The important characteristics of industrial development in 1980 were:

1. *The growth rate of light industry far exceeded that of heavy industry.* The output value of light industry was 234,400 million yuan, an increase of 18.4% over the previous year, while the output value of heavy industry was 264,800 million yuan, an increase of 1.4%. After 1979, the proportion of output value of light industry in the total industrial output value rose even further, increasing from 43.1% in 1979 to 46.9% in 1980.

2. *Energy conservation achieved remarkable success.* Although the total output of the three kinds of energy — coal, oil and electricity — increased by only 1.9% in 1980, the value of industrial output increased by 8.7%. That meant that a large portion of the energy that would have been required for the growth of industrial production was compensated for through conservation.

3. *Housing units completed and under construction during 1980 reached an all-time high.* Overall housing under construction totalled 156 million sq. m. of floor space, an increase of 25.8% over 1979. Of this total, completed units accounted for 82.3 million sq.m., an increase of 31.6% over the previous year and exceeding the

three-year total for completed housing from 1974 to 1976. The rate of housing completions was 52.7%, registering another increase over the 1979 rate of 50.4%.

All of these figures indicate that China's industrial front achieved remarkable success again in 1980.

2. The Readjustment of Industry in 1980. The foremost achievements of industry in 1980 consisted of the positive results yielded by the readjustment of both industry and the entire national economy.

There were two main aspects of the readjustment: one was the readjustment of industrial structure; the other was the readjustment of distribution structure. The first readjustment mainly focused on ratios and relationships among agriculture, light industry and heavy industry:

1. *Following the Third Plenary Session of the 11th Central Committee of the Communist Party of China, a series of measures to boost agricultural development were adopted by the state.*

These included implementation of a series of economic policies of the party in rural areas; the state strengthened financial support to agriculture; the purchase prices of farm and sideline products were raised by a relatively large margin; and portions of rural taxation were reduced or remitted, thus fostering rehabilitation in the rural areas. These measures greatly aroused the enthusiasm of the peasants. And, once funding had been provided, agricultural production began to develop at a relatively rapid pace. The fairly quick development of agriculture provided conditions for faster development of industry and especially light industry related to grain, non-staple foods and raw and semi-finished materials. In 1980, the total value of farm and sideline products purchased by commercial units amounted to 67,700 million yuan, an increase of 15.4% over 1979 (or about 9% if adjusted for price-increase factors), a year in which such purchases also registered a large increase. In 1980, the amount of cotton purchased reached a record 2.6 million tons, an increase of 25.8% over the previous year.

2. *The Party Central Committee and the State Council had stated at the Second Session of the Fifth National People's Congress that for the years of readjustment, one of the major aims is "to achieve a growth rate for the light and textile industries equal to or slightly greater than that of the heavy industry."*

In order to give priority to the development of the light and textile industries, the State

Council decided to enforce the principle of "six priorities" for textiles and light industry in 1980, giving priority to the supply of raw and semi-finished materials, fuels and electricity; to measures for tapping potential, renovation and transformation; to capital construction; to bank loans; to foreign exchange and imports of technology; and to transport and communications services. In 1980, raw and semi-finished materials used for production by textiles and light industry for the most part enjoyed a remarkable increase over the previous year. For example, timber for the paper-making industry increased by 7%; cast iron for sewing-machine production by 25%; supplies of copper, aluminum, zinc for light industries were to increase by a range of 8.7% to 43.3%; and soda and caustic soda for the textile industry were to increase by 7.2% and 18.8%, respectively. Imports of industrial raw materials for textiles and light industry amounted to U.S.\$2,375 million in 1980, an increase of 83% over 1979; the proportion of these imports to the gross total of imported commodities increased from 8.4% in 1979 to 12.8% in 1980.

Investments in textiles and light industry in 1980 amounted to 4,360 million yuan, an increase of 1,330 million yuan over the previous year; their proportion of total investments increased from 6.1% in 1979 to 8.1% in 1980. In addition, the state extended foreign-exchange loans of over 200 million yuan to units in light industry and affiliated organizations for the purpose of importing advanced foreign technology and equipment. All of these measures enabled light industry to develop at a faster pace than heavy industry during 1979 and 1980.

3. *In order to readjust the serious disproportions among agriculture and light and heavy industries, the growth rate of heavy industry was further reduced over the previous year.*

Despite the growth-rate decline, the variety and range of specifications of heavy industrial products were somewhat increased and quality somewhat improved. Divisions within heavy industry, including steel, machinery, chemicals and military production, had made progress in readjusting their product alignments so as to better serve agriculture, light industry and foreign and domestic markets.

Readjustments in distribution structure sought mainly to strike a balance between accumulation and consumption.

For many years, China's accumulation and consumption had also been in a state of serious disproportion. The rate of accumulation was too high. Within the total accumulation fund, the proportion of productive accumulation was too large,

while non-productive accumulation was too small; within the productive accumulation, the proportion of heavy industry was too large, while that of agriculture and light industry was too small.

This state of serious disproportion began to change somewhat in 1979 when the rate of accumulation decreased from 36.5% to 33.6%. In 1980, the rate further declined to about 32%. Following the drop of the rate of accumulation, the consumption funds of the people in towns and villages increased. In 1980, the average wage of workers and staff in enterprises owned by the whole people was estimated at 803 yuan, an increase of 13.9% over 1979; the average wage of workers and staff of collective enterprises in cities and towns was estimated at 624 yuan, an increase of 15.1% over the previous year. Even when accounting for the fact that the general index of retail prices across the country in 1980 rose by 6% over 1979, the growth in the average wage of workers and staff was still relatively large.

Of total investments in capital construction in 1979, the proportion of investments in productive construction decreased from 82.6% in 1978 to 73%, while that of nonproductive construction increased from 17.4% to 27%. Within the latter category, investments in housing construction increased from 7.8% to 14.8%. In 1980, investments in productive construction were 5,700 million yuan; their share in total investments declined to 66.3% from 73% in 1979. Investments in non-productive construction were 18,200 million yuan, the proportion in total investments rising to 33.7% from 27% 1979; within this category, investments in housing construction were 10,800 million yuan, their proportion of total investments increasing from 14.8% in the previous year to 20% in 1980, reaching a record high in terms of both investments in housing construction and their proportion of total investments.

In 1979, the share of industrial construction investment in capital construction investments decreased to 56.4% from 61.4% in 1978. Industrial construction investment in 1980 showed a slight increase over 1979, but its share in total capital construction investment decreased from 56.4% in 1979 to 54.1%. In 1980, investments in capital construction for heavy industry totalled 24,800 million yuan, about 300 million yuan less than in 1979; their share of the total investment went down to 46.1% from 50.3% in 1979. The investment proportion of chemicals, machinery and defence industries all fell dramatically as compared with 1979. Investments in textiles and light industry amounted to 4,360 million yuan, topping the previous year's figure by 1,330 million yuan; their share of total investments rose from 6.1% in 1979 to 8.1% in 1980.

These readjustments in the structure of production and distribution assured the development of China's industry, particularly the more rapid development of light industry in the fields of raw materials, energy, equipment and funds. Moreover, it provided conditions for improving the livelihood of workers and staff (including housing levels) in commodity supply and monetary income, thus boosting the working incentive of workers and staff and expediting the development of China's industry.

3. Reform of the Industrial Management System in 1980. Reform in the economic management system also gave an important impetus to industrial development in 1980:

1. *Carrying out of experiments on enlarging the decision-making power of enterprises.*

In the past two years, experiments in enlarging the decision-making power of enterprises at selected sites had made successive advances and had attained a certain magnitude. In 1980, more than 6,000 state-owned industrial enterprises of various provinces, municipalities and autonomous regions (excluding Tibet), participated in the experiment, comprising 15% of the 42,000 industrial enterprises operating under the state plan and accounting for 60% of total industrial output value and 70% of total profits. These enterprises enjoyed varying degrees of decision-making authority in matters of retaining certain portions of profits, production plans, sales of products, trial production of new products, use of funds, reward methods and organizational set-ups and personnel. Since 1980, a few enterprises had been selected by some provinces, municipalities and autonomous regions as experimental units to practice the substitution of taxes for profits, independent accounting and assumption of sole responsibility for their own profits and losses under the guidance of state plans. According to incomplete statistics, through the end of 1980, units engaging in this experiment included a city (Liuzhou), a corporation (the Shanghai Light Industry Machinery Corporation) and more than 80 individual enterprises.

Following their achievements in 1979, enterprises with enlarged powers continued to register remarkable economic results in 1980. During that year, some enterprises with widened powers worked below capacity and had to cope with unfavourable factors such as rising prices of raw and semi-finished materials and shortages of energy. These factors posed certain difficulties for these enterprises in their quest to fulfil production and financial income plans. However, their wider authority to a certain extent helped bring about integration of the strengths, the responsibilities and

profits of the enterprises; it linked the enterprises' economic interests with results gained from their management of production; and it fused interests of the state with those of the enterprises. As a result, the enterprises gained in inner resolve. With the unfolding of competition, the enterprises were placed under external pressure. Therefore, the enterprises' initiative was brought into full play, enabling the vast majority of them to achieve increased production and increased income.

According to preliminary statistics from 5,777 experimental enterprises (not including those units experimenting in assuming sole responsibility for their profits and losses) belonging to local industries of 28 provinces, municipalities and autonomous regions, total industrial output value came to 165,350 million yuan, an increase of 6.8% over the previous year; profits realized were 33,360 million yuan, an increase of 11.8%; profits turned over to the state were 29,000 million yuan, an increase of 7.4%. On the basis of increased production and increased income, the integration of the interest of the state and that of the enterprise was realized. Of the profits of 33,360 million yuan realized by afore-mentioned enterprises, 29,000 million yuan were turned over to the state, occupying 87% of their total profits; 3,330 million yuan were kept by the enterprises, occupying 10% of their profits; the remaining 3% went to repayment of loans and subsidies. Whereas enterprises outside of the experiment during 1980 had resorted to the method of drawing down on enterprise funds, enterprises in the experiment actually earned excess funds of 1,240 million yuan, occupying 35.2% of their increased profits of 3,520 million yuan; moreover, a large portion of these increased profits went to the state. This indicates that expanding enterprises' decision-making powers had brought about increased production and increased income, with the income of both the state and the enterprises enhanced.

2. Implementation of market regulation under guidance of the state plan

In the past two years, reforms were carried out in the management systems for planning, materials and commerce, and market regulation was put into effect under guidance of the state plan. The main purpose was to gradually reduce the planned targets in production, permitting the enterprises to work out their supplementary production plans after fulfilling the state plan in accordance with market needs and their own conditions, thus bringing about a preliminary change of the situation in which state-owned departments of materials and commerce held a monopoly over management, allotment of materials and purchases and marketing of products. The new reforms per-

mitted free purchasing and marketing of a certain segment of materials and commodities. This played a positive role in impelling the enterprises to broaden the avenues of production, to compensate for deficiencies, to readjust the orientation of products, to transform the structure of products, to readjust the relationship between production and demand, to promote the readjustment and to activate the economy. The reforms also played a role in spurring the enterprises to strengthen management, improve the quality of products, increase the variety of products, decrease the cost of production, raise labour productivity, improve the style of management and provide good technical service. Finally, it helped to broaden the channels of distribution, reduce the links in distribution, tighten the relationship between purchasing and marketing, and invigorate the market. As indicated above, one clear sign of the serious disproportion in China's national economy was surplus production in the machinery industry. The implementation of market regulation under the guidance of the state plan played a beneficial role in changing this situation. For example, Changchun, as a municipality chiefly engaged in the machinery industry, has had to confront a situation of a serious reduction in its production tasks. However, the Changchun machinery industry was able to compensate for this fall-off by adopting a series of measures for taking the initiative and contracting for processing, increasing the variety of their products, improving their performance, raising quality and enlarging their own role in marketing their products. Thus, they not only developed production but also raised labour productivity. From January to November 1980, labour productivity across the municipality increased by 5.6% over the same period in 1979 (the machinery industry increased by 6.9%). All of these results were inseparable from the introduction of market regulation under guidance of the state plan.

3. Implementation of the reorganization and integration of industries and enterprises.

For the last two years, experiments have been undertaken to reorganize industries according to the principle of coordination among specialized departments. In this vein, a group of specialized corporations, general plants and technological coordination centres were established. According to recent statistics from 28 provinces, municipalities and autonomous regions (except Tibet), 1,973 specialized corporations and general plants (including 225 experimental enterprise-type corporations) had been established; in addition, 19,173 enterprises had been organized, constituting 5.38% of the total number of enterprises in these 28 administrative divisions. Within these totals, the

three big municipalities of Beijing, Tianjin and Shanghai had already established 278 corporations and general plants, with 4,548 enterprises participating — making up 31% of the total enterprises in the three municipalities. Moreover, some localities broke down the limitations of ownership by regions, departments and trades and organized more than 3,300 economic integrated bodies of different forms such as cooperation in operation, joint operation and domestic "compensatory trade," with 8,000 enterprises participating.

The reorganization and integration of industrial enterprises began to alter the organization of industrial production and to break through the presently dissected economic management system, thus promoting the development of coordination among specialized departments, strengthening the economic links among departments and localities. This played a beneficial role in raising the level of coordination among the specialized departments, taking advantage of their assets, tapping production potential, accelerating the technological transformation of enterprises, improving the quality of products, raising labour productivity and lowering the cost of production. It also played a supportive role in reducing production capacity for unwanted products, enhancing production capacity of products in short supply and readjusting the structure of industries and products.

In 1952, there were 25,878 factories of all types in Shanghai with a total labour productivity of 6,288 yuan; profits and tax receipts created for the state by workers and staff for the year averaged 1,200 yuan per capita. Since then, Shanghai has established certain key new industries on the one hand and, on the other, has carried out, on four successive occasions, fairly large-scale reorganization schemes among existing enterprises. By the end of 1980, factories throughout the city were merged and reorganized into 6,770 units, a reduction in number of nearly 75% over 1952. During the same period, however, total labour productivity rose by 370%, with profits and tax receipts created by workers and staff per capita increasing by an average of 650%.

4. Carrying out experiments to reform the industrial management systems of county-level enterprises.

According to incomplete statistics, current experiments to reform the industrial management systems of county-level enterprises are underway in 125 counties (or cities) of 25 provinces (or municipalities). The experimental work of Qingyuan County of Guangdong Province had taken a fairly early start, and gained some experience in this regard. In the past, this county had only 17 state-owned industrial enterprises, with 6,000

workers and staff; they functioned under the administration of eight bureaus. The economic commission and bureaus were in charge of production but were not in charge of personnel, finance and materials, while other multiple departments with responsibility for personnel, finance and materials were not in charge of production. An industrial management system with so many administrative levels seriously handicapped the initiative of enterprises. In 1979, Qingyuan County took steps to restructure this system. The restructuring resulted in the abolition of the bureaus. Personnel, finance, materials, production, supplies and marketing activities of the enterprises, which had formerly been subordinated under different bureaus, were shifted to the direct management of the county's economic commission. Tasks for enterprises by upper level departments were now exclusively set by the economic commission, which transferred a part of its power to the enterprises. The enterprises now had the right to draw and retain a portion of profits, to liquidate fixed assets, to set production tasks outside the plan, to sell products exceeding quotas, to select a bonus system and reward measures and to recruit, penalize and dismiss workers; they also had the right to establish new organizations and to administer their personnel affairs. Although this sort of restructuring was preliminary, it achieved good results. In 1979, profits realized by local state-owned industrial enterprises across the county came to 4.25 million yuan, three times the figure of 1978. In 1980, under conditions of rising prices for raw and semi-finished materials and fuels, insufficient production tasks in portions of enterprises and energy shortages, profits realized still came to 5.424 million yuan, a 26.7% increase over 1979. In 1979, the nationwide profit rate of output value was 9.3 yuan, an increase of 170% over 1978; it reached 11.14 yuan in 1980, an increase of 19.7% over 1979.

For a long time, under the guidance of "Left" thinking, collectively-owned industries were too quickly "escalated" to the category of state ownership, thus seriously handicapping the development of collectively owned industries. Collective ownership was in fact not only the dominant economic practice in rural areas, but also had great potential for development in the cities. After the Third Plenary Session of the 11th Central Committee of the Communist Party of China, such "Left" errors began to be put right, and the recovery and development of collectively owned industries achieved remarkable progress. In 1979, the number of workers employed by collectively owned industries in the cities and towns came to 22,735,000, an increase of 2,255,000, or 11%, over 1978. In 1980, the figure soared to 24,250,000 an increase of 1,515,000, or 6.7%, over the previous

year. The development of the collectively owned economy has played an important role in promoting China's industrial development. In 1980, China's total industrial output value reached 499,300 million yuan, an increase of 40,100 million yuan over 1979; of the 1980 figure, industries owned by the whole people occupied about 60% and collectively owned industries, around 40%. It should be pointed out that at present in the industrial output value of China's second light industry system, collectively owned industries account for more than 90%, while in the industrial output value of the light industry system, the industrial output value of the second light industry system accounts for more than 50%. The development of collectively owned industries, therefore, is of special significance to the development of China's light industry.

4. *The Consolidation and Improvement of Industries in 1980.* The growth of industry in 1980 was also due to the consolidation of enterprises. In the consolidation of enterprises, new successes were achieved in 1980. These included:

1. *A further step was taken to readjust and strengthen administration in the enterprises.*

A number of cadres who were well versed in political ideology, familiar with their field of work and techniques, knew how to manage the business at hand and were in the prime of life were promoted to leading positions; some cadres who were incompetent were removed; and the structure of cadre contingents underwent preliminary improvement. According to incomplete results from Beijing, Tianjin, Shanghai, Liaoning, Sichuan and Hubei, leading cadres proficient in technology and management now comprised about half of the membership of the leading groups in key enterprises; their average age, 53, was somewhat lower than the mean; their average cultural levels were raised somewhat, with about one-third of the cadres having received college or secondary professional school educations.

2. *A strict system of responsibility began to be established.*

The system of responsibility with the factory director responsible for the entire enterprise as the core was strengthened. The factory director was now to take full charge of organizing and directing the production of the enterprise; the general engineer was to take charge of the technical work of production; and the general accountant was to take charge of financial work. Each link at every level as well as every position and every process was to acquire a clear measure of responsibility. The situation prevailing in many enterprises in the past,

in which only collective leadership was advocated with no assignment of personal responsibility, began to be changed.

3. *The basic work of enterprise management was consolidated and strengthened.*

About 4,000 enterprises practiced overall quality control — that is, the control of quality throughout the process, from design, trial manufacture and production through to utilization.

4. *The enterprises generally strengthened their economic accounting.*

Some enterprises systematically conducted an overall economic accounting for the entire factory, reviewing the entire production process with the participation of all workers and staff members. As a result, they accumulated some useful experience:

A. They established and strengthened the three-tier accounting system comprising the factory, workshops and teams and groups; B. They strengthened cost management and financial management; C. They practiced the delineation of norms — the major norms for technical economy in the enterprise were divided among relevant administrative offices, workshops and teams and groups down to the level of machines and individuals; D. They checked and confirmed distribution fund quotas and the amounts of fixed funds needed by related workshops and administrative offices within the enterprise as well as those of the enterprise itself, and assessed the state of fund holdings; E. They established a periodic analysis system for economic activities of the factory, the workshops and the teams and groups; F. They gradually established a system wherein an enterprise settled its account internally. Some enterprises adopted internal methods for calculating profits and losses on their own and drew up economic contracts within the enterprise.

5. *Training work for all workers and staff was enhanced.*

Leading cadres of enterprises above the county level who were trained in rotation numbered 328,000; 50% of all large and medium-sized enterprises operated schools and some 20% of their workers and staff participated in the training.

6. *Many enterprises — especially those experimental units with widened powers — began to stress the broadening of the scope of management work.*

The previous state of affairs in which attention was paid only to production but not to marketing and only to administration but not to management began to change. Some positive re-

sults achieved in this respect have been:

A. The strengthening of marketing organizations, identifying marketing as the key link in management work, and integrating production plans with marketing plans. B. Launching timely market investigations and forecasts so as to become apprised of new conditions, changes and trends taking place in domestic and foreign markets; and thus increasing products suitable for marketing, enhancing the gains for both production and marketing. C. Strengthening the impact of scientific research, design and trial manufacture and taking full account of market information and its "feedback" to improve the design of products and their quality; and to energetically develop new products, apply new techniques and new crafts, thus reducing costs so as to achieve high quality, new varieties and low prices. D. Effectively publicizing products and actively launching various activities to serve consumers, in particular improving technical services. E. Fulfilling economic contracts with respect to requirements for quality, quantity and schedule, stressing credit for the enterprise. F. The factory director should be personally in charge of management, paying attention to information, grasping opportunities and determining management policies promptly and opportunely.

In short, the enterprise should organize production and determine management policy based on both the state plan and market demands; it should systematically establish corresponding structures and systems of management; and it should launch wide-ranging management activities that link up production with marketing.

7. Democratic administration of enterprises has begun to be strengthened and workers and staff have begun to exercise their democratic rights as masters of their own affairs.

According to incomplete statistics, the enterprises which have established the system of workers' congresses now number 36,200.

Consolidation of China's industrial enterprises has raised their management levels and has upgraded major standards in economic techniques. From January to November, 1980, the 60 principal norms for product quality in the ten industrial divisions averaged an 80% improvement over the corresponding period in 1979. Of the 74 major norms for material consumption, 68% showed a decline compared with the same period of the previous year. Moreover, the average labour productivity of workers and staff in state-owned industrial enterprises was valued at 12,031 yuan, a 2% increase over the previous year.

III. Challenges and Prospects for Future Work in Readjustment

In 1980, conspicuous successes had been achieved in implementing the party's guiding principle and in developing industry and the entire national economy. Nevertheless, some latent crises emerged: Since 1980, some fairly large financial deficits have appeared, leading to the over-issuance of bank notes and price increases for a large number of commodities. If no remedies had been taken, large financial deficits would have again emerged in 1981, and the entire economic situation would deteriorate further. Such an occurrence would influence political stability.

Fundamentally, these problems were due to the long-term influence of "Left" thinking in economic work, a tendency that had brought about serious disproportions in the national economy. Since the party's Third Plenary Session, the Central Committee and the State Council have determined to carry out the guiding principle for the national economy that takes readjustment as the core. This ought to bring about a basic turning point in China's economic development. However, this guiding principle was not effectively implemented, as evidenced by the fact that the general scale of capital construction was not in any way reduced; construction work on some of the 22 large imported projects which should have been stopped was in fact not stopped; and localities and enterprises continued to be blindly engaged in a large number of redundant construction activities.

In 1980, the total investment in capital construction throughout the country came to 53,900 million yuan, an increase of 7.8% over 1979. The level of duplicated construction, however, was quite serious. For example, China's machine-building industry had already reached a stage of serious over capacity, with the rate of utilization of machine tools in 1979 reaching only 52.1%. But according to statistics from 20 provinces, municipalities and autonomous regions, 2,018 new machinery industry enterprises were established during the first ten months of 1980. In China's textile industry, production capacity was already well above levels required by supply levels of domestic raw materials. Nevertheless, there was a further increase of 1.02 million spindles in 1979, bringing the total to 16.63 million spindles. In 1980, there was a further increase of 800,000 spindles (including 400,000 spindles added for technical reasons).

On the industrial production front, there were also serious problems of over-extension and duplication. Despite the fact that in 1979 some 3,600 enterprises either closed down, suspended opera-

tions, merged or switched to other kinds of manufacture, by the end of that year the total number of enterprises across the country registered an increase of 6,566. According to incomplete statistics from 20 provinces, municipalities and autonomous regions, during the first ten months of 1980, 4,110 enterprises ceased operation, while 13,611 enterprises were newly constructed and entered operation. Adding other factors of growth or cutbacks, the net increase in the number of enterprises by the end of October as compared with January 1980 was 7,331. In terms of the ownership of the new enterprises, those run by rural communes numbered 8,272, accounting for 60.8% of the total. In terms of their activity, most of the new enterprises were engaged in textiles and industry, using farm and sideline products as raw materials; enterprises in this category numbered 9,378, accounting for 69% of the total. The majority of those newly-constructed were small enterprises which were brought into being haphazardly and which duplicated production. They had the effect of squeezing the larger and more advanced enterprises, thus aggravating the difficulties of readjustment work.

Another important problem in the readjustment of industrial production was that it proved virtually impossible to cut down on products in excessive supply — especially output levels of iron and steel products with high energy consumption. The iron and steel industry is a sector marked by a huge concentration of funds and by high levels of energy consumption. Gross funds of the nation's iron and steel industry in 1979 came to 41,450 million yuan, accounting for 10.5% of total gross industrial funds; energy consumption (in terms of units of standard coal) for the year was 72.69 million tons, or 18.5% of the nation's industrial energy consumption. In other words, funds for the iron and steel industry were equal to one-half of those for light industry, while its energy consumption was one-third more than that of light industry. The planned output of steel was 33 million tons, a reduction of 1.48 million tons compared with actual output in 1979. This cut-back was designed to economize on energy and to make greater use of steel product inventories. But actual output reached 37.03 million tons, of which 5.85 million tons was derived from small and medium-sized steel mills. The latter's comprehensive energy consumption per ton was 5.02 tons, a rate 180% higher than that of the major steel factories. Thus, if the output of small and medium-sized steel factories could be reduced by 4 million tons, the equivalent of 20 million tons of standard coal could be saved in one year. The same situation prevailed in chemical fertilizers, especially in the small-scale production of synthetic ammonia.

This situation indicates that up to now, the serious disproportions long existing in our national economy had not basically changed and that this state of affairs must have taken its effect on economic results. From the perspective of state-owned industrial enterprises within the state budget, profits realized for the output value of each 100 yuan in 1980 were 16.7 yuan, an increase of 3.2 yuan over the 1976 level of 13.5 yuan; but this represented an increase of only 0.1 yuan as compared with the 16.6 yuan ratio of 1979 and was 8 yuan lower than the 24.7 yuan ratio achieved in 1957. The profits realized from sales income for each 100 yuan worth of products were 17.3 yuan, an increase of 3.1 yuan over the 14.3 yuan ratio of 1976; but this was an increase of only 0.1 yuan as compared with the 17.2 yuan ratio of 1979, and a reduction of 5.8 yuan as compared with the 23.1 yuan level of 1957. Circulating funds for each 100 yuan of output value came to 31.2 yuan in 1980, a reduction of 7.3 yuan from the 38.5 yuan level of 1976; but this was a reduction of only 0.8 yuan as compared with the 32 yuan ratio of 1979, and an increase of only 3.8 yuan as compared with the 27.4 yuan level of 1957. According to our calculations, if tax revenues and profits realized for each 100 yuan of funds in state-owned industrial enterprises were raised to the average level of 31.8 yuan achieved during the period of the First Five-Year Plan, then tax revenues and profits could realize additional increases of 20,000 million yuan; if circulating funds for each 100 yuan of output value could be reduced to the average level of 19.6 yuan of the First Five-Year Plan period, then tens of billions of yuan in circulating funds could be saved.

In order to further implement the readjustment policy for industry, great efforts must be made in the following respects in future:

1. To further compress investments in capital construction.

Construction projects (including imported projects) not already provided with construction means or that have not yet entered the construction stage must be suspended resolutely; in addition, duplicated construction projects that compete with existing enterprises for raw materials, fuel and power must also be suspended. Investments should be concentrated on construction projects of immediate necessity that are already in production; on construction projects that have been supplied with all components and that can be rapidly completed and put into operation; on construction of housing for workers and staff; and of municipal public utilities, etc. In the meantime, enterprises which turn out low-quality, high-cost, unwanted goods and that show large deficits and,

especially, small, backward enterprises that compete with advanced enterprises for raw materials, fuel, power and transportation, must close down, cease operation, be amalgamated, or change over to other products — with emphasis placed on amalgamation and change-over. The state should resort to administrative intervention and to economic measures as means of accelerating this work.

2. To ensure the large-scale growth of production in light industry this year.

This is a critical factor in increasing financial revenues and foreign-exchange income and in stabilizing commodity prices. Therefore, the "six-priorities" principle is to be applied constantly to light industrial production this year, with the following four points to be put into effect at the same time:

A. In addition to a sizeable increase in the quantity of products, light industry must strive to improve quality, to expand variety, to transform the array of products and to enlarge the proportion of high- and middle-quality goods. B. Integrated coordination is to be organized for large-scale production centred on famous-brand goods and on goods in short supply. C. Regulating the supply of raw materials needed by light industry. For raw materials from agriculture, sideline production and animal husbandry needed by light industry — and especially those needed by large cities like Shanghai, Tianjin and Beijing — localities must guarantee supplies according to the state allotment plan. D. Industrial enterprises under collective ownership in towns are characterized by their flexibility, diversification and strong adaptability, as well as being able to absorb additional workers. Their characteristics must be fully taken advantage of, and handicrafts and other labour-intensive products should be actively developed in this sphere.

3. Heavy industry must genuinely turn to the path of serving agriculture and light industry and, in the last analysis, of meeting people's daily needs so as to achieve healthy development for itself.

The machinery industry, which at present mainly manufactures equipment for capital construction items, must turn to serve the technological transformation of enterprises in different trades, focusing on the conservation of energy and electricity; moreover, its production of durable consumer goods must be increased as much as possible. Similarly, the metallurgical industry, which at present mainly serves capital construction, must also revert to serving the technological transformation of the national economy, and supply various kinds of high-standard semi-finished

materials for the production of durable consumer goods. The chemical industry must not deal solely with fertilizers; it should make great efforts to increase the production of different kinds of raw and semi-finished materials needed by light and textile industries. The energy industry should continue to implement the policy of laying equal stress on increasing production and practicing economy, with increasing stress on the latter during the near future. The consumption of energy must be greatly reduced through readjustment of industry and products structures and through technological transformations that save energy and electricity; a greater quantity of goods that have enjoyed good sales are to be produced with existing levels of energy. To accomplish these tasks, existing generating units that use oil must be converted to coal as soon as possible; thus, needed oil will be freed up to alleviate the serious under-capacity output of petrochemical works. In the meantime, a portion of petroleum output must be set aside for export so as to obtain foreign exchange. These revenues are to be specially used as circulating funds for the conversion of generating units.

Further readjustments in the economy in the near future will mainly seek to establish a fundamental balance in financial revenues and expenditures, to stabilize the economy and to avoid the potential crisis that has not yet emerged. But more important, through readjustment, a new path for developing our economy should be found — that is, a path that uses more limited investments to achieve better results. Of course, the pursuit of this path through sole reliance on readjustment is not enough. Even during the present period of readjustment, any restructuring that serves or enhances readjustment is to be implemented. Specifically with regard to industry, restructuring should take the following forms:

A. Those 6,000-odd enterprises that have already experimented with broadened powers of decision-making must strive to continue their experimental work and to sum up their experiences earnestly so as to perfect the various measures undertaken. The scope for this sort of experimentation will not be enlarged during 1981. For those enterprises which have not joined the experiment, the enterprise fund system is to be enforced as usual; meanwhile, they may apply the method of assuming responsibility for a given task until it is completed. Enterprises and cities which have experimented with "substituting taxation for profit, with independent accounting and assuming sole responsibility for their profits and losses" must continue carrying on with the experiment to gain experience from it. C. Market regulation must be carried on under the guidance of the state plan. The departments in charge should strengthen the

work of market forecasting and use necessary administrative intervention so as to avoid acting blindly. D. This is the opportune moment to take advantage of the success of readjustment in actively carrying out the reorganization and integration of enterprises. Various forms of economic integration are to be organized according to the principle of coordination among specialized departments and of economy and rationality, through integration from the bottom up and through leadership and coordination from the upper authorities, and by means of combining economic measures with requisite administrative interventions. E. Experimental work in restructuring the leadership system of some enterprises should be carried out earnestly in order to obtain experience. But all enterprises should stabilize their leadership systems in cases of those where the director of a factory still takes responsibility for production under the leadership of the party committee. Party leadership in such factories must be improved and strengthened conscientiously; the factory director is to take full responsibility for the administrative work of the enterprise, with the principle of democratic management properly taken into account. F. Experiments in restructuring the industrial management system should be carried out on the county level.

If the above-mentioned course is to be attained, the consolidation and management of the several hundred thousand existing enterprises must be carried out, especially in the case of the several thousand large and medium-sized enterprises. For the present, the following tasks should be carried out in due course: A. Continue to consolidate

and build the leadership body. B. Earnestly consolidate the basic work and actively practice overall economic accounting and overall quality control. C. Energetically comprehend the tasks of management. D. A rational award system is to be implemented; awards should be assessed by means of points registered on the basis of responsibility and examination systems as well as by strengthening quota controls and should be calculated according to the principle of "to each according to his work." Rewards paid to workers and staff must be strictly commensurate with the results of production and management and with overfulfilment of labour quotas by the workers and staff; and egalitarianism must be resolutely avoided. E. Great efforts should be made to provide training to all workers and staff. F. Strengthen and improve ideological and political work. G. Earnestly launch activities to emulate Shanghai and its progress. H. Lastly, equipment renewal and technological transformation of existing enterprises — especially equipment for conserving energy — must be carried out methodically and systematically.

We believe that if the path put forward by the Central Committee of the Communist Party and the State Council is followed and provided that the guiding principle for the national economy centered on readjustment is implemented resolutely, not only can the existing potential crisis be completely overcome, but also the long-surviving errors of "Left" tendencies can be fundamentally eradicated — with the result that we can march forward on the healthy track of economic development. China's socialist modernization has a very bright future.

9. CHINA'S LIGHT INDUSTRY

By the Policy Research Office,
Ministry of Light Industry

Light industry in China mainly provides consumer goods for daily use. It is closely linked to the provision of clothing, food, daily necessities, housing and communications to hundred of millions of people in China. China's light industry is an important sector of the national economy, with a great number of divisions, enterprises, workers and staff members. The development of light industry plays an active role in improving people's livelihood, bringing forth flourishing markets, withdrawal of currency from circulation, expanding exports, increasing financial revenues and foreign exchange, as well in promoting sound development of the entire national economy.

I. Contrasts Between Present and Past Conditions in Light Industry

Early Contributions. China has a long history and is the home of one of the world's earliest civilizations. The history of many light industrial products can be traced back several hundred to several thousand years ago. China's art of painted earthenware and the technique of making salt from sea water both began in the neolithic age. In the Shang Dynasty of 3,000 years ago, handicrafts such as bronze ware were relatively well-developed. The invention of paper, porcelain and lacquerware in China made outstanding contributions to disseminating culture and enriching people's lives throughout the world.

Pre-Liberation Conditions. As a result of its long-term suffering from feudal rule and due to imperialist invasion, brutal exploitation and oppression in the mid-19th century, old China's modern light industry developed very slowly. By 1949, the total national output value of light industry amounted to only 4,380 million yuan (calculated at 1970 constant prices, excluding handicrafts, textiles), yielding only 8.9 yuan per capita.

At that time, the varieties of light industrial products were few and outputs low. Even the highest pre-Liberation output was very limited. For example, raw salt had reached 3,918,000 tons (1943); sugar, 414,000 tons (1936); machine-made paper and paperboard, 165,000 tons (1943); and cigarettes, 2,363,000 cases (1947). By 1949, the output of light industrial products had been re-

duced by one-third to one-half compared with previous record outputs.

Developments Since the Founding of New China. After the founding of the People's Republic of China, under the leadership of the Communist Party of China and the people's government, workers and staff members of light industry worked hard and diligently to resume production. By 1952, the output of major light industrial products surpassed the previous highest levels in history. During the Five-Year Year Plan, the party's policy was carried out in socialist transformation of capitalist industry, commerce and handicrafts; in the realization of joint state-private operation of entire trades; and in the cooperative transformation of the handicrafts industry. As a result, the country's productive potential was liberated from the yoke of the old relationships of production. At the same time, capital construction was carried out in a planned way; productive capacity was expanded; and light industry underwent great changes. Output increased at an average annual rate of 14.3% during these five years.

During the Second Five-Year Plan, due to the influences of arbitrary and impracticable directives and to boasting and exaggeration, as well as to the "tendency to bring about the transition to communism prematurely," production suffered a serious setback. In 1962, the total output value of light industry was 3% below that of 1957. Later the policy of readjustment, consolidation, filling out and raising standards was implemented. Light industrial production again picked up rapidly. From 1963 through 1965, output increased at an average rate of 13.1% per year.

During the ten years of the "cultural revolution," light industrial production again suffered a very serious setback. The management of enterprises was chaotic, the quality of products declined, their variety was reduced, labour productivity fell, production costs were raised and the deficits of enterprises grew as never before. The time needed for construction projects was long, the rate of putting them into operation was low, and the economic results very poor.

After the Gang of Four was smashed in 1976, and particularly after the Third Plenary Session of the 11th Central Committee of the Communist Party of China, production underwent a steady increase at a relatively high speed. Variety and quality showed marked improvement and economic results gained.

Present Product Lines and Status of Light Industry. At present, 43 trades function under the administration of the Ministry of Light Industry. These include: paper-making, salt-making, sugar refining, cigarettes, bicycles, sewing machines, clocks and watches, enamelware for daily use and ceramics, glassware for daily use, electric bulbs, photosensitive materials, dry batteries, three types of glue (bone glue, hide glue and gelatin), articles for cleaning, essences and perfumes, toothpaste, matches, printing ink, typewriters, pens, alcoholic beverages, canned foods, dairy products, foodstuffs, gourmet powders, plastic products, leather, furs and fur products, arts and crafts products, carpets, toys, hardware for daily use, tools and hardware for construction, electric household appliances, weighing apparatus, clothing, shoes and hats, stationery, sporting goods, furniture, bamboo products, rattan and palm fibres, miscellaneous goods for daily use, special daily necessities for national minorities and machinery for light industry.

According to 1980 statistics, there were 69,000 light industrial enterprises in China with 11.18 million workers and staff members. Total output value was 96,100 million yuan.

Key Growth Indices Since 1949. Since the founding of the People's Republic, the path that light industry has taken has been tortuous. Nevertheless, it has achieved remarkable success and has undergone relatively enormous changes.

The speed of development of New China's light industry has by far exceeded that in old China. Total output value in 1980 reached 96,100 million yuan, nearly 21.9 times that of 1949, and yielding an average annual increase of 10.5%. The 1980 total was 9.6 times that of 1952's output of 9,960 million yuan, and since then has had an average rate of increase of 8.4%. This rate of increase not only far exceeded that of old China, but also surpassed that of many other countries. The output of all major light industrial products increased by wide margins. According to the statistics for 37 kinds of products, 23 varieties increased at an average rate of more than 10% every year during the past 30 years. The number of bicycles manufactured in 1980 totalled 13,024,000 and sewing machines came to 7,678,000 — both totals ranking first in the world.

Geographic Distribution. In China's coastal and interior cities, light industry has undergone significant changes. Shanghai has become an important centre for production, exporting and scientific research in light industry. Shanghai's total output value in light industry amounted to 12,380 million yuan in 1980, accounting for

12.9% of the national total and ranking first in China. Provinces ranked after Shanghai were Guangdong, Shandong, Jiangsu, Liaoning, Zhejiang and Sichuan; in each, the total value of light industrial output exceeded 5,000 million yuan. There was also notable progress in the hinterlands and remote border provinces which previously had weak foundations in this sector. During the past 30 years, for example, output of light industry in Guangxi Zhuang Autonomous Region increased at an average annual rate of 11.1%, higher than the national growth rate. At present, Guangxi's output of refined sugar accounts for about one-sixth of total national output and ranks second in the country. Its canned products account for one-tenth of the national total and occupy fourth place in the country.

