any case low, was seriously sabotaged by Lin Biao and the Gang of Four during the "cultural revolution" period. Therefore, the management of many enterprises became mired in a state of chaos.

In accordance with the situations described above, the Party Central Committee after its Third Plenary Session put forward the guiding principle of readjustment, restructuring, consolidation and improvement with readjustment as the central link. Thus it was on the aforementioned industrial basis and under the guidance of this central principle that industry in 1980 developed.

II. Achievements of China's Industrial Development in 1980

1. Some Characteristics of Industrial Production and Construction in 1980. Under the guiding principle and on the basis of achievements made in 1979, China achieved notable successes in industrial development during 1980. In 1980, China's total value of industrial output was 499,200 million yuan, fulfilling 103.1% of the state plan, and representing an increase of 8.7% over the previous year.