Owing to the inland development of light industry, production areas have been enlarged nationwide. During the early years after Liberation, only three or four provinces manufactured bicycles, sewing machines and clocks; toothpaste, thermos bottles and fountain pens were produced only in five or six provinces. Now, the production of most of these products, which are planned by the state and by the ministry concerned, has been extended to 27 or 28 provinces, municipalities and autonomous regions.

Growth in Variety and Product Diversity. The basic categories of light industry in New China are now complete, whereas in old China these were very few. Before Liberation, not only were the categories of light industry very few, but even the spare parts for some products and materials, as well as equipment for special purposes, had to be imported. Scientific research and professional training were almost non-existent.

Since the birth of New China, the structure of light industry has gradually been perfected, trades are relatively complete, and complete arrays of products and lines exist within the trades. Education, scientific research and machine manufacture in service of light industry have been initiated. New manufacturing sectors for watches, photosensitive materials, essences and perfumes, synthetic detergents, fatty acid, household electrical appliances, etc. have been successively developed or set up, while old trades have also developed with higher technical levels or new products. For instance, the paper industry has evolved a good assortment of papers for technical use and can produce basically all kinds of paper for domestic needs. The salt industry has developed a salt chemical industry. The dry battery industry has developed silver and zinc cells. The electric light and lighting industry has developed fluorescent lamps and a variety of special lamps. Industries producing hardware for

daily use and musical instruments have developed electronic products. The productive capacity of materials, semi-finished products and spare parts for special purposes has been augmented within all trades and the creation of comprehensive production lines has been strengthened.

Take the clock and watch industry, for example: a comprehensive production capacity has been established — from the basic materials, spare parts (gem bearings, shockproofing, hairsprings and mainsprings) of watches and clocks to complete movements and machine tools for special purposes, as well as scientific research. A complete production line for the electric light and lighting industry has also been built up — including tungsten and molybdenum materials, lamp holders and fluorescent powder. Photographic gelatin, base paper and most of the film base of the sensitive-materials industry are self-supplied.

Education and Research. Educational programs, scientific research units and machine manufacturing that serve production and construction in light industry have been built from scratch. Higher and medium levels of training at institutes and schools of light industry, as well as training of workers and staff members, have been gradually developed. There are now 13 colleges of light industry, 10 comprehensive engineering institutions of higher learning with courses specializing in light industry, and over 70 secondary technical schools. Since the founding of the People's Republic, more than 17,000 university graduates and 29,000 technical secondary school graduates have been trained for light industry. There are now 341 scientific and technological research institutes within the system of light industry throughout the country; these have more than 27,000 workers and staff members. There are also a number of professional researchers engaged within large and medium enterprises. Quite a number of exceptional technical innovators have emerged.

Technological Development. In the early period after Liberation, the annual output of light industrial machinery only aggregated several hundred tons; today, however, various kinds of equipment for special purposes can be produced. Output aggregated 130,000 tons in 1980.

The technical level of production in New China's light industry has registered continuous growth, while that in old China was extremely backward. Apart from the handicrafts field (including art handicrafts) — which had attained a higher technological level, production techniques of light industry in old China were very low, poor in quality and limited in variety. In New China, innovations in light industrial production techno-

logy have increased steadily, the quality of products has improved, the variety of goods has increased, and a large number of products of famous brands and fine quality are now welcomed by consumers.

According to incomplete statistics, nearly 2,000 research projects have achieved important scientific results since the birth of New China; 201 items received awards at the National Science Conference convened in 1978. These achievements have played an important role in raising the level of science and technology in all fields of light industry. Some trades which were mainly characterized by manual operation have now markedly raised their levels of mechanization. For example, about 40% of sea-salt production has been mechanized or semi-mechanized, while 80% of well-ore salt production has adopted the method of vacuum evaporation. Through innovation, those trades which had been basically mechanized have since strikingly altered their production technology. The degree of mechanization in large-scale sugar plants has been raised from 50% to 90%, while single-machine automatic control has been achieved for portions of working procedures.

The Guangzhou General Flashlight Factory, which accounts for half of national output, has installed semi-automatic and automatic production in 40% of its processes. In addition, automatic production lines for glass bottles, table-tennis balls and plastic drawing-pins have also come into being. New technologies in electronics, microwaves, lasers, infra-red rays, electrodialysis and silicon-controlled rectifiers are also being applied and popularized in some fields.

Revenue Contributions and Profits. Light industry in New China is an important contributor to the state's financial revenues and is a significant source of foreign exchange. In contrast, in old China, several light industrial products had to be imported with large sums of foreign exchange. Since the founding of the People's Republic, along with supplying the domestic market, light industrial export products have increased continuously, producing a large quantity of construction funds and foreign exchange for the state. In 1980, 21,600 million yuan in profits and taxes were provided to the state by national sectors of light industry.

Since 1949, the total accumulation of profits and taxes turned over to the state totalled 261,900 million yuan. The proportion of profits and taxes from light industry in state financial revenues has been going up steadily. During the period of rehabilitation, it accounted for 5.1% and during the First Five-Year Plan, 7.7%; it accounted for 13% during the Second Five-Year Plan, and from 1963

to 1965, it made up 14.8%; the share was 15.9% in the Third Five-Year Plan; 17.5% in the Fourth Five-Year Plan; and stood at 20% in 1980.

Exports and Foreign-Exchange Earnings. Exports of light industrial products have expanded steadily. There were only 50 kinds of products for export in 1953; these have since increased to more than 700 items sold to over 150 countries and regions. By 1980, light industrial goods worth U.S.\$4,000 million were exported, accounting for 24.7% of the total sum of China's foreign exchange earned from foreign trade.

Since the birth of New China, accumulated foreign exchange from light industry totalled U.S.\$24,400 million. The proportion of light industrial products in the total amount of export foreign exchange has also grown continuously. During the period of rehabilitation, it accounted for 5.1%; during the First Five-Year Plan, 8.7%; during the Second Five-Year Plan, 16.6%; and from 1963-65, 19.2%; it accounted for 20.5% during the Third Five-Year Plan; for 20.7% during the Fourth Five-Year Plan; and for 26.4% in 1977, an all-time high.

Supplies to the Domestic Consumer Market. In order to meet the needs of the people's livelihood, New China's light industry has sought to provide inexpensive products of good quality, while in old China many light industrial goods were priced beyond the means of the broad masses. Since 1949, the production of light industrial goods has been greatly increased; quite a number of products are low-priced and of fine quality and have made important contributions to improving people's livelihoods and to establishing flourishing urban and rural markets.

In 1979, retail sales of products manufactured by enterprises under the Ministry of Light Industry totalled 51,180 million yuan, accounting for 35.8% of national retail sales of consumer goods. Consumer expenditures for light industrial products have demonstrably increased in comparison with the early post-Liberation period.

According to statistics from 20 major light industrial products, the average consumption volume per capita of sewing machines, watches, clocks, bicycles and aluminium pots was raised from 17 to 32 times in 1980 over 1952; consumption of electric bulbs, pencils, thermos bottles, enamel wash basins, batteries and leather and cloth shoes increased from 5 to 11 times; fountain pens, sugar, soap, enamel drinking bottles, flashlights, iron pots, cigarettes and liquor increased from 2.6 to 4 times.

In rural areas, a large quantity of sewing machines, bicycles and watches have been sold. Furthermore, goods owned by consumers have in-

creased markedly. A bicycle was formerly called "foreign horse" in the countryside, but today in North China the peasants call it "the little donkey which does not eat grass." By the end of 1980, there were 90 million bicycles in China — one for every 11.3 persons; 43 million sewing machines — one for every 4.3 households; and 130 million watches — one for every 7.5 persons. Price discrepancies between light industrial products and farm products have been steadily minimized. The maximum retail price for salt is 0.15 yuan per catty — the days of exchanging a catty of salt for an entire decalitre of rice in the remote border areas of old China has gone forever.

II. Current Readjustments and the Speeding-Up of Development

In New China, light industry has made progress without parallel in old China. This is obvious to all.

However, for a long period the guiding policy for economic construction placed undue emphasis on the development of heavy industry, taking "steel as the key link." As a result, the development of light industry fell far short of meeting demands to improve the livelihood of the people. From 1949 to 1978, heavy industry increased 91.5-fold, while light industry increased only 20.7-fold. The proportion between light and heavy industry fell seriously out of balance.

For many years past, the supply of several industrial products for daily use fell short of demand. Most of the 66 major industrial products as listed in the national plan and by relevant departments failed to meet demands. Production technology in quite a number of light industrial enterprises is still lagging. Labour productivity is low. Some light industrial goods are poor in quality, variety and design, sometimes using out-of-date patterns that have been passed down for dozens of years.

Tasks for the Current Readjustment. In 1979, the Central Committee of the Communist Party and the State Council set forth the policy of readjustment, restructuring, consolidation and improvement. In readjusting the economy, primary attention will be given to the coordination of the proportional relationship between agriculture, light industry and heavy industry — to speed up the development of agriculture and light industry. In the past two years, in compliance with the state plan, the speed of development of heavy industry was decelerated and a series of measures adopted for the active development of light industry. Priority was given to the supply of raw materials,

fuel and electricity, and measures were taken to encourage tapping potential, innovation and reform of techniques; for the provision of labour for capital construction; for granting bank loans; for expending foreign exchange and importing new technology; and for communications and transportation.

During the past two years, light industry has gradually aroused attention and obtained support from all sides and a great deal of work has been done by light industrial divisions in readjustment and restructuring. A new situation of speeding up the development of light industry has emerged throughout the country.

The total output value of light industrial production in 1979 increased by 6.8% over 1978; in 1980, it increased by 14.3%. There were large increases in the output of major products. The output of 6 of 17 major light industrial products increased by more than 20% in 1980 over 1979; and 9 products increased by 10-20%.

The output of bicycles, sewing machines, clocks and watches, cigarettes, leather and cloth shoes, clothing, glassware for daily use and electrical household appliances increased in 1980 by more than 16% over 1979, some even doubling in production. Some consumer goods, such as paper for printed materials, cleaning articles, electric bulbs, iron pots and powdered milk, have been in sufficient supply in the domestic market. The export of light industrial products also increased rapidly, registering a 18.3% rise in 1980 over 1979. While increasing production in the past two years, the divisions of light industry have given increased attention to the following:

1. *The focal point of work has shifted from the quantity and value of output to quality and variety.*

At the Third Plenary Session of the Party's 11th Central Committee emphasis was placed on shifting the focus of our work to modernization of socialist construction. By taking account of actual conditions in light industry, the Ministry of Light Industry urged departments and enterprises at all levels to raise the quality and variety of their products. Variety and quality serve as key links in developing light industry, and a relatively sound job was done. After a serious study of present conditions in quality and market demands at home and abroad, a general plan was mapped out for raising the quality of products, finding substitutes for present products and defining the objectives and measures to be adopted.

An exhibition to compare domestic and foreign products was sponsored and circulated in Beijing, Shanghai, Wuhan, Chengdu and other places. Workers and staff members of light indus-

trial enterprises in nearby provinces or districts visited this exhibition to learn from advanced products and broaden their outlook.

Quality Control. Enterprises generally enhanced the basic work of technology and established and broadened systems of quality control. Overall quality control tests were conducted at more than 1,000 enterprises, and over 46,000 quality control units were set up.

Some major trades established quality inspection centres. In 1980, a number of national inspection centres and 26 district inspection stations were set up for quality control of 17 different products. In 1979 and 1980, the Ministry of Light Industry conducted contests to compare and assess the quality of 70 and 89 categories of products produced by comparable divisions throughout the country. The more advanced versions were praised and the less advanced were criticized.

Stress on Brand-Name Products. The production of formerly popular brands has resumed and new products created. Of 2,000 types of products of fine quality submitted from various parts of China, 28 won national gold medals, 70 won silver medals, and 815 were given certificates of merit by the Ministry of Light Industry. Products winning gold and silver medals included traditionally popular brands such as Maotai liquor from Guizhou, Wuliangye liquor from Sichuan, blue-and-white and powder-enamel porcelain from Jingdezhen in Jiangxi, under-glazed tableware and tea sets from Liling in Hunan, Xuan paper from Anhui, fine powdered ink sticks from Anhui, Zhang Xiaoquan scissors from Hangzhou, Pock-Marked Wang scissors from Beijing, and Fengchuan woolen carpets from Tianjin. Newer product brands that won awards included 28-inch PA 22-type Flying Pigeon bicycles, produced in Tianjin; 28-inch PA 13-type Forever bicycles, made in Shanghai; JA 1-1-type Butterfly household sewing machines, of Shanghai; 100-type Hero fountain pens, of Shanghai; Double Crane electronic computer paper from Shandong; Jingjiang No. 5 thermos bottles from Hubei; Hong Mei sweet condensed milk from Heilongjiang; Yilan Brand eucalyptus oil from Yunnan; pig suede leather for garments from Zhejiang; Gold Cup footballs from Tianjin; White Pigeon porous plastic slippers from Fujian; Nanhai rattan articles from Guangdong; drawnwork table cloths from Changshu in Jiangsu; Triangle stainless steel tableware from Tianjin; Three Circle padlocks from Shandong; Tiantan men's shirts from Beijing; Hailuo men's shirts from Shanghai; Red Double Happiness table-tennis balls from Shanghai; and Xiamen photographic paper from Fujian. According to preliminary appraisals, about 60 of the

above-mentioned products have reached or approached international levels in quality.

New Products. More than 10,000 new products have been successfully trial-produced within two years. A number of new products, patterns, varieties and packaging designs have been supplied for the market and are being well-received by consumers. Through practice, light industrial enterprises have come to realize that it is in their vital interest to serve the people by maintaining quality and increasing variety. There will be a bright future for these enterprises if they give high priority to the improvement of products by raising their level of quality, expanding variety and finding substitutes. Otherwise, they will lose their competitiveness and fall behind.

2. Altering the structure of products by adjusting the output of products that exceed demand so as to increase those in short supply, and by expanding output of products that fit the needs of the market.

In keeping with the policy of readjusting the national economy, light industry departments placed emphasis on readjusting the structure of products. Because market demands are great, most products are in short supply. Production capacity is insufficient and raw materials are limited. However, a small portion of products enjoy adequate production capacity with output to spare as a result of changes in the market. The timely readjustment of the structure of products, a reduction in overstocked products and increases in goods in great demand will aid light industry's ability to meet market demands. For example, in accord with changes in market demand at home and abroad, the Shanghai Light Industry Administration drew on the products whose supply exceeded demand to offset those whose supply was short of demand; it cut down low-grade products and increased high-grade ones. It also developed the product lines of popular brands.

In 1980, 106 products with ready markets were produced, resulting in a net increase of 210 million yuan in output value for those products as compared to 1979. Of these, bicycles increased by 10% (with high-quality bicycles increasing by 42.9% and their proportion of the total rising from 28.2% to 36.67%); sewing machines increased by 6.04% (high-grade machines increased by 10.19% and their proportion rose from 48.62% to 50.54%); watches increased by 17% (output of calendar watches approximately doubled and lady's watches increased by 64.7%).

During the past two years, the Shanghai Handicrafts Administration readjusted the production orientation of 47 enterprises, expand-

ed the production capacity of products in great demand and concentrated its efforts on the production of 100 products in great demand. The administration registered an increase of 32% in 1979 as compared with 1978, thus achieving an increase of 200 million yuan in output value. In 1980, output value increased by 300 million yuan, an increase of 37% over 1979. Through the readjustment of the structure of their products, exports from these two administrations registered a relatively large increase. The net increase of exports within these two years was 820 million yuan, an average annual increase of 18.4%.

Apart from the readjustment of the structure of products, readjustment of the structure of enterprises and trades was also carried out in some concentrated light industrial areas, while specialized coordination and economic combination was developed and the latent potential of production was tapped; some readjusted the structure of productive techniques, integrating the readjustment of the structure of products with the popularization of new technology and advances, thus raising the rate of production in labour and the technical level of production; some other areas adjusted the structure of raw materials to better suit the needs of production development.

3. In the course of readjustment of enterprises, experimental units should be given more power of self-management and should make efforts to improve the management of enterprises.

During the "cultural revolution," the management of light industrial enterprises was thrown into confusion as a result of disruption and sabotage by Lin Biao and the Gang of Four. After the downfall of the Gang of Four and especially since 1979, close attention has been paid to the readjustment of enterprises.

By the end of 1980, more than 500 large and medium-sized light industrial enterprises had been fundamentally readjusted. Most enterprises under the administration of provinces and districts were also readjusted, although the readjustment of widely dispersed enterprises at the county level developed disproportionately. While some readjustments were done well, others were poorly handled. Generally speaking, however, the readjustment achieved remarkable success. Through readjustment, the structure of the leading groups of many enterprises began to change after they were joined by a number of cadres who were young and were skilled in technology or management.

The System of Personal Responsibility. To increase production, practice economy, increase revenues and to cut down expenses, a variety of

rules and regulations were further established and amplified with the system of personal responsibility as the core; work on original production records, statistics and measurements was strengthened and management of production quotas and oversight of raw materials, energy and utilization of man-hours were strictly carried out. Thus, economic accounting was developed day by day.

In order to improve economic results, 133 light industrial enterprises in Liaoning Province carried out measures such as the "method of selling on commission" inside the factory, the system of economic contracts and various forms of accounting including proportional profit allocation and allocation of bonuses by the hundred-mark method. Through readjustment, many enterprises raised their level of enterprise management and a good situation of parity, safety and high-level production has emerged.

Granting enterprises more power of self-management is an important aspect of the reform of the economic management system. Experiments have proved that this has played a stimulating role in mobilizing the enthusiasm of enterprises, workers and staff members in production development and has increased output and income.

Extending Rights of Self-Management. The practice of giving experimental units of light industrial enterprises more rights of self-management began in Sichuan Province in September 1978. Up to the end of 1980, there were a total of 861 such experimental units operating in Sichuan, Shanghai, Beijing, Tianjin and 15 other provinces and cities. In the past, the production achievements of enterprises and business management had nothing to do with the vital interests of workers and staff members, no matter what results they achieved. Furthermore, the phenomenon of turning a blind eye to squander and extravagance in spending money persisted despite all efforts. But from the time an enterprise has been given extended authority in self-management, profit-allocation — which is directly related to the interests of the workers and staff members — became available. People acted as their own masters in conducting financial transactions.

They undertook careful calculations and strict budgeting and practiced thrift in all areas.

Many enterprises improved their analysis of economic activity in the manufacturing process, from raw materials to finished products. Targets for reducing expenses were broken down into small components which were handed down to groups or individuals for the purpose of working out accounts at all levels of the factory. In the past, enterprises organized production in accordance with plans assigned by higher authorities, no

matter whether the products in question were fit for sale or not. Now, production is organized according to what the market needs in an attempt to increase sales. Formerly, authority was concentrated in the hands of higher administrative bureaus. When enterprises met with difficulties in areas such as assignment of production tasks or supplies of raw materials, they often had to wait for the higher authorities to address these problems. Once an enterprise is given more power in making its own decisions, it acquires an independent economic interest and will shoulder more economic responsibility, taking the initiative to overcome difficulties and to seek out every means for increases in production and income.

In 1980, the total output value of the Chongqing First Light Industry Bureau of Sichuan Province increased by 12.8% over 1979 and profits increased by 25%. The total output value of 32 enterprises which had been given more power of self-management rose by 18.9% and their profits increased by 30.5%. The Chongqing Watch Industry Company, which is experimenting in "substitute taxation for profits," increased its total output value by 68% and its profits by 224%, achieving remarkable economic results.

Owing to the fact that enterprises that are given more power to manage their own affairs have retained a certain amount of profits, the proportion of deducted or retained depreciation funds for fixed assets has also been raised; now that enterprises have the economic capacity for developing production, they are speeding up the expansion of reproduction. The collective welfare of workers and staff members has also been initially improved.

In 1980, the Tianjin No. 3 Plastic Plant withdrew 906,000 yuan from its retained funds, or more than one-third of state investments during the past ten years. Of this amount, 421,000 yuan was spent on expanding reproduction and purchasing equipment such as an hydraulic press, a kneading machine and a punch press. In addition, a new product — foam slippers — was manufactured. This novel style of slippers has now been marketed in more than ten countries and regions.

4. Under the guidance of the state plan, market regulation is being carried out and some products are being sold through channels of the enterprises themselves.

The production and sale of light industrial products had for a long period been managed separately by industrial and commercial departments. Products were monopolized for purchase and exclusive selling by commercial departments. This unitary distribution channel was not only prone to becoming blocked up, but production

also failed to meet the needs of the masses. Products were sometimes either out of stock or overstocked. Under these circumstances, the situation was unfavourable both to production and consumption.

Since 1979, the departments and enterprises of light industry in many areas, while strengthening their links with the commercial sectors and improving production, have put into effect the principle of market regulation under the guidance of the state plan and as put forward by the Third Plenary Session of the 11th Party Central Committee. By means of seriously investigating the market situation, they have actively developed sales through their own channels, thus enlivening industrial production.

Instituting Direct Sales by the Enterprises. In the past two years, sales of light industrial products through the channels of the enterprises themselves have developed step by step. According to incomplete statistics, by the end of 1979 the bureaus, companies and enterprises of light industry sectors from 21 provinces, municipalities and autonomous regions had set up 3,788 direct-sales retail departments. These bureaus and companies also established a number of management departments for supplies, marketing and service, handling both retail and wholesale transactions. More sales outlets were added in 1980. Methods for self-sale are flexible and various. Besides retail and wholesale activities, many other forms of endeavour have evolved through practice. These include participation in various kinds of exhibitions for the exchange of experience in goods supply; visiting other provinces or cities in order to sell products and at the same time conduct market research; sponsoring sales and supplying fairs; inviting commercial departments to judge samples and place orders; bringing factories and commercial stores into direct touch with each other; setting up trial sales sections for new products in the stores; and appointing large stores as wholesale agents.

In September 1979, the National Exhibition of Light Industrial Products was held in Beijing by the Ministry of Light Industry. Light industry sectors from 28 provinces, municipalities and autonomous regions took part. More than 4,000 kinds of products were on display. The exhibition lasted for one month. It was attended by 800,000 visitors, and the turnover of sales amounted to 31,260,000 yuan.

This was the first large-scale fair to produce great results in promoting direct sales through industry's own channels. Products within the scope of direct sale by industry include above-quota products, surpluses after planned selection by commercial departments, portions deducted from plan-

ned purchases by commercial departments, new products, portions of products made from self-derived raw materials, products that commercial departments do not purchase or manage and traditional direct-sale products.

The volume of direct sales and the proportion occupied by them have both increased. According to incomplete statistics from light industry departments of 21 provinces, municipalities and autonomous regions, the total of direct sales in 1979 amounted to 2,880 million yuan, accounting for 5.1% of total output value. Of this amount, the total of the first light industry sector accounted for 4% and the total of the second light industry sector for 10%. According to statistics from the second light industry departments of 26 medium-sized cities, the total of direct sales from January through September 1980 reached 1,390 million yuan, accounting for 38.8% of total sales.

Production Gains from Direct Sales and Regulation Through the Market. The implementation of market regulation under the guidance of the state plan and the evolution of direct sales by industry have promoted the development of production. First of all, they have played a positive role in assuring implementation of the state plan. After direct sales by industry was put into practice in 1979, the departments concerned handled the sale of products themselves. These were products that commercial sectors did not need, so that unmarketable goods became goods which sold well. This rapidly put an end to overstocking and to the resultant setting aside of part of productive capacity. It also halted decreases in production. In the latter half of 1979, production increased at a rapid rate, paying overdue bills and ensuring the implementation of the annual plan. In 1980, direct sales by industry developed further, since the integration of production and sales is an important factor in greatly increasing production.

Secondly, market regulation enhanced the goal of serving consumers and promoted the raising of quality and the variety of products. New products and new varieties developed. In the past, the Dandong Watch Factory produced only one variety and three designs of bad quality, resulting in a large quantity of overstock in commercial departments. Since 1979, by visiting stores and consumers and listening to opinions for raising quality, this factory has manufactured large quantities of new watches, increasing its output to 5 varieties and 58 designs. They have exchanged 450,000 old watches for new watches distributed by selling agents all over the country. Their watches are not only in great demand on the domestic market, but are also exported to Hong Kong.

Thirdly, it facilitated timely investigation into changes in market demand in order to guide production and make products that would satisfy the needs of the customers. At present, direct sales by industry have become an indispensable supplement to the distribution of commodities. Commercial purchases and direct sales by industry complemented each other. Their mutual promotion is also beneficial to making the market more active.

5. Making good use of capital investment and loans in raising economic results.

In the field of capital construction in the past two years, light industry departments have carried out projects conscientiously and have strengthened the organization, management and inspection of construction projects, devoting major energy to gaining full advantage from these investments. Therefore, the erroneous tendency of ignoring whether or not the application of investment is rational or whether its results are good has begun to change. In 1979, actual investments from the state budget for national capital construction in light industry totalled 950 million yuan; the total for 1980 was 698 million yuan. Both overfulfilled the state plan.

The rate of forming fixed assets was raised steadily, reaching 77% and 78.3%, respectively, in the two years. During that period, 32 large and medium-sized projects went into operation and 29 large and medium-sized projects were partially put into operation. Paper, sugar, salt, beer, bicycles, sewing machines, watches, leather, synthetic detergents, electric bulbs, products of high-quality aluminium, pottery and porcelain for daily use have increased in production capacity.

At the same time, the share of housing construction in investments has been increased; 4.3 million square metres of floor space were completed in the two years. Figures for the completion of the capital construction plan and for buildings being put into use in 1979 and 1980 were the best in recent years.

In capital construction, we have begun the reform of moving from state appropriations to bank credits. By using loans, enterprises will bear explicit economic responsibility. When an enterprise decides upon the construction of an item, it selects those items that will have good sales, good construction conditions and can easily repay loans. When loans are in hand, attention is given to careful calculation and strict budgeting. Enterprises will strive to put new items into operation sooner and to achieve desired results earlier, thus repaying loans earlier. By taking this approach, the economic gains in most undertakings have been evident. In 1980, light industry used 700 million yuan in short-term bank loans, and production

capacity increased in that year: bicycles increased by 1.5 million; sewing machines by 900,000; clocks, 550,000; watches, 2 million; beer, 25,000 tons; high-quality liquor, 21,000 tons; pigskin, 8 million pieces; leather shoes, 2.97 million pairs; and furniture made of steel and wood, 2.7 million pieces.

6. Enhance work in scientific research and education and strengthen these weak key links in light industry.

Owing to using limited funds mainly for expanding production capacity, scientific research and education in light industry have always been weak. During the past two years, the leading groups in scientific research institutes, colleges and secondary schools as well as the ranks of scientific research personnel and teachers have been strengthened. Investments for capital construction and using foreign exchange have been appropriately increased and equipment urgently needed for scientific research and teaching aids purchased, so that the conditions for scientific research and teaching have been improved. Scientific research institutes in light industry throughout the country have increased from 253 in 1978 to 341 in 1980, while research personnel have increased by more than 3,000. While developing organizations for scientific research, research work within the enterprises has also been strengthened. For example, 85 enterprises of the first Light Industry Bureau of Shandong Province have set up scientific research institutes or departments.

Scientific and technological advances have been achieved all over the country. Applications for awards for 1,331 items of scientific and technological results produced during 1978-80 were made by light industry departments; of these, 671 items received awards from the Ministry of Light Industry and 279 of those have since been put into operation. These items have solved some technical problems that had existed in the light industry sector and have achieved marked technological and economic results. A high-speed laser-beam drilling machine that was successfully manufactured in Shanghai and Suzhou can be used for drilling watch jewels at rates of 10-16 particles per second, reaching international standards.

Activities in Education. Students enrolled in colleges of light industry and in science and engineering schools affiliated with light industry increased to over 13,000 in 1980; students in technical secondary schools numbered over 16,400 — increases of 50% and 72%, respectively, over 1978. At the same time, education for workers and staff members has been developing gradually. In addition to spare-time study classes sponsored by the enterprises for elementary education and for learn-

ing technology and management, students enrolled in all types of higher educational institutions for workers and staff members numbered more than 16,000; those in technical secondary schools for workers and staff numbered more than 8,000. Technical schools have grown to 250, with over 28,000 students. The quality of teaching has been raised.

Bright Prospects for the Future

During the past two years, light industry has achieved a great deal of success. However, China has for a long period placed stress on the development of means of production, ignoring means of consumption, so that agriculture, light industry and heavy industry have developed well out of proportion. This situation cannot be rectified within a short period of time. At present, technical equipment is rather backward, factory buildings are rather crowded, technical strength is weak, production capacity is insufficient, production management is relatively backward and low in economic results, while increases in production fail to keep pace with increases in social purchasing power, and some light industrial products are still short in supply on the market. But these weaknesses are also potentialities. Once light industry is developed adequately, we can supply more consumer goods for the market, accumulate more funds, earn more foreign exchange, absorb more social labour forces, consume less energy and, as the period for construction is short, we can achieve quick returns. This is vital for improving market supplies, withdrawing currency from circulation, balancing financial revenues and expenditures and consolidating and developing the desirable situation of stability and unity. Proper handling of the production of light industry is a problem of major importance to the entire ques-

tion. The government has decided to place the production of consumer goods in a strategic position, urging all sectors to support light industry and to increase the production of consumer goods.

The current situation is extremely favourable to light industry. In 1981 and the coming five years, light industry will continue to develop at a comparatively high speed. Advances will occur amidst readjustment. In the course of readjusting the relations between light industry and other sectors of the national economy, the structure within light industry should also be properly readjusted so as to lay a good foundation. Progress must be made from the present foundation, applying the limited funds that exist to technological reforms. Efforts should be made to increase production and practice economy. The acceleration of production should be promoted along with raising quality, reducing attrition, increasing products that satisfy the needs of customers and striving for economic results to better meet the needs of people's livelihood.

In 1981, the structure of products must be readjusted, special attention must be given to the production of items such as bicycles, sewing machines, clocks and watches, paper, salt, plastic products, articles for cleaning, cigarettes, sugar, beer, leather and its products, furniture, electrical household appliances, clothing and arts and crafts. In particular, Shanghai, Tianjin, Beijing and other key cities in light industry have to increase the production of famous-brand goods. Products of the best quality should be developed. Apart from continuing the promotion of light industrial products of excellent quality throughout the country, "hundred-flower contests" in arts and crafts should also be conducted. We must bring the role of existing enterprises into full play, enhance co-ordination between industry and commerce, enact the reforms well, and improve business management.

10. CHINA'S TEXTILE INDUSTRY

By the Research Office,
Ministry of Textile Industry

The textile industry is an industrial sector of China's national economy which underwent a relatively early development and has a relatively good foundation. Socialist transformation and socialist construction carried out since the founding of New China have transformed the industry into an industrial sector that is quite comprehensive in nature, self-sufficient in raw materials and equipment and in possession of fairly advanced production technology.

There are now more than 11,900 enterprises and 4.29 million workers and staff members in China's textile industry. An annual output of more than 1,000 million metres (m.) of fabrics made from cotton, wool, flax, ramie, silk and chemical fibres has made it possible for the textile industry to supply China's urban and rural markets with a wide variety of textile products and to contribute its share in the accumulation of capital construction investment and to the development of foreign trade as well.

I. Thirty Years in Retrospect

China's modern textile industry was founded in the 1880's and thus has a history of 100 years. The development of the textile industry in old China is, in effect, the history of the gradual disintegration of the handicraft textile industry and of the difficult struggle of national capital under the oppression of the "three big mountains" (viz. imperialism, feudalism and bureaucrat-capitalism — which weighed like mountains on the backs of the Chinese people before Liberation). In contrast, the 30 years of New China's modern textile industry bespeaks the history of the Chinese people advancing along the socialist road under the leadership of the Communist Party of China and the people's government, relying on their own efforts, working hard for the prosperity of the country and continuously moving from strength to strength.

Cotton. The cotton industry has the largest production capacity and the best foundation in China's textile sector. In 1979, China ranked first in the world by producing 2.63 million tons of cotton yarn and blended cotton-synthetic yarn and 1,215 million m. of cotton fabric.

Wool. Considerable progress has also been

made in the wool industry. During the 70-year period from China's first woollen mill (known as the Gansu General Bureau of Woollen Piece Goods) — set up in 1876 by Zuo Zhongtang in Lanzhou, Gansu Province — up to 1949, there were only 130,000 spindles in China. The total number of wool spindles installed during the 30 years of construction since the founding of New China is equivalent to over three times the number installed during the 70 years prior to Liberation. In 1979, 90.17 million m. of wool piece goods and over 40,000 tons of hand-knitting yarn were produced.

Silk. China was the first country to produce silk fabrics. As early as 2,000 years ago, exquisite silks were shipped along the renowned Silk Road to countries in the west and became highly regarded all over the world.

Since the 20th century, however, China's silk industry suffered from the plunder and destruction by reactionary forces at home and abroad, and a gradual decline took place. On the eve of Liberation, output of silk fabrics was only one-fourth of the previous peak record.

After Liberation, silkworm breeding and mulberry cultivation were encouraged by the state, bringing about a gradual restoration of the silk industry. Now, China's mulberry silk reels are approximately 10 times those of 1949. In 1979, 29,749 tons of silk and 663,450 m. of silk fabrics were produced. Exquisite silk fabrics still comprise one of the important export commodities in foreign trade.

Jute, Flax and Ramie. A significant change has also come over the jute, flax and ramie industries, represented by a rapid growth of the jute industry and the construction of a number of linen and ramie textile mills. At present, China's aggregate number of spindles in these industries is 5.9 times that of 1949. In 1979, 344 million jute bags, 20.81 million m. of linen fabrics and 15 million m. of ramie fabrics were produced.

Key Aspects of Post-1949 Development. The development of the textile industry over the past 30 years is demonstrated not only by an increase in production capacity, but also by the following achievements:

1. *Significant improvement in regional distribution of the industry.*

The textile industry of old China was concentrated mainly along the coastal regions. Cotton spindles in Shanghai, Qingdao and Tianjin accounted for approximately 70% of the country's total and wool spindles in Shanghai alone accounted for 75% of the national total.

In the early 1950's, New China plunged into large-scale economic construction. Under the direction of state planning, new textile bases were set up in Hebei, Henan and Shaanxi provinces — all raw-material producing areas. At present, cotton spindles installed in cotton-producing areas account for two-thirds of the country's total, while wool spindles installed in wool-producing areas account for one-half of the country's total. Textile mills of various sizes were also constructed in border areas and autonomous regions such as Inner Mongolia, Xinjiang, Qinghai, Ningxia and Yunnan.

2. Increased production of natural fibres and great efforts in the development of chemical fibres.

Old China was not self-sufficient in raw materials for the textile industry. In 1946, imported cotton accounted for 50% of the total amount of cotton consumed by spinning mills throughout the country. The majority of wool was also imported.

After Liberation, a set of economic policies and measures with respect to the restoration and development of agriculture and animal husbandry was put into effect, resulting in inciting the initiative of the peasants and herdsmen. From 1952 to 1979, the amount of cotton purchased by the state increased by nearly 100%, that of sheep wool by over 300% and that of mulberry silk cocoons by approximately 300%. As to other textile materials, such as ramie, goat hair, tussah silk and rabbit hair, further developments and rational utilization were effected.

Along with the development of natural fibres, vigorous measures were taken to start from scratch construction of a chemical fibre industry. In the early 1950's, the Baoding Viscose Rayon Plant and the Beijing Synthetic Fibre Experimental Plant were established. Subsequently, in the mid-1960's, a vinylon plant and an acrylic fibre plant were built. After the 1970's, capital expenditure by the state for the construction of the chemical fibre industry was increased and new petrochemical technology was imported from abroad. Large-sized modern chemical fibre complexes using either petroleum or natural gas as raw materials underwent construction in Jinshan County of Shanghai, Liaoyang city of Liaoning Province, Changshou County of Sichuan Province and Tianjin, lending great impetus to the development of the chemical

fibre industry. At present, chemical fibres account for 12% of the overall textile materials consumed in China.

3. Manufacture of textile machinery through self-reliance.

The growth of the textile industry over the 30 years following the establishment of New China was made possible by the effort to manufacture textile machinery through self-reliance. Before Liberation, China's textile machinery plants could not even manufacture a complete machine; they could only carry out repairs on textile machinery. After Liberation, machinery repair plants were reorganized and amalgamated according to their specialization and coordinated on a nationwide basis, thus bringing about the initial establishment of a textile machinery manufacturing system. With 30 years of experience in construction, China can now build more than 1,200 types of machinery for integrated production lines. These are for use by 13 different textiles sectors, including cotton, wool, linen, silk, chemical fibres, knitting, printing, dyeing and finishing. For the cotton industry alone, more than 15 million spindles and 500,000 looms have been manufactured. As a result, not only were the domestic needs of construction in the textile industry satisfied, but complete sets of machinery for over 1.8 million spindles were manufactured for export to foreign countries.

4. Continuous improvement in product quality.

For many years in the past, China's textile industry has always attached great importance to correctly handling the relationship between quantity and quality; in this respect, it has given priority to tasks concerned with improving the quality of products and increasing product variety. Recently, many enterprises have strengthened their basic technical management and some enterprises have initiated a total quality control programme, resulting in a significant improvement in product quality. China's cotton fabrics and cotton textile products enjoy a relatively high reputation both at home and abroad.

The quality of raw silk and silk fabrics have been improved. Double-A-grade raw silk, considered to be the highest quality in the early 1950's, is now regarded as a medium-quality product owing to the fact that many enterprises can currently produce 5-A grade or even 6-A grade superior quality raw silk. Silk fabrics with traditional Chinese motifs produced in Hangzhou and Suzhou, printed silks from Shanghai with contemporary motifs, Beijing's Iceberg Brand fine-count cotton-polyester fabrics and Changzhou's

Watermoon Brand cotton khaki are in great demand on both foreign and domestic markets because of their excellent quality and extensive range of product variety.

5. *New levels in textile science and technology and in textile education.*

At present, China has 14 textile technology colleges with an aggregate enrollment of more than 10,000 students. The number of engineers and technicians working in the industry has increased from 7,000 in pre-Liberation days to over 50,000 today. This growth has played an important role in pushing China's textile science and technology to a higher level. China's production rate per spindle ranks among the highest in the world. Important results have been achieved in research into new spinning processes, such as open-end spinning, self-twist spinning and electrostatic spinning; new weaving processes using air-jet looms, rapier looms and gripper-projectile looms; and new dyeing, printing and finishing processes, such as rotary screen printing and transfer printing.

In the wake of these developments in production and construction in the textile industry, the technical qualifications of vast numbers of workers and staff have been substantially raised through participation in actual production and training in spare-time colleges and trade schools. As of today, China has formidable technical contingents in engineering, construction, assembly and production management.

6. *Rapid increase in textile exports.*

Textile exports in 1950 amounted to only U.S.\$26 million; by 1979, the figure had reached U.S.\$2.9 billion, 100 times that of 1950. China's export of grey goods ranks first in the world, while its exports of filature silk account for three-fourths of the total volume of world trade in that commodity. China's textile products are sold in over 130 countries and regions abroad and are in great demand on the international market.

After the fall of the Gang of Four and especially after the Third Plenary Session of the 11th Party Central Committee and the implementation of policies in shifting the focus of work to the modernization of socialist construction and to the policy of readjustment, restructuring, consolidating and improving the economy, the development of China's textile industry reached a new stage. The principle of "six priorities" (priority in the supply of materials, fuel and power; priority in measures concerning technical innovation, tapping potential and reformation; priority in capital construction; priority in bank loans; priority in foreign exchange and importation of new technology; priority in

communications and transportation) put forward by the State Council for application to light industry and textiles has given powerful impetus to the development of the textile industry.

Over the last few years, the share of textile industry in the national economy has increased, its output value accounting for 12% of the country's total industrial output value. Profits turned over to the state account for 10% of state revenues. Sales on the domestic market account for 20% of the country's total volume of retail sales in consumer goods, while foreign-exchange earnings from textile exports account for approximately 20% of the country's total foreign-exchange earnings from exports.

II. New Advances Under the Readjustment Plan

The year 1980 was the second year of readjustment in the national economy. In light of China's actual conditions, a readjustment of the relationship between agriculture, light industry and heavy industry has been carried out over the past two years. As a result, the textile industry has developed at a speed surpassing that of heavy industry and now has the highest growth rate among China's industrial sectors.

1. *Output increased and new target levels reached.*

With the support of other sectors, the textile industry sought out every possible means to broaden its sources of raw materials and to effect measures for increasing output. In this respect, every effort was made to obtain more imported raw materials and to undertake the processing of imported raw materials and raw materials supplied by foreign companies. With a view to expanding production, many enterprises exerted great efforts to open up new avenues for obtaining raw materials.

A rotary four-shift system has been put into practice as a reform of the old labour system in the cotton industry and in parts of the wool and jute industries. This system calls for three shifts on duty and one off duty every day. Like the Chinese saying "Let the rider be knocked off and keep the horse going," textile mills work around-the-clock in three shifts, fully utilizing machinery capability.

An intensive movement for mutual aid and mutual learning in the various areas has effectively narrowed the gap in production levels between inland and coastal enterprises. In areas and enterprises where such movements were adequately launched, product quality improved, product variety increased, management strengthened, and

production costs fell, all of which gave rise to growth in production and earnings.

In 1980, the output value of the textile industry was 1,355 million yuan, an increase of 24% over 1979. Output of all major textile items overfulfilled state production targets. Chemical fibre output was 450,000 tons (an increase of 38% over 1979), including 314,000 tons of synthetic fibres (an increase of 46.7% over 1979). Production of cotton yarn was 16.286 million bales (or 2.93 million tons) and cotton fabrics, 13,470 million linear metres (or 12,800 million sq. m.) — increases of 11.4% and 10.9% (or 12%), respectively, over 1979. Wool fabrics amounted to 101 million m. and hand-knitting yarn, 57,000 tons — increases of 12.2% and 29%, respectively, over 1979. Production of filature silk was 35,400 tons and silk goods, 759 million m. — increases of 19.2% and 14.5%, respectively, over 1979. A total of 433 million jute bags were produced, representing an increase of 25.9% over 1979. Annual taxes and profits paid to the state in 1980 increased by 24.8% over 1979 and all major technical and economic targets reached all-time highs.

2. New developments in product quality and variety.

With a view to bringing about further improvements in product quality, vigorous attempts were made in 1980 to strengthen basic technical management of the enterprises. A series of technical seminars on topics which were considered to be weak points in production technology were organized throughout the country. Aiming at raising operating techniques, many areas organized textile workers to give demonstrations of their working methods. Some areas launched comprehensive quality-control programmes, bringing about good initial results.

In 1980, 15 quality indices of 9 major categories of textile products examined by the state overfulfilled their targets and surpassed 1979 levels.

Good results were obtained from activities to establish famous brands and high-quality textile products. During 1980, over 30,000 textile products with variations in materials, weaves, patterns and colors were designed and produced. By the end of 1980, the industry had 1,714 high-quality products, 328 famous-brand products and 80 products that won medals of quality from the state.

As to popular consumer textiles such as wool-type chemical fibre fabrics (polyester and viscose staple fibre-blended fabrics), polyester filament knitwear, silk quilt covers and upholstery fabrics, which are well-received by people in all walks of life, not only was output raised, but achievements

were gained in product type, design and color. At present, there are over 30 types of wool-type chemical fibre fabrics with more than 80 kinds of patterns and colors.

3. Returns of capital investments realized by vigorous efforts to expedite completion and commissioning of construction projects.

In 1980, the state allocation of capital construction investments to the textile industry was increased slightly. Meanwhile, there were substantial increases in allocations to the textile industry in the form of funds raised by local governments and through bank loans. Local authorities responsible for capital construction have focused their efforts on faster completion and commissioning of construction projects so that better economic results could be achieved. Thirty-four large and medium-sized projects under state planning with a total value of 1,100 million yuan in capital investments (110% of the target value) were completed. Of this total, 807 million yuan in investments came under the state budget, accounting for 124% of the annual plan. Of 13 projects to be completed in 1980, 12 were wholly or partially put on stream.

Most of the key chemical fibre projects have already reached the stage of completion and commissioning. The Sichuan Vinlon Plant, China's first large-scale chemical fibre plant using natural gas as the basic raw material, was put into operation and has already produced certified products. Some production units in the two petrochemical fibre complexes in Liaoyang and Tianjin underwent test runs, while other units were put into operation. Construction of two spinning plants in Acheng and Dandong, which form an integral part of the Liaoyang Complex, was completed.

The Shanghai General Petrochemical Works completed the first phase of its construction, which has been inspected and accepted. Up to the end of 1980, synthetic fibres produced by this plant totalled 280,000 tons; aggregate output value amounted to 4,770 million yuan; and profits and taxes turned over to the state totalled 1,810 million yuan — equivalent to 82% of total capital investment for the first phase of construction. Construction of the second phase has already started. In addition to this, excellent progress has been made in the construction of textile processing projects.

4. The programme of tapping potential, technical innovation and reform for existing plants continued, while the clearing of bottlenecks strengthened.

In addition to vigorous measures to get more

projects completed and put into operation, a campaign for tapping potential, technical innovation and reform, and for making up for what is lacking, was launched in key enterprises. Fruitful results were achieved in upgrading product quality and boosting production of products which had fallen short of market demand. In 1980, the Ministry of Textile Industry allocated special loans to 478 projects to carry out plans on tapping potential, technical innovation and reform.

By the end of 1980, 143 projects were completed, accounting for 30% of the total. Most of the work on projects such as printing and dyeing of polyester-cotton blends, spinning of wool-type acrylic fibres and technology for production of silk fabrics — all of which commenced in 1978 — were completed by the end of 1980. In this way, the long-term contradiction of insufficient production capacity and growing demands of the market were somewhat alleviated. In addition to increasing production capacity by adopting measures for tapping potential, work was also carried out by local governments to renovate buildings which were classified as dangerous and liable to collapse and to put up new warehouses, apartment buildings and facilities for waste-water treatment.

Construction of new plants and tapping the potential of existing plants brought about the following increases in annual production capacities of the different sectors: 60,000 tons of chemical fibres; 880,000 cotton spindles (including 761,000 new spindles from capital construction); 70,000 wool spindles and facilities for dyeing, printing and finishing; 900 million metres of cotton fabrics and polyester-cotton blends.

5. *Strengthening of scientific and technological work.*

Following the National Science Congress held in 1977, relatively significant developments took place in the scientific and technological work of the textile industry. Textile research institutes of the ministry and of provinces and cities directly under provincial administration increased from 48 to 83, while the number of research workers increased by 89%. With the gradual implementation of the party's policies on intellectuals, the initiative of scientific and technical personnel was greatly aroused, with a consequent quickening in the pace of scientific research. Fruitful results were achieved in long-standing research projects which for years could not make breakthroughs at critical points; some of these were eventually popularized and applied in the industry. Breakthroughs in spinning and weaving technologies — such as open-end spinning, self-twist spinning, air-jet looms, rapier looms and tufted blanket looms

— made it possible for these technologies to be initially applied to the industry. A number of scientific and technical achievements have been successfully used in the technical innovation of existing production facilities in the textile industry. Batch production of new types of chemical fibres — such as profile fibres, conjugated fibres, polypropylene split filaments and mass-dyed polyester fibres — was begun. Several research projects on energy conservation were near completion. At the end of 1980, the Convention for Scientific Research Achievements in Textiles was held by the Ministry of Textile Industry; awards were given to 340 research projects, 193 of which were applied in the industry.

6. *Export targets for textiles well-fulfilled.*

Given the recession in textile markets in the capitalist world which occurred in 1980, China's textile organizations and enterprises used their best efforts to increase export volumes and foreign-exchange earnings.

Priority was given to increasing exports of textile products which would bring greater foreign-exchange earnings. Earnings from exports of worsted and woolen fabrics, woolen blankets, wool knitwear and garments were up by 24-28% over 1979. In the category of cotton fabrics, the proportion of printed, dyed and yarn-dyed fabrics rose to some extent. The Shanghai No. 1 Knitting Mill produced a variety of high-quality, high-fashion knitwear by improving workmanship, edging garments with rims, inlaying threads and piecing together material of different colours. In this way, the mill was able to realize a considerable increase in output value. The average output value per garment in 1980 increased by 24.7% over 1979. The Tianjin Wool and Jute Corporation expanded production of famous-brand products such as pure wool worsted flannel and pure wool gabardine. As a result, the average purchasing price per metre of worsted and woolen fabrics exported by this corporation in 1980 rose by 19.4% over 1979.

More and more export products came up to high quality standards and fulfilment of export contracts showed an improvement. All corporations under the management of the Tianjin Bureau of Textile Industries either set up new systems or improved on existing systems for the execution of export contracts. In these systems, an account of each export contract was kept so that monthly analyses and quarterly check-ups could be performed and corporations would be in a position either to redistribute the work or assist those enterprises which had difficulties in fulfilling the export contract. The fulfilment rate of contracts reached 95.7% in 1980, an all-time high. Shanghai

was generally able to deliver all categories of textile exports on schedule.

Textile exports in 1980 jumped to U.S.\$3,250 million, an increase of 11.4% over 1979.

7. Market research and product development was boosted.

With a view to making textile products sell well and to increasing their competitiveness, textile organizations of various localities held sales exhibitions and carried out market investigations and research. Never before were sales exhibitions so enlivening. In Beijing alone, more than ten sales exhibitions of textile products from over ten localities were held in various department stores and markets. Beijing, Jiangsu and Hubei provinces, together with several foreign-trade organizations, held sales exhibitions in Hong Kong and the United States, and carried out market investigation and research. Furthermore, retail stores selling new textile products were established throughout the country by provinces, cities and autonomous regions; others were set up by prefectures and counties and still others by factories and industrial organizations. There also emerged a small number of retail stores jointly run by the industry and the commercial organizations themselves. These stores took up different forms, some handling general commodities and others specialized commodities.

Many cities and provinces set up factories and retail stores under a system whereby textile products were distributed directly to retail stores, resulting in a closer link between industry and commerce. During the past two years, the Bureau of Textile Industries in Liaoning Province held meetings twice a year for product selection and production quotas. These meetings were also attended by representatives from industry and commerce. After product selection, contracts were signed providing for allocations of raw materials, organization of production and purchases of products. During the past two years, the number of enterprises attending these meetings steadily increased to over 300. Product types, designs and styles exhibited at the meetings doubled, now totalling 7,400. New products shown at each meeting reached 50% and fulfilment of production-marketing contracts exceeded 95%.

Sales exhibitions, trial-sale stores and meetings for product selection and production quotas all served to link production closely with market demand, to promote quicker development of new products, to enliven the industry and to enrich market supply.

8. Preliminary achievements in the reform of economic management.

During 1980, the textile industry carried out

experiments in granting extended decision-making power to 60% of its enterprises. These experiments stimulated the enterprises and produced positive results. Under the policy of granting individual enterprises the right to reserve part of the profits, enterprises were able to use the money to develop production and increase welfare benefits of workers and staff. According to incomplete statistics, construction of 2,670,000 sq.m. of floor space of residential housing for workers and staff was started in 1980 and 750,000 sq. m. were completed, representing a record high. At present, a portion of profits can be retained by the participating bureau, corporation or even the enterprise itself. Despite the variety of approaches used, significant results were achieved. However, problems do exist and a careful summing up of experiences is required to resolve them.

In 1980, the Shanghai Bureau of Textile Industries initiated experiments in granting extended decision-making power by retaining a portion of profit for all enterprises under its management. The bureau held itself responsible to the state for three guarantees: 1. The guarantee to fulfil the annual growth rate in output value; 2. The guarantee to pay to the state the aggregate amount of profits for five years; 3. The guarantee to reach the target for foreign-exchange earnings.

Under the condition that the above-mentioned guarantees would be fulfilled, 90.5% of the total profits made by the Shanghai Bureau of Textile Industries would be turned over to the state and 9.5% would be retained by the enterprises as their share of the profit.

As a result of this experiment, significant economic results have been achieved over the past year. In comparison with 1979, the year 1980 showed an increase of 11.6% in total output value, an increase of 17.8% in profits (from which a portion was deducted to pay back loans, leaving a net increase of 16.6% in profits turned over to the state) and an increase of 13.2% in foreign-exchange earnings from textile exports. Such growth rates represented all-time highs.

Some cities and provinces set up regional textile corporations while others conducted experiments in establishing organizations with joint participation of industry, commerce and foreign trade. Shaanxi Province set up a Textile Industries Corporation in October 1979. The corporation exercised centralized leadership and centralized management over all enterprises directly under its control, in matters of production, administration, financing and work between the party and the masses. The resulting elimination of superfluous administrative levels raised work efficiency.

III. Major Problems at Present

Despite the many achievements in the textile industry, several problems exist at present, including:

1. *Developments in production have been unable to meet the requirements for improved livelihood of the people.*

Particularly in the past two years, the purchasing power for commodities has rapidly increased. With the raising of the people's living standards, a change has taken place in the structure of consumer goods whereby the proportion of garments in the total volume of retail sales of consumer goods has been increasing steadily. At present, the textile market is on the whole thriving, but there are still some products which fall short of market demand.

2. *Existence of some weak links in major sectors of the industry.*

In sectors such as wool spinning, chemical fibre production, knitting, dyeing, printing and finishing, plant capacity cannot meet the needs of the market. A relatively wide disparity exists among different localities and among different

enterprises. In some old textile centres and existing enterprises, many buildings are classified as dangerous and liable to collapse; a large quantity of waste-water from dyeing and printing houses is in need of treatment; and there is a general shortage of housing for workers and staff, as well as of warehouse space.

3. *A tendency towards decentralization and lack of planning in capital construction.*

In some localities, small-scale textile mills have cropped up. These mills produce poor quality products and consume added raw materials, thus affecting the normal flow of adequate raw materials to the large mills.

In order to produce more textile products of better quality to meet the demands of the urban and rural people, to accumulate funds for national capital construction and to increase foreign exchange earnings, the textile industry will have to make greater efforts to implement the readjustment policy by curtailing capital construction, developing science and technology, strengthening management and administration, increasing production, improving quality, widening product range and raising economic efficiency.

11. CHINA'S HANDICRAFTS INDUSTRY

By the Policy Research Office,
Ministry of Light Industry

I. 30 Years of Development and Change

China is a country with an ancient civilization and its handicrafts industry has a long history. Through the ages, China's handicraft labourers had become known throughout the world for their intelligence and wisdom as well as for their assiduousness and diligence.

In *The Chinese Revolution and the Chinese Communist Party*, Comrade Mao Zedong said: "Throughout the history of Chinese civilization, its agriculture and handicrafts have been renowned for their high level of development ... The compass was invented in China very long ago. The art of paper-making was discovered as early as 1,800 years ago. Block-printing was invented 1,300 years ago, and movable type 800 years ago. The use of gunpowder was known to the Chinese before the Europeans." All of these early discoveries made brilliant and lasting contributions to world civilization.

Setbacks Under Imperialism and the Kuomintang. However, China's handicraft production developed slowly as the result of brutal exploitation and oppression by the ruling class of past dynasties. Particularly during the 100 years or so since the Opium War, the handicrafts industry could not develop smoothly along the path of modern, large-scale industry. It suffered from severe attacks and devastation stemming from imperialist aggression and the dumping in China of large quantities of imported goods. During the reactionary rule of the Kuomintang, handicraft production was damaged even further. A great number of craftsmen were forced to leave home and wander about. Some traditional handicraft techniques were on the verge of becoming extinct. It is only in New China that genuine prosperity in handicrafts production and thorough emancipation of the handicrafts industry have been realized.

Early Progress Under the People's Republic. Since the founding of the People's Republic of China, in accordance with the principles of Marxism-Leninism and Mao Zedong Thought, the Communist Party of China and the people's government have led craftsmen to advance towards the road of collectivization and modernization. Generally speaking, they have achieved great success and have enriched their experiences despite

some setbacks met in the course of the advance. The total output value of the handicrafts industry in 1949 was 3,240 million yuan, an amount that increased to 7,310 million yuan by 1952. According to a survey taken in 1954, about 18,910,000 people were then engaged in handicrafts, of whom some 7,700,000 were individual craftsmen and 10,000,000 were peasants who had taken up the commercial production of handicrafts on a part-time basis.

There were numerous sectors and product varieties in the handicrafts industry, including metal and wood processing; cotton; textiles and knitted goods; fabrics of wool, flax, hemp and silk; foodstuffs, paper-making, pottery and porcelain; leather products, stationery and sporting goods; products of bamboo, rattan and palm fibre; arts and crafts; building materials; iron smelting; non-metallic ore mining; and chemical processing. There were also several hundred kinds of natural trades and tens of thousands of handicrafts products.

Distribution of handicrafts was on a wide scale and had an extensive base among the broad masses. According to statistics in 1952, 36.5% of craftsmen throughout the country lived in urban areas and 63.5% in the countryside; 46% were in coastal cities and 54% in the hinterland. An estimated 400,000 to 800,000 people were engaged in handicrafts in the provinces of Jiangsu, Zhejiang, Shandong, Sichuan, Guangdong, Hebei, Henan and Hunan, where handicrafts were comparatively well-developed. In 1952, the gross output value of handicrafts accounted for 8.8% of the output value of industry and agriculture, and for 21.3% of the total output value of industry.

The Cooperative Movement. Following the fundamental principles of Marxism-Leninism and combining these with China's actual conditions, the Communist Party of China and the people's government drew up a series of policies, measures and means for transforming individual handicrafts; at the same time, special bureaus in charge of handicrafts cooperative undertakings were set up at all levels one after another. By 1956, under the guiding light of the general line for the transitional period and through the three developmental stages of model example, universal dissemination and cooperative upsurge, China's handicraft industry, in 1956, basically accomplished the socialist transformation of the ownership of means of

production of individually produced handicrafts, thus bringing about a fundamental transformation from the individual to the collective and from private to public ownership. Six million craftsmen joined the socialist collectivization. Although during the co-operative movement some shortcomings emerged — such as developing too fast, blindly setting up big cooperatives, merging service establishments and too much concentration — it may be nevertheless concluded that productive forces had been extensively emancipated, giving an impetus to the rapid development of production.

In 1957, the gross output value of the nationwide handicrafts industry reached 13,370 million yuan, a more than four-fold increase over 1949, and a 77% increase over output in 1936, the peak period for handicrafts production prior to Liberation. Productivity per capita in 1957 reached 2,190 yuan, a 55.8% increase over 1952. With the development of production, the living standards of craftsmen and staff members was greatly improved.

Setbacks in 1958. But China's handicrafts industry has not developed smoothly and has gone through repeated twists and turns. Following the cooperative movement in handicrafts, new relations of production were established. At that point, steps should have been taken to consolidate and improve the cooperative organization of handicrafts, perfecting it systematically so as to promote the further development of productive forces. However, under the influence of erroneous "Left" thinking in 1958, policies such as "transition in a rush" and "transfer of production and change of orientation" were carried out. Of the more than 100,000 handicraft cooperatives (or groups) with more than 5 million members then in existence, 85% were transferred to other factories or trades; 48% were shifted over to local state-owned factories, while a considerable portion of the sector was converted to cooperative factories. As a result, the production of manufactured goods for daily use decreased, while the varieties and types of handicrafts products declined. This caused great harm to people's livelihoods.

The Restoration of 1959-1961. During the period from 1959 to 1961, measures were adopted by the Central Committee of the Communist Party of China. These included Instructions on Rapid Restoration and Development of Handicrafts and Provisions on Some Questions Concerning the Policy of Handicrafts in the Urban and Rural Areas (Draft). These two measures were promulgated, with the result that integrated organizations were restored at all levels of the cooperative handi-

crafts sector. This development played an important role in adjusting ownership and restoring and developing production of handicrafts, as well as in consolidating the collective economy. It achieved marked results.

By 1965, handicrafts enterprises had reached 100,000, with 6 million workers and staff members. In that year, the No. 2 Ministry of Light Industry was established and placed in charge of several trades including enterprises under collective ownership and those owned by the whole people [i.e., state-owned — Ed.] .

Administrations in charge of handicrafts were also set up by local governments at all levels and correspondingly improved, and both leadership and management were further strengthened.

Sabotage Under the "Cultural Revolution." During the ten years of turmoil of the "cultural revolution," the handicrafts industry was severely sabotaged. Institutions were withdrawn and amalgamated, enterprises were merged, equalitarianism and indiscriminate transfer of resources was practiced and workers and staff members were transferred to lower levels — all causing great losses to production and seriously dampening the socialist enthusiasm of the workers and staff members.

Post-1978 Reforms. After the smashing of the "Gang of Four," and particularly after the Third Plenary Session of the 11th Central Committee of the Communist Party of China, a good situation of thriving handicrafts emerged with the implementation of the policy of readjustment, restructuring, consolidation and improvement. In many provinces, municipalities and autonomous regions, energetic measures have been taken to recover and develop the second sector of light industry [i.e., the sector formerly known as the handicrafts industry — Ed.], especially handicrafts enterprises with collective ownership in the towns. In light of concrete local conditions, new policies have been formulated and economic regulations have been relaxed; the proportionate distribution among enterprises has been readjusted; added power of self-management has been granted; combined regulation though planning and market forces has been practiced; the scope of enterprise-sold products has been expanded; market forecasting has been strengthened; the structure of products has been rationally readjusted and specialization co-ordination enhanced; and economic integration was carried out — all these measure provided the handicrafts industry with new impetus for development.

Survey of the Handicrafts Industry in 1980. According to the 1980 statistics, there were 58,000 enterprises within the second national sector of light industry; these had 6,970,000 workers and staff members. Gross output value amounted to 49,330 million yuan, a 15.6% increase over 1979; realization of profits and taxation accounted for 5,650 million yuan, a 12% increase as compared with 1979. Products in urgent need by the market were greatly increased in 1980. For example, clothing output was increased by 33.3%, arts and crafts by 12.7%, leather by 35%, pigskin shoes by 29.4%, leather shoes by 38.7%, cloth shoes by 36.6%, washing machines by 130%, electric fans by 260% and furniture by 6.3%.

With the emphasis of the party's work shifted to socialist construction, handicraft production has further developed soundly. Attention was paid to arranging production in accordance with market demand, the tendency of stressing output value and yield and neglecting quality and variety was corrected, and priority was given to improving quality, variety and design. The control of quality was strengthened and quality competitions held. Thus, the quality of handicraft articles was markedly improved and traditionally known products were restored and developed. In 1980, 19 kinds of handicraft articles won national gold and silver medals and 169 products were designated as "fine quality" by the Ministry of Light Industry. Several trades and enterprises also manufactured new products, designs and varieties.

Systems of Ownership. Through years of evolution, China's handicrafts industry has taken on diversified ownership, with collective ownership predominating. This situation suits the present level of development of productive forces.

Collective Ownership. Enterprises of collective ownership are the major components of the handicrafts sector. Among these are handicrafts cooperative organizations which were formed in 1956 on the basis of socialist transformation of individual handicrafts. Included are neighbourhood factories organized by socially idle productive forces consisting mainly of housewives; "May 7" factories sponsored by many state-owned industrial enterprises in the early 1970's; and producers' service cooperatives recently established by urban youths who are waiting for jobs. The collective economy of the handicrafts industry has a strong vitality. However, under the influence of erroneous "Left" ideology, it was limited and cut back on several occasions in the past 20 years. Nevertheless, it broke through

all obstacles time and again, and grew in strength.

This demonstrates that the superiority of collective economy cannot be repressed. Firstly, collective economy can effectively integrate the interests of the state, the collective and the individual; it can link the economic interests of the individual with the economic results of the enterprise, thus better mobilizing the enthusiasm of workers and staff members. Secondly, enterprises which are carrying out independent accounting and which assume sole responsibility for their profits and losses can divert production in directions closer to the demands of society; they possess greater authority for self-management in business matters than do enterprises owned by the whole people; and under the guidance of the state plan, they may take full advantage of regulation through the market. Thirdly, a great number of handicrafts enterprises are characterized by small size and flexibility; they can readily make use of local materials, extensively utilize social resources, arrange production according to local conditions and the need of the masses in different areas. Fourthly, given the elastic and diversified modes of handicraft management, they can adapt to the diverse, complex and ever-changing needs of society. Fifth, the handicrafts industry has a fine tradition of industrious and thrifty management, paying attention to careful calculation and strict budgeting, to diligence and frugality and particularly to economic results.

Ownership by the Whole People. Handicrafts enterprises under ownership by the whole people have in the main been transformed from handicraft enterprises of collective ownership. In national terms, economic sectors owned by the whole people are the economic foundation of China's socialism. Within the scope of handicrafts, although the proportion of enterprises owned by the whole people is very small, this segment plays an important role in the production of industrial goods for daily use.

According to 1979 statistics from the second sector of light industry [i.e., comprising handicrafts enterprises — Ed.], there were a total of 2,100 enterprises owned by the whole people, making up 3.8% of all enterprises within the second sector of light industry. Despite this small proportion in number, their output value accounted for 22% of the total. Generally speaking, these enterprises are large-scale units with good technological equipment and comparatively high productivity. They have provided experience and served as an example to other enterprises capable of large-scale production and suited to development in mechanization and specialization. Collectively owned enterprises and enterprises

owned by the whole people can learn from and help each other, each drawing on the other's advantages to enhance their contribution to developing the production of industrial consumer goods and artistic handicrafts, thus satisfying people's diversified needs.

Individually produced handicrafts, under the leadership of the socialist economy, are a necessary supplement to socialist economy. Individually produced handicrafts represent a type of ownership that is characterized by individual labour and that occupies a part of the means of production on its own. In the course of the past 20 years, individualized handicrafts were regarded as a feature of capitalism, and the phenomenon was almost eliminated. Since the Third Plenary Session of the Central Committee of the Communist Party of China, with the readjustment of the national economy and relaxation of economic regulations, and under the conditions of an economy dominated by systems of ownership by the whole people and collective ownership, individualized handicrafts marked a new stage of development. In the present period, individualized handicrafts are a form of ownership subordinated to the socialist state-owned economy and the collective economy.

Jointly Operated Handicrafts Sector. This is a new form of ownership. Since the Third Plenary Session of the Central Committee of the Communist Party of China, in the course of carrying through the policies of readjustment, restructuring, consolidation and improvement and "seeking out excellence, competition and integration," various kinds of economic associations have emerged, systematically forming jointly operated handicrafts enterprises. Associated handicrafts enterprises were first organized by the Shanghai Handicrafts Administration. The state of the handicrafts industry there had been characterized by numerous trades, a wide variety of goods and a broad range of services — some products exceeding demand, while others fell short; some enterprises had heavy tasks, while others had light or insufficient tasks; some were lacking in funds, factory buildings and equipment, while others had assets, buildings and equipment that were lying idle. In 1979, in order to rapidly step-up production of industrial products for daily use — and in line with the demands for tapping the latent potential of enterprises, raising economic results, increasing products in short supply and organizing specialized coordination — the Shanghai Handicrafts Administration organized various forms of economic association among different trades, enterprises of different ownership and different sectors. Since 1980, additional attempts have been made to organize joint operation of

handicraft enterprises. The superiority of this approach has begun to become evident and good economic results have been achieved.

After 30 years of development, China's handicrafts industry has undergone tremendous changes. Few handicrafts enterprises still resemble the original "family stores" or workshops, and few remain under completely manual operation; a considerable number of enterprises now have considerable size and are mechanized to a certain degree. As such, these enterprises now form a component part of light industry, often referred to as the second sector of light industry. Although this is still sometimes called the handicrafts industry, that term is habitual and no longer conforms to reality.

II. The Role of the Handicrafts Industry in Socialist Modernization

Handicrafts are an important component of China's national economy and play an active role in socialist modernization. Handicrafts fall into the category of labour-intensive work, and are therefore able to engage a large workforce and use more flexible management techniques. Handicrafts enterprises are adaptable, convenient for the masses, require less investment, produce quick results, and consume low quantities of energy. To achieve modernization, the handicrafts sector must gradually adopt modern science and technology and must make efforts to change its backward aspects. However, the positive role of the handicrafts industry in achieving modernization must not be underestimated.

China is a populous large country with a rich reserve of labour. But China has a weak foundation, its technology is backward and its economy undeveloped. To enable the handicrafts sector to reach its full potential, we must fully utilize all kinds of resources, open up all avenues of production and increase production of industrial consumer goods and arts and crafts. All this is of profound significance to improving people's livelihoods, to enlivening urban and rural markets, to increasing accumulation, to expanding exports and to satisfying employment goals, among other things. Some important aspects of the role of handicrafts in promoting modernization are as follows:

1. *Handicrafts are an important force for developing industrial goods for daily use.*

Devoting major efforts to developing the production of consumer goods is a matter of vital importance to the national economy as a whole. It

is also an important component in the readjustment of the structure of the national economy. Stepping up the production of consumer goods is at the crux of enlivening the national economy. Most handicrafts items are consumer goods. They are daily necessities for everyone and are closely linked to the people's livelihood. The main categories of products include hardware, plastic goods, leather, fur and fur products, clothing, shoes and hats, stationery, sporting articles, wooden furniture, sundry goods for daily use, bamboo products, rattan and palm-fibre goods and arts and crafts. There are tens of thousands of varieties. Some small commodities for daily use include buttons, thimbles, nipples for feeding bottles, hair pins, collar hooks, shoe eyes, needles, washboards, rolling pins, knives, scissors, locks, pots, bowls, wooden dippers and spoons. Although these products are small, they have a great impact. Shortages in these commodities would cause great inconvenience to the broad masses. Items such as washing machines, electric fans, electric irons, refrigerators, ready-made furniture, high-quality leather shoes and clothing, as well as mass-produced arts and crafts managed by handicrafts enterprises and departments of the second sector of light industry are required in ever-growing quantities as living standards of the people are constantly raised.

2. *Handicrafts are an important source for state accumulation of construction funds.*

Handicrafts enterprises are not large, and most of their products are small items with low profits. However, the handicrafts sector embraces numerous enterprises which manufacture a large quantity of products; the profits of these tens of thousands of products, if added together, would amount to a fairly sizeable figure. Industrial goods for daily use and manually-produced arts and crafts funds occupy a very large proportion of product output. Inasmuch as the fixed capital of these enterprises is rather low, it is possible to achieve greater results with less money and bring about fast results with less investment. According to statistics, recovery of investments in heavy industry takes an average of 5 years and 7 months, but in light industry it takes an average of only 1 year and 7 months. The recovery rate of investments in handicrafts is even faster. In arts and crafts, for example, from 1973 through 1979, state investments totalled 86.1 million yuan; productive capacity in terms of output value increased from 1,000 million to 4,000 million yuan; and total output value increased in real terms from 1,600 million yuan to 3,700 million yuan. For each yuan of investment, output value can be increased by 5-7 yuan, investments can

begin to yield returns within the same year.

During this period, industrial, commercial and income taxes paid to the state amounted to 1,920 million yuan, yielding a ratio to state investments of 1:22.

3. *Handicrafts can create wealth for society by fully utilizing a variety of resources.*

Many approaches can be taken in the development of handicrafts production. As to raw materials, with the exception of imported materials, materials controlled by the state and those being distributed according to a unified plan — certain products can make use of local materials. Craftsmen who live on mountains can live off the mountain, those who live near the sea can live off the sea. In this way, waste can be converted into useful materials. Examples include feathers, shells, wicker, bark, weeds, palm leaves, maize husks, wheat stalks, bamboo shoots and leaves, all of which are useful for woven and carved products. Products made of bamboo, rattan, palm fibre and palm leaves have been developed into a wide category of arts and crafts employing 30 kinds of raw materials. With the exception of a small quantity of rattan, which has to be imported, all other materials are either agricultural sideline products or natural raw materials.

There are over 66,000 workers and staff members now engaged in these trades, with those working part-time totalling more than one million. The gross output value of these products in 1979 was 650 million yuan, with foreign-exchange earnings from exports amounting to U.S.\$190 million.

China's handicrafts products are in great demand in western and northern Europe, Japan, Hong Kong, Southeast Asia and other countries and regions, and account for approximately 40% of the capacity of the international market. The arts and crafts straw-weaving factory of Linhai County in Zhejiang Province utilizes natural raw materials such as leaves from bamboo shoots, stalks, maize husks and ornamental grasses such as eulaliopsis to produce 200 kinds of straw-plaited hanging baskets, candy boxes and planters, which are exported to more than 30 countries and regions. There were only ten workers and staff members when the factory was established in 1971. By 1979, it increased its workers and staff members to 156 persons, with 25,000 persons outside the factory engaged in processing work for the factory; its annual output value reached 5.52 million yuan, with profits of 470,000 yuan. During the past nine years, the annual increase of output value was 56%. Total exports for the period earned U.S.\$12,420,000 and profits reached 2.04 million yuan. Payments for pro-

cessing work performed in rural areas amounted to 9.84 million yuan. With the growth of production, both peasants' income and exports have increased.

4. Relatively fewer raw materials but more labour is used in handicrafts production, resulting in low levels of energy consumption.

Much handicrafts production has now got rid of the slow pace and intensive manual labour of the past. Many processes have been mechanized or semi-mechanized. In some cases traditional craftsmanship has been combined with modern science and technology and thus greatly enhancing productivity. However, generally speaking, the share of input from manual labour is still relatively large. Engraving, weaving, drawnwork, embroidery and other work are mainly done by hand, and consumption of energy is relatively low. But in arts and crafts trades, consumption of coal and electricity has been even lower; the average amount of coal consumption for 10,000, yuan of output value was 0.96 tons, and electricity consumption, 540 kwh. According to statistics from Shanghai, in 1979 the average value of taxes and profits produced by 10,000 tons of energy (expressed in standard coal units) throughout Shanghai's industry enterprises was 7 million yuan; the average value produced by the Handicrafts Bureau was 22.02 million yuan — more than three times the aggregate level for the city.

For example, some peasants dramatically demonstrated the productive efficiency of drawnwork and embroidery; production requires a hosiery needle — which costs only 0.30 yuan, a string and two hands, and yet it is able to meet the demands of domestic and foreign markets. It will increase income and gain foreign exchange for the state, and it is a factory without smoke. This shows how the development of industrial goods for daily use and the production of arts and crafts will play a very important role in saving energy and in supporting the four modernizations.

5. The larger the proportion of handicrafts exports, the greater the income from foreign exchange.

Many manufactured consumer goods, especially arts and crafts, have a long tradition of superb techniques and fine quality. They enjoy a good reputation on the international market and are welcomed by customers abroad, thus earning a high rate of foreign exchange. Generally speaking, some of the products of the intensive labour type are not being manufactured in capitalist countries, where there is a shortage of labour forces and the wages are high. Giving full play to the superiority of the large number of labourers and low wages, we

should develop these kinds of products. According to statistics, the export value of handicrafts and of products from the second sector of light industry reached U.S.\$3,110 million in 1980, an increase of 25.6% over 1979; among these products, arts and crafts accounted for U.S.\$1,200 million, an increase of 13.2% over 1979; hardware for daily use, U.S.\$195 million, up 25%; hardware for use as tools and in construction, U.S.\$198 million, up 44%; leather and fur products accounted for U.S.\$386 million, an increase of 27.4%. Exports of clothing and of products made of feathers and velvet have expanded with particular speed in recent years, increasing by more than three times from 1977 to 1979; exports of these products reached U.S.\$814 million in 1980, an increase of 41.4% over 1979. It should be noted, however, that many of our export products still occupy a very small proportion in international trade, and a great potential for expansion still exists. Exports to the United States and Europe in particular are relatively small. China's arts and crafts exports to the United States account for only 0.54% of the total trade volume of these products in the U.S. market.

6. Handicrafts are able to accommodate a larger labour force and can thus expand social employment.

China has a large population. An important means of solving the employment problem is to develop consumer industrial products and arts and crafts, especially those products that require intensive labour. According to statistics, the numbers of employees in heavy industry for each 1,000,000 yuan of fixed assets was 94 persons, while in light industry and textiles, the number was 257. In the four trades of arts and crafts, clothing, hardware for daily use and leather, however, the average number of employees for each 1,000,000 yuan of fixed assets was 800 persons, or 8.5 times the ratio in heavy industry and 3.1 times that of the overall average for light industry and textiles. Employment numbers would be even larger if people engaged in processing work outside of the factories were included. For example, regular workers and staff members in drawnwork and embroidery factories total 60,000, while those engaged in processing outside of the factories numbered 3,780,000. The drawnwork and decorative fringe factory at Changshu, Jiangsu Province, has more than 200 workers and staff members, while processing workers outside of the factory numbered 150,000.

In view of the above points the importance of China's handicrafts industry should not be underestimated. We want to accomplish a Chinese type of socialist modernization under which automated,

mechanized and semi-mechanized production as well as various kinds of manual labour can be developed in coordination and so that the range and quality of production can be developed.

III. Measures for Further Development of the Handicrafts Industry

The party and government have decided to further carry out readjustment of the national economy beginning in 1981. This major policy decision followed an overall analysis of China's economic situation. Since the founding of the People's Republic, China's handicrafts have greatly developed and have achieved tremendous successes. However, there still exist quite a number of problems and the industry is still not able to meet objective demands. Some problems must be solved in the course of readjustment of the national economy. Possible solutions should be studied carefully in order to systematically develop and improve handicrafts.

Eliminating "Left" Influences. To lay the ideological foundation for the further development and improvement of handicrafts, the influence of "Left" thinking should be eliminated. In tackling problems in handicrafts, the main manifestations of "Left" thinking were: 1. Disregard for the objective law that relations of production must be suited to the nature of productive forces, thus advocating a too rapid and premature transition to ownership by the whole people. 2. Infringing on the proprietary right of collective-ownership enterprises, using various forms to indiscriminately transfer resources and divert funds, property and labour force of the collective economy. 3. Disrespect for the right of self-management in production and operations in enterprises of collective ownership and excessive interference in the internal affairs of enterprises; running collective ownership enterprises according to the models of enterprises owned by the whole people, thus discarding a host of fine traditions. 4. Lack of unified planning and due consideration for the full range of commodities concerned; lack of rational management of small commodities; planning without accounts and having no targets for material supply, with the result that for a long time production of small commodities was unstable. This abnormal production and reduction in the number of designs and varieties affected people's livelihood. 5. The administrative organs of handicrafts and combined organization of collective economy of mass character were abolished or amalgamated on several occasions. Effective systems and methods

that had been formed over many years were undermined. This shows that considerable harm was done to handicrafts by the mistakes of "Left" tendencies. If this influence is not eliminated, the continued development and improvement of the handicrafts industry will be hindered.

Therefore, the influence of "Left" ideology must be eliminated in order to correctly handle the relationships between the goals of modernization and development of handicrafts and to establish the policy for a long-term rigorous development of handicrafts, and to correct some wrong views and practices as regards handicrafts; not only do enterprises owned by the whole people and those of collective economy have to be developed, individualized handicrafts also have to be developed properly.

Aspects of the Current Readjustment. In the course of its development the handicrafts industry has accumulated a wealth of positive and negative experiences. In view of the demands of the present new situation, it is extremely important to further emancipate thinking and rationally readjust all economic policies in handicrafts. Many collective handicrafts enterprises have been converted from small to large collective enterprises; enterprises that took sole responsibility for their own profits and losses have been converted to enterprises for which cities (or counties) are assuming unified responsibility for profits and losses; and from running a cooperative democratically to granting final say to administrative officials, effectively transforming enterprises into government organs.

The management of some enterprises has become like that of state-owned enterprises and this has encouraged workers and staff members to think in terms of the "iron rice bowl" and of "eating from the same pot." This situation must be steadfastly altered. Handicrafts enterprises under collective ownership should acquire the following attributes: with the aid of the state, working people should associate with each other voluntarily, raise funds by themselves, take part in manual labour, control the means of production together, carry out independent accounting, assume sole responsibility for profits or losses and practice distribution according to work; in other words, they should become collective economic organizations of a mass character. In compliance with the above mentioned, "government-run" enterprises should be transformed into enterprises "run by the people" — that is, enterprises of collective ownership that are worthy of the name.

In regard to the supply of raw materials, sales, exports, taxes, prices, wages and welfare facilities, old policies of utilization, restriction and transformation that applied to capitalist industry and

commerce were followed. These imposed more restrictions but gave less assistance, required more effort, but helped solve only a few problems. This obstructed the development of handicrafts. As for those policies, measures and regulations which hamper the development of handicrafts production and dampen the enthusiasm of workers and staff members, they must be reviewed seriously and reformed thoroughly. For instance, the supply of raw materials should be carried out through normal channels, and materials for unified distribution should be brought under state and local plans so as to assure continuous supply.

In the past, the major characteristics of handicrafts were: small but flexible; strong in adaptability and diversified in management; carrying out mass production and repair services; accepting manufacturing from raw materials and repairs as well as turning old materials into new ones; maintaining service branches and mobile services in support of both concentrated and diffuse production, both of which can be beneficial to productivity and convenient for people's livelihoods. Today, these traditional forms of management have for the most part been discarded, causing great inconvenience to people's livelihoods and arousing dissatisfaction among the masses. In the large and medium-sized cities, people say that it is difficult to buy or make clothing, to have something repaired or to buy furniture.

There are subjective reasons for this situation. Some enterprises prefer to manufacture goods instead of carrying out repair services; they prefer to engage in mass production rather than processing services; they prefer to produce goods that earn more profits rather than small, inexpensive commodities with low profits. This state of affairs has its causes. For example, the prices of small commodities, as well as the charges for processing and repairs are low, as are the profits, and this undoubtedly affects development of the enterprises

and the welfare of workers and staff members. Moreover, they had failed to acquire materials through normal channels. All these issues should be resolved.

Improving Methods of Management. In order to bring into play the active role of the handicrafts industry, to make things convenient for the masses and to suit social needs in all aspects, the methods of management must be improved.

Firstly, organizational forms in handicrafts must be diversified and some large-scale enterprises should produce products in great demand by society. The scale of enterprises that produce small commodities which are manufactured and sold locally should not be too large for the purposes of changing designs or varieties at any time in accordance with social demand. If a number of small plants are merged into large factories, in terms of adaptation to market demands, they would not be as flexible as when they were functioning as scattered, small factories.

Secondly, the handicrafts processing that uses raw materials should be restored and developed. Some trades, such as clothing, shoes and hats, wooden articles, furniture and hardware should increase their service branches, expand processing with raw materials and accept orders for processing according to samples, turning old materials into new ones and so on.

Thirdly, the role of market regulation should be brought into greater play and factories should be more directly linked to the stores. Sales of most small commodities for daily use should be carried out by giving priority to the stores, thus cutting down on distribution and reducing expenses. Some products can be sold by the factories themselves, with the prices of products allowed to float to a certain degree to suit the situation of supply and demand in the market.

12. COMMUNE-AND-BRIGADE-RUN INDUSTRY IN CHINA'S RURAL AREAS

By Qi Zong

Bureau of Commune-Run Enterprises, Ministry of Agriculture

China has a population of 1 billion, 80% of which lives in rural areas. The collective economy has but a poor foundation and the living standard of the peasants is still rather low. In 1952, the labour force in rural areas numbered about 180 million and the various kinds of agricultural machinery had an aggregate horsepower of only about 250,000. But in 1979, total motorized power increased by 180 million hp while the labour force in the countryside, instead of shrinking, gained 130 million people since the period of the early 1950's. In 1952, each peasant worked 9 *mu* of cultivated land, but in 1979, each peasant had responsibility for only 4.8 *mu*. Thus, the increase in usage of machinery in farming has created a surplus labour force.

In order to alter the state of poverty and gradually provide work for surplus labourers in the countryside, the Central Committee of the Communist Party of China pointed out in the Decision on Some Questions Concerning the Acceleration of Agricultural Development that "it is not possible or necessary for all of the surplus labour force to find jobs in the existing large and middle-sized cities of the country, while it is also not possible or necessary for planned industrial and construction projects to be built in these cities." The solutions to these problems are: 1. Exploitation, utilization and development of resources should be undertaken in order to promote a diversified economy; 2. The individual economy of commune members should be allowed to expand; 3. Commune-and-brigade-run enterprises should be actively developed in market towns in the rural areas.

Through the general development of agriculture, forestry, animal husbandry, sideline occupations and fishing as well as the comprehensive management of agriculture, industry and commerce, the raising of labour productivity and the increase of the commodity exchange, the rural areas of China will be built into a rich and prosperous socialist countryside. The maintenance and development of commune industry is not only part of an inevitable trend but is also urgently needed by the majority of Chinese peasants.

I. Development of Commune-and-Brigade-Run Industry

China's commune-run industry came into existence

in 1958, and has continued to develop and expand for over 20 years. The industry has long been underdeveloped and the rural areas had a "natural" economy for a long period of time. Initially because of the needs of the peasants, the handicrafts industry, the "five kinds of artisans" (the carpenter, bricklayer, blacksmith, mason and bamboo stripknitter) and the "four kinds of mills" (the power mill, bean-noodle mill, oil mill and bean-curd mill) were predominant at that time. Then, due to the socialist transformation of the handicrafts industry and to the state monopoly over the purchasing and marketing of grain, cotton and oil, many handicrafts mills were merged. The "four kinds of mills" were forced to cease operations due to a shortage of raw materials. These changes caused the peasants much inconvenience in their daily lives at home and at work. Enthusiastic endorsement for industry in the communes was prevalent after the people's communes were set up throughout the country in 1958. In order to develop commune-run enterprises, the property of the agricultural producers' cooperatives and their members was requisitioned without compensation. By the end of 1958, the labour force in the commune-run enterprises had reached 18 million and the gross output value of these enterprises was over 6,000 million yuan. This kind of "Left" adventurism seriously dampened the enthusiasm of the masses, causing a drop in agricultural production in 1960.

In order to correct the mistake of depriving the peasants of their property and to regain their confidence, slogans such as "return what one has unlawfully taken or pay compensation for it" and "going bankrupt for repaying debts" were promoted. Therefore, the commune-run enterprises were closed one after another. By 1961, the gross output value of commune-run industry throughout the country had been reduced to 1,980 million yuan. In 1962, the state also stipulated that "as a rule, the communes and production brigades are not to set up enterprises." Thus, by 1963, the gross output value of commune-run industry was reduced to 410 million yuan. There were 120,000 commune-run enterprises in Shandong province in 1958, but only 138 several years later.

In 1966, the Party Central Committee decided that "it is necessary for the communes to run some small factories." In response to this decision commune-and-brigade-run industry once again

began to develop. By 1971, the gross output value of the commune-and-brigade-run industry reached 7,790 million yuan.

Following the Conference on Agriculture for North China in 1970, because of the prevalent ultra-"Left" notion of "learning from Dazhai in agriculture," commune-run industry was often criticized and compared to capitalist industry. But these enterprises had a strong appeal and inspired a great vitality among the people, so they continued to develop despite the criticism. In 1976, the gross output value of commune-and-brigade-run industry reached over 24,300 million yuan, of which 12,390 million yuan was attributed to commune-run industries, and 1,196 million yuan to brigade-run industries.

Since the downfall of the Lin Biao and Jiang Qing cliques, commune-and-brigade-run enterprises have won legitimacy. In 1978, the Third Plenary Session of the 11th Central Committee of the Communist Party of China pointed out in its "Decisions on Some Questions Concerning the Acceleration of Agricultural Development" that "under the principles of reason and economy, all agricultural and sideline products well-suited to being processed in rural areas should be increasingly produced by commune-and-brigade-run enterprises. Factories in the cities should, in a planned way, turn over those products or parts which can be processed in rural areas for processing by the commune-and-brigade-run enterprises, as well as lend support in equipment and guidance in technology." It was also stated that "the commune-and-brigade-run enterprises are entitled to a tax cut or tax exemptions." In 1979, the State Council promulgated the Resolutions on Some Questions Concerning the Development of Commune-and-Brigade-Run Enterprises (Draft for Trial Implementation). Since then, commune-and-brigade-run industry has been developing healthily. In 1977, the gross output value of the commune-and-brigade-run enterprises reached 32,270 million yuan and increased by 63.6% to 52,800 million yuan in 1980.

II. The State of the Commune-and-Brigade-Run Industry in 1980

The commune-and-brigade-run industry consists of enterprises run collectively by the communes, production brigades and market towns in rural areas. These enterprises include metallurgical, power, coal and coking, petroleum, chemical, engineering, building materials, forest, food, textile, sewing and leather, paper-making and stationery industries as well as arts and handicrafts such as knitting and embroidery.

There were 767,000 commune-and-brigade-run enterprises in 1980 employing over 19.91 million commune members. The gross output value of these enterprises reached 52,800 million yuan, of which the commune-run enterprises shared 28,700 million yuan or 54.3% of the total. The brigade-run enterprises shared 22,730 million yuan, or 42.1%, while the collective enterprises belonging to the commune-run industry in towns and cities shared 1,860 million yuan or 3.5%. The gross output value of commune-and-brigade-run enterprises in 1980 was 18,300 million yuan more than that of all industry in China in 1953.

The gross output value of the commune-and-brigade-run enterprises of different provinces, municipalities and autonomous regions, arranged in descending order, is as follows: the output value of Jiangsu Province reached 10,000 million yuan, accounting for 21.2% of the total in the country; the output value of Shandong, Guangdong and Zhejiang between 3,100 and 5,000 million yuan each, accounting for 24.4%; the output value of Hebei, Henan, Liaoning, Sichuan and Shanghai between 2,100 and 3,000 million yuan each, accounting for 26.3%; the output value of Hunan, Hubei and Shanxi between 1,100 and 2,000 million yuan each, accounting for 10.1%; the output value of Beijing, Tianjin, Jilin, Heilongjiang, Fujian, Jiangxi, Anhui and Shaanxi between 600 million and 1,000 million yuan, accounting for 14.3% each; the output value of Guangxi, Inner Mongolia, Yunnan, Guizhou, Gansu and Xinjiang between 100 million and 500 million yuan each, accounting for 3.5%; and the output value of Qinghai and Ningxia less than 100 million yuan each, accounting for 0.2%.

By examining the increase in output value of commune-and-brigade-run industry, it can be seen that output value in Shanghai, Jiangsu, Zhejiang and Guangdong increased by more than 31% in 1980 over the previous year; output value in Qinghai, Xinjiang and Fujian increased by between 21 and 30%; Liaoning, Beijing, Yunnan, Tianjin, Shaanxi and Hubei increased by between 11 and 20%; Jiangxi, Shandong, Shanxi, Jilin, Heilongjiang, Anhui, Henan and Hunan increased between 1 and 10%; and Hebei, Guangxi, Gansu, Inner Mongolia and Guizhou showed no increase in output value.

Light industry took up 43% of the total gross output value of the commune-and-brigade-run industry and heavy industry accounted for 57%, of which the excavation industry took up 22.3%; raw materials industry, 14.3%; and manufacturing industry, 63.4%.

The commune-and-brigade-run industry has several distinguishing features. It has a collective-

ownership economy of "independent accounting" and "assumes sole responsibility for its profits and losses." Only 20% of the industry's production, supply and marketing were directly or indirectly brought into the state plan; the rest was regulated by the market economy. Most of commune-and-brigade-run enterprises are small, each having an average of 20 workers and 19,000 yuan of fixed assets. Most of the enterprises are labour-intensive — every 10,000 yuan of fixed assets can provide for 10 workers and each worker turns out an output value of 2,624 yuan annually.

In order to take advantage of local conditions, to assure a rational distribution of industry and to avoid unnecessary redundancy in the construction of factories, the boundaries of different regions, communes and production brigades have been broken up. Under the principle of independent accounting, over 20,000 integrated economic complexes of various forms with each assuming responsibility for its own profits and losses have come into being, and over 1,100 specialized companies have been set up throughout the country.

To find a new way to speed up rural economic development, an experiment in setting up combined agricultural, industrial and commercial enterprises was carried out in 20 provinces, municipalities and autonomous regions in 1979. There were two kinds of experimental units for the rural collective economy: one was a state farm comprising collective units; the other was a combined organization within the collective unit. The experimental units were run by counties, people's communes, or production brigades. At present, the 16 county-run experimental units are well-developed. They include Yushu, Nongan and Huaid counties in Jilin Province; Anda and Keshan in Heilongjiang; Haicheng in Liaoning; the southern suburb of Taiyuan, Shanxi; Changan in Shaanxi; Fuyun in Xinjiang; Ruogai in Sichuan; Puqi in Hubei; Kaiping and Gaoyao in Guangdong; Gaoan in Jiangxi; Jiading in Shanghai; and Taicang in Jiangsu. All of these experimental units have shown the superiority and great vitality of this new form of enterprise.

To clear the supply and marketing channels of the commune-and-brigade-run enterprises, supply and marketing corporations with a combined total of 30,000 staff members have been set up in over 95% of the counties in the country. These corporations had a turnover of 2,500 million yuan in 1980.

III. The Role of Commune-and-Brigade-Run Enterprises

China's commune-and-brigade-run enterprises

can be divided into five categories: commune-and-brigade-run industry; agricultural and breeding farms; communications and transportation; building; and commercial services. Proportional distribution among the five sectors is as follows:

1. *The proportion of the number of enterprises:* commercial services, 9.3%; building, 3.3%; communications and transportation, 5.6%; plantations and breeding farms, 30%; industry, 51.8%.

2. *The proportion of workers in the enterprises:* commercial services, 5%; building, 10.3%; communications and transportation, 4%; plantations and breeding farms, 18.2%; industry, 62.5%.

3. *The proportion of income of the enterprises:* commercial services, 5.6%; building, 7.5%; communications and transportation, 4.1%; plantations and breeding farms, 6.5%; industry, 76.3%.

The commune-and-brigade-run enterprises have manifested ten areas of contribution to our country's national and rural economies:

1. *Commune-and-brigade-run enterprises have already played quite an important role in the national economy.*

In 1980, the total output value of commune-and-brigade-run industry amounted to 52,800 million yuan. The building materials produced by commune-and-brigade-run enterprises (brick, tile, lime, sand and stone) made up 80% of the total national output. Commune-and-brigade-run enterprises turned out 30% of the gold, 17% of the coal, 15% of the silk and 11% of the salt produced in China. Most arts and crafts products, such as knitting and embroidery, are made or processed by the commune-and-brigade-run enterprises and commune members. In 1980, commune-and-brigade-run enterprises provided 2,270 million yuan worth of export products for foreign trade, and supplied the home market with large quantities of goods, accounting for 10% of the output value of the country's light industrial products.

2. *Commune-and-brigade-run enterprises constitute an important part of the rural collective economy.*

The total income of these enterprises in 1980 was 61,400 million yuan, making up 34% of the total income of the rural economy; fixed assets were 32,600 million yuan, accounting for 35% of total rural fixed assets.

3. *Commune-and-brigade-run enterprises have helped the agricultural economic structure to develop from a single-management system, which cultivated only a limited variety of products, to a*

multiple-management system of agriculture, whose domain includes many aspects of farming, forestry, animal husbandry, sideline occupations and fishing.

In 1980, agriculture accounted for 54.2% of output in the six rural vocations of farming, forestry, animal husbandry, sideline occupations, fishing and industry. Of the 54.2% earned from agriculture, commune-and-brigade-run enterprises made up 28%; and forestry, animal husbandry, sideline occupations and fisheries, 17.8%. Tree farms, orchards and vegetable gardens run by communes and brigades covered 110 million mu of land. Cultivated forests occupied 19% of the total; fruit groves, 30%; tea, 33%; and silkworm cocoons, 10%.

4. *Commune-and-brigade-run enterprises have increased the country's revenue.*

In 1980, they paid 2,560 million yuan in state agricultural taxes.

5. *Commune-and-brigade-run enterprises have helped the development of agricultural production.*

In 1980, they spent 2,260 million yuan of their profits to help agriculture.

6. *Commune-and-brigade-run enterprises have increased the incomes of commune members.*

In 1980, they paid a total of 1,190 million yuan in workers' wages. This means that each commune member added an average of 15 yuan to his income, accounting for 18% of the collective labour distribution of the commune member's income.

7. *In their supporting role, the commune-and-brigade-run enterprises have served the cities' big industries well.*

As big industry specializes in its production of a greater variety of products, it needs more small-sized factories to supply raw materials, semi-finished products, spare parts and fittings, and to make use of waste gas, liquids and residues, turning harmful wastes into less dangerous and even useful forms.

8. *Commune-and-brigade-run enterprises have served the interests of scientific research and development.*

Due to limitations in installations, capital and raw materials, some scientific research units met with much difficulty in experimental and small-batch production. Owing to a series of technological problems, many big factories have been unwilling to undertake the responsibility for scientific research. Commune-and-brigade-run factories,

on the other hand, have given much priority to undertaking experimental scientific research work gratis, to acquiring new techniques to trial-produce new products, and to filling in gaps in the fields of science and technology for localities and the state.

For instance, in 1980, commune-and-brigade-run factories in Wuxi and Wujin counties of Jiangsu Province cooperated and signed contracts with over 100 science and teaching units. With assistance from scientific research units, the commune-and-brigade-run enterprises in Suzhou Region trial-produced over 100 new products.

9. *Commune-and-brigade-run enterprises have played an important role in the construction of market towns in the countryside.*

The industrial output value of market towns in the Chinese countryside in 1980 was 30,570 million yuan, an average of 560,000 yuan per town. In addition, the communes and brigades have operated service and repair trades in market towns. They are also important sources of construction capital in market towns. According to a survey of 35 towns in Wuxi County, Jiangsu Province, the total construction fund was 150 million yuan, 70% of which came from commune-and-brigade-run enterprises.

10. *Commune-and-brigade-run enterprises have opened a new means for absorbing surplus labour forces in the countryside.*

At present, commune-and-brigade-run enterprises have provided work for 29 million surplus labourers. As these enterprises grow, more of the surplus labour force will be absorbed.

IV. Existing Problems and the Direction for Future Development

The concept of commune-and-brigade-run enterprise, although relatively new, is of extreme importance for the Chinese peasants. Due to a lack of experience, and influenced by erroneous "Left" thinkers, who were over-anxious for the transition of ownership without a concrete programme, and due to the side-effects of sole reliance on market regulation, commune-and-brigade-run enterprises have developed on an uneven course. Most of the enterprises' profits have been used for expansion and the vital interests of the masses have been neglected. In addition, administration and financial management have not developed as well as could be desired. All of these problems must be settled in the course of the readjustment of our national economy.

From a long-term point of view, commune-and-brigade-run industry has a bright future. Along

with the readjustment of economic policies for the countryside, this industry will surely break through the limitations of communes and production brigades, and combine into various forms of industries run by the brigades, by commune members jointly, by peasant individuals, as well as into handicrafts workshops run by each commune member-household.

The development of the commune-and-brigade-run industry should focus on the county as its basic unit. On the basis of investigation, exploitation and full use of local resources, the industry should be integrated with the development of rural market towns. Through unified planning and the rational distribution of local, state, urban and rural

collective enterprises, and the handicraft workshops of commune members, commune-and-brigade-run enterprises will develop in the direction of combined specialized production and multiple-level management of industry, agriculture and commerce.

The task at hand is to gradually change the present system of commune-and-brigade-run enterprises, so that it may be built on the basis of joint-management by brigade and commune members.

After readjustment, consolidation and reform, the commune-and-brigade-run enterprises will surely develop more vigorously, and play an ever greater role in our country's socialist construction.

13. CHINA'S PETROLEUM INDUSTRY

By the Research Office,
Ministry of Petroleum Industry

The petroleum industry is one of the important energy industries in our country. During 1980, China's crude oil production reached 105.95 million tons (excluding Taiwan, as below), ranking sixth in the world, while natural gas production was 14,270 million cubic metres (cu.m.), placing China 13th. By supplying 26.8% of China's total primary energy production, petroleum and natural gas occupy an important position in the country's energy balance. The development of China's petroleum industry has been a significant achievement in our socialist construction.

I. Petroleum Development in China Since 1949

In 1949, when New China was founded, there were only three oil fields: Laojunmiao (also known in the West as Yumen) in Gansu Province, Dushanzi in Xinjiang and Yanchang in Shaanxi Province; there were two gas fields: Shengdengshan and Shiyougou, both in Sichuan Province; and there were two shale-oil plants, both in Liaoning Province. Annual production of crude oil was only 120,000 tons. At that time, China had only a few rigs for drilling medium-deep wells. With an annual drilling footage of only 4,500 metres (m.), the foundation of the petroleum industry was very weak.

Progress in Exploration and Output. After Liberation, the Ministry of Geology conducted massive geological prospecting work to develop China's petroleum industry. During the period of rehabilitation (1950-1952) and the First Five-Year Plan (1953-1957), production from the original oil fields was restored and expanded; exploration and exploitation of oil resources in the northwest were carried out, and the Karamay oil field in Xinjiang and the Lenghu oil field in Qinghai were successively discovered and developed.

During the First Five-Year Plan, the average annual growth rate for oil production was 27.1%. Oil production increased to 1.46 million tons in 1957 and natural gas production rose to 70 million cu.m. During the period of the Second Five-Year Plan (1958-1962), regional exploration was conducted in several large basins in the northeast, southwest and northern sectors of the country. Crude oil production was increased by a large margin during this period.

In 1959, the first commercial oil flows from the Songliao Basin in Northeast China confirmed the reserves of the Daqing oil field. In 1960, the battle for Daqing was organized and in only a few years exploitation of the new oil field had begun. In 1963, China's crude oil production rose to 6.48 million tons.

In December of the same year, at the Fourth Session of the Second National People's Congress, Premier Zhou Enlai solemnly declared that China has become basically self-sufficient in petroleum. The days when the Chinese people had to rely on imported oil had passed forever. Exploration and exploitation of the Daqing oil field not only removed the "oil-poor" label from China, but also provided much experience, such as in the application of dialectical materialism to the analysis and study of various contradictions in underground conditions in the oil fields, to the formulation of general and specific programmes for exploitation, and to the solution of technological problems in geology and development. Daqing also contributed to the fostering of the style of the "three honests and four stricts" (i.e., be honest in thought, word and deed; set strict standards for work, organization, attitude and observance of discipline) and to adoption of the system of personal responsibility, etc.

Starting in 1964, the stress of exploration was shifted to the Bohai Gulf basin. The Shengli oil field in Shandong Province, Dagang oil field in Tianjin, Liaohe oil field in Liaoning Province, Jizhong oil field in Hebei Province were discovered and exploited one after another. Meanwhile, a large number of new oil fields were discovered in Jiangsu, Henan, Hubei and in the Shaanxi - Gansu - Ningxia area. In 1978, China's crude oil output reached 104.05 million tons, rising to 106.15 million tons in 1979. By then, China had become one of the major oil producing countries in the world.

Current Output. China can now meet its own needs in crude oil production, with a small surplus available for export. During the 30-year period from 1950 to 1979, the average annual growth rate for petroleum output was 25.3%, a relatively high rate. By the end of 1979, oil and gas fields had been discovered in 19 provinces, municipalities and autonomous regions. Of these, 122 fields were put into production. In addition, a total of 15 oil and gas production centres were

established in Daqing, Jilin, Liaohe, Jizhong, Dagang, Shengli, Henan, Jiangnan, Jiangsu, Xinjiang, Qinghai, Yumen, Changqing, Yanchang and Sichuan. The current state of development of several major oil and gas producing areas is described as follows:

Daqing. The Daqing oil region is located in the central part of the Songnen Plain in Heilongjiang Province. Daqing is an anticlinal structural oil reservoir of Cretaceous sediments. Exploitation of Daqing began in May 1960. At present, three oil fields are in operation, covering 1,022.4 sq.m. By the end of 1980, a total of 7,000 oil and water wells had been drilled, and a stable annual oil output of 50 million tons has been registered successively in the five years since 1976. As the oilfield was developed, water injection was initiated at an early stage to maintain the reservoir's pressure.

Daqing's crude oil is a paraffin-base light oil, with a wax content of 20-30%; its melting point is 25-30°C; viscosity is 10-11 centipoise; and sulfur content is below 0.1%. With a fairly complete array of production, scientific research, education and public service facilities, Daqing has become the largest oil producing base in China, as well as one of the giant oil fields of the world.

Shengli. The Shengli oil region lies in the Lubei Plain, adjacent to the seacoast near the mouth of the Huanghe River in the Bohai Gulf. Shengli, in operation since 1965, now comprises 23 producing oil fields, including Chunhua, Pingfangwang, Shangdian, Binnan, Linpan, Shanghe, Kenli, Kenxi, Bonan, Yihezhuang, Yibei, Yidong, Lijin, Wenliu, Shengtuo, Gudao, Dongxin, Chengdong, Yongan, Haojia, Xianhezhuang, Guangli and Wangjiagang. In 1980, total crude oil production reached 17.58 million tons.

The major productive formations in Shengli oil district are of Tertiary sandstone, mainly in the form of anticlinal structural reservoirs and fault-block reservoirs.

Jizhong. The Jizhong oil region is situated in the northern part of the Huabei Plain. The major productive formation is a Sinian Carbonate reservoir overlying a buried-hill type basement. Jizhong has been in production since 1976. Today, 14 oil fields covering 114.8 sq.m. are on stream. These include: Renqiu, Yanling, Longhuzhuang, Liulubei, Liulizhuang, Nanmeng, Hejian, Balizhuang, Xuezhuan, Balizhuangxi, Bieguzhuang, Zhongchikou, Yongqing and Mozhoudong. Crude production in 1980 reached 16.026 million tons. The discovery of Jizhong's buried-hill reservoirs has opened a new sphere of oil exploration for our country.

Liaohe. The Liaohe oil region is located in the northeastern part of the Liaodong Gulf. The major productive formations are Tertiary sandstone, mainly anticlinal structural reservoirs and fault-block reservoirs. Since the start of the high-production oil flow from the first well in the middle part of the Xinglongtai faulted structure zone in July 1969, nine oil fields were discovered and exploited in succession, including the Xinglongtai, Shuguang, Huanxiling, Gaosheng, Huangjindai, Yulou, Rehetai, Fahaniu and Damingtun fields. These oil fields, covering 174.5 sq.m., produced 5.09 million tons of oil in 1980.

Liaohe also contains oil and gas reservoirs of various types and the distribution of oil, gas and water is rather complex. In recent years, some comprehensive measures have been taken in line with the characteristics of Liaohe's oil fields and conditions for exploitation have been improved.

Dagang. The Dagang oil region lies at the mouth of the Haihe River, south of Tianjin. In late 1965, the Beidagang oil field was discovered in the Tertiary. Thereafter, another nine oil fields were discovered and exploited, with a total area of 150.5 sq.m. These include Yangsanmu, Yangerzhuang, Banqiao, Zhouqingzhuang, Wangxuzhuang, Kongdian, Zao yuan and Wangguantun. Most of these oil fields were created by faulting. Some produce thick oil of high viscosity, and sand up vigorously. Oil production in 1980 totalled 2.908 million tons.

Xinjiang. The Xinjiang oil region — with the discovery of the Karamay oil field in 1955 — now has three oil fields on stream; these include Karamay, Dushanzi and Baikouquan. The productive formation is Tertiary sand-conglomerate, consisting of a stratigraphic oil accumulation formed by monocline and faults. By adopting the techniques of water injection at an early stage and separate-layers injection, output has risen steadily, reaching 3.905 million tons in 1980.

Sichuan. The Sichuan oil and gas region includes Sichuan Province and part of western Hubei. It covers 230,000 sq.km. of sedimentary basins. Drilling here began in 1953. Up to now, a total of 59 gas fields and 11 oil fields have been discovered. Of these, 53 gas fields have been put into operation, with a flow of 6,300 million cu.m. in 1980. The Sichuan basin contains ten oil and gas bearing formations dating from the Sinian to the Jurassic; the reservoirs are mainly fractured. In recent years, stimulation measures have included the drilling of deep exploratory wells, seismic exploration and large-scale acid fracturing treatment, all adopted with good results.

The Continental Shelf. In addition to the above fields, the Ministry of Petroleum Industry and the Ministry of Geology have carried out geophysical exploration and exploratory drilling on the continental shelf. In the Bohai Gulf, 95 exploratory wells have been drilled successively, of which 22 have resulted in commercial oil flows with three production platforms constructed. In the South China Sea, in Beibu Gulf, Yinggehai and outside the Zhujiang River estuary, 17 exploratory wells have been drilled, 8 of which have produced oil. Exploratory work has also been carried out in the East China sea.

Developments in Refining. With the continuous growth of crude oil production, the refining industry of our country has also developed considerably. When the People's Republic of China was founded, there were only a few small refineries in Gansu and Liaoning provinces, with a total annual crude distillation capacity of only 116,000 tons. At that time, the country was dependent mainly on imported petroleum products. After Liberation, these refineries were rapidly restored and put back into operation. After reconstruction and expansion, their capacity was greatly increased. However, they could then produce only 38 varieties of petroleum products, such as gasoline, kerosene, diesel fuel and small quantities of lubricating oils.

The Lanzhou Refinery. In 1958, China's first large refinery, at Lanzhou, had its test run. In 1963, the Daqing refinery, the first to be designed, equipped and constructed by China, went into operation. During the 1960's, some of the most advanced petroleum refining processes of that time — such as catalytic cracking, catalytic reforming, delayed coking, and manufacture of catalysts and additives — were mastered by China's refiners, resulting in a wider variety and better quality of products. Thus, we achieved our goal to rely basically on domestic petroleum products, and our country became basically self-sufficient in this area. In the 1970's, new processing technologies were developed successively; for example, riser catalytic cracking, multimetallic catalytic reforming, hydro-treating and molecular sieve dewaxing. At the same time, great progress has been made in refinery construction. Today, refineries are distributed over 21 provinces, municipalities and autonomous regions. Refineries with annual capacities of over 500,000 tons now total 33. They can produce 687 kinds of products. The capacity of China's refineries, as well as the variety, quality and quantity of their products, can now basically satisfy the requirements of socialist construction in our country. In addition, China's

petroleum products have begun to enter the international market. A description of some of China's major refineries is given below:

The Lanzhou Refinery was completed and placed into operation in 1958. Its original designed capacity was 1 million tons per year; now the capacity is 3 million tons per annum. This refinery has become a petroleum processing complex, including production of fuels and lubricating oils, as well as the manufacture of catalysts, additives, petroleum equipment and instruments. The refinery consists of 52 processing units. It produced 109 kinds of petroleum and petrochemical products and in 1980 was chosen as an advanced organization in product quality and energy conservation.

The Changling Refinery. The Changling Refinery went into production in 1970. Its designed capacity was 2.5 million tons per year, now expanded to 3.5 million tons annually. The refinery is of fuel-catalyst type, possessing nine process units. In 1980, it produced 25 kinds of petroleum products and chemicals and was selected as an advanced refinery in energy conservation, product quality, environmental protection and personnel training.

The Shanghai Refinery. The Shanghai Refinery had been a storage terminal prior to 1949. At present, its crude capacity is 4.3 million tons per annum. This refinery is a fuel-lubricating oil refinery, with 22 processing units. In 1980, it produced 79 kinds of petroleum products, and has been singled out as an advanced refinery in energy conservation and product quality, as well as in enterprise management.

The Daqing Petrochemical Complex. The Daqing Petrochemical Complex went into operation in 1963. Its designed annual capacity was 1 million tons, now increased to 4.8 million tons. The complex consists of a fuel-lubricating oil refinery, a chemical plant and a fertilizer plant. In 1980, it produced 38 kinds of petrochemical products, and was selected as an advanced organization in product quality.

The Dalian No. 7 Petroleum Refinery. The Dalian No. 7 Petroleum Refinery had a crude capacity of only 49,000 tons annually in 1950; by 1980, its annual capacity stood at over 5 million tons. It is now a fuel-lubricating oil refinery. In 1980, this refinery produced 84 kinds of petroleum products, and is one of China's major exporting refineries. It has been chosen as an advanced enterprise in energy conservation.

The Dongfanghong Refinery. The Beijing Yenshan Petrochemical Industry Corporation's Dongfanghong Refinery went into operation in 1969. Its original designed capacity was 2.5 million tons per year. By 1980, its capacity stood at 7.5 million tons per year. The refinery is a fuel-lubricant type, and possesses 15 refining units. In 1980, it produced 40 kinds of oil products, and was elected as an advanced refinery in environmental protection.

Pipeline Construction. With the development of the petroleum industry, the construction of long-distance oil and gas pipelines has been carried out vigorously. Up to the end of 1979, a total of 9,746 km. of long-distance pipeline were built, and a crude oil pipeline network was initially set up in northeastern and northern China. Crude oil from major oil fields such as Daqing, Jizhong, Dangang, Shengli and Liaohe can be transported directly to ports and refineries through the pipelines. The oil pipeline volume in 1979 accounted for 61.2% of China's total domestic crude oil transportation.

Technological Progress. Through 30 years' efforts, great advances have been made in petroleum science technology:

Geological Exploration. In the field of geological exploration, a complete range of comprehensive exploratory methods for oil and gas has been established and mastered. Moreover, the geological theories of lake basin deposit facies, oil and gas field formation, and oil generation in sedimentary basins of continental origin have been enriched.

Also, important achievements have been made in research into the mechanism of buried-hill type formations and fault-block reservoirs. Comprehensive geophysical prospecting techniques — including gravity, magnetic, electric and seismic surveys — have been promoted. Digital seismic instruments have been introduced, hence significantly improving the technique and precision of seismic exploration. Seismo-stratigraphy geology has been applied to the study of strata, rock character and facies.

A large quantity of field geophysical logging instruments have been successively manufactured. Logging series and log interpretation methods for sand-shale have been established; a digital processing technique has been preliminarily developed and is being advanced with the aim of achieving a complete range of logging series and digitalization.

Drilling Technology. In drilling, as the techniques of jet drilling, high-efficiency bits and high-

quality mud have been popularized, drilling speed and quality have been raised. Deep-drilling techniques for depths of more than 3,000 m. have been skillfully applied, and eight ultra-deep wells of 6,000-7,000 m. have been tentatively put into operation. In oil field development, the production techniques of water injection for pressure maintenance and separate-layer production have received wide-scale application and expanded development; reservoir engineering methods and production techniques suitable to the specific conditions of China's oil fields and aimed at higher productivity and long-term stable oil production, have been initially created.

Refining Technology. Daqing, in particular, has become more advanced in the study of exploitation geology and production technology. Based on its mastery of 1960's refining technologies, Daqing has developed refining techniques suited to the characteristics of China's crude oil, as well as to the needs of the national economy; a number of oil products have been especially developed for sophisticated defence purposes and for use in imported equipment; a large quantity of high-efficiency refining machinery and equipment have been put into use; production processes controlled by computers have been tested on some atmospheric-vacuum units; and a group of in-line analyzers have been developed.

In some refineries, storage and transport systems have been computerized and are automatically operated with remote metering, controls and signalling. Also, some new technologies and techniques have been applied to oil sewage treatment and to noise-pollution control.

Research Capabilities. In the course of scientific research and production, a corps of scientists and technicians has been built up, who are capable of tackling key problems independently. At present, we have set up a number of scientific research organizations of considerable size and advancement; these comprise a relatively complete range of specialties. There are a total of 29 key scientific research institutes and 6 experimental centres possessing comparatively advanced scientific research facilities, including a number of pilot plants, model test engines and test rigs.

Education. Great achievements have been gained in educational work in the petroleum industry. Before Liberation, there were no petroleum educational institutions in our country. Petroleum specialties were established in the institutions of higher learning only after the foundation of New China. As a result of 30 years' construction, five

petroleum institutions have been set up — Huadong, Xinan, Daqing, Jiangnan and Fushun. They offer a total of 36 programmes of specialization, with a combined enrollment of 7,383 students; graduates of these programmes number 23,734. There are 25 secondary technical schools in the petroleum industry, with a total of 122 specialities and an enrollment of 14,943; accumulated graduates number 87,290. Petroleum enterprises have themselves established 18 colleges for their own workers and staff members; they also operate 92 complete college-level television courses with more than 5,800 students enrolled.

After 30 years' construction, Chinese petroleum industry has attained relatively high levels and a fairly high volume of exploration, exploitation, crude-oil processing, machinery manufacture, oil field facilities and pipeline construction, as well as in scientific research and design. Large numbers of petroleum workers and staff members with a relatively complete range of specialities have been developed. Over the past 30 years, the petroleum industry's accumulated volume of profits and taxes turned into the state tripled the value of total investments in capital construction. In 1979, the profit ratio per 100 yuan of investment funds was 60 yuan; circulating funds per 100 yuan in output value was 16.8 yuan.

II. Petroleum Industry Development in 1980

In implementation of the guiding principle of readjustment of the national economy, the production and construction situation in the Chinese petroleum industry progressed fairly well in 1980.

Readjustments and Output in 1980. In oil field development, the exploitation of new regions was carried out conscientiously in each oil field, the construction of newly exploited areas proceeded normally and their oil output was fairly stable. Comprehensive readjustment, including measures to increase oil production and to retard depletion rates, was carried out in 22 sectors of existing oil fields such as those at Daqing, Jizhong, Dagang, Liaohe and Karamay. Crude oil production totalled 105.95 million tons in 1980, or 100.3% of planned state targets for the whole year; the production of natural gas totalled 14,270 million cu.m., or 104.2% of the annual target. More than 13.309 million tons of crude oil was exported, while exports of petroleum products totalled 4.2 million tons.

Exploration Activities in 1980. Exploration for oil and gas has been carried out in the eastern part of the country with searches for geologically

CHINA'S CRUDE OIL AND NATURAL GAS PRODUCTION

Period	Average Annual Production		Annual Crude Processing Volume (million tons)	Number of Products
	Oil (million tons)	Gas (million cu.m.)		
Rehabilitation Period (1950-52)	.32	6	.38	38
First 5-Year Plan (1953-57)	1	28	1.24	140
Second 5-Year Plan (1958-62)	4.45	824	4.28	416
Readjustment Period (1963-65)	8.76	1,060	8.34	494
Third 5-Year Plan (1966-70)	19.36	1,806	17.6	577
Fourth 5-Year Plan (1971-75)	56.12	6,188	41.76	636
1976	87.16	10,100	57.71	642
1977	93.64	12,123	63.10	648
1978	104.05	13,734	70.70	656
1979	106.15	14,515	71.46	668
1980	105.95	14,276	75.38	687

FINANCIAL STATISTICS FOR THE PETROLEUM INDUSTRY

Period	Output Value (million yuan)	Investment in Capital Construction (million yuan)	Profits (million yuan)	Taxes (million yuan)
Rehabilitation Period (1950-52)	336.69	156.1	63.93	6.09
First 5-Year Plan (1953-57)	2,259.15	1,954.73	673.58	232.22
Second 5-Year Plan (1958-62)	7,874.1	3,739.31	2,644.62	959.60
Readjustment Period (1963-65)	8,702.51	1,701.01	3,123.96	1,223.23
Third 5-Year Plan (1966-70)	30,112.78	4,007.64	12,839.50	3,281.40
Fourth 5-Year Plan (1971-75)	70,591.56	9,213.60	30,646.98	8,817.34
1976	19,660.03	2,250.15	8,734.58	2,190.13
1977	21,456.65	2,321.62	9,409.11	2,390.19
1978	24,412.91	4,389.00	10,419.11	2,707.98
1979	15,727.09	3,404.91	10,520.81	2,909.42
1980	26,559.12	3,576.60	10,615.91	3,030.82
Totals	237,692.59	36,714.67	99,692.09	28,288.42

complicated reservoirs. At the same time, regional exploration (mainly seismic surveys) was strengthened in several large basins in the west. Commercial flows of oil and gas were begun in more than 400 exploratory wells in the east; hence, a number of oil-bearing regions and sectors were discovered and proved. In offshore exploration, agreements with foreign oil companies were signed, and geophysical surveys were conducted over an area of 430,000 sq. km. in the South China sea and southern Yellow Sea; 110,000 km. of seismic lines were finished; and four contracts were signed with Japanese and French oil companies to carry out joint exploration and exploitation of oil and gas in parts of the Bohai Sea and Beibu Gulf.

Readjustments in Refining. In adapting to the demands of the national economy, all refineries readjusted their processing schemes, placing stress on raising yields, improving quality and conserving energy. Production plans were fulfilled in all respects. Outputs of gasoline, lubricating oils, commercial fuel oil, petrochemical naphtha, paraffin and asphalt increased by large margins over 1979. Of these, production of petrochemical

naphtha increased by 41.5%. The overall commodity yield of petroleum products reached 91.8%, while the volume increase in petroleum products came to 950,000 tons. Among the oil products of major refineries, world-level quality requirements were approached or attained for 88 kinds of products, including jet fuel, lamp kerosene, motor gasoline, refined white paraffin, universal diesel oil, asphalt and portions of naphtha output. National gold and silver medals were awarded to ten oil products.

Efforts in Energy Conservation. All petroleum enterprises made great efforts to reduce energy consumption as well as to raise output. By introducing measures such as oil transportation without heating, recovery of light hydrocarbons, treatment of oily sewage, and converting oil-burning boilers to coal, cumulative energy consumption of all oil fields fell by 0.6% as compared with 1979. Hence, commodity yields of crude distributed by state monopolies reached 95.1%, with crude supplies surpassing the state plan by more than 1 million tons. Refining enterprises carried out energy-saving transformation on 16 units and implemented energy-saving measures such as recovery of waste

heat, renovation of heating furnaces, improvement of boiler efficiency, regulation of machines and pumps, readjustment of heating networks and heat exchange flow; these efforts resulted in lowering cumulative energy consumption by 10.58% over the previous year. As a result, even though refining volume increased by 5% in 1980, overall energy consumption fell by 6%.

In long-distance pipeline transportation, measures were taken to reform oil transportation procedures, to rationalize operating conditions and to transport oil without raising or lowering temperatures; as a result, the energy consumed by pipeline transportation fell by 4%. In 1980, all petroleum enterprises saved a total of 960,000 tons of crude and fuel oils, 300 million kwh of electricity and 26,000 tons of oil products.

Achievements in Research. With regard to scientific research in petroleum, the management of scientific planning and the achievement of results was strengthened. A total of 46 scientific and technological research projects were completed. Many of these were badly needed for current production and yielded significant technoeconomical results after being put into practice. For example, a foam-plastic pipe-line cleaner prepared by the Pipeline Transportation Bureau of the Ministry of Petroleum Industry solved the problem of pipeline deformation and difficulties caused by paraffin. After being put into use in the northeast, the annual pipeline flow volume increased from 37 million tons to 40.3 million tons. An atmospheric residue catalytic cracking and metal deactivator, developed by the Petroleum and Chemical Engineering Scientific Research Institute, showed good results in reducing the requirement for feed-stock in catalytic cracking and in increasing the yield of light products by 6%; a total of 2 million yuan was saved on a pilot unit with an annual capacity of 120,000 tons. By popularizing CO combustion supporters, more than 80,000 tons of diesel oil was saved and an accumulated annual increase of more than 19 million yuan in income was achieved in refineries such as Changling, Daqing and Shanghai.

In 1980, the Ministry of Petroleum conducted an appraisal of 64 scientific and technological research results: 12 were presented with national invention awards and four each won second, third and fourth grade awards.

Reforms in Management. In 1980, all petroleum enterprises further improved their operational management, vigorously pursued either increased production with efforts to economize or increased revenues and reduced expenditures, and good results were obtained. A total of 15 refineries

and 3 machinery building factories gained experience in methods of increasing their decision-making powers. Based on the principles of "fixing tasks and costs, retaining a portion of surpluses and savings and offering rewards according to *fen* (a unit of grade mark)," all oil fields further improved and perfected their managerial methods; good economic results were also obtained from establishing internal cost-accounting; vigorously enforcing economic responsibilities and improving the system of rewards. In 1980, gross output value for the petroleum industry registered an increase of 3.2% over 1979; profits turned into the state for 1980 were 10,610 million yuan; and taxes totalled 3,030 million yuan.

Current Problems. Currently, the main problems facing China's petroleum industry are: deficiencies in proven reserves, disproportions in reserves-to-production ratios, depletion of old oil fields, and difficulties in maintaining current production levels. These problems owe mainly to three factors: the decade of turmoil (the "cultural revolution"), when growth of crude production exceeded that of reserves; after 1976, insufficient regional exploration was carried out and no important breakthroughs were gained; the load on old oil fields had to be increased in order to maintain production growth.

According to the guiding principles of readjustment of the national economy and to national energy policy, during the period of readjustment, an appropriate readjustment in crude production should be made and exploration should be enhanced so as to increase crude reserves, to improve the reserves-to-production ratio and to prepare for future development.

Future Prospects. Thirty years' practice in petroleum exploration and exploitation, as well as the current situation in the petroleum industry have shown that targets for readjustment of the petroleum industry can be realized and that the prospect for future development is fairly good. Throughout China's land area, widely dispersed sedimentary rocks are favourable for oil and gas accumulation and generation. The land area covers 4.2 million sq.km., while the area of offshore continental shelf (with a water depth of 200 m.) is 1.3 million sq.km.; average thickness of sedimentary rocks is 4,000 m., hence the total volume is about 22 million cu.km.

The eastern region, including the Songliao Basin, Bohai Gulf Basin, Erlian Basin and Nanyang Basin, covers 940,000 sq.km. Hundreds of oil and gas fields have been discovered, among which is one giant oil field as large as Daqing and an oil field with production as high as Jizhong. Although the

region has been extensively explored, new discoveries have occurred continuously by drilling in the deeper formations; and additional new reserves have been enlarged by quite a number of newly discovered oil-bearing structures and blocks after further exploration; also, new oil-bearing areas may be discovered in the less explored basins and depressions.

The western region, including the sedimentary basins of Junggar, Tarim, Qaidam, Ordos and the Hexi Corridor, covers 1.18 million sq.km. Apart from the known oil fields at Yumen, Karamay, Lenghu and Changqing, throughout this widespread region only a small amount of general investigation and drilling work has been carried out in local areas. Hence, this is an important area for increasing crude reserves.

China's continental shelf extends for 1.3 million km., while the area of main sedimentary basins covers 950,000 sq.km. Based on the preliminary analysis of current data, 400 structures were discovered in portions of the sea areas of Nanhai, Huanghai and Bohai and oil flows were established in 30 wells over the sea area of Bohai and Nanhai. The prospect for locating oil and gas reserves is fairly favourable — the continental shelf is an important area for solving the problem of expanding known crude reserves.

The marine carbonaceous sediment area in southern China — occurring in Dian, Qian, Gui, Jiangzhe and Xianghe — covers 2 million sq.km. and has been subject to only minimal investigation.

In Sichuan, sedimentary deposits cover 230,000 sq.km. and are rich in natural gas resources.

Throughout the above-mentioned widespread sedimentary regions there exist many oil-bearing formations; commercial oil and gas flows have been discovered in sediments from the Sinian and Cambrian levels of Paleozoic to Tertiary of Cenozoic. During the past 30 years, however, exploratory work has been conducted mainly in shallow formations above 3,000 metres. Most are known as structural oil pools; hence, some important spheres for oil exploration have yet to be

broken through. The prospecting potential for oil and gas resources is fairly high.

Accordingly, in the period of readjustment, maintenance of current levels of crude production will rely mainly on the eastern region, while further increases in reserves and production will depend on activities in the western region and offshore.

For the eastern region, efforts will be made to improve and perfect the development of the old oil fields, as well as to increase recovery rates; to prolong stable crude production and to retard depletion; to adopt technically advanced and economically appropriate measures to exploit those portions of proven reserves which are relatively difficult to develop; and to enhance exploration so that more reserves can be found and stable production be maintained.

In the western region, selecting favourable areas with good geology and surface conditions, seismic investigation could be carried out to a wide extent; if exploratory drilling can be increased steadily according to the progress of exploration and to resources of the state, then new oil fields might soon be discovered. At the same time, cooperation with foreign oil companies should be continued; utilization of foreign capital and technology are pursued vigorously and conscientiously, exploration and exploitation of offshore oil resources can be accelerated. And, if after several years' efforts, reserves-to-production ratio may be improved, then favourable conditions for the further development of the petroleum industry may be formulated.

For the future development of the petroleum industry, advanced technology, larger investments and greater amounts of work are needed. By implementing the guiding principle of readjustment of the national economy, drawing up feasible techno-economical policies, reforming operational management, reinforcing scientific research, enhancing technical training and doing all work in a down-to-earth manner, the readjustment targets of the petroleum industry can ultimately be realized.

14. CHINA'S COAL INDUSTRY

By the Research Division, General Office,
Ministry of Coal Industry

I. Development of China's Coal Industry

Coal is the principal energy resource of China. Since the establishment of the People's Republic in 1949, coal has supplied approximately 70% of the country's energy consumption needs. The coal industry has thus become one of China's major industrial sectors.

China is rich in coal resources and has all types of coal deposits. Proven reserves exceed 600,000 million tons. Of China's 2,000 or more counties (municipalities), more than half have coal deposits. Shanxi Province alone has proven reserves of well over 200,000 million tons.

The party and the government have attached great importance to the growth of China's coal industry. Total capital investment in the coal industry has amounted to 44,930 million yuan since the founding of New China. The capacity of mines brought into production each year has averaged 11,087 million tons. Meanwhile, as a result of the further tapping of the existing potential, of technical innovations and of selected reconstruction of existing mines — along with the vigorous growth of small, locally run mines — coal production has been increasing rapidly.

Growth in Output Since 1949. In 1949, the total output of raw coal was only 32.43 million tons. By 1957, following three years of economic rehabilitation beginning in 1950 and after completion of China's First Five-Year Plan, coal output increased to 13,073 million tons. Although the coal industry had by then gone through some tortuous roads on the way to advance, the rate of development has been relatively fast. In 1977, after the overthrow in 1976 of the Gang of Four, annual coal production reached 500 million tons, and maintained a level above 600 million tons during the period from 1978 to 1980. Thus, during the period from 1949 to 1980, China's coal output increased at an average annual rate of 10%.

Through 31 years of reconstruction since 1949, China's coal industry has become an industrial sector of considerable scale. There are now 2,200 coal mines operated above the county level. Total employment is 4,190,000. Of the total number of mines, 580 are under the jurisdiction of the Ministry of Coal Industry; these have a combined annual designated capacity of 290 million tons. Coal mines operated by the provinces, prefectures

and counties total 1,634, with an annual designated capacity of over 180 million tons. The number of coal mining centres with an annual production of more than 50 million tons has expanded to 20, of which 10 have production capacities exceeding 10 million tons. Annual production in the Kailuan and Datong coal mining centres has reached more than 20 million tons each.

Improvements in Processing. Significant improvements have also been made in coal processing. A total of 176 treatment plants have been built or expanded. At present, processed raw coal in China totals 100 million tons annually. Additional new coal mining centres, mines and treatment plants are now under construction.

Technological Development. With development both in production and construction, a great many changes have also taken place in technological levels of the Chinese coal industry. Coal mining in China has virtually done away with the backward methods of human postage and hauling by draught animals as practised in the old society, and fully mechanized and semi-mechanized operations have been installed. At present, China has more than 1,200 single-drum shears of domestic manufacture, and 223 installations of fully mechanized equipment supplied both by domestic and overseas manufacturers. Similarly, coal production methods in China's coal mines have been improving, advanced mining technology has been progressively popularized, plans for mining development are following rational procedures and technical know-how in equipping the mines is increasing steadily. Today, single longwall mining is extensively used for dip and flat-dip and thin and medium-thick seams, while double-unit face longwall and inclined longwall methods have been used successfully in some mines. In most flat-dip and dip thick seams, inclined slice and slice-with-water sand stowing are in general use. In steep seams, mining methods such as horizontal slicing with artificial roofs, overhead step systems, small steps and coal winning with shields are all widely used methods. In addition, hydraulic mining has also been developed to a considerable extent. At present, in mines under jurisdiction of the state coal industry, the longwall method of mining accounts for 86.74% of the coal produced, while the methods of horizontal slicing, coal winning with

shields and the overhead step system for steep seams as well as hydraulic mining account for 4.58% of the total.

Technical and equipment capabilities in capital mine construction are improving and the construction work force has become rich in skills. Techniques of shaft construction are improving rapidly. A production line for shaft sinking mechanization has begun to be adopted in common shaft sinking, while other special sinking methods have achieved varying results. Since the country's liberation in 1949, more than 300 shafts have been successively sunk using techniques of freezing, bore-holes, the curtain method and drop-shaft sinking; 21 shafts have been sunk with shaft-sinking machines: these have a maximum diameter of 7.9 mm. and depths up to 308 metres. A number of grabbing, hoisting, loading and hauling machines for sinking and tunneling have been developed, and a small quantity of complete sets of equipment have been imported. The mechanization level for underground heading and loading has reached 80%.

In order to keep pace with the development of the coal industry, educational units and special research organizations pursuing geological engineering and scientific subjects have been established.

Exploration, Planning and Research. There are now 24 coal geology companies and 125 geological exploration teams at work throughout the coal industry. Borehole and geophysical surveys are the major methods for geological exploration at present. In areas with good conditions, a combination of geophysical and borehole methods is adopted. Meanwhile, the development of up-to-date exploration techniques, the manufacture of digital seismographs and modernization of drilling equipment is underway.

Up to the present, 30 coal-mining engineering and planning institutes have been set up, of which eight are main institutes under the Ministry of Coal Industry. These institutes can undertake design and planning work for mines and processing plants of various capacities. New computer technologies have begun to be employed in design and planning.

There are now 31 coal science research institutes and laboratories engaged in a range of research work in areas such as coal geology and exploration, coal extraction, mine construction, mining safety, coal processing, mining machinery and coal chemistry.

There are at present 12 colleges, 36 technical schools and 102 vocational schools training personnel for the coal industry. The number of graduates since 1949 has totalled 120,000.

The fact of the development of China's coal industry eloquently proves the superiority of the socialist system. It is clear that we could have accomplished still greater achievements and a faster development rate had it not been for the setbacks caused by the ten-year calamity of the "cultural revolution" and the influence of erroneous "Left" thinking.

II. The Consolidation and Advance of China's Coal Industry in the Midst of the 1980 National Economic Readjustment.

Because of long-term interference and sabotage by Lin Biao and the Gang of Four during the "cultural revolution" and the influence of "Left" thinking in our economic work, serious imbalances occurred in the coal industry. The serious imbalance between extraction and development in some mines, caused by improper coordination in the production chain and poor application of safety measures and compounded by problems of insufficient housing for workers, brought about great difficulties in the development of the coal industry.

In 1980, China's coal industry adhered the policy of taking readjustment as the key link and embraced the spirit of ensuring the necessary supply of coal during the national economic readjustment, while at the same time pursuing the readjustment within the coal industry itself. The readjustment work proceeded apace, and various tasks in coal mine production and construction were satisfactorily fulfilled. The coal industry has been able to achieve both consolidation and advancement in the course of the readjustment:

1. Coal output: Coal production was maintained at 600 million tons while readjustment work in the mines progressed.

China's raw coal output in 1980 was 620.13 million tons, representing a 7.9% increase over the state plan requirements. This accomplishment was both essential and advantageous to readjusting proportionate relationships within the coal industry. Although coal output in 1980 was 2.4% less than the 1979 total, the average annual production level of 600 million tons, a high level of production, was maintained.

Of the 1980 total, 344.39 million tons were produced by state-owned mines, exceeding the state plan by 0.7%, although falling below 1979's total by 3.7%. Coal output from small, locally run mines was 275.74 million tons, over-fulfilling the state plan by 8.2%, and 0.7% below 1979. Of the above total, output from small mines run by provinces, prefectures and counties was 162.12

million tons, or 9.33 million tons less than in 1979. Output from small mines run by communes and brigades was 113.62 million tons, representing an increase of 7.31 million tons over 1979.

Output of washed coal in 1980 was 58.66 million tons, of which output from state-owned mines accounted for 50.75 million tons. Treated raw coal in 1980 accounted for 34.7% of total production, a higher total than 1979. Output in 1980 of large-sized coal from state-owned mines was 33.53 million tons, of which anthracite accounted for 7.87 million tons; bituminous coal, 23.63 million tons; and brown coal, 2.03 million tons.

Raw coal production from state-owned mines in 1980, classified according to type, was as follows: anthracite, 39.5 million tons; brown coal, 11.99 million tons; and bituminous coal, 292.9 million tons, of which coking coal (including coking coal, fat coal, gas coal and non-flammable coal) made up 213.24 million tons.

Effects of the Readjustment. As to the readjustment situation in China's coal industry during 1980, due to clear projections and effective application of taking readjustment as the key link, good results were achieved throughout the coal industry.

In order to adjust the relationships between extraction and tunneling in mines, great efforts were made both in underground mine development and in removing overburdens in open-cast mines. The development schedule for state-owned mines in 1980 was 840,000 metres, with 946,000 metres actually fulfilled in that year. According to statistics released for 96 mines with problems in balancing extraction and development, 898,000 metres were left incomplete prior to the readjustments. Eventually, however, 167,000 metres and 253,000 metres respectively were completed during 1979 and 1980. Thus, 36 mines were restored to a normal balance in their extraction and development activities (among which six had undergone this adjustment in 1979). For five open-cast mines with imbalance problems between extraction and development, there were 63.6 million cubic metres of over-burden left undone, with 14.3 million cubic metres removed in 1980.

The readjustment programme was preliminarily worked out following an investigation into the current state of imbalance problems in the extraction of thin and thick seams. As a result, output from thin coal seams in 33 coal-mining administrations (including Kailuan, Fengfeng, Zaozhuang and Jiaozuo) increased substantially over 1979.

Qualitative Improvements. New break-

throughs were also made in improving the quality of coal and in increasing coal washing capacity. The ash content of salable coal from state-owned mines reached an average of 21.58%, or 1.27% lower than the planned index of 22.85%. Waste content averaged 0.51%, or 0.24% lower than the index of 0.75% and thus breaking the best ratio ever of 0.62%. A total of 114 provinces and 49 coal-mining administrations had gained record results in reducing waste content during 1980. Ash content for washed coal was 10.27% on the average, or 0.08% lower than the index of 10.35%. This was the best result to be achieved since 1973.

The quality of the products in 24 coal treatment plants was improved, while 43 treatment plants transformed their product patterns and attained multi-product outputs. The level of water content in washed coal achieved the best record since 1971, with an average content of 12.03%. There were 116 new coal treatment projects underway in 1980, of which 73 were completed in that year. As a result, the amount of raw coal processed increased by 8.1 million tons while screening capacity increased by 3.75 million tons.

Improving Safety Standards. Meanwhile, strict attention was paid in all mines to strengthening basic work standards. Owing to efforts made in work safety and to preventive maintenance overhauls, there was a considerable reduction in the fatal accident rate, in mechanical and electrical equipment shutdowns and in the proportion of road-ways that were out of repair. Great changes took place in safety. A total of 39 state-owned mines were able to raise their standards of safety production.

Rectifying Imbalances. During 1980, a number of mines succeeded both in rectifying the imbalance between extraction and development and in increasing production. For example, the Hegang Coal Mining Administration of Heilongjiang Province seriously implemented the policies of the readjustment, beginning by strengthening its basic work standards. Its imbalance problem was progressively corrected and its coal production steadily increased. Its raw coal output in 1980 was 12.73 million tons, overfulfilling its plan by 1.13 million tons and placing Hegang first among the coal mining administrations in the surpassing of production targets. The Coal Mining Administration of Henan Province had serious problems of imbalance between extraction and development. As a result of taking readjustment work as the key link and, at the same time, seeking every opportunity to increase production, Pingdingshan not only achieved a rapid pace in readjustment, but also maintained a production level of more than 13.6 million tons. After two years of hard work,

the Xieyi Coal Mine of the Huainan Coal Mining Administration in Anhui Province succeeded in overcoming the imbalance problem, and raw coal production in 1980 reached 1.55 million tons, an increase of 240,000 tons and 150,000 tons, respectively, as compared with 1978 and 1979. Above all, good achievements were also gained in coal mining administrations such as Huaibei in Anhui Province, Datong in Shanxi Province and Zibo in Shandong Province.

[For detailed information on technical-economic norms fulfilled by state-owned mines, please see tables 1, 2, 3, and 4 below.]

2. Work Safety: *Work safety in mines was improved and a new approach was taken to mining safety.*

Coal in China is extracted mainly by underground methods. The geological structure of most mines is complex and natural calamities occur quite readily.

Table 1: The Structure of Output in State-Owned Mines in 1980

Category	Percentage (%) of total output
Seam thickness up to 1.3 m.	12.60
1.3 - 1.5 m.	44.21
over 3.5 m.	43.19
Dip of the coal seams	
< 12°	47.87
12° - 25°	36.29
25° - 45°	10.59
> 45°	5.25

Table 2: Partial Production Figures for Working Faces of State-Owned Mines in 1980

Item	Unit	Quantity
face		2,167
Working face length	m./face	95
(average) advance/month	m.	39.3
output/month	ton/month	11,032
Production capacity of the coal seams	ton/m ²	2.95
Total output	10,000 tons	28,687

Table 3: Partial Index for Prepared Face of State-Owned Mines in 1980

Face prepared	Average number	Advance/month (average) (m./face/month)
Total	5,269	107.9
Coal heading	1,744	154.6
Alternate heading	1,381	121.9
Rock heading	2,144	60.9

Table 4: Selected Technical-Economic Index of State-Owned Mines in 1980

Item	Unit	Index
Productivity		
total face worker	ton/manshift	0.912
heading worker	ton/manshift	4.129
	m./manshift	0.125
Quality		
salable coal	ash waste	%
		%
		21.58
		0.51
of coal	washed recovery	%
	ash	%
	water	%
		56.16
		10.27
		12.03

In 1980, China's coal industry persisted in the policy of "safety first." Moreover, by paying special attention to readjustment and management, improved results were gained in safety. The accident fatality rate dropped by 20.58% from the previous year; within that figure, the rate of decline in state-owned mines and capital construction units fell by 32.31% and 20%, respectively. The fatal accident rate per million tons of coal extracted reached the lowest level in the past 7-8 years. Compared with 1979, 81% of all coal mining administrations (coal mines) under the jurisdiction of the Ministry of Coal Industry achieved some level of reduction in fatal accidents and 52 coal mines achieved a record of no fatal accidents for the entire year.

Similarly, reductions were achieved in all types of accidents throughout the coal industry: roof accidents dropped by 23.2%; haulage accidents by 13.0%; methane accidents by 31.8%; and mechanical and electrical accidents by 12.7%.

Mining safety readjustments and work-safety standards were taken into consideration at various levels in the coal industry in 1980:

The idea of safety first was repeatedly inculcated, with leading cadres taking full respon-

sibility for safety and for conducting a programme of safety meetings as laid down by the Ministry of Coal Industry and by provincial coal bureaus.

Regulations for Coal Mining Safety were issued by the Ministry of Coal Industry in February 1980. Classes for studying these regulations were held from the ministry level down to the coal mining administrations and coal mines themselves where more than 158,000 workers and staff members attended. Meanwhile, investigations and safety measures were undertaken by various organs in accordance with the regulations. Thus, safety at work was assured and safety management was strengthened.

There were 332 safety readjustment projects throughout the coal industry, involving a total investment of 43.65 million yuan, of which 165 were fulfilled by the end of the year. After further reorganization and readjustment, safety standards in mines run by provinces, municipalities and autonomous regions were substantially improved.

"May Safety Month" campaigns and "100 Days of Safe Production" (i.e., no fatal accidents) competitions were launched and, during the fall, thoroughgoing safety examinations were carried out. The goal of "100 Days of Safe Production" was realized in 175 state-owned mines, of which 71 mines realized "100 Days of Safe Production" three times in succession. The Linxi Coal Mine of the Kailuan Coal Mining Administration achieved a record of no accidents for 400 days running. In August and September of 1980, advanced-experience propaganda teams were organized by the Ministry of Coal Industry and by coal mining unions to promulgate experiences among the coal mines.

In strengthening organizations safety through supervising and enthusiastically introducing safety supervision work, coal mining safety-supervision administrations were authorized for 11 provinces and autonomous regions. Safety-supervising divisions had already been set up in 41 state-owned coal mining administrations. At the same time, for the purpose of readjusting the existing structure, some leading cadres were assigned to safety supervision at various levels.

3. Improvements in Mechanization:

Total output from mechanized methods in state-owned mines was 106.3 million tons in 1980, an increase of 9.98 million tons over 1979.

The mechanization level (the ratio of the mechanized output to total production) reached 37.06% in 1980, an increase of 4% over 1979.

Coal-mining mechanization in China consists of three categories:

A. Coal mining by general mechanization.

These mainly are Type 80 single-ranging drum shearers of domestic manufacture; there are at present more than 1,200 such pieces of equipment in China. The average number in utilization in 1980 was 453; their output totalled 63,003 million tons, which accounted for 21.97% of total production.

B. *Coal mining by full mechanization.* China has 223 installations of fully mechanized equipment (56 made in China and 171 imported). The average utilization number in 1980 was 93; their output was 37.73 million tons, which accounted for 13.16% of total production. The 1980 figure was twice the output of 1979.

C. *Hydraulic mining.* Output from hydraulic mining in 1980 totalled 5,534,000 tons, or 1.93% of total production.

Various technical-economic indexes of fully mechanized mining had been further improved in 1980. Coal output increased by 18.79 million tons compared to 1979. The output of working faces per month reached 33,600 tons, or an increase of 1.6 tons compared to 1979. One hundred newly imported installations of fully mechanized equipment from overseas were all received by the end of 1980; of these, 76 were installed underground and 66 were put into production. The average monthly output from these faces reached 42,800 tons, with an O.M.S. of 12.3 tons.

A number of coal mines have emerged with high-level mechanization and advanced mechanized mining. The mechanization level in the coal mining administrations of Luan, Jixi, Shuangyashan, Yanguan and Jincheng and of 55 coal mines, including Shigejie and Pangzhuang, exceeded 70%. Thirty-three fully mechanized mining teams and 177 general mechanized teams had come up to the standard team level set by the Ministry of Coal Industry in which the annual output of the No. 1 Fully Mechanized Mining Team of the Tongjialiang Coal Mine, Datong Coal Mining Administration, reached 920,000 tons, with O.M.S. up to 34 tons.

D. *Tunnelling mechanization:* There were 6,670 scraper-type rock loaders, scoop-type rock loaders and coal loaders in state-owned mines in 1980; 2,850 heading faces were so equipped. Loading mechanization in terms of drivage (e.g., boring by rock and electrical coal drills and loading by machines) was 37.49%, or an increase of 1.9% as compared to 1979. Within this category, loading mechanization for rock headings came to 63.78%; alternate headings, 42.32%; and coal headings, 21.74%.

Investigations and studies were carried out

with regard to the production chain of drivage mechanization work lines, and an equipment schedule for rock headings was worked out. A number of heading faces began work towards the goal of mechanization work lines — consisting of heading machines with extensible and suspended belt conveyors or heavy-type flight-bar conveyors — were preliminarily set up. In 1980, 82,900 metres were completed, accounting for 1.21% of the total drifting footage of all state-owned mines. Meanwhile, main stress was laid on ten mechanization work lines in coal mining administrations such as Datong, Kailuan and Xuzhou. The annual drifting footage was 6,926 metres for mechanization work lines in the Dangzhuang Coal Mine, Xuzhou Coal Mining Administration, with a monthly footage of 577 metres; drifting footage reached 1,125 metres in April alone.

E. Coal Mining Machinery Manufacturing and Repairing: Most coal mining equipment used in China today was made domestically. There are now 173 enterprises engaged in the manufacture of coal-mining machinery and equipment, of which 34 are major manufacturers under the Ministry of Coal Industry.

For the above 34 manufacturers, total employment is 63,000; they have a combined total of 7,290 metal-cutting machines, 1,482 units of forging equipment; and 730 million yuan worth of fixed assets. Their main products include shears, coal loaders, flight-bar conveyors, coal-mining safety instruments and metal roof supporting facilities.

Insufficient production tasks that occurred during the readjustment were compensated by vigorous measures taken by these manufacturers to improve the quality and increase the range of their products, as well as in the carrying out of technical services to users. Finished products were the equivalent of 142,000 tons.

Readjustment and transformation among coal mining machinery manufacturers according to the principle of reasonable economy and coordination among specialized departments is now underway, and reorganizations are being carried out. The China General Specialized Coal Mining Equipment Service Corporation and the China Coal Mining Safety Equipment Industrial Corporation, both set up in 1980, have already begun operations.

There are 99 coal mining machinery repair workshops in the state-owned mines and in the coal mines run by various provinces, with total employment of over 91,000. These workshops are responsible for repairing mining machinery and for manufacturing spare parts for different mining areas.

4. Coal Mine Construction: *Proposed projects and the scale of coal mining capital construction were readjusted and great attention was paid to the economic results.*

Readjustment was carried out among ongoing projects in 1980, and stress was placed on speeding up construction, improving engineering quality, reducing costs and increasing returns on investments. In this way, certain results were achieved:

A. Capital construction investment for the coal industry totalled 3,610 million yuan in 1980. Of this amount, 1,352 million yuan was used for the construction of new mines and 422 million yuan for tapping the potential of and expanding existing mines.

B. There were 31 coal mines set up and put into operation in 1980 with a combined annual production capacity of 8.29 million tons. Of these, 24 were newly constructed mines, with a combined annual production capacity of 5.93 million tons; and 7 were expanded mines with a total annual production capacity of 2.36 million tons. Of the 31 mines, 13 belonged to large and medium-sized projects with a combined annual production capacity of 5.25 million tons. There already were four newly opened mines in 1980, with a total annual designed capacity of 4.8 million tons.

C. A thorough examination of on-going projects was carried out, following which development was halted on 22 mines with an annual designed capacity of more than 30,000 tons each. In addition, a number of pending mine construction projects and production chains for coal mining areas were suspended. Investments could thus be better concentrated and more reasonably distributed.

Thanks to the implementation of the policy of economic readjustment, the construction scale for coal mines with an annual designed capacity of more than 30,000 tons was reduced to 140.22 million tons in 1980 from 114.43 million tons in 1979. Those ongoing new mining centres with an annual designed capacity of more than 10 million tons include Gujiao in Shanxi Province, Yianzhou in Shandong Province, Huainan and Huaibei in Anhui Province and Handan in Hebei Province. Ongoing new mining centres with an annual production capacity of 500,000 tons include Tiefsa and Shenbei in Liaoning Province, Zaocheng in Shandong Province and Datun in Jiangsu Province.

Shanxi Province, which commands one-third of China's proven reserves, has made further use of its rich coal reserves and has accelerated its coal exploitation. The production capacity of ongoing

projects in Shanxi Province reached 18.14 million tons in 1980; Yanzhishan in Datong and Xiqu in Gujiao are among the largest mines, with an annual designed capacity of more than 3 million tons each. Preparations were also made in the pre-exploitation of large mines such as Guishigou in Jiangquan and Chengzhendi in Gujiao. The three large mines of Xinglongdian, Baodian and Dongtan in the Yanzhou coal mining centre of Shandong Province are now under construction, with a combined annual designed production capacity of 10 million tons. The Xinglongdian Coal Mine, which has an annual production of 3 million tons, was to be put into operation in 1981.

Preliminary results in coal mining capital construction in 1980 centred on accelerating production rates, increasing efficiency, improving quality costs and readjusting management. The annual drifting footage for the newly constructed mines overfulfilled the schedule by 1%. The percentage of first-line projects in mine construction, civil engineering and installation engineering increased to 38%, 67% and 76%, respectively. Efficiency levels in the drifing of shafts, rock headings and inclined headings all increased to some extent compared to 1979.

Geological Exploration: In 1980, geological exploration by China's coal industry was conducted according to capabilities. The overall approach in geological exploration was regulated and the scale of exploration was reduced in areas south of the Chiangiang River and in some provinces and autonomous regions with relatively low reserves. On the other hand, great efforts were made and exploration was accelerated in the major coal mining areas such as Shanxi, Henan, Heilongjiang, Anhui and Shandong.

Planning and Design: In coal mine planning and design work carried out during 1980, few new projects were undertaken in the midst of the economic readjustment. Rather, meticulous preparations were made for future mine construction. Seven full-scale design projects were completed in 1980, with a combined capacity of 88.85 million tons; preliminary coal mine designs totalled 20, with a total capacity of 16.44 million tons; processing plant designs totalled 11, with a capacity of 18.4 million tons. Standardization, serialization and interchangeability work was carried out in design, including interchangeable designs completed for five types of large mines with capacities of 900,000–3,000,000 tons; for coal treatment plants with capacities of 600,000–1,800,000 tons; and for repair workshops in four or five categories of coal mining centres.

5. Scientific Research: *scientific research and education in china's coal industry are progressing.*

A total of 152 projects were taken up under the research and development programme of the coal industry in 1980; of these, 39 were major state projects. More than 70% of the projects were carried out in accordance with the programme, and 51 scientific research achievements were recorded, including the following notable results:

A. The development of NDZ-18 self-contained hydraulic prop and DZ-18 hydraulic prop, providing needed accessories for the development of high-level general mechanized mining.

B. The development of BM-100 thin seam shearers suitable for coal seams of 0.8–1.3m.

C. The development of a SMY 540/1500–61 pressure filter and a GUD-30 single-chamber belt filter which reduces the solid content in filtration liquids to below state disposal standards, thus providing new capabilities for reducing the loss of coal slurry and for preventing environmental pollution.

D. The technology of recovering sulphur iron ore from coal waste was preliminarily developed.

E. The development of an AZL-40 filtration self-rescuer has increased effective protection time from 40 to 70 minutes.

Of the 50 advanced technical findings which were to be disseminated in early 1980, 17 produced positive results.

Education and Training: In 1980, 2,922 students and 36 postgraduate students were enrolled in 11 colleges of coal mining under the jurisdiction of the Ministry of Coal Industry. Correspondence courses were resumed and set up in eight mining institutes with 680 students enrolled. Following readjustment and augmentation, 24 worker's colleges in mining areas were officially approved as institutions of higher learning for workers and staff members; these have an enrollment of more than 2,000 students. Administrative units of higher educational institutions under the jurisdiction of the Ministry of Coal Industry were adjusted and consolidated. Among the new administrators, 46 newly assigned leaders, professors and associate professors account for nearly one-third of the total.

Coal-mining technical schools have been expanding rapidly. For the 100 technical schools in

1980, graduates totalled 11,200; 20,000 full-time students were enrolled; 45,000 students were attached to the schools; and teachers and staff members totalled 8,000.

Stress was placed on the training of workers and staff members at their posts: According to statistics provided by 45 units, of the total of 1.7 million workers and staff members in 1980, training for 320,000 was planned, and 350,000 were actually trained; of these, 82,000 attended full-time training courses.

Fully mechanized mining requires more rigorous training of workers. In 1980, 3,400 workers were released from work to attend training courses, and 250 coal-mining administration directors, managers and engineers in charge of mechanized mining operations underwent training.

Work in the training of cadres has been strengthened. A training programme for the 1982-1990 period has been worked out, while 25 training schools which can receive 5,600 cadres at a time have been restored or established.

III. Major Problems and Trends for Future Development of China's Coal Industry

The situation in China's coal industry is excellent, but difficulties and problems still exist. The readjustment of existing mines is an arduous task. The size of recently constructed new mines is relatively small and cannot meet requirements for the development of the national economy. The rational utilization of coal resources, the limited range of coal products, the small proportion of processed coal and low overall quality are all factors that are unfavourable to coal.

Above all, there are still huge gaps in technical equipment and management levels as compared with major coal-producing countries. The mechanization level in China's coal industry is not high. The status of safety in coal mines has not been essentially changed and there are still quite a few accidents.

The Communist Party of China and the people's government have attached great importance to the coal industry. They have established coal as China's main energy resource and have given priority to its development. Proceeding from the actual conditions in our country, the vital policies of laying equal stress on both development and conservation of energy resources and giving priority to saving energy in the near future have been worked out. The prospects of the Chinese coal industry are splendid.

In order to meet the requirements of national

economic readjustment and to stabilize the life of the people, the coal industry should not only carry out good readjustment work within its own confines, but should also maintain certain production levels and continue the pursuit of progress. Therefore, "two speed-ups" should be grasped:

1. *Speeding up the readjustment and consolidation of coal mines and maintaining the production level of 600 million tons.* Tapping potential, promoting innovation and reconstructing selected existing mines should be carried out continuously so as to ensure increases in production. In order to stabilize present production levels, supportive measures for small, locally-run mines should be taken. Consolidation of management and administration should be vigorously pursued so as to increase economic results. In addition, those enterprises engaged in the manufacture and repair of mining machinery will be readjusted and reorganized; coal science research and education will be expanded and the physical well-being of miners will be improved steadily.

2. *Speeding up the construction of the new mines will be expanded and accelerated.* In exploiting coal reserves, the old mining bases should be fully made use of. Expansion and reconstruction of those existing mines with suitable conditions will be carried out. New mines will be opened up in the old mining areas so as to increase coal production. Meanwhile, coal fields in areas with rich reserves and convenient transportation facilities will be selected for systematic development and new mining centres will be opened up. Shanxi, East China, the Northeast region (including three eastern administrative divisions of the Inner Mongolia Autonomous Region), and Henan will become the main coal-producing areas.

Furthermore, great attention will be paid to the development of open-cast mines. A number of small and medium-sized mines requiring less investment and promising immediate results will enter construction during the readjustment period. In order to speed up coal-mine development, co-operation with various friendly countries and enterprises will continue to expand and all foreign investments will be welcome.

3. *The structure of coal products will be changed so as to create conditions for consumer energy conservation.*

Coal processing will be increased on a large scale; coal quality will be improved; and coal products will be variegated so as to meet the needs of various sectors. Coal chemistry, gasification and liquifaction will be studied and pursued, as will the comprehensive utilization of coal.

4. *Coal-mining mechanization will be increased and safety in mines will be improved.*

In light of actual conditions in our country, not only will the full mechanization of mining be increased, but hydraulic mining, general mechanization and small-scale mechanized equipment will also be developed. With coal mining mechanization as the centre, mechanization levels in geological exploration, shaft sinking, civil engineering, coal preparation, safety and transportation activities

will also be stepped up. The technical equipment level of China's coal industry will be improved in an all-around way.

5. *Scientific research and education in China's coal industry will be strengthened.*

The training of cadres and workers will be expanded. Mine management will be consolidated. And the coal industry will march forward towards the great goal of modernization.

15. CHINA'S ELECTRIC POWER INDUSTRY

By Chen Zengqing

Ministry of Power Industry

I. The Development of China's Electric Power Industry

Before Liberation, the electric power industry in China was very backward. In 1949, when the People's Republic of China was founded, total electric energy generation was only about 4,300 million kwh, ranking China 25th in the world. Total installed generating capacity was only 1,850 mw., and most of the power stations were located in a few big cities in the coastal regions; there was very little electricity supply in the vast expanse of China's interior provinces. As for transmission lines, there were only a few 154-kv (kilovolt) lines and only one 220-kv line in the northeastern region, while there were neither extra-high-voltage transmission lines nor extra-high-voltage power grids at all in other parts of the country.

After three decades of national construction under the leadership of the Communist Party of China and the government, by the end of 1979 the country's total electric energy generation amounted to 282,000 million kwh, representing an increase of 65.6 times over that of 1949 and ranking China seventh in the world. The average annual growth rate of energy generation from 1949 to 1979 was 15%.

At the end of 1979, installed generating capacity of the entire country showed an increase of 34 times over that of 1949, with an average annual growth rate from 1949 of 12.5%. Energy generation and installed capacity of hydroelectric power amounted to 17.8% and 30.3%, respectively, of the national total.

In the past 30 years, we built a great many hydroelectric and thermal power stations and power grids, and the distribution of the power industry had been greatly changed. The irrational placement of most power stations in coastal regions no longer existed.

By the end of 1979, there were 2,860 hydroelectric and thermal power stations above 500kw. (1,524 hydro and 1,336 thermal), of which 70 large power stations had capacities above 250mw.; aggregate capacity was 30,520 mw. A total of 32 power grids had been built in the country with installed generating capacity above 100 mw., of which 12 were in excess of 1,000 mw. The length

of 330-kv transmission lines in the country was 801 kw., while 220-kv lines and 110-kv lines totalled 25,000 km. and 61,000 km. respectively. Total capacities of power transformers on 330-kv, 220-kv and 110-kv lines were 1,900 mva, 63,000 mva and 72,320 mva, respectively.

Technological Advances. Along with the development of science and technology, we have used on a rather large scale some modern techniques and innovations in power stations and power grids, and have gained certain experiences in construction and operation. The maximum capacity of hydroelectric power units has been raised to 300 mw.; the highest water head of reservoirs is 629 metres, and the lowest is 6 metres; all of these hydro power units are of domestic manufacture.

The largest thermal power units, both domestic and imported, are 300 mw. and 320 mw., respectively, and a large number of 200-mw. thermal units have already been placed in operation. Among thermal power stations above 500 kw., high-temperature and high-pressure units, medium-pressure condensing units and cogeneration units make up 62%, 29% and 10%, respectively, of the total thermal units.

Automatic monitoring equipment for ensuring reliable operation — such as scanning and measuring equipment for steam parameters, steam turbine metal expansions, vibrations, axial displacements, oil systems; and automatic monitoring and control equipment for steam, water, draft and fuel systems of boilers — have been used in the large thermal stations. In some power stations, partial monitoring and control with computers have been in trial operation.

Several technical methods of improving the stability of power system operations — such as fast single-phase automatic reclosers and series capacitive compensations on transmission lines; quick response excitations, automatic load shedding and electric breaking on generators; and various kinds of communication facilities, such as power line carriers, microwave, extra-high frequency communication equipment, etc. — have been widely used in many power grids. Systemized modern protective relays on generators, power transformers and transmission lines, and telesignals, tele- meters, CRT displays and digital computers for

off-line calculations in the large system dispatch centres have contributed a great deal to reliable and economical system operations.

Fuel Consumption. In general, however, the development of technology in our power industry is still lagging, and the main consumption indexes are comparatively high. The average unit fuel rate of all thermal units above 6,000-kw. was 456 grams of standard coal per kwh on bus bar in 1979 (422 grams of standard coal per kwh on generator). In 1979, total fuel consumed by both thermal and cogeneration units amounted to 125 million tons of raw coal and 19.83 million tons of oil. Both the coal and oil consumed were equivalent to 111.65 million tons of standard coal, accounting for 21.5% of total fuel consumption in the country. The average rate of power stationhouse use and line loss were 6.54% (0.195% in hydro power stations, 7.63% in thermal power stations) and 9.24%, respectively. The average of annual utilization hours for all generating units was 5,175 (3,112 for hydro power units, 5,956 for thermal power units). At present, the average electricity rate in the country is about 0.065 yuan per kwh, a figure that has been kept almost unchanged for the past 30 years.

Energy Use by Sector. An analysis of the structure of electric energy consumption shows that industries took a very large share, rural consumption grew rapidly and used a larger and larger share, while the portions of transportation and of municipal and residential consumption were rather small. The structure of electric energy consumption in each sector in 1979 was as follows: house consumption of power stations together with line losses, 15.1% of total generation; industrial sector, 65.4% (10.1% for light industry, 55.3% for heavy industry); agricultural sector, 13.6%; transportation sector, no more than 0.5%; municipal and residential sectors, only 5.4%.

With a population of nearly 1,000 million, electricity generation per capita in 1979 was only 290 kwh (it was a meagre 8 kwh in 1949). Indeed, this figure is quite low, and about one-half of rural families, mainly in mountainous and border districts, are still without any electricity supply.

The Bottleneck. In the past 30 years, although our electric power industry had developed quite rapidly, disproportionate relationships emerged in our national economy because of mistakes in the economic work, particularly in the 10-year period of upheaval. As a result, the power shortage in the country lasted even more than 10 years. The development of industry, agriculture and people's daily lives were adversely affected by the power defi-

ciency, and the electric power industry became a bottleneck in our national economy.

II. Production and Construction in the Electric Power Industry in 1980

Our electric power industry proceeded in 1980 under the guidance of the principle of readjustment of the national economy. In the readjustment period, the guiding principles of production and construction in the power industry seek primarily to manage and effectively utilize existing power facilities and to carry out necessary technical innovations so as to bring them into full play and to reduce energy consumption. Secondly, the plan calls for great efforts to construct new power stations and to exploit new electric energy sources, in order to gradually change the unfavourable power shortage.

In the 1980 plan, aggregate electricity generation was targeted at 290,000 million kwh; actually, 300,600 million kwh were generated, an increase of 6.6% over the previous year. Hydro-electric generation accounted for 58,200 million kwh of the 1980 total, an increase of 16.1% over 1979. The aggregate heat supply from cogeneration stations was 73.40×10^{12} Kcal, an 1.8% increase over the previous year.

In 1980, 28 generating units were commissioned, of which 13 were hydro power units and 15 were thermal power units. In addition, a large number of small power stations up to 500 kw were built in the rural areas. We also built 5,812-km. transmission lines of 110 kv and over, as well as 5,840 mva sub-station equipment.

In accordance with the guideline of "safety first," power system operations proved to be more reliable in most utilities as a result of the readjustment and consolidation of technical management. Following the reduction of accidents to some extent in the previous two years, accidents were further reduced by 23.8% in 1980 compared with 1979, and severe accidents were reduced by 21%. Furthermore, improvement work on power plant and power grid facilities continued.

Consumption and Conservation. As a result of the strengthening of technical management and economical dispatch, the main consumption indexes improved in 1980. The share of high-temperature and high-pressure thermal units in total generation increased. The average coal consumption per kwh (calculated on bus bar) for all thermal generating units of 6,000 kw. and above in 1980 was 448 grams, an equivalent savings of 2.9 million tons of raw coal. As a result of the eco-

nomical utilization of water resources in existing hydro power stations, water consumption per kw. in 26 major hydro power stations was reduced in 1980. Consequently, more than 1,600 million kwh of electricity could be generated, equivalent to a savings of 1 million tons of raw coal.

With respect to electric energy conservation, routine activities and some technical measures succeeded in reducing the average rate of house consumption of power stations of 6,000 kw. and above to 6.44% (0.19% in hydro stations, 7.65% in thermal stations) in 1980, and as a result 260 million kwh of electricity were saved. The average rate of line loss was cut to 8.93%, and 770 million kwh of electricity were saved. In addition, 7,000 million kwh of electricity were saved in all sectors of our society. A programme of oil conservation has also made progress.

Power Supply. With an increase of 18,600 million kwh of electricity generation in 1980, and owing to the readjustment of national industrial structure and the implementation of load management (including priority supply to customers of advanced industries), the electric power demands of agriculture, light and textile industries, and residents in cities and towns were basically met. The critical situation of power supply in a number of interior provinces (municipalities) was alleviated, but the power supply in the industrial bases of the coastal regions, such as power grids in Northeast China, Beijing-Tianjin-Tangshan, East China and some other provinces, remained critical. The average value of annual utilization hours of all generating units in 1980 was 5,078 (3,293 for hydro power units, 5,775 for thermal power units). Although a little lower than 1979, the figure was still very high.

Because of the readjustment of the national economy, the structure of power consumption changed somewhat in 1980. An analysis of the share of power consumption in each sector (compared with 1979) shows that energy for agricultural use increased 0.7%, which was the highest among all sectors, while industrial use decreased 0.1% (light industry use increased 0.5%, heavy industry use decreased 0.6%). The share of transportation use remained unchanged, and municipal and residential use increased 0.1%.

Management. In 1980, we also augmented the centralization of power system management and extended the power grids. As a result, we were able to establish the Northwest China Electric Power Administrative Bureau and the North China Electric Power Administrative Bureau. Meanwhile, we experimented on enlarging the decision-making

powers in some operations and construction enterprises, which yielded certain positive results.

Other Achievements. In the field of capital construction, following the re-establishment of both the Hydroelectric Power Construction Administration and the Electric Power Construction Administration in 1979, we opened some survey and design institutes in 1980. As a result, the preliminary work of power industry projects was strengthened to some extent, and progress was speeded up for some projects under construction. Based on the consolidation of engineering management, we initiated a system of total quality control and quota management, which improved the quality of engineering work.

Some scientific research achievements and technical innovations were made in the power industry in 1980. Management and administration were also improved somewhat. Much work was done to ensure the fulfilment of state revenue quotas and to receive sufficient funds for our enterprises, as well as supplying enough materials to both production and construction projects. In addition, work on finance, auditing of assets, and material and inventory management yielded relatively good results.

Some progress has been made in the consolidation of organizations and in personnel training systems. A system of training our cadres and workers has been initiated; on-the-job training programmes for workers and staff have also been established. Training organizations have been set up, and cadres and teachers solely responsible for on-the-job training have been augmented in 21 training schools. Correspondence courses for higher education, television education, on-the-job polytechnic training and general-knowledge courses have been conducted in electric power enterprises. The leading cadres at different levels have been trained, and some two-year programmes of off-job training for young and middle-aged leading cadres have also been conducted. In 1980, 217,000 workers and staff, representing 29.5% of the total, were trained in all enterprises under the Ministry of Power Industry.

The living standard of workers and staff in the power industry has been raised to some degree. In accordance with state stipulations, the wages of about 40% of the workers and staff were increased. Moreover, the bonus system was expanded. In addition to the regular bonus system in each enterprise, rewards were given in utility enterprises for encouraging energy conservation (particularly fuel conservation and reduction of line losses), and in construction enterprises for encouraging the saving of materials, such as steel, cement, wood, etc. In addition, we built many living

quarters for our workers and staff. The total floor space of living quarters now under construction in the power industry is about 3.8 million square metres.

Remaining Problems. Although the power industry made definite progress in 1980, because of power deficits accumulated over many years, problems of serious dislocation between the power industry and the national economy still have not been thoroughly resolved. Moreover, within the power industry, disproportionate relationships between generation, transmission and distribution still exist in varying degrees within each power grid. As for power production and construction, we are facing many problems concerning reliable operation, quality of construction, economic accounting and cost-effectiveness.

III. Trends in Power Industry Development

The power industry is an important part of the energy industry. Whether during the period of readjustment or in the long term, the power industry should make great efforts to increase the power supply capability. At present, the electric power supply cannot meet demands, and therefore the government has attached tremendous importance to the power industry. At a time of further readjustment of our national economy as a whole and reduction of the scale of national capital construction, capital investment in the power industry in 1981 has been somewhat reduced compared with 1980. However, its share in national capital investment, the number of projects and the scope of construction all have increased in comparison with 1980.

Future Goals. In the years to come, the principle of readjustment, restructuring, consolidation and improvement of the national economy should be implemented continually in the power industry. In the readjustment period, in order to generate and supply electric energy reliably and economically, we must first of all consolidate existing generating facilities and power grids, reinforce the management of the power industry and focus on the policy of "safety first." The national plan of power generation should be achieved with high quality and in sufficient quantity as well.

Energy conservation is a long-term policy in our national economy, and it should be strictly implemented in the power industry. We must carry on the load management, encourage the rational use of electric energy by consumers, supply electric power to advanced industrial units with priori-

ty, and further convert oil-fired thermal power units into coal-fired ones.

Water Power Development. Based on the reality of our energy resources, the policy of the power industry in the long run can only be the development of both water power and thermal power according to local conditions in different parts of the country. Although at present thermal power exceeds hydro power in quantity, we must concentrate our efforts on increasing the proportion of hydro power generation to 25%-30% within this century.

Water power resources in our country are abundant: the theoretical potential of waterpower amounts to about 680,000 mw, and the exploitable potential of water totals, 370,000 mw (1.9 X 10⁶ million kwh of annual electricity generation), of which not more than 5% has been exploited in both large and small hydro power stations. In the exploitation of waterpower, we should place emphasis from a long-term point of view on the southwest, south-central and northwest regions. However, some medium-sized hydroelectric power stations should also be built in the east, north and south-central regions.

New Construction. Another strategy of our energy industry will be to expedite the construction of combined coal mining and electric power generation facilities. We shall build a number of thermal power stations in areas such as Shanxi, Inner Mongolia, Shaanxi, Ningxia, Henan and Anhui, where coal deposits are abundant. Meanwhile, we shall also build some load centre and estuary power stations in locations where land and sea transportation is convenient and loads are relatively concentrated.

In order to gain experience, we shall build a few nuclear power stations, initially in the regions where natural energy resources are comparatively scarce. In addition, some geothermal, wind, tidal, solar and bio-gas energy resources shall be utilized according to local conditions.

We must take vigorous measures to develop large-capacity generating units that will be manufactured by our own factories. In view of the vast territory and great dispersive loads of our country, thermal generating units of 200, 300 and 600 mw. capacity will be widely installed.

Power Grids. To bring the advantages of large power grids into full play and to attain optimum economic results, the development of power grids must be based on the practical distribution of loads and energy resources instead of on administrative borders. Modern techniques and advanced technical equipment must be adopted in power

grids to improve the quality of electric energy and to raise the reliability of power system operations. Rural electrification relies mainly upon the supply from power grids. Meanwhile, the development of small hydroelectric and thermal power stations and small power grids is also necessary.

We must fully exploit scientific research and

survey and engineering design, which are of vital importance to the preliminary stages of all construction work in the electric power industry. Environmental protection is also important, and we must strive to take effective measures to prevent power stations from polluting the water and air.

16. CHINA'S CHEMICAL INDUSTRY

By the Research Office,
Ministry of Chemical Industry

China's chemical industry is developing at a relatively fast pace. Before Liberation, the foundation of the chemical industry of China was rather weak. Only eight chemical factories of significant size and some manually operated shops existed in coastal cities such as Shanghai, Nanjing, Tianjin, Qingdao and Dalian. Production of sulphuric acid in 1949 was 40,000 tons, caustic soda 88,000 tons and chemical fertilizer 6,000 tons. Other production consisted of rubber articles and medicinal preparations processed in small volume; organic chemicals were nonexistent.

Since the founding of the People's Republic of China, the chemical industry has made great progress under the leadership of the Communist Party and the government adhering to the policy of independence and self-reliance. The annual average rate of growth of China's chemical industry from 1950 to 1978 was 17.7%, higher than that of industry as a whole. The following table shows the rate of increase of the chemical industry compared with that of all of industry in different periods.

Table 1. Growth Rate of China's Chemical Industry

Year	Rate of increase of all industry (%)	Rate of increase of chemical industry (%)
Recovery Period (1950-52)	34.8	63.6
First 5-Year-Plan Period (1953-57)	18.0	31.2
Second 5-Year-Plan Period (1958-62)	3.8	14.3
Readjustment Period (1963-65)	17.9	23.9
Third 5-Year-Plan Period (1966-70)	11.7	17.3
Fourth 5-Year-Plan Period (1971-75)	9.1	10.4
1953-78	11.2	17.7

From 1952 to 1979, state-owned chemical enterprises (including pharmaceuticals in and prior to 1978) contributed a total amount of profits and taxes equal to 2.5 times capital investments for the same period, thus increasing significantly the accumulation of the state.

Expansion of the Industry. The chemical industry of China has now been placed on a relatively solid foundation. By the end of 1979, the fixed assets owned by state chemical enterprises with independent business accounting amounted to 10.5% of the national total; output value accounted for 12.8% of the whole; and the sum of profits and taxes accounted for 12% of industrial taxes collected by the government. There are many major divisions of the chemical industry, including chemical ores, chemical fertilizers, acids and alkalis, inorganic salts, synthetic rubber, synthetic fibres, synthetic resins and plastics, organic raw materials, pesticides, dyestuffs, coatings, photosensitive substances, rubber products, solvents and additives and catalysts - altogether producing more than 20,000 varieties of products of relatively complete categories. Most main commodity chemicals are produced on a large scale.

Currently there are 5,880 state-owned chemical enterprises with independent business accounting in China, of which 302 are priority enterprises. A rational distribution of the industry is underway. In addition to coastal enterprises, including both newly constructed large-scale plants and old ones that have developed considerably through technical transformation, many new enterprises have been established in the interior; and some chemical factories have been constructed in border regions such as Yunnan, Guizhou, Qinghai, Xinjiang, Ningxia, Inner Mongolia and Tibet.

The output value of the chemical industries in Shanghai, Beijing, Tianjin, Qingdao, Dalian and Shenyang accounts for 30% of the total, and these cities have become major centres of centralized chemical production. The chemical industries in Guangzhou, Nanjing, Chongqing, Changzhou, Wuhan, Xian, Harbin and Taiyuan are also developing at a comparatively rapid pace, with their output value accounting for 10% of the total.

After the completion of large-scale chemical complexes in Jilin, Lanzhou and Taiyuan in the 1950's, more than 10 petrochemical complexes and large-scale fertilizer plants have been built one after another in Yanshan (Beijing), Qilu (Zibo, Shandong), Daqing, Guangzhou, Anqing, Yueyang, Jintang and Luzhou, with their output value accounting for 17.5% of the total.

The number of production and non-production workers and staff in state-owned chemical enterprises has reached a total of 2,800,000.

Research and Education. Scientific research and engineering design institutions, with relatively complete lines of specialties, are being gradually established. Currently there are 180 chemical research units in China, of which 23 research institutes belong directly to the Ministry of Chemical Industry and 8 are operated by large-scale complexes. In addition, 146 research institutes (or laboratories) are maintained by large enterprises. Colleges of chemistry also have their own facilities that conduct research in the fields of organic and inorganic chemistry, petrochemicals, rubber processing, mining of chemical ores and chemical equipment and machinery. There are 17 major chemical engineering design units in China, of which 13 belong to the Ministry of Chemical Industry. Large-scale complexes also have their own design units. Provinces and cities with relatively large numbers of chemical enterprises usually have their own research and design units.

Education for the chemical industry is being developed continuously. There are now 40 chemical colleges and colleges with chemical specialties (five led by the Ministry of Chemical Industry), with 29,000 students enrolled. There are also 34 technical middle schools, 133 technician schools and 1 cadre school.

Characteristics of the Industry

The chemical industry of China, at its present stage of development, is characterized by the following features:

1. The industry is composed mainly of

medium-sized and small enterprises.

For 30 years, the central and local governments have placed much emphasis on chemical production and construction with increasing investment. Local investment, including investment by enterprises themselves, accounted for a considerable part of the capital outlay. State and local investment in the chemical industry during different periods are shown in Table 2.

Practically all local investment and a portion of state investment were for the development of medium-sized and small enterprises. Consequently, these enterprises have experienced comparatively rapid expansion and have become the major forces in the chemical industry.

In 1979, the production of main products by small enterprises, except for a few chemicals such as soda ash and synthetic rubber, accounted for a considerable portion of the total. This was particularly true in the case of chemical fertilizers and synthetic ammonia, more than half of which was manufactured by small enterprises.

2. The amount of chemical products for agriculture, light and textile industries accounted for a large part of total production.

An analysis of the composition of capital investment shows that investment in chemicals for agriculture constituted 57% of the total, that for light and textile industries 20%, and that for other sectors only 23%. The output value of chemicals serving agriculture and light and textile industries in 1978 amounted to 72% of the total value, while in 1979 the value of chemicals for these purposes rose to 77.5%. Gains were especially strong in chemical fertilizers. As the main products support-

Table 2. Investment in China's Chemical Industry

Year	Total Investment	Source of Chemical Investment		State (%)	Local (%)	Chemical Investment of Total Industrial Investment (%)
		State Investment (%)	Local Investment (%)			
1949	220	220	—	100	—	—
Recovery Period	10,210	9,300	870	91.5	8.5	3.2 in 1952
First 5-Year Plan Period	138,900	109,100	29,800	91.4	8.6	4.8
Second 5-Year-Plan Period	529,792	340,500	189,300	77.5	22.5	7.3
Readjustment Period	247,569	222,600	25,000	89.9	10.1	11.4
Third 5-Year-Plan Period	616,288	340,092	276,196	82.6	17.4	11.1
Fourth 5-Year-Plan Period	1,274,376	816,200	458,200	65.5	4.5	12.5
Fifth 5-Year Plan (First 4 Years)	1,236,900	883,400	353,500	69.4	30.6	12.4

ing agricultural production, chemical fertilizers usually occupy a leading position in the development of the chemical industry, with their output increasing year by year. Table 3 shows the yearly production of chemical fertilizers from 1950 to 1979.

Tables 6 and 7 show the production of synthetic materials and some major organic chemicals in different periods.

4. *New breakthroughs in scientific research and design have been made continually.*

Table 3. Annual Output of Chemical Fertilizers

	Total	Large & medium-size	% large & medium-size of total	Small	% Small of total
Type of enterprises:	7,362	328	4.5	7034	95.5
Output value (100 million)	407.1	213.0	53.3	194.1	47.7
<i>Output of main products (10,000 tons):</i>					
Pyrite ore	633.7	334.1	52.7	299.6	47.3
Phosphate ore	851.7	444.0	52.2	407.7	47.8
Sulphuric acid	699.7	388.7	55.6	311.0	44.4
Soda ash	148.5	137.7	92.8	10.8	7.2
Caustic soda	182.5	146.7	80.4	35.8	19.6
Ammonia	1,348.1	619.7	46.0	728.4	54.0
Fertilizers	1,065.3	426.7	40.1	638.6	59.9
Pesticides	53.6	40.0	74.6	13.6	25.4
Plastics	79.3	57.6	72.6	21.7	27.4
Dyestuffs	7.2	3.4	47.0	3.8	53.0
Paint	42.6	9.8	22.9	32.9	77.1
Calcium carbide	140.7	61.7	44.0	79.0	56.0
Synthetic rubber	12.1	12.1	100.0	—	—
Tires	1,168.8	608.0	52.0	560.8	48.0

In addition to engineering plastics for use in industry and agriculture and films for farming use, the plastics industry provided the consumer market with a considerable quantity of plastic sandals, raincoats and articles for daily use. In recent years, the dyestuff industry has annually placed on stream more than 10 varieties of disperse, vat and cation dyestuffs, thus greatly improving the coloration of textile fabrics.

3. *The chemical raw material industry has developed at a comparatively rapid rate.*

The foundation of the chemical raw material industry left by old China was very small, and there was no production of organic chemicals. Practically the entire industry was established and developed after the liberation of China. A comparison of the raw materials industry and the processing industry in different periods is shown in Table 5.

The relative portion of chemical raw material industry in whole chemical industry was increasing year by year. Organic chemicals and the "three synthetic materials" started in the 1960's, and along with the construction of large-scale petrochemical complexes, the speed of development accelerated in the 1970's.

In the middle 1960's, the development of small and medium-sized plants in the nitrogenous fertilizer industry was greatly advanced by the application of the carbonization-synthetic ammonia process for the manufacture of ammonium bicarbonate and the three new catalytic technologies of desulphuration by zinc oxide, low-temperature conversion and methanation, applied to the 50,000-ton/year synthetic ammonia units.

Table 4. Chemical Fertilizer Production

Chemical fertilizers (on 100% basis)		
Year	Output (in 10,000 tons)	% increase over previous year
1950	1.5	—
1965	172.6	—
1976	524.4	—
1977	723.8	38.0
1978	869.3	20.1
1979	1,065.4	22.6

Annual average rate of increase from 1977 to 1979 = 26.87%.

Table 5. Raw Materials and Processing Industries

Year	Raw materials industry (%)	Processing industry (%)
1st Five-Year Plan Period	24.59	75.41
2nd Five-Year Plan Period	19.98	80.02
3-Year Recovery Period	42.81	57.19
1974	49.00	51.00
1975	52.20	47.80
1979	48.70 ¹	51.20
1980	56.40 ²	45.60

¹ Including pharmaceuticals, comparable with previous years.

² Not including pharmaceuticals, not comparable with previous years.

Table 6. Production of Synthetic Materials (in 10,000 tons)

Year	Ethylene	Plastics	Synthetic rubber
1965	0.30	9.70	1.59
1975	6.50	33.00	5.67
1979	43.50	79.30	12.06
% increase in 1979 over 1975	69.2	240.30	212.70
Avg. % increase (1975-79)	60.8	24.5	20.8

Since the production of synthetic ammonia by the 300,000-ton/year units in recent years, eight kinds of new catalysts, which are indispensable to the operation, have been successfully tried, and a considerable portion of spares and components for the ammonia units can now be fabricated domestically.

In other lines of the industry, the following achievements should be mentioned: the dual process for production of soda ash, the manufacturing technology for cis-butadiene rubber, industrialization of the metallic anode-diaphragm process for manufacture of chlor-alkali, preliminary achievement on beneficiation technology for colophane, the heavy water production installation at a certain level of technology, the successful production of various chemicals and materials for missiles and atomic bombs, and the mastering of production technology for colour films by using oil-soluble colour couplers and technicolour. All these achievements testify to the high level of

science and technology reached by the chemical industry of China.

Problems of the Chemical Industry

Although it has made great progress in the past 31 years, the chemical industry of China is still quite behind those of developed countries, and cannot keep pace with the demands of national economic development. Its shortcomings are indicated by the following:

1. *Sectors inside the chemical industry are not well-coordinated and not in proportion to each other.*

The raw material industry and the processing industry still do not relate well to each other. Since the 1970's, major organic chemicals have experienced comparatively rapid progress. However, because of weakness in the foundation, the development is still insufficient and not well-balanced. The exploration, mining and ore dressing of chemical mines are lagging behind; the development of sulphuric acid and alkalis are slow; and the production of basic raw materials, major chemicals, various intermediates, additives, solvents and catalysts are not meeting requirements. All these result in a surplus of processing capacity. Among the different kinds of fertilizers, the ratios of nitrogen, phosphorus and potassium are much out of proportion, and the ratio of phosphorus and potassium to nitrogen even declines year after year.

2. *The structure of products is not rational.* Nitrogenous fertilizer accounts for the largest part of the fertilizer industry. Ordinary and lower-grade products are manufactured in much larger quantities, while fine chemicals, particularly those necessary for the production of high-grade and durable products by the light and textile industries, are not well-developed. These chemicals are few in variety and are being manufactured in small batches at a high price.

3. *There are too many small enterprises, and most of them are not well-organized.*

A great majority of the small enterprises are "small but complete," with high material and energy consumption and low product quality, and thus have relatively poor economic effects. The number of small enterprises accounts for 95.5% of the total, while their profits account for only 13.1%. The labour productivity of the small enterprises is only about half that of the large enterprises.

4. *Insufficient attention has been paid to the*

reconstruction and upgrading of existing enterprises.

More funds have been invested for newly constructed enterprises, whereas little is used for renewal of equipment, technical innovation and improvement of product quality. Furthermore, much remains to be done in pollution treatment, warehousing and residential construction. Because of a deficiency of fuel and raw materials and the unfitness of supplementary construction the productivity of some enterprises cannot be sufficiently utilized, and others are at a relatively low level of production, technology and management.

5. Logistics services, such as scientific research, design and education, were weakened by the 10-year "cultural revolution."

The interrelationship of basic theory study, technical development and applied research is not quite satisfactory. The period between research and application of the results is usually too long. Technical development and applied research are not well-coordinated with each other, thus adversely affecting the application of new products and the upgrading of old ones. In the field of education, not enough attention is given to the training of economic management personnel. The number of technical schools is decreasing to some extent. The ratio of students in secondary technical schools to those in colleges and universities has declined from 3:1 to 1:1. Storage and transportation facilities are also lagging far behind, affecting the turnaround of products and exports.

6. In importing equipment and technology from abroad, more equipment is purchased than patents and technical information, and less importance is attached to the use of the advanced technology introduced.

In 1978, in a case where feasibility studies had not been well-conducted and the provision of raw material and funds not assured, four sets of ethylene plants and four sets of fertilizer plants were imported, without considering the actual financial and material effects on the country.

All these problems testify to the fact that the adjustment of the chemical industry is a rather difficult task. However, it is evident that only through adjustments and reforms can the chemical industry of China be developed to meet the requirements of the national economy.

Achievements of China's Chemical Industry in 1980

In 1980 the chemical industry, while carrying

out the policy of "readjustment, restructuring, consolidation and improvement" raised by the Central Committee of the Communist Party, adjusted its capital construction by halting or delaying some large and medium-sized projects. At the same time, many small enterprises, because of high consumption, low quality and poor sales, were closed, merged or transformed to manufacture other products. For factories located at random with products manufactured in duplication, adequate concentration and redivision of production were effected. The manufacture of products that were in surplus was restricted or changed to others, while the production of those needed by the textile and light industries and the consumer market was increased through rational reorganization.

Applied research work was strengthened in the areas of energy conservation, lowering of raw material consumption, upgrading of product quality and treatment of pollution. The development of new products and the expansion of applications of old products were actively undertaken. Under the guidance of the national plan, market regulation was conducted to further enlarge product sales.

In a number of places, the assignment to each line of the industry of full responsibility for gains and losses and the granting of more power of operation were tried out; and different forms of economically united organizations, such as general factories and specialized corporations, were established. In certain localities, some loosely united, trans-trade organizations were formed. The chemical industry, in the process of adjustment, was advancing steadily, and recorded good results in 1980 both in production and construction.

Production Gains. The output of 19 major products of the chemical industry surpassed the amount specified by the national plan. Gains were especially strong in products serving agriculture, light and textile industries or directly placed on the market. For instance, the production of soda ash, caustic soda and sulphuric acid increased 8.5%, 5.3% and 9.2%, respectively, over the previous year. The volume of fertilizers reached 12.32 million tons, 15.7% more than that of 1979 and the output of ready-sale products, such as paints, rubber shoes and plastics, was also greater than in the previous year.

There are now over 700 varieties of rubber shoes being placed on the market by enterprises of the chemical industry. Plastic flooring and furniture have also been supplied to the market. The figured candles manufactured by the Yanshan General Petro-Chemical Corporation not only increase the pleasant atmosphere of festive occasions

for the Chinese people, but also are being marketed in Hong Kong, Macao and Southeast Asia.

Forty-nine new varieties of medium and high-grade dyes were produced in 1980 alone, which further enriched the colour pattern of fabrics. The production of chemicals needed by the light and textile industries and those made directly for the market in large cities such as Beijing, Tianjin and Shanghai was increasing with comparatively great speed. The production of main chemical products and their rate of increase in 1980 are shown in Table 8.

in 1980 increased 6%, production costs were lowered 0.8%, profits submitted to the government increased 8%, and total labour productivity rose 4.6%. Losses sustained by small enterprises for each ton of ammonia produced was 65 yuan in 1979, and dropped to 10 yuan in 1980. Consequently, the total deficit by small nitrogenous fertilizer plants declined from 410 million yuan in 1979 to 85 million yuan in 1980. An economic profile of the chemical industry in recent years is shown in Table 10.

Exports of chemical products in 1980 were

Table 7. Production of Selected Organic Chemicals (in 10,000 tons)

	1965	1975	1979	% increase in 1979 over 1975	Avg. % increase (1975-79)
Methanol	4.40	13.70	24.7	180	12.4
Acetic acid	2.07	6.69	11.5	172	11.4
Phenol	2.08	4.13	7.0	170	11.2
Pure benzene	11.80	21.20	33.9	159	9.7
Acetone	0.73	2.19	3.2	150	8.5
Naphthalene (technical)	0.53	4.61	6.3	147	8.0
Butanol	1.44	3.19	3.9	122	4.0

Awards. The quality of chemical products has been further improved. In 1980 national gold and silver awards were won by 17 products, including Red Triangle Brand soda ash, Yanshan Brand cis-polybutadiene rubber, Friendship Brand 729 inward-grained rubber for ping-pong bats and Warrior Brand high basketball shoes. A total of 237 products were recognized as being of high quality by the Ministry of Chemical Industry; 39 products, including Double Coin Brand 900-20 automobile tires, Heaven Brand technical sulphuric acid, Ship Brand white alkyd enamel and Panda Brand light rubber shoes, won national gold prizes or silver prizes; and 222 products won certificates for quality issued by the Ministry of Chemical Industry.

Conservation. Energy consumption in the industry decreased by a wide margin. Consumption by priority enterprises in the production of caustic soda, calcium carbide, synthetic ammonia and oil refining decreased 8% in 1980, as compared with 1979, with a total energy saving for the year equivalent to 3.3 million tons of standard coal. Conservation was particularly notable in small enterprises. Table 9 shows energy consumption per ton of synthetic ammonia.

Economic Data. Economic efficiency was improved to some extent. Compared with the previous year, the total value of industrial production

Table 8. Output of Major Chemical Products in 1980 (in 10,000 tons)

Product	Output	% increase (decrease) from previous year
Pyrite	578.3	- 8.7
Phosphate rock	1,072.6	25.9
Sulphuric acid (100%)	764.2	9.2
Concen. nitric acid (100%)	22.8	-19.1

% deficit decrease compared with previous year			35.16	29.66	79.50

Development Trends

According to the demands of the national economic readjustment, for a period of time the development of the chemical industry will focus on the needs for clothing, food, shelter, transportation and daily necessities. Emphasis will also be placed on the provision of raw materials and chemicals needed by the light, textile, electronics and construction industries, and on production of chemical fertilizers and pesticides for agricultural use. At the same time, some chemical end-products will be provided directly to the market, supplying the daily living requirements of 800 million peasants and the urban population. Thus, improvement of product structure, reorganization of lines of industry and reconstruction of existing enterprises should be carried out step by step, so that the chemical industry can progress continuously and steadily.

1. In accordance with the demands of national economic development, we should readjust the proportional relationships of various sectors within the chemical industry.

We should further readjust the ratio between the raw material industry and the processing industry by giving top priority to the production of raw materials and chemicals. We should increase the output of basic chemicals, such as acids and alkalis and major organic chemicals, and accordingly develop the production of various intermediates, additives, solvents and catalysts; in this way the relation between the "bone" and the "flesh" can exist in a much more normal and harmonious way.

We should devote major efforts to the production of phosphate fertilizers, study and develop potassium resources, expand the production of complex fertilizers, and increase the output of trace element fertilizers. Thus, the disproportionate relation among nitrogen, phosphorus and potassium fertilizers can be corrected gradually. We

should develop the petrochemical industry and increase the output of organic chemicals according to our own conditions. At the same time, we should strengthen technical logistics in the course of the readjustment to make it suit the development of production and construction.

2. We should gradually change the structure of products.

There should be substantial development of chemicals necessary for the production of the light, textile, electronics and construction industries, especially synthetic materials, such as plastics and chemical fibres. We should make every effort to increase the production of ready-sale, high-grade products, such as high-grade dyestuffs, synthetic paints, additives and other fine chemicals. Efforts should be made to have a considerable part of the main chemicals used in production of ready-sale, durable consumer goods supplied domestically in the not too distant future.

There is also the problem of readjustment con-

cerning the constitution of varieties for each line of industry. For instance, readjustment of the pesticide industry seeks primarily to increase new varieties and formulations of highly effective pesticides with low toxicity, to develop adequately some fungicides and herbicides, and to guide their application for best results. The chemical enterprises could manufacture some end-products to be placed directly on the market, and could also provide light industrial enterprises with processing technology and guidance in application.

3. We should reorganize the lines of industry and carry out overall planning by trade, step by step according to schedule.

In compliance with the principle of specialized coordination and economic rationality, general factories or corporations are to be established by regions of dispersely located enterprises producing the same category of products. The production of raw materials is to be centralized, while the processing plants could be more or less dispersed. Trans-trade or trans-region unions could also be formed where conditions permit. In that case, the first step is to form a loosely coordinated organization, laying emphasis on the coordination, directing, servicing and consulting. The large-scale complexes should continue to apply comprehensive management more efficiently. Effective policies are to be formulated to control the uncontrolled growth of small enterprises.

4. Full use should be made of existing enterprises, and the levels of production, technology and management should be raised.

In the reconstruction of old enterprises, emphasis is to be placed on energy conservation, treatment of pollution and environmental pro-

tection. Through renewal of equipment and technical renovation, production could be continuously increased, the quality of products upgraded, new varieties of products developed and accumulation increased. Investment in the chemical industry will hereafter be focused on innovation, reconstruction and tapping the production potential of old enterprises.

5. Developing the task of scientific research and education.

In the next few years, we should continue to strengthen the work of scientific research. Emphasis is to be placed on research and development of new products and reconstruction of old enterprises. Units of scientific research and production should be organized in closer cooperation, through contract or other form; some can even be united economically. In the field of education, aside from improving higher education, emphasis will be placed on the development of secondary technical schools and technician schools. Economic management specialties will be established in some colleges and secondary technical schools to train management personnel.

6. Exerting more effort on international exchange.

The approach to importing foreign equipment and technology will be shifted away from complete sets of equipment into individual machines and technical know-how and patents where conditions permit. Technical exchange and technical cooperation should be positively developed. Furthermore, it is important to understand international market conditions so that the export of chemical products can increase step by step.

17. CHINA'S FIRST MACHINE-BUILDING INDUSTRY

By Yan Qiushi

*Policy Research Office,
First Ministry of Machine-Building*

As an important equipment supply sector of the national economy, the industry under the First Ministry of Machine-Building has played an essential role in socialist construction since the founding of the People's Republic.

Without any foundation to speak of, the machinery industry of old China was dispersed throughout several coastal cities, such as Shanghai, Tianjin, Shenyang and Dalian, where a number of small and medium-sized machine shops were engaged in the manufacture and repair of such simple machines as small motors and belt-drive machine tools, using primitive methods and equipment. It was on this dilapidated foundation left over from semi-feudal and semi-colonial China that we started to construct a new machine-building industry.

Since the birth of People's Republic, steps have been taken — in accordance with the policy of self-reliance and hard struggle — to develop a sizeable machine-building industry composed of nearly 100 branches, including machine-tools, power generators, metallurgical plants, mining equipment, general machinery, autos and bearings.

Achievement of the Industry

This new machine-building industry now yields some 26,000 types of products. Its annual output value in 1980 was more than 50 times that of 1952. Under the management of the Ministry, the industry, in the course of the past 30 years, has furnished a large amount of machinery (including complete sets of technologically advanced plants) to more than 3,000 large or medium-sized industrial projects in the country.

Notable Examples. A few outstanding examples are the complete plant for an iron and steel combine with an annual capacity of 1.5 million tons of steel, which has been running smoothly since its completion; a 30,000-ton die-forging press; a 2,800-mm. aluminium-plate rolling mill; a 12,500-ton aluminium extruder; and a railroad wheel and tire rolling mill — all of which have proved satisfactory in their operation.

Other examples are the complete plant for a 2.5 million-ton-per-year colliery shaft and a 3 million-ton-per-year washery; a complete set of drilling, pumping, storing and transferring equip-

ment for oil fields; a 2.5 million-ton-per-year crude refinery; 100-, 125-, and 200 mw. steam power plants; a 225 mw. mixed flow hydroturbine; and 330 kv. power transmission equipment. A 170 mw. Kaplan hydroturbine has been produced on a trial basis.

For the development of our chemical industry, the machine-building industry has successfully produced a complete 300,000 ton-per-year synthetic ammonia plant and a 240,000 ton-per-year urea plant. Both plants are turning out satisfactory products in Shanghai's Wujin Chemical Factory.

In addition to this heavy equipment, our machine-building industry has also produced much state-of-the-art equipment, including some 110 kinds of high-precision machine tools. Examples include the T42200 jig-borer with raster-measurement and digital display manufactured by the Kunming Machine Tools Factory, which has a 2m. X 3m.-long worker table and a positioning accuracy up to 0.01 mm., and the S7450 and the SG7432 thread grinders made by the Shanghai Machine Tools Factory, which can work, respectively, on 5m.-long or 0-class leadscrews.

An outstanding achievement for the machine-building industry was gained by the No. 2 Motor Factory, in which most of the operating equipment for machining, including several dozens of transfer lines and numerous highly efficient specialized machine tools, is made in China.

Exports. In the course of its development, the industry has exported 137 kinds of products to 97 countries and regions. These have included machine tools, metal-forming equipment, refrigeration plants, electric motors, bearings, measuring tools and cutters. Moreover, we have undertaken the construction of more than 50 projects for foreign countries as part of technical or economic aid programme of China. These have included a heavy machinery complex, cable factories, bearing factories and fastener factories.

Shortcomings. In spite of its many achievements, much remains to be improved in the structure of the industry and the First Ministry of Machine-Building. This is reflected in the lack or short supply of certain equipment needed by agriculture, as well as our light and textile industries and the service sectors for equipment renewal in the facilities of the various branches of the

national economy.

This shortcoming is partly due to the lapse in technological progress during a certain period and the lagging of research and development, and partly due to the lack of an effective management system. What we need is better-organized specialization in production.

Progress in 1980

However, as a result of implementing the policy of "readjustment, restructuring, consolidation and improvement," the industry under the First Ministry of Machine-Building made considerable progress in 1980.

First of all, we have improved, to a certain extent, the structure of the industry so that it is now more correctly oriented and in a better position to meet not only the needs of heavy industry but also of the light and textile industries, urban construction, equipment replacement in existing factories, the export trade and the people's demand for consumer goods.

By 1980, our industry had supplied 93 kinds of light industry equipment or durable consumer goods, with their output value three times that of 1979. This included equipment used in the plastic knitting, jute carding, shoe making, animal slaughter and herb-medicine processing industries. Much specialized equipment and automated processing lines have also been provided for the bicycle, motorcycle, sewing machine and watch-making industries to facilitate their technical renovation.

Due to the expanding scope of service, the industry attained an output value in 1980 approximately equal to that of 1979, in spite of the decrease in capital investment under the economic readjustment. The volume of exports of machinery products in 1980, however, registered an increase of 60.6% over the preceding year. The output of major machine products in 1980 was as follows:

Machine tools	134,000 sets
Forging equipment	48,000 sets
Power generation plants	4,193 mw.
AC motors	25,700 mw.
Automobiles	222,000 units
Bearings	227,550,000 sets

Ten Positive Trends. Pursuant to the reform in management systems and the adoption of market regulation as a complement to the planned economy, many of our industrial enterprises have gained fresh motivation and have begun to show new signs of progress. These may be summed up in the following 10 points.

1. Industrial enterprises are shifting away from serving mainly heavy industry to actively catering to the needs of agriculture, the light and textile industries, people's daily consumption, urban construction and the export trade.

2. They are turning from meeting chiefly the demands of capital construction to actively satisfying the demands of technical renovation of the various branches of the national economy.

3. They are turning gradually from production merely for the fulfilment of high production targets to production for satisfying the demands of the users.

4. They are turning from placing more emphasis on quantity than on quality to trying to win in competition through improving quality.

5. They are turning from producing limited specific types of products to extending their range to achieve much greater variety.

6. They are turning from supplying mainly the principal equipment to providing complete plants, spare parts and accessories.

7. They are turning from placing more emphasis on production to actively undertaking services such as equipment maintenance, installation, adjustment and personnel training.

8. They are turning from a relative negligence of economic results to intensive economic accounting and raising economic benefits.

9. They are turning from subjecting contracts to pre-set production plans and producing in disregard of demand to arranging their production according to the users' demands on the basis of optimum profitability.

10. They are turning from placing emphasis only on domestic markets to also penetrating into foreign markets and seeking to expand exports.

These favourable developments indicate a gradual improvement in our economic management and operation.

Integration. In the meantime, steps have been taken by our industrial enterprises to increase the production of certain badly needed items by pooling their efforts. Such joint efforts have brought about progress in the specialization of production among different enterprises. On the basis of mutual benefit, such integration of enterprises takes various forms, according to existing

circumstances. There is integration in the manufacture, sales or export, product development and the providing of complete plants through joint efforts.

Many associations, formed for the purpose of meeting the demand of a product which is in short supply on the market, have achieved favourable results in the quality, variety, cost-reduction and growth of production through tapping the potential resources of existing enterprises and organizing specialized production.

The Ningbo Water Meter Works played an active role in organizing an association involving 19 factories, each of which is charged with the mass production of certain special parts. Their output and turnover have doubled for three consecutive years.

Meanwhile, the First Ministry of Machine-Building has undertaken to develop, step by step, the industrial integration of the casting, forging, heat-treating and electric-plating processes in 33 industrial cities, with a view to saving energy, protecting the environment and improving productivity.

Quality Gains. The improvement of enterprise management has resulted in higher quality and economic gains. Some enterprises have now moved ahead from merely being concerned with the proportion of sub-quality products to trying to upgrade quality standards and earn a good reputation for their products. Some have advanced their quality control systems from merely final inspection and rejection to stressing quality control in every step of the operation, from design, manufacture, examination, sale, and service to market research.

Some enterprises have gone forward gradually from paying attention only to the physical accuracy of a product to improving the intrinsic quality — namely, the accuracy, durability, service life and reliability — of a product. Still others have changed their quality standards from factory inspection requirements to meeting the users' own requirements.

Evidence of such improvement in quality are the 1,756 production groups and 162 kinds of products that won the "Reliable Quality" awards of 1980. The most outstanding 29 items to win the State Quality Awards include the T42100 double-column jig-borer produced by the Kunming Machine Tools Factory, the Z3040x16 radial drilling machine produced by the Shashi No. 1 Machine Tools Factory and the Sino-Czechoslovak

People's Friendship Factory, the "Shanchuan" 3BA, 4BA and 6BA single-stage centrifugal pumps produced by the Boshan Pump Factory, the 12,500 ton horizontal non-ferrous metal extruder produced by the Shenyang Heavy Machinery Factory, the "Yunfeng" 100 mw. hydropower generator produced by the Harbin Electric Generator Factory, the "Leidian" 4114 auto engine spark plug produced by the Nanjing Porcelain Insulator Factory, the "Diamond" 400 mm. AC desk fan produced by the Guangzhou Far Eastern Electric Fan Factory and the "Shield" ½-inch and 5/8-inch roller chains produced by the Hangzhou Chain Factory.

New Products. Another achievement of the industry under the First Ministry of Machine-Building in 1980 was attained in the development of new products, processes and techniques. This is reflected in the fruition of some 600 research projects and the development of 937 new products.

Twenty-four items are considered to have reached a high level of technology. Among them are the double-cone seal for 2m. and 3m. diameter high-pressure containers, the model study of low- and high-pressure centrifugal fans, the 150 mm. band reduce-rolling mill, the trackless underground mining machinery powered by an internal combustion engine, the brushless revolving transformer, the silicon-controlled hand-operated arc welder and the Y-series three-phase asynchronous meters.

In addition to these 24 advanced items, we have achieved 131 research projects that reached the higher level set by our national standards and 50 other projects that pioneered new fields in our domestic production.

Additionally, progress also has been made in the design and production of a number of new products to serve the purposes of energy conservation and environmental protection. Included in this category are some 18 different kinds of waste-heat boilers in 12 series, as well as many different types of air-purification, sewage or acid-gas disposal and dust-removal equipment that have proved satisfactory to their users.

With the readjustment of the national economy as the central pivot of our work, we shall concentrate on the restructuring and reorganization of the machine-building industry and the reform of our industrial enterprises, in order to raise the industry under the First Ministry of Machine-Building to a new and higher level.

18. CHINA'S SHIPBUILDING INDUSTRY

By Hong Lun

*Policy Research Office,
Sixth Ministry of Machine-Building*

China's centuries-old shipbuilding industry once was one of the most advanced in the world. But the industry developed very slowly because of the long-term bondage under imperialism, feudalism and bureaucrat-capitalism. In the period before Liberation in 1949, only ship-repairing could be done. Even if ships were built, all material and equipment had to be brought from abroad. There was no capability for manufacturing marine equipment and for scientific research and design. The Chinese shipbuilding industry lagged further and further behind those of the developed countries. On the eve of Liberation, most of the shipyards were destroyed and production came to a standstill.

Development of the Modern Industry

Since the foundation of New China under the leadership of the Communist Party and the People's Government, however, the industry has developed rapidly, becoming a multiple industry. Today it not only builds ships but also produces diesel engines, marine auxiliary machinery and instruments, and has played an important role in the buildup of the national economy and national defence.

Since Liberation, the shipbuilding industry has gone through a transformation from ship-repairing to shipbuilding, from transfer and copying to self-design and self-manufacture and from small shipbuilding to the building of warships, oceangoing merchant ships and various kinds of engineering vessels.

Government Steps. At the beginning of Liberation, the People's Government confiscated the shipbuilding enterprises owned by the bureaucrat-prador capitalists and took over some shipyards owned by foreign capitalists. The government also turned some privately owned factories into state-private owned enterprises. At the start of the Five-Year Plan, the state reconstructed and expanded the major ship-repairing yards in Shanghai, Guangzhou, Dalian, Wuhan and Tianjin, gradually turning them into shipbuilding bases. Dozens of small and medium-sized shipyards were built and expanded in the main water transportation and fishing areas, resulting in the development of capacities for building river boats and small and medium-sized coastal ships. At the same

time, one shipyard after another introduced an important innovation — welding in hull construction in place of riveting.

During this period the state proceeded to establish ship research and design organizations (the first was the Ship Design Institute) and began building several kinds of warships, as well as 10,000-dwt-class oceangoing cargo vessel on the basis of foreign designs, foreign materials and foreign equipment. In 1958 the 10,000-ton vessel *Dongfeng* was designed and built with domestic material and equipment.

In the 1960's, the industry's scientific research capacity was strengthened and a fairly comprehensive ship research and design system, with the ability to design various types of vessels, was established. At the same time, priority was given to the building of marine equipment facilities, such as diesel engine works and navigational instrument factories. As a result, the production of marine equipment was increased to suit the shipbuilding capability. Since then, the shipbuilding industry has been developing continuously.

Ministry Operations. At present, China's shipbuilding industry is managed by the Sixth Ministry of Machine-Building, the Ministry of Communication and the State Administration of Aquatic Products, as well as by the provinces, municipalities and autonomous regions concerned.

The Sixth Ministry of Machine-Building operates more than 100 enterprises and institutions, with more than 70 building berths, including 10 berths for vessels over 10,000 tons, and 9 dry docks, including 3 docks for vessels over 10,000 tons. Major shipyards are located in Jiangnan, Dalian, Hudong, Guangzhou, Zhonghua and Wuchang. The Henan Diesel Engine Works, Shaanxi Diesel Engine Works, Wuhan Marine Machinery Works, Wuhan Forging Works, Hanguang Machinery Plant and Nanjing Marine Auxiliaries Plant are major factories among the marine diesel engine works, auxiliary machinery works and instrument plants.

The Sixth Ministry of Machine-Building manages a certain number of shipbuilding, marine equipment research and design organizations. Among them are the Marine Design and Research Institute of China, which has strong ship design capabilities; the China Ship Science Research Centre, China's largest ship performance research

organization; and various research institutes specializing in marine diesel engines, auxiliaries, electrical equipment and materials. The Ministry also runs the Shanghai Shipbuilding Technology Research Institute, which is a pioneer in the development of new shipbuilding technology; the Jiujiang Precision Instrument Technology Research Institute, which deals mainly with design for high-accuracy and sophisticated technological equipment and elements; and the Shanghai Shipbuilding Engineering Design Institute, which is engaged in design for factories. In addition, the Sixth Ministry of Machine-Building operates three institutions of higher learning, the Shanghai Jiaotong University, the Harbin Shipbuilding and Engineering Institute and the Zhenjiang Shipbuilding Institute, as well as two secondary technical schools. Shipbuilding departments are also maintained in some of the universities.

By the end of 1980, with the coordination of different sectors of the national economy, the Sixth Ministry of Machine-Building had built 14,700 vessels of 500 different types. These include large and medium-sized merchant vessels, such as 50,000-dwt tankers, 25,000-dwt bulk carriers, 24,000-dwt tankers, 15,000-dwt tankers, 16,000-dwt coal-ore carriers, 13,000-dwt cargo ships and 7,500-dwt passenger-cargo ships, as well as various engineering vessels for special purposes, such as oceangoing instrumentation ships, oceanographic research ships, large dredgers, powerful tugboats and self-elevating drilling rigs. The Ministry also had submitted various types of warships and auxiliary ships to the People's Navy. In addition to marine products, the Ministry also manufactured non-marine products; the first set of 12,000 T hydraulic presses in China was made by the Jiangnan Shipyard in 1958.

In 1980 various enterprises controlled by the Sixth Ministry of Machine-Building fulfilled the State Plan. Total output value increased by 20% and commodity value by 18%; the actual profit exceeded the target set in the state plan by 65%. More than 1,800 vessels, with a total tonnage of 484,000, were built during this time.

Rocket Tests. In May 1980, when China carried out long-range carrier rocket tests in the Pacific Ocean, an oceangoing fleet was assembled, consisting of multi-purpose instrumentation vessels, oceanographic research ships, salvage vessels, oil-water supply ships, oceangoing tugboats and escorts. All of these vessels were developed, designed and built by China. The fleet fulfilled triumphantly the tasks of survey, salvage and escort, and its performance demonstrated a new level of the Chinese shipbuilding industry in the scientific and technical field.

Achievements in 1980

The Sixth Ministry of Machine-Building and its affiliated factories and departments conscientiously carried out the policy of readjustment, restructuring, consolidation and improvement in 1980, achieving the following successes:

1. Readjusting service orientation; rationalizing production structure.

The ministry readjusted its service orientation and production structure according to demands in domestic and foreign markets. It made great efforts in expanding the scope of business and provided more services for users. Production capacity for merchant ships was increased, while the production plan of military products was fulfilled; products were manufactured not only for domestic markets, but for foreign markets. Besides ships, consumer goods and other non-marine equipment were also produced; statistics gathered from marine equipment manufacturers show that in 1980 the output value of non-marine products amounted to 32% of their total output value. Expansion in the production capacity of offshore oil exploitation equipment (drilling and production platforms) is a new facet in the development of China's shipbuilding industry.

2. Reforming the financial system; implementing the policy of allowing the enterprises concerned to keep the remaining profits after delivering taxes and a predetermined amount of profit to the state.

This is a fairly important reformation. The new policy adopted in 1980 replaced the planned profit system previously used in the shipbuilding industry. In line with the new policy, the Ministry allowed most of its affiliated enterprises to practice the new measure and worked out means to allow the other enterprises to earn more profits. Thus all enterprises were able to reap more economic benefits so long as they overfulfilled their profit quotas, thereby encouraging them to increase their production.

In order to raise their profits, all enterprises have geared their products to the needs of the market, expanded their business scope, increased production, cut down expenses and practiced economy for better financial results. Although the Ministry did not obtain enough production tasks for the factories from the state in 1980, the total amount of profits earned by its enterprises, nevertheless, exceeded that of the previous year by a considerable margin and set a new historical record. In this the new policy played an important role.

3. Readjusting investment ratio; sorting out capital construction projects.

The focus in investment has shifted from construction of new factories to technical transformation of existing factories, scientific research and education. The amount of investment for these projects has gone up. While the shipbuilding industry obtained less investment from the state, the priorities for using the investment have been given to the construction of a 100,000-dwt building berth in the Dalian Shipyard and reconstruction of a 50,000-dwt dock in the Jiangnan Shipyard, in order to increase their capacity for 50,000-100,000-dwt class ships. In the field of scientific research, advance work has been strengthened; expenditures for advanced applied research and basic theory research reached at least 30% of total expenditures.

4. Proceeding to reform the management system.

Under the guidance of instructions issued by the State Council, eight factories in the Shanghai area have been chosen as experimental units. They are gradually being given more power of self-management and are being freed from the limitations of the system of unified management with its over-concentration of power. This has further stimulated the initiative of the enterprises, as well as workers and staff. Furthermore, the Guangdong Shipbuilding Corporation and the Shanghai Marine Power Station Equipment Corporation were founded in 1980 on the principle of economic integration.

5. Further strengthening foundational work in various aspects; improving business management and upgrading technical levels.

Several business management training courses, mainly for leading cadres in charge of factories, were conducted for the purpose of raising management competence. More attention was paid to the education and training of workers and staff at their posts. A training programme for all people on the job was unfolded. About 80,000 people - 30% of all employees in the industry - studied in short-term training courses, part-time and television universities, etc. Nearly 50,000 people participated in the basic study of total quality control, which has continued to be popularized in the industry and has improved the management of factories and the quality of products.

National quality awards, three gold and nine silver, were given to 12 kinds of products, including a small ship propeller and underway oil and water transfer system of the Dalian Shipyard and an oceangoing instrumentation ship of the Jiangnan Shipyard. A quality-control group for a

cast-steel anchor chain in the Dalian Shipyard won the honour of national high quality group. Because of total quality control, the elongation percentage of anchor chain made by this group increased from 14% to 22% or better, and has been brought up to international standards.

6. In 1980 the Sixth Ministry of Machine-Building made great strides in adapting to foreign market demands, and as a result achieved a breakthrough in ship exports.

This development has promoted readjustment of the shipbuilding industry, given great impetus to its growth and is of considerable significance in the history of New China's shipbuilding industry. In the past, products manufactured by the Chinese shipbuilding industry were mainly for domestic users. Not until 1977 did the industry export its first vessel, a 3,700 dwt freighter. Since then, China has received additional export orders.

Functions of the CCSI

In order to develop ship exports, the state restructured the import/export management system for the shipbuilding industry. The China Corporation of Shipbuilding Industry (CCSI) was founded in 1978. In March 1980, the government approved the corporation as an independent import/export corporate body integrating industry and trading. It has been allowed to negotiate and sign contracts directly with foreign companies.

Range of Activities. The business lines of the new corporation are as follows: export of various vessels and offshore oil exploitation equipment; repair of various ships; export and import of marine engines and equipment; introduction of advanced technology, licence trade, joint design, cooperative production, compensation trade, processing or assembling of given materials or parts, and joint ventures; hydrodynamics and structural mechanics research and test service; ship design and consultant service; shipyard, marine engine works and instrument factory design and consultant service; acting as an agency or jointly running maintenance and service stations for foreign marine engines and equipment of all kinds and other non-marine products.

In addition, the corporation also offers qualified technical personnel and a skilled labour force for research, design and construction of ships. The factories and research institutes affiliated with CCSI may also negotiate and sign agreements directly or indirectly with foreign companies for

product export and repair service. CCSI has branches and offices in Shanghai, Guangzhou, Wuhan, Jiujiang and Shenzhen for export business.

The China Corporation of Shipbuilding Industry has been making every effort to meet the requirements in foreign trade, with quality products. It has the ability to meet contract delivery dates, equip ships with marine machinery up to international standards and provide technical services. CCSI's policies in dealing with overseas companies are highly flexible, allowing shipowners to select equipment commonly used throughout the world and to choose Classification Societies for their ships. By the end of 1980, the Shipping Register Bureau of the People's Republic of China had signed technical cooperation agreements with 11 foreign Classification Societies, from France, Britain, West Germany, Italy, Norway, Japan, Romania, Yugoslavia, Poland, the Democratic Republic of Korea and the USSR. Both sides may mutually act as an agency for ship inspection.

To broaden mutual understanding, CCSI participated in the maritime exhibition "Expo-Ship Far East 80," held in Hongkong in November and organized by the Seatrade Publication (Far East) Ltd of England. This was the first international non-governmental trading exhibition in which CCSI participated. Visitors from all over the world expressed great interest in China's exhibits.

Integration. Integrating industry with trading is one of the major reforms in the shipbuilding industry. Under the integration system, industrial organizations engage in import and export trade, and manufacturers may enter into direct contact with clients, thus reducing the role of the middle man. They take responsibility both for the technical and economic aspects of their trade, so that the new system brings into play the initiative of the industrial departments and enterprises.

CCSI has made rapid strides in business since dealing directly in foreign trade. In May 1980 the corporation concluded a contract with the Regent Shipping Company of Hong Kong for a 27,000-dwt bulk carrier. By the end of the year, total tonnage of export orders received by CCSI reached more than 300,000 tons, including 27,000-dwt and 36,000-dwt bulk carriers and numerous barges. The corporation is expecting to export more vessels, especially drilling rigs, pleasure boats and various kinds of small and medium-sized ships of up to 5,000 dwt, such as cargo vessels, perishable-goods ships, lumber carriers, etc. CCSI also has signed contracts on assembly work using the buyer's materials or on compensation trade for containers, deck cranes, cement spreaders for highway-building, radios and cassette tape recorders. In one of these agree-

ments, a container plant was built within 14 months as a subsidiary of the Guangzhou Shipyard, and went into operation in September 1980. The containers made in this plant have met the requirements of Bureau Veritas of France.

Licensing Agreements. In the light of demands of foreign markets, CCSI has upgraded the industry in a short time. Eight well-known licences were purchased in 1980 — including those for B&W heavy-duty, low-speed marine diesel engines, deck cranes, hatch covers, marine diesel generating sets and hydraulic deck machinery — from Denmark, West Germany, Japan and other nations. With the 4 licences acquired previously, the corporation now has a total of 12 foreign licences. Several kinds of prototype machines have been turned out under licence.

CCSI also has signed three agreements with foreign companies for technical transformation of shipyards and engine works. Furthermore, several factories have established technical cooperation relations or friendly enterprise relations with overseas enterprises, enabling them to utilize their partner's advanced technology and management techniques to implement the reformation of their production management system as well as technical transformation.

Problems and Prospects

Tremendous progress has been made in China's shipbuilding industry over the past 31 years. However, the following problems remains to be solved: the organization lacks inter-departmental coordination; the industry is still behind advanced countries in management systems; technical exchange with foreign countries is not widespread enough; and some marine equipment made in China has not been up to international standards. All of these have to be resolved in the course of the readjustment of the national economy and the shipbuilding industry.

China is a vast country with 18,000 km. of coastline and 108,000 km. of inland waterways, and it has many deepwater and ice-free harbours. The shipbuilding industry has benefited from these favourable natural conditions. In recent years China's shipbuilding industry has laid a fairly strong foundation, developed international contacts and made a good beginning in ship exporting. It certainly can be expected that China's shipbuilding industry will make important contributions to national defence, communications and transportation, exports, oceanographic exploitation, agriculture and consumer goods production in the course of further readjustment of the national economy.

19. CHINA'S AGRICULTURAL MACHINERY INDUSTRY AND AGRICULTURAL MECHANIZATION

By Long Jiyan

Ministry of Agricultural Machinery

China is a nation with a population of about one thousand million people, of which eight hundred million are peasants. It has a vast expanse of territory and wide differences in natural conditions and economic development. In such a country, therefore, it is an arduous task to carry out agricultural mechanization, to replace manual labour with power farming and increase the output of agricultural production by raising both land and labour productivity, to gradually change the backwardness of China's rural areas and to lift the peasants out of the poverty which they have endured for thousands of years. Agricultural mechanization, however, is of vital importance to the development of the entire national economy of China.

Since the establishment of New China, our government has paid great attention to the development of the agricultural machinery industry and agricultural mechanization, and has put forward a series of guiding principles, policies and specific measures. Despite errors and setbacks during the course of development, China has made, nevertheless, great progress in the agricultural machinery industry and attained brilliant achievements in agricultural mechanization. For most sections of China, agricultural machinery now has become an indispensable element in agricultural production and rural economic life. By summing up both the positive and negative experiences in the development of the agricultural machinery industry and agricultural mechanization in the past 30 years, we will undoubtedly break a new path to farm mechanization that accords with the realities of China.

I. Growth of the Industry and Mechanization

The development of China's agricultural machinery industry and agricultural mechanization began only after the establishment of New China. Before 1949, there was hardly any substantial industry in China, to say nothing of an agricultural machinery industry. All that could be produced for farm use at that time were traditional hand tools, such as hoes and sickles, which the peasants had been using for a thousand years in agricultural production. On the eve of Liberation, the country had only 300 to 400 tractors and a limited number

of irrigation and drainage units that had been imported from abroad at different times.

Early Developments. After the founding of New China, as part of the restoration and development of the national economy, animal-drawn implements such as improved ploughs, portable steam engines and horse-drawn harvesters, began to make their appearance to meet the urgent needs in agriculture. In 1953 we started the preparatory work for the construction of the Luoyang No. 1 Tractor Plant, the largest tractor manufacturer in China. By 1957, after the fulfilment of the First Five-Year Plan, the number of animal-drawn implements introduced into China's rural areas amounted to over 4.6 million.

During that period, 352 tractor stations and 710 state farms were set up. Tractors in use approximated 25,000 standard units (one standard unit = 15 drawbar hp). The area of power-cultivated land amounted to 39 million *mu*, about 2.2% of all land under cultivation. The combined capacity of irrigation and drainage equipment was 560,000 hp, and the area under mechanical irrigation amounted to 18 million *mu*, accounting for about 1% of the total cultivated area.

In 1959, the Luoyang No. 1 Tractor Plant was completed and went into production, thus beginning the mass production of tractors in China. Around that time a number of manufacturers of combines, diesel engines and some other attached implements were built up or rebuilt. In the same year, a new government department — the Ministry of Agricultural Machinery — was established to administer the work of the agricultural machinery industry and agricultural mechanization in China. Since then, China has been capable of producing not only animal-drawn, semi-mechanized implements but also tractors, diesel engines, and their accessories in quantity.

In the meantime, relevant research work on farm machinery began to develop. By the end of 1961, three national research institutes of agricultural machinery — the Chinese Academy of Agricultural Mechanization Science, the Luoyang Tractor Research Institute and the Shanghai Research Institute of Internal Combustion Engines — and a large number of research centres of provinces, prefectures and counties were established. As a result, China came to have its own ranks of research workers in agricultural machinery engineering science.

The State of the Industry in 1979. By 1979 the agricultural machinery industry and agricultural mechanization in China had developed to a considerable degree. The total output value of the agricultural machinery manufacturing industry amounted to 10,910 million yuan, 161 times that of 1952. By the end of 1979, China had more than 1,900 agricultural machinery factories above the county level and 2,400 county manufacturing and repair factories, with 189,000 machines for metal-cutting and 24,000 machines for forging and pressing, and a total number of workers and staff of 1.45 million.

China is now able to mass-produce 75-hp and 100-hp crawler tractors and bulldozers; engines ranging from 0.5-hp petrol engines to 10,000-hp diesel engines (for ships), as well as a variety of internal combustion engine electric generating sets below 500 kw.; various wheel tractors ranging from 20 to 55 hp suitable for both paddy fields and dry land; self-propelled or trailed grain combines and head-feed rice combines; irrigation and drainage equipment, including deep well pumps, electro-submersible pumps and large-sized automatically adjusted axial flow pumps with diameters of 1.6 m., 2.8 m., 3.1 m. and 4 m.; sprinkling equipment, including large-sized centre pivot sprinklers; various types of power-driven rice transplanters, boat tractors and rice windrowers; and other agricultural machinery and implements. In short, China can now basically produce by itself all the kinds of agricultural machinery it needs.

In addition, the county farm machine manufacturing and repair factories possess 73,500 metal-cutting machines, 11,600 forging and pressing machines and 15,700 sets of repairing and testing equipment. In 1979, they repaired 217,800 large and medium-sized tractors, 362,900 small-sized tractors and 483,000 internal combustion engines.

Technical Achievements. China has trained a contingent of relatively proficient research workers and engineers of agricultural machinery. By the end of 1979, trained personnel numbered over 100,000; they were able to design and construct various types of agricultural machine-making and assembling factories on different levels and to provide them with complete equipment. They could also develop all kinds of agricultural machinery to suit for the specific features of China's agricultural production and natural conditions.

China has also made appreciable progress in higher education for the field of agricultural machinery. By 1979 there were 11 colleges of agricultural machinery and a number of agri-

cultural machinery departments set up in agricultural or engineering colleges, with a total enrolment of 23,000. The teaching staff of the seven agricultural machinery colleges directly under the leadership of the Ministry of Agricultural Machinery numbered 3,400, including 180 professors and associate professors and 1,600 lecturers. Graduates from these colleges during the 1953-79 period totalled about 40,000.

Machinery and Mechanization. By the end of 1979, the amount of agricultural machinery held by peasants and the relevant level of mechanization were as follows:

1. *Equipment for irrigation and drainage.* There were over 5 million units, with a combined capacity of 71 million hp. Power-irrigated areas amounted to 379.81 million mu, accounting for 56.3% of the effective irrigated area.

2. *Machinery for processing grain, cotton and oil-bearing seeds.* There were over 3 million units in all, with a combined capacity of over 20 million hp, averaging 5 units per production brigade. Except in some remote regions, wheat and rice processing had been basically mechanized in most of China's rural areas.

3. *Equipment for crop protection.* There were 230,000 power-operated units and 20 million hand-operated units. Almost every production brigade used some of this equipment.

4. *Equipment for agricultural transportation.* Trailers pulled by large and medium-sized tractors amounted to 460,000 units; trailers pulled by small-sized tractors, 1.29 million units; animal-drawn, rubber-tyred carts, 2.47 million units; wheel barrows, 32 million units; power-driven boats, over 84,000 units; and trucks for agricultural use, 100,000 units, most of which were on state farms.

5. *Harvesting machinery.* Grain combines amounted to 20,000 units, windrowers 70,000 units. Post-harvest machinery, including threshers and grain throwers, totaled 2 million units, with a combined capacity of about 10 million hp.

6. *Tractors and implements.* Large and medium-sized tractors amounted to 670,000 units, small-sized tractors 1.67 million units, with a combined capacity of 48 million hp. In addition, there were 1.3 million large and medium-sized tractor-drawn implements, including 180,000 seeders. A total of 90,000 power-driven rice transplanters, 430,000 hand-operated rice trans-

planters, and 96,000 boat tractors were employed in the paddy areas.

7. *Equipment for animal husbandry.* Feed-milling machines amounted to 1.39 million, with a capacity of about 10 million hp; forage harvesting and processing machines, 11,000; power-driven clippers, 2,000; and power-driven milkers, 1,300.

8. *Equipment for forestry and fishery.* There were 5,900 skidding tractors, with a combined capacity of 258,000 hp. Fishing vessels and motorized junks numbered over 50,000.

The total power capacity for agricultural machinery was estimated at 180 million hp.

The average amount of equipment for every 10,000 *mu* of cultivated land in China was: 4.5 large and medium-sized tractors, 11.2 small-sized tractors, irrigation and drainage units of 477.2 hp and 0.7 agricultural truck; total average power capacity amounted to 1,218 hp.

The power-ploughed area in China totalled 630 million *mu*, accounting for 42% of the total cultivated land; power-sown area, 230 million *mu*, 13% of dry crop land; power-harvested area, 57 million *mu*, 2.6% of China's grain crop area.

China's agricultural machinery consists mainly of medium and small-sized models. Priority has always been given to the development of irrigation and drainage equipment, crop protection equipment and semi-mechanized implements. Large cultivating machines, combines and agricultural trucks account for only a small proportion of the total, which is in keeping with China's realities and the practical needs of the rural areas.

Benefits of Mechanization. Widespread use of agricultural machinery and the development of agricultural mechanization has played an increasingly important role in promoting agricultural production and bringing about economic prosperity in rural China. The grain output in China has been increased from 100 million tons per year in the early years after Liberation to 300 million tons per year at the present time, thus enabling China to feed 20% of the world's population, which inhabits only 7% of the world's land. This would have been impossible without the contribution of agricultural mechanization.

In the first place, the use of agricultural machinery has strengthened the ability to fight against natural calamities. Because China has a vast territory with a great variety of climates, a very large area could be stricken by natural calamities each year. During the past 30 years the area hit by calamities averaged 420 million *mu* annually. With the steady expansion of water conservation installations and the widespread use of irrigation

and drainage equipment and crop protection equipment, the ability to cope with natural calamities has been increasingly improved, leading to a gradual reduction of disaster areas year after year.

In 1978, when 11 provinces in China's east and central-south regions suffered from serious drought, we used diesel engines with a combined capacity of 21 million hp and electric motors with a combined capacity of 10 million kw. to pump over 170,000 million cubic metres of water — the equivalent of three and a half years' discharge of the Huanghe River. This enabled China to reap a bumper harvest, with an output of 20 million tons over that of 1977.

The benefits realized by the large-scale use of equipment to protect crops from pests and of grain dryers to reduce grain loss from mildew have been widely recognized.

Secondly, the use of agricultural machinery has helped the peasants do their farm work faster, resulting in a rise in land productivity and an increase in agricultural production. In China, farmland per capita is comparatively small, and the land available for reclamation is also limited. Therefore, the chief means of increasing output is to raise both worker and land productivity. Farmland under power ploughing can yield much higher harvests, because tractor-pulled ploughs till the soil deeper and loosen it more effectively than animal-drawn ploughs. This makes the root mass of the plant well-developed and increases soil fertility.

Seasonal shortages in manpower and animal-power commonly occur all over China, whether in the north or the south, especially during the period of "double rushes" (rush harvesting and rush planting) in South China, or the periods of "three summer jobs" (harvesting, planting and field management) and "three autumn jobs" (harvesting, ploughing and sowing) in the Huanghe River and Huihe River Valley. Racing against time to get these farm jobs done often causes either a decrease in crop production or an increase in production but no increase in harvests because there is no labour to get the crop in. With the widespread introduction of agricultural machinery in these areas, however, this problem has basically been settled.

North China has a comparatively large area of farmland and a low population density. As the frost-free period there is short, an early frost often threatens crop production due to untimely sowing and harvesting. With the development of agricultural machinery, sowing and harvesting can be done in a shorter time, enabling a growing number of communes and brigades to show a steady increase in output.

Thirdly, the introduction of agricultural machinery has raised labour productivity and

helped to develop a diversified economy and commune and brigade-run enterprises, thus bringing about a prosperous rural economy and higher scientific and cultural levels in rural areas. As a whole, China has abundant labour resources but a scarcity of farmland. Moreover, the population of China is not evenly distributed. In border provinces such as Heilongjiang, Xinjiang and Inner Mongolia, there are large areas of farmland and small populations. Labour shortages cause extensive cultivation of land, resulting in low per-unit yield and unsteady total output. If forestry and animal husbandry are to be developed, the labour shortage will be even more serious. Naturally, peasants in those areas have an urgent need for agricultural mechanization.

Example of One Brigade. In the densely populated lower reaches of the Changjiang River, mechanization can also play an important role in agriculture when conditions mature. The No. 1 Production Brigade of Yuexi Commune in Wuxian County, Jiangsu Province, is a typical case in point. That brigade started with mechanization of irrigation and drainage, followed by the mechanization of tillage (the most labour-consuming job) through the use of walking tractors. In order to relieve the peasants from "back-breaking" operations of rice transplanting and harvesting, rice transplanters and rice harvesters were used, and at the same time seedlings were nursed in workshops instead of in the fields. Then came the gradual mechanization of grain and feed processing and water transportation. Later, some sprinklers were installed in part of the paddy fields.

As a result of mechanization, 70% of the brigade's labour force was saved. The surplus labour was channeled to intensive and meticulous cultivation and sideline occupations, with pig-raising the main job. The brigade cultivated various water plants, such as water peanut, water cabbage and water hyacinth, to feed pigs, sheep and poultry, whose manure, in turn, helped bring about three crops a year (one crop of wheat and two of rice). It also set up a farm machinery-repair and spare-parts factory and an electronic parts workshop.

By 1979, the brigade's labour force engaged in agricultural production had been reduced from 90% of the total in 1970 to 50%. The total output value of agriculture, industry and sideline occupations amounted to 1.2 million yuan, 16 times that of 1970; of that total, industry and sidelines accounted for 750,000 yuan, or 62.5%. The output value per capita (in terms of agricultural population) averaged 751 yuan. This production brigade, with farmland averaging only 1.2 *mu* per capita, had a high commodity grain production

rate, accounting for 43% of the total grain output. Including the consumption of concentrated feed for pigs, fish and poultry bred for sale, the actual production rate of commodity grain reached 55.8% of total output. Some agricultural economists both at home and abroad believe that the road this brigade was taking to agricultural mechanization is the road toward the modernization of China's agriculture.

The development of agricultural mechanization in China has created millions of new-type peasants with a fairly good knowledge of science and technology, and this undoubtedly has had a significant effect on the raising of scientific and cultural levels in China's rural areas.

Remaining Problems. In the course of development of China's agricultural machinery industry and agricultural mechanization over the past 30 years, we have long suffered the influence of "Left" thinking and especially serious interference and sabotage by Lin Biao and the Gang of Four in the 10 years of "cultural revolution." As a result, there are errors, setbacks and quite a number of problems to be solved.

The main problems are: lack of thorough investigation and understanding of China's realities; underestimation of the difficulties for agricultural mechanization owing to ignorance of the differences in social and economic conditions in China's rural areas and the diversity of China's crop varieties, cultivation methods, and cropping systems and lack of a real understanding of the complexity, difficulty, and specifics of carrying out farm mechanization. Errors and mistakes in our guiding work included an impatience for success, which resulted in seeking the same speed of development for different areas; reaching for too rapid development of agricultural mechanization, which was out of step with the development of the national economy; neglecting the actual needs of agricultural production and other wishes of the peasants, resulting in the erroneous tendency to bring about agricultural mechanization by administrative orders and running everything by ourselves to the exclusion of the peasants; and, in particular, ignoring the actual economic results of agricultural mechanization (that is, seeking to attain agricultural mechanization only for its own sake).

In developing agricultural machinery products, there used to be an erroneous tendency to lay stress on crop production machinery at the expense of machinery for animal husbandry, and to emphasize grain crop machinery at the expense of machinery for cash crops. The agricultural machinery industry itself also had the shortcomings of overlapping projects and production,

unreasonable structure and disproportionate development; furthermore, our agricultural machinery enterprises remained at low levels of technology, productivity and management. Compared with the products of developed countries, ours display some superior features and qualities such as small and medium sizes, lower prices, and good adaptability and durability; but as a whole our products are comparatively backward in performance, lacking in variety and unsatisfactory in quality.

II. Major Achievements in 1980

In keeping with the policy of "readjustment, restructuring, consolidation and improvement" of our national economy in 1980, the agricultural machinery industry and agricultural mechanization were also being readjusted by continuously eliminating the pernicious influence of "Left" thinking. In order to meet the new demand for agricultural machinery as a result of continual implementation of rural economic policies and the institution of various systems of responsibility in agricultural production, the departments responsible for agricultural machinery scored inspiring achievements in developing production and in improving both the quality and varieties of products.

The following are some of the successes achieved in 1980:

ducts from 55 enterprises were awarded certificates for high-quality products by the Ministry of Agricultural Machinery.

Products awarded the state gold medal and/or the state silver medal were as follows: Models S195 diesel engine by the Changzhou Diesel Engine Works (silver medal in 1979 and gold medal in 1980); Model 495A diesel engine by the Shanghai Internal Combustion Engine Works (gold medal); Model S195 diesel engine by the Wuxi County Diesel Engine Works (silver medal); Model Dongfeng-12 walking tractor by the Changzhou Tractor Factory and the Wuxi County Tractor Factory, respectively (silver medal); Model 518-12 walking tractor by the Shenyang Small Tractor Factory (silver medal); Model 261P Turbocharger by the Wuxi Power Machinery Factory (Silver medal); Crankshaft for Model Dongfanghong-75 tractor by the Chengde Crankshaft & Connecting Rod Factory (silver medal); Model L-5-35 heavy-duty 5-furrow plough by the Heilongjiang Agricultural Machinery Factory (silver medal); 24-row applicator-planter by the Xian Agricultural Machinery Factory (silver medal); Model ZF40 gearbox for ships by the Hangzhou Gearbox Factory (silver medal); "Torch" Brand spark plug by the Zhuzhou Spark Plug Factory (silver medal); Model 1100 thresher by the Jiamusi Combine Factory (silver medal); Model 40 mixed-flow pump by the Wuxi Pump Factory (silver medal); Model 6135C diesel

1. Output of principal agricultural machinery products:

Large and medium-sized tractors	98,000
Small-sized tractors	218,000
Internal combustion engines (aggregate million hp).	25.39
Combines	5,979
Large and medium-sized tractor-operated implements (including ploughs, harrows and seeders)	106,000
Large and medium-sized farm trucks	73,000
Power-driven machines for crop protection	64,000
Agricultural pumps	706,000

2. A marked improvement in the quality of principal agricultural machinery products. The Ministry of Agricultural Machinery made selective checks on 67 principal products from 50 agricultural machinery enterprises, 65.7% of which reached the standard of first-rate products and high-class products, compared with 48% in 1979.

In the appraisal of "high-quality products" under the direction of the State Economic Commission, seven products were awarded state silver medals in 1979; in 1980 another seven products were awarded state silver medals and two products awarded state gold medals. In addition, 52 pro-

engine by the Shanghai Diesel Engine Factory and the Guizhou Diesel Engine Factory, respectively (silver medal); Model X195 diesel engine by the Gold Horse Diesel Engine Factory, Yunnan Province (Silver medal).

3. Progress in modifying outdated products and developing new products. The most impressive achievements are the marked modification of the large-sized combines by the Siping Combine Factory, the Jiamusi Combine Factory and the Kaifeng Combine Factory, respectively; develop-

ments of new varieties of the Model Tieniu-55 wheeled tractor, Model Dongfanghong-28 wheeled tractor, Model Hongqi 100A crawler tractor and Model Dongfeng-12 small tractor, in addition to structural modifications; the advanced-structured four-wheel drive tractor with 60 hp being developed by the Luoyang no. 1 Tractor Plant and displaying satisfactory performance after 2,000 hours of field tests; another four-wheel drive tractor with 150 hp under development; and two gas engines with 1,000 hp and 1,200 hp, respectively, being developed by the Hongyan Diesel Engine Factory so as to conserve petroleum and to make use of a variety of energy sources for agricultural machinery.

The year 1980 also saw inspiring progress in the development of machinery for animal husbandry. We succeeded in building complete sets of large, medium- and small-sized feed-processing equipment, mechanized equipment for chicken-raising, and equipment for hay-harvesting, including a variety of mowing machines, raking machines, self-propelled windrowers, square balers, round balers and hay stackers. In addition, other machinery for animal husbandry, such as hay resowers, silage combines and livestock and hay trucks, were also developed.

4. *The start of readjustment in the agricultural machinery industry.* Measures taken included a reduction of capital construction projects; a reduction of overlapping enterprises that compete with existing enterprises for raw materials, fuel and energy; and an increase in production capacity of products in short supply. In 1980 there were only 38 tractor factories, 34 walking tractor factories and 199 internal combustion engine works whose production quotas were assigned directly by the Ministry of Agricultural Machinery.

Compared with 1978, the year 1980 saw a 75% increase in production capacity of large and medium-sized grain combines. New facilities included 12 more factories for manufacturing machinery for animal husbandry (added to the original 12 factories in 1979); 2 factories for manufacturing complete sets of equipment for chicken raising and 2 factories for manufacturing complete sets of equipment for silage processing; 8 manufacturers of seed separators; 12 grain-dryer factories with 8 relatively mature products; and 3 factories for manufacturing large-sized sprinklers. Moreover, the output of the above products in short supply was greatly increased.

5. *An increase in exports of agricultural machinery products and extension of technical cooperation with other countries.* Our agricultural

machinery products are simple in construction, easy to operate, and low in price, making them suitable for Third World countries. In 1980 we exported over 100 agricultural machinery products to 68 countries and regions, the export volume rising by 46% over 1979. Up to the present we have established technical cooperation agreements with 34 countries and regions.

In 1980, the United Nations Industrial Development Organization (UNIDO) organized in Beijing the Meeting on Exchange of Experiences and Cooperation among Developing Countries in the Development of Agricultural Machinery Industry, which was attended by representatives of over 30 countries. During the meeting the representatives visited the Exhibition of China's Agricultural Machinery and showed great interest in a variety of medium- and small-sized agricultural machinery displayed. The meeting passed a resolution to set up an agricultural machinery research center for developing countries in Beijing.

6. *Implementation of various systems of responsibility in agricultural production throughout China's rural areas.* This action brought into full play the enthusiasm of the peasants for production, leading to an all-around development of agricultural production, an increase in the peasants' income and a steady improvement in the standard of living. At the same time, it promoted the development of agricultural mechanization. In formerly poverty-stricken Guizhou Province, commune and brigade collectives, as well as commune members, purchased in 1980 agricultural machinery valued at 34.8 million yuan, of which 30 million yuan were funded by communes and brigades and commune members themselves — over three times the average annual self-raised funds for the purchase of agricultural machinery in the three previous years.

In Chuxian Prefecture of Anhui Province, which had long suffered from natural disasters and therefore yielded low harvests, productivity was low and the life of the people was poor. Since the implementation of the systems of responsibility in agricultural production, great changes have taken place. According to preliminary statistics, the commune members of the prefecture purchased 126 large and medium-sized tractors, 1,933 small tractors, 1,926 produce-processing machines and 18 agricultural trucks with their own funds in 1980.

It was not a novelty for commune members to purchase tractors with their own funds and operate a tractor station to plough land for the peasants, who were practicing the system that fixes output for each peasant household and for individual peasants and pays according to the output. The system brought about changes in the

management of agricultural machinery. The implementation of the party's economic policies, the changes in methods of management, the development of production and the competition among peasants to purchase agricultural machinery were the most impressive developments in the rural areas. These developments activated the rural economy, brought about a better standard of living, and stimulated the peasants' enthusiasm for agricultural mechanization.

7. *Preliminary reforms in the management of agricultural machinery products.* Previously, the state had a monopoly on the purchase and marketing of agricultural machinery products, which were then distributed by administrative departments at each level without direct contact between producing and marketing departments. This system gave rise to a series of abuses, such as lack of communication between producing and marketing departments and insurmountable barriers between one economic department and the other. In 1980 a preliminary reform was carried out in the state monopoly for purchase and marketing of products, opening up a market for agricultural machinery under the guidance of state unified planning. The monopoly was lifted on the supply of most products, and customers were free to choose and purchase. Enterprises were allowed to market their own products after they had sold to the state the amount specified by the state plan, giving rise to competition under socialist conditions, which had a positive effect on raising the quality of products, reducing costs, developing new products, better service for customers, and improving management.

III. Industry Goals During Readjustment Period

In the ongoing readjustment of the national economy, efforts have been made to speed up agricultural development. At present, the fundamental principle for developing agriculture is centred on "implementation of specific policies and application of scientific knowledge." "Implementation of specific policies" implies continuing to break away from the fetters of "Left" thinking, and strengthening and perfecting various practicable systems of responsibility in agriculture suitable for the local level of development of the productive forces, so as to bring into full play the initiative of the peasants. Practice has proved this is the prerequisite for the development of agricultural mechanization. "Application of scientific knowledge" implies efficiently extending and applying to agricultural production achievements in science and technology, whose application is, in

turn, inseparable from advanced production tools including various agricultural machinery.

The development of the agricultural machinery industry and agricultural mechanization, therefore, should accord with the development of the national economy. In view of the country's current conditions and the actual needs of agricultural production, our principle is to act according to our capability and to lay stress on increasing economic results. The requirements of the continuing readjustment of the national economy and state of the agricultural machinery industry necessitate further readjustment in the agricultural machinery industry and the programme of agricultural mechanization.

Principal Requirements. The main tasks of the readjustment of the agricultural machinery industry are: (1) readjustment of the orientation of services of the agricultural machinery enterprises and the disproportionate relationships within the agricultural machinery industry; (2) restructuring the agricultural machinery industry, i.e., organizing existing agricultural machinery enterprises into integrated economic complexes of all forms; (3) carrying out technical transformation of agricultural machinery enterprises so as to raise the quality of products, increase varieties and enlarge the export volume and; (4) reform of the system of enterprise management, supply and marketing, scientific research and management of agricultural mechanization. It is imperative that the levels of management technology, production and services be raised in order to lay a good foundation for the future development of enterprises.

1. *Readjustment of the orientation of structures of products, and expansion of the scope of services.* Five kinds of "catering" are to be put into effect, i.e., catering to the needs of agriculture, forestry, animal husbandry, sideline occupations and fisheries; catering to the needs of commune- and brigade-run enterprises; catering to the needs of urban and rural construction and to the people's livelihood; catering to the needs of increasing exports; and catering to the needs of technical transformation of various departments of the national economy.

In the light of the development of agriculture and the demands of the market, agricultural machinery enterprises should increase the varieties of products in short supply; expand the production capacity for urgently needed products; eliminate systematically outdated products that are of poor quality and do not sell well on the market, or which have a high consumption rate of energy and materials; and develop new products that sell well on the market.

Moreover, according to the actual needs of implementation of various systems of responsibility in agricultural production we should expand the production of small, semi-mechanized implements and hand tools. We should utilize fully the production capacity of the agricultural machinery industry, strive to develop light industrial and electromechanical products for the people's livelihood that sell well on the market, and help fill in the gaps by completing sets of equipment for other branches, such as engineering, construction, transportation, communications and so on.

2. *Restructuring the agricultural machinery industry according to the principle of economy and rationalization, and specialized cooperation.* Overlapping production has to be reduced, and scattered and backward small-scale production has to be converted into specialized production. It is imperative to readjust and restructure trades, one by one, under the leadership of the National Commission of Engineering Industry. The key agricultural machinery enterprises whose products are marketed throughout the country should be integrated so as to connect various regions and trades. Local agricultural machinery enterprises may be readjusted and restructured according to local needs by the local administration. As for agricultural machinery manufacturing and repairing factories at the county level and commune- and brigade-run manufacturing and repair units, apart from undertaking the tasks of manufacturing and repairing agricultural machinery, they are to be readjusted (in light of the principle of serving local needs) by the local administration to become general machine manufacturing and repair factories that mainly serve agricultural production and concurrently manufacture some other products for the market. During the period of readjustment we must select a group of agricultural machinery enterprises that have good facilities but inadequate tasks, and require them to produce light industrial produce whose processing technology is similar to that of the agricultural machines they are producing and whose supply falls short of people's demands.

3. *On the basis of readjustment and restructuring, we must carry out technical transformation of key enterprises step by step in a planned way, and strive to raise the quality of products and labour productivity by relying mainly on our technical strength and with appropriate introduction of new technologies from abroad.*

4. *Corresponding readjustment and restructuring of scientific research and educational work in the field of agricultural machinery.* It is neces-

sary to reorganize the technical and research personnel of scientific research institutes, institutions of higher learning and key agricultural machinery enterprises; to make a rational division of work, giving full play to their professional knowledge; to stress the key programme and the application of research work to production; and gradually to change the present dispersion of technical personnel and overlapping of research programme so as to spur the development of the agricultural machinery industry and agricultural mechanization.

5. *Gradual restructuring, during the period of readjustment, of the system of management, supply and marketing, as well as scientific research and educational work of the agricultural machinery industry and agricultural mechanization.* Restructuring must be subordinate to and benefit readjustment, and must be carried out steadily.

The Country's Realities. During the period of readjustment, it is necessary to make a thorough study of China's realities on the basis of historical experiences, going further into the orientation, road and steps of China's development of agricultural mechanization. From the point of view of agricultural mechanization, special attention should be paid to the following basic realities of the country:

1. *A very large population and limited farmland.* China has a territory of 9.6 million sq. km. but the average resources per capita are not great. Farmland per capita is about one-fourth that of the entire world, one-eighth that of the United States, one-seventh that of the Soviet-Union, one-third that of France, and two-fifths that of India. Forest per capita is about 12% that of the world, and grassland per capita is less than 50% that of the world. Moreover, the distribution of the population and agricultural resources is unequal from place to place. 90% of the population lives on only 10% of the land. Even so, a large part of the land and resources have not been exploited and utilized. The emphasis of agricultural mechanization, therefore, should be placed on cultivated land, which is, however, not enough. From a long-term point of view, we must give our attention to 4,000 million mu of grassland, 1,000 million mu of grass hill, approximately 2,000 million mu of forest, 250 million mu of inland water and one million square nautical miles of sea areas.

2. *Variations in natural conditions, crop varieties and farming systems, and the highly multiple crop index, which lead to the complexity and difficulty of our mechanization of agriculture.*

China's plains account for only one-fourth of the total territory, while the mountain areas, hilly land and plateau regions cover three-fourths of the land. Annual rainfall varies from dozens of mm. to over 1,000 mm., and frost-free periods range from 100 days to 300 days or more, resulting in one, two or three crops a year. The farming system of interplanting and intercropping multiplies the difficulties for agricultural mechanization. Any subjective or metaphysical way of specifying the same speed of development for all places will not succeed.

3. *A great disparity in economic development from place to place.* There are highly developed coastal areas whose per-capita GNP exceeds US\$1,000, while in remote border mountain areas people are still practicing slash-and-burn cultivation. In view of the diversity of natural conditions as well as the great disparity in levels of economic and cultural development from one place to another, we should not specify the same speed for developing agricultural mechanization throughout the country. We must establish our priorities in line with local conditions, with an appropriate array of measures and methods.

4. *An underdeveloped commodity economy in the rural areas.* At the present time, the commodity economy is not well-developed in China's rural areas, where the principal commodity for exchange is a small amount of "surplus grain." For a production brigade to realize mechanization, there must be a variety of agricultural machinery; however, the utilization of such machines is very limited because of the variety of crops raised. This is one of the chief reasons why some areas have quite a few machines and equipment but have still not achieved a high level of mechanization or improved economic results. In order to correct this situation we must raise agricultural productivity, give full play to commodity production, move step by step toward a relatively concentrated distribution of crops and specialized agriculture, which is a very long process. The speed of development of agricultural mechanization must correspond with these considerations.

5. *Surplus manpower and its proper arrangement.* Surplus manpower as a result of agricultural mechanization should be absorbed wherever it exists, and should not be allowed to overflow into the cities. This is an important difference between China and other countries. The agricultural mechanization of the country will take a relatively long time. It is a process involving the gradual transfer of manpower from grain production to a range of economic activities including industry and sideline occupations and commune- and brigade-run enterprises. Such a transition requires a considerable period of time, and it cannot absorb manpower as quickly as large-scale industry does. The speed of development of agricultural mechanization, therefore, must accord with the realities. Otherwise, it will give rise to an excess of manpower, adversely affecting the economic benefits of mechanization.

6. *Simultaneous industrial development and agricultural mechanization.* China's agricultural mechanization experience is different from that of developed countries, where industrialization preceded agricultural mechanization; it is proceeding simultaneously with industrialization. As a result, we have to cope with difficulties in obtaining enough iron and steel, rubber, oil, electricity and transport facilities necessary for the realization of agricultural mechanization. In the case of transport, for example, some mountain areas are lacking highways, thus preventing machinery and equipment, if any, from being sent there. The pressing problem for these areas is to build highways. Furthermore, agricultural mechanization requires considerable investment, which is impossible and inappropriate for the state to offer in a short time.

In view of these realities, agricultural mechanization should by no means develop at too fast nor on too large a scale. For a fairly long time to come we will have to follow the principle of developing mechanization and semi-mechanization simultaneously, using a combination of manual power, draught animals and machinery.

20. CHINA'S ELECTRONICS INDUSTRY

By the Policy Research Office,
Fourth Ministry of Machine Building

I. Establishment and Development of China's Electronics Industry

Just after the Liberation of China in 1949, relying on the forces for assembling and repairing radio stations in the areas liberated earlier, we managed to take over 10 or more very small wire and wireless telecommunications factories, scattered in Tianjin, Nanjing, Shanghai, Chongqing, Wuhan, etc., from the hands of the Kuomintang reactionaries. At that time, we had only 4,106 employees in this field and could assemble and repair only a small quantity of radio sets and radio stations with components and parts bought from abroad. The total output value was 4.95 million yuan, representing a mere 0.05% of total national industrial output value. That marked the beginning of China's electronics industry. Despite its weak basis, the electronics industry, owing to the great concern shown by our party and government and the efforts of our workers and staff members, overcame numerous difficulties and succeeded in developing rapidly from assembling and repairing to manufacturing and from copying products to designing its own.

The Present Scale. After more than 30 years of development, China's efforts in the electronics field have produced a fair-sized industry. According to 1980 statistics, the Fourth Ministry of Machine Building has 3,137 directly run and locally run electronics enterprises with 1,355,000 employees and more than 7,800 million yuan of fixed assets. The output value of the industry in 1980 was 20,100,000 yuan, accounting for 4% of total national industrial value. That represents an increase of 4,000 times over 1949, and a 30.7% average annual growth rate. Up to 1979, the profit and tax handed over to the state by the electronics industry amounted to 3.2 times the state's investments in capital construction in the electronics field during the same period.

In addition to the ministry's directly run electronics enterprises and the locally run ones, there are fair-sized electronics research and manufacturing facilities operated by the Ministry of Posts and Communications, the Ministry of Railways, other ministries of machine building, the Chinese Academy of Sciences and various universities and colleges.

beration, the 10 or more radio industry enterprises of China were concentrated mostly in such large coastal cities as Shanghai, Nanjing, and Tianjin. After the founding of New China, the State successively set up a number of primary electronics factories in major cities and inland areas. At the same time, various provinces, municipalities and autonomous regions set up their own electronics factories, greatly promoting the development of both the coastal and inland industries. At present, our 29 provinces, municipalities and autonomous regions all have established their electronics enterprises. The electronics operations of Shanghai, Jiangsu, Beijing, Liaoning, Shandong, Tianjin, Sichuan, Hubei, Shaanxi, Guangdong, Guizhou and Jiangxi are particularly concentrated and are growing rapidly, thus forming the basis of China's electronics industry. The previous irrational distribution of the electronics industry has been basically corrected, and a solid foundation has been formed through the linking of central and local, coastal and inland enterprises.

Main Products and Technical Capabilities. China's electronics industry, though a nascent industry, has developed so far as to be able to manufacture a fairly wide range of specialized products for both military and civilian uses. The industry can produce good used in production or by consumers, for scientific and cultural purposes, for use by society, both military and civilians, as well as for general military-civilian use.

The main product categories are the following:

1. Radar, fire control systems and associated products.

2. Communication and navigation equipment used for cable communication, HF communication, microwave communication, troposphere-scatter communication, satellite communication and different types of mini-radio stations. Some of these products have reached an advanced level.

3. Computers. The industry can now produce Series 100 and Series 200 computers in volume. The IC computer with 5 million calculations/second was successfully developed in 1979. The production capacity for large and medium-sized computers is more than 400 units per year.

Distribution of the Industry. Before Li-

4. Radio and television broadcast products.

The industry can now turn out black-and-white TV sets, radios and recorders in large quantities, and colour TV sets in small batches. The annual production of radio sets amounts to 30 million units; the assembling capacity of TV sets is 4 million per year, and that of recorders is 600,000 per year. The production of videorecorders has already begun. The production of radio and TV broadcast equipment can basically meet the requirements in this field. The industry can also produce more than 730 varieties of electronic products for the national economy, science and culture, as well as for society; more than 700 types of electron tubes; more than 600 types of discrete semiconductor devices; more than 400 types of ICs; 2,000 kinds of electronic parts; 500 kinds of electronic measuring instruments; and special-purpose radio equipment as well as special-purpose materials for the electronics industry.

The development of these specialized categories enables us to provide electronic products for the national defence industry, the national economy, and the requirements of the material and cultural life of the people. A certain number of the products are available for export.

Science, technology and education. China's electronics industry is served by a strong contingent of scientific and technical research personnel. At present, the engineers and technicians in the industry number more than 10,000 and more than 10,000 students are now majoring in electronics science and technology at institutions of higher learning and secondary technical schools. During the past 30 years, the large number of achievements of research and development personnel have made a significant contribution to the electronics industry.

In the early 1950's, a 1,000-kw. MW radio broadcasting transmitter was designed and manufactured on our own. Though scientific research suffered a setback during the turmoil of the "cultural revolution," our scientific workers nonetheless designed and manufactured a set of satellite earth stations, successfully developed colour TV broadcasting equipment, explored laser infrared technology, developed and manufactured such technologically advanced communications equipment as a 300-channel small-diameter coaxial cable carrier system, a tropospheric-scatter communications system, a high-powered SW transmitter, etc. Since the smashing of the Gang of Four, the 5 million calculations/second computer, Model 210, 220-1 and 260 computers, the 960-channel small-diameter coaxial cable carrier system, the 1 million-x radio telescope, the 4096-bit memory chip, etc., have been successfully developed one

after another, and a number of other scientific research projects have reached high levels and passed official evaluations.

In 1979, 218 items among the scientific and technological achievements in the electronics industry won the national significant technology improvement achievement prizes, 247 items won the top-level science and technology achievement prizes and 3 items won the national invention prizes. With the application of scientific research to production, the quality of electronics products has been improved and a number of well-known brand products have emerged, 3 of which won gold medals and 11 won silver medals in a national competition.

II. The Electronics Industry in 1980

In early 1980, at a meeting of leading cadres of the electronics industry, the principle of "readjusting actively and doing a good job of the change" was put forward in accordance with the guiding principle of readjustment, restructuring, consolidation and improvement and in conformity with the actual situation in the electronics industry. The meeting stressed the need for readjustment in five major areas — military and civilian products, scientific research work and production, equipment and bases, capital construction and enterprise organization.

A new approach must be taken in each of these five areas. Scientific research work should be changed to strengthen basic research in the technological sciences, applied research, research and development of new-generation products of great significance, and advanced research for the long-term development of the electronics industry. The production of military products should be changed to permit a rational composition of the industry that will accommodate both military and civilian needs. The expanded reproduction should be changed to carry out coordination among specialized units and technological transformation. Business management should be changed to combine economic methods with administrative measures. Training of personnel and cadres should be changed to meet the new requirements of modernization.

Important steps. One year's experience has shown that it was both necessary and timely to set forth the principles of readjustment and transformation in these five areas. Good results have been obtained and advances have been made in different areas of work because of the implementation of the above principles. Major examples of this progress are as follows:

1. *Production has been further increased, particularly of civilian products, and the product composition of the electronics industry is already beginning to orient itself more rationally.* Readjustment of the product composition of the electronics industry has been under way for a year. While the production of military products has been guaranteed, the production of urgently wanted but scarce products such as TV sets, radios, recorders, phonographs, etc., as well as major associated parts, components and accessories, has been increased.

The total output value of the electronics industry in 1980 was 21,000 million yuan, an amount 22.5% greater than that of 1979. The output value of civilian products of the national electronics industry accounted for more than 80% of total output value. The number of TV sets produced by the enterprises affiliated with the Fourth Ministry of Machine Building increased 87% compared with 1979; radios, 80%; recorders, 500%; phonographs, more than 100%; electronic calculators, 600%; TV transmitters, 267%; and retransmitters, 37%.

2. *Considerable progress has been made in research and development and in trial-production, and scientific research has been accelerated.* The industry supplied electronics systems for the experimental launching of carrier rockets over the Pacific Ocean. These systems proved to be stable, reliable and accurate, and accomplished their assignments quite satisfactorily.

Design work has been completed for micro-computer models 051 and 061 and the computer 100/132, which adopted Chinese-made LSI's. A prototype of computer Model 153, with its sophisticated software, has been developed. The floppy disc unit is already in use. The 30-m.-high Oersted permanent magnetic material of rare earth cobalt has been finalized and is up to world standards. The 4096-bit RAM and monolithic microprocessor circuits have passed the evaluation of final design stage. Prototypes of decimetre-wave TV transmitters and retransmitters, 2/3-inch small-sized colour pickup cameras, low-light level TVs and X-ray medical TVs have been produced.

Progress also has been made in the trial-production of single-tube colour projection-type TVs and colour videorecorders. Design institutes affiliated with factories have made great and continuous efforts to increase the designs and varieties of their products. New models of radios, radio/recorders, radio/recorder/photographs and decimetre-wave TV sets have been produced on a trial basis. Some of these units, which are small, attractive, and perform well, have been mass-produced and placed on the market.

3. *The quality of electronic products has been improved, and the acceptance inspection of quality rectification and the practice of overall quality control have brought good results.* In 1980, the Fourth Ministry of Machine Building practiced acceptance inspection of quality rectification in a certain number of its affiliated enterprises and some local enterprises, while implementing a trial practice of all-around quality control in some other enterprises. Concurrently, an extensive effort was made to produce high-quality products.

In addition, some related units and departments jointly held a forum on overall quality control of TV and radio sets, at which a tentative method for managing reliability tests of some components and devices was proposed, emphasizing the need to improve the reliability, stability and uniformity of components, devices and raw and processed materials. This plan also demands that certain districts set up two major quality control feedback systems — one consisting of the industry, commerce and user, and the other involving equipment, components and devices — so that an in-trade and trans-trade all-around quality control can be carried out.

The Shanghai Instrument Bureau and several specialized corporations have organized a large quality feedback network involving 11 equipment plants and more than 70 components and devices plants. The Electronics Bureau of Jiangsu Province has formed "a dragon" (or coordination chain) system for conducting series quality control of products ranging from equipment to components and devices. Preliminary reports on the results of these efforts show that the reliability of equipment, components and devices has been improved to varying degrees.

In 1980, 3 electronic products were awarded the state national gold medals and 14 received silver medals. In addition, many electronic products won a high reputation for quality in the provinces and municipalities. The MTBF (Mean Time Between Failure) of TV sets made from discrete components and ICs has reached 1,500 and 2,000 hours, respectively. The main specifications for certain brands of recorders have neared or reached the advanced level of foreign-made recorders of the same grades.

A great amount of work has been done in improving the reliability of electronic components and devices. The Fourth Ministry of Machine Building successfully selected 70 plants producing components and devices and organized 82 "experimental lines of 7-special-item quality control," resulting in the production of more than 400 varieties of components and devices of greater reliability. The availability of component products for major projects was raised from the original

20% to 95%. The life time of Chinese-made B/W tubes exceeded 5,000 hours.

4. *The state plan for investment in capital construction has been fairly implemented.* The scale of capital construction has been greatly reduced. In 1980, 104.9% of the state investment plan was implemented by the electronics industry, and newly increased fixed assets accounted for 76.7% of fulfilled investment. Major capital construction projects undertaken by ministry-related enterprises included: the Xianyang Colour Tube Plant, the IC production line in the Jiangnan Radio Appliances Factory of Wuxi and the line-cutting machine of the Chengdu Hongguang Electron Tube Plant. The colour TV assembly line of the Tianjin Radio Factory was built and put into trial-production. The local electronics industry also made great strides: among other achievements, assembly lines for 16/12-inch B/W tubes in the Shanghai Electron Tube Factory and the Shijiazhuang Tube Plant were built and entered into production. In 1980, 520,000 sq. m. of housing was built for ministry-affiliated enterprises and institutions, the largest amount of construction ever completed in one year by the electronics industry. This construction helped to alleviate crowded living conditions for workers and staff.

5. *Progress has been made in our experiment conducted at selected points, to enlarge enterprises' decision-making powers and to promote their integration.* The reform of the economic management system in the electronics industry has begun. The experiment to enlarge self-decision powers was carried out at some ministry-affiliated enterprises, research institutes and local enterprises, while a single-item profit package system was practiced in some other ministry-affiliated enterprises. All these enterprises succeeded in expanding their production capacity and increasing profits. Of these enterprises, the ministry-affiliated ones overfulfilled the year's planned profit quota by 21.2%. Good results also were obtained at those research institutes that conducted the experiment of enlarging self-decision powers.

As for the promotion of integration, the year of 1980 witnessed the establishment of the China Nanjing Radio Company and preparation for organizing joint corporations in Shanghai, Tianjin, Guangzhou, Chongqing, Chengdu, and other cities. The establishment of the China General Company of Electronic Components and Devices served as a guide to learning how to run nationwide specialized corporations. In addition to the corporations that were established a few years earlier and were being perfected, some new corporations and economic complexes of various forms were set

up, and the organized management of enterprises was raised to a higher level. The establishment of these corporations and economic complexes play an active part in the development of the electronics industry.

Since its founding, the Nanjing Radio Company, has overfulfilled its production plan every month, and its 37 affiliated enterprises have succeeded in turning over much greater profits to the state. The readjustment of product composition within the company was already under way, and some new products were developed. The enterprises affiliated with the China General Company of Electronic Components and Devices overfulfilled the planned total output value by 45%; the output of kinescopes exceeded the plan by 24%, and the profit total by 32%.

In some provinces and municipalities where electronics corporations were founded, management and technical capabilities were more concentrated and enterprises shared in the work and cooperated with one another, so that the production potential of these enterprises was in a better position to be utilized fully. For example, with the establishment of the Shanghai TV Industry Company, 10 TV set assembly lines came into being through transformation and reorganization of existing production facilities, and the production of certain associated parts was automated to varying degrees on the single-machine basis. As a result, production capacity increased several times and the profit for one month equalled the total investment in the transformation of the 10 production lines.

The Dandong Municipal Electronics Company of Liaoning Province reorganized its 21 enterprises into 13 and readjusted the varieties of products from 201 to 101. With the realization of large-scale specialized production, the annual production capacity of tuners reached one million, which is one-fourth of the total capacity of the country. The profits it made in 1980 accounted for one-third of the total profits realized by the entire electronics industry of the province in that year. This is a good example of the advantages of integration and reorganization.

6. *Business with foreign countries has increased, and a good beginning has been achieved in the reform of the foreign trade system.* In May 1980, the China Electronics Import and Export Corporation, a combined industry and trade outfit with branches in Tianjin, Guangzhou and Shanghai, was established. As a first step, a team of foreign trade experts within the electronics industry was formed. The corporation vigorously pushed import and export business and signed three contracts for importing the Solar computer, fixed-

head magnetic disc drive and controlled printer; its export business is now up to US\$25 million. According to incomplete statistics, more than 300 contracts for the processing and assembly of imported materials and components, valued at US\$27 million, have been signed by various provinces, municipalities and autonomous regions.

7. *Management and administration have shown some improvement, and good results have been obtained in the drive to vitalize the economy and increase economic efficiency.* Various regions and enterprises strengthened their marketing methods and began to investigate market conditions. The Radio Appliances Corporation and its various branches have turned from centralized distribution, purchasing and selling, and the manufacture of complete sets of equipment — its dominant business in the past — to concentrate on selling, adjusting to market conditions and organizing department shows and sales, commissioned sales outlets and trial sales. The corporation also enlarged the range of supply services. The total volume of supply was 25% more than that of the previous year. The quota for savings on major goods and materials, such as steel, gold, silver and lumber, have been overfulfilled, and more than 42% of the surplus, as well as long-kept goods and materials in stock that were discovered through a warehouse inventory, have been put to use. Joint ventures were initiated with the local goods and materials departments of the electronics industry in Anhui, Jiangxi and Fujian provinces, and better results were achieved.

Various enterprises have strengthened their accounting and put into practice various economic responsibility systems, thus succeeding in reducing production costs of their products, particularly of the so-called "four kinds of machines" (TV sets, radios, tape recorders and phonographs). Among these, the costs of various TV sets were reduced by from 3.8% to 32%, and the average cost reduction of radios ranged from 4.4% to 8.6%. The market for tape recorders was opened up through the positive cooperation between assembly plants and various component-manufacturing plants, enhancing the quality, developing new products and reducing costs (although it was affected twice by a reduction in prices of imported products), and thus both production and income were increased.

Some plants that produce special parts and accessories for assembly plants reduced selling prices on the basis of increasing yields and lower production costs, creating favourable conditions for further reducing the costs of complete sets. In 1980 the "four kinds of machines" alone accounted for sales of about 2,100 million yuan, and turned over to the state 33% more profits and taxes

than in 1979.

To promote the development of the electronics industry, the role of technical services was strengthened. In addition to the former Communication Engineering Corporation were established the China Computer Technical Service Corporation, Radio and TV Broadcasting Service Corporation and Instrument Joint Service Department. Businesses that contract for engineering projects, design machine rooms, install, align and service electronic equipment, train operators for the users, and organize department shows and sales of electronic products were expanded.

At the same time, various types of technical services were offered in provinces, municipalities and enterprises. It was reported that more than a quarter of the total number of TV manufacturing plants in China began to provide services at customers' homes during the guarantee period of the purchased products. Some of these plants made considerable efforts to set up service networks or points in urban and rural areas or to offer service-on-wheels (mobile service) to meet the customer's needs. All these services were warmly welcomed by users.

8. *Considerable progress was made in education and cadres' work.* The education of qualified personnel and the assignment of cadres began to adapt to the new requirements of modernization. Two secondary technical schools in Guilin and Hangzhou now have been formally upgraded to colleges, and some college branches for training computer software personnel were established. Emphasis was placed on renovation of college facilities, thus improving school conditions and expanding enrollment capacity. Through consolidation, 20 colleges for staff members and workers run by factories managed to raise their education quality basically up to the requirements of the state.

The training of leading cadres and staff and workers of the enterprises also was strongly emphasized. Training classes for leading cadres have been given 15 times, and 771 cadres trained. Leading groups of some ministry-affiliated enterprises have been readjusted. A total of 115 young and middle-aged cadres who had good professional qualifications have been promoted to positions of leadership. The proportion of leading members of enterprises with university, college and senior middle school educations is already as high as 40.7%. The party's policy towards intellectuals has been further implemented. The enthusiasm of technical personnel in general has been mobilized by the widespread adherence to previous stipulations which promoted technicians to the rank of professionals.

III. Main Tasks of Further Readjustment

The general state of the electronics industry in 1980 was favourable. Good results were achieved, and some development was attained. But the passive position of the industry caused by the "Left" errors and mistakes in the past has not been fundamentally changed. Imbalance within the industry and unreasonable structures are still relatively serious problems. The main problems at present are as follows:

Wide differences exist between the changing of product composition and rational economic requirements. Professional reorganization and technical reform have not made great progress, and the organization of enterprises is a long way from meeting the requirements of mass production. Scientific research work is still weak and has not yet succeeded in "moving ahead of production," and the technical levels of products and production cannot meet the needs of development. The composition of cadres and of staff and workers has not yet fundamentally changed to accord with the development of the electronics industry. The management of enterprises is relatively backward, and quite a few enterprises still suffer from high consumption and waste and poor economic results. All of these problems demonstrate that the further readjustment and reform of the electronics industry is still a rather difficult task.

Five Structures. During the period of further economic readjustment, the main task of the electronics industry is to quicken the readjustment and to promote changes that will enable the industry to proceed on a coordinated, steady and sound path. The electronics industry must establish five reasonable structures through readjustment, reorganization, combination and relevant reforms:

1. *Establish reasonable product composition to serve the Four Modernizations and the needs of both domestic and overseas markets.* The general requirement is that the electronics industry must serve various social needs. This means that military electronic products have to be guaranteed; durable consumer electronic products must be increased; the electronic products used for production, scientific research and educational and cultural purposes, as well as social management, must be developed; and electronic products for export must be expanded. To meet this requirement, basic products and complete sets must be developed in a coordinated manner. For the so-called five major items (TV, radio, tape recorder, phonograph and calculator), we must achieve mass production, high quality, low cost, expanding grades and increasing

varieties so as to accommodate the purchasing power of various social strata. As for electronic clocks, watches and household utensils, close attention must be paid to relevant research and development, as well as to reduce costs in preparation for mass production.

Those electronic products that are needed by various sectors of the national economy — especially by light industry, textiles, transportation and energy, all of which are engaged in technical reforms — must be positively developed. The electronic computer, in particular, is a tremendous potential need. Investigations must be made to determine actual market conditions and to make technological preparations for new production while present production is going on.

The current position in electronic products for export must be expanded and consolidated. The amount of high-grade products for export will be gradually increased. Special workshops and plants producing goods for export, as well as export bases, will be established so as to open up new markets and increase foreign exchange earnings. The ratio between the production of basic products and that of complete sets, and the proportional relations between various kinds of basic products, must be reasonably readjusted. Special attention must be paid to adopting effective measures to deal with such weak links as LSI's, B/W picture tubes, high-reliability components and devices and critical parts for assembly of complete CTV sets.

2. *Realize a rational composition of science and technology so as to meet the needs of product renewal and change of product generations and to speed the development of electronics science and technology.* In developing products, it is essential to improve one generation while developing another and preparing for the development of still another. The method of "three generations at the same time" must be implemented effectively so as to achieve a balance between applied scientific research, pre-research, major products study, technological research and reliability study. As for production technology, it is essential for us to accommodate modern mass production, strengthen the study of manufacturing processes, implement technical reforms and renew manufacturing equipment and combine advanced technology with applied technology and manual work. Therefore, readjustment in three areas, i.e., orientation of scientific research, scientific organizations and items and subjects of scientific research, should be made. In particular, the readjustment of scientific organizations must be carried out firmly and effectively with a view to bringing about the unification of ministry and research institutes and

the unification of factory and research centres. The tight integration of scientific research and production will clarify the direction and task, rationalize the organizational structure and make scientific research projects and subjects suit the development of the electronics industry. This readjustment will enable us to achieve more highly valuable results, and at a faster pace.

3. *Establish rational organizational structures for enterprises so as to suit the needs of mass production.* Existing enterprises must be reorganized in a planned and sound way according to the principles of professional cooperation and economic rationality. This will promote the establishment of various economic complexes and raise the organized management of enterprises to a higher level, resulting in a more rational organization of production capabilities of the electronics industry. First of all, enterprises manufacturing components and devices must be thoroughly readjusted, reorganized and integrated. On the basis of reorganization and integration, technical reforms and the renewal of technology and equipment will be achieved in a planned way.

In order to establish the rational organizational structures for enterprises, the integration of ministry-affiliated enterprises and local enterprises must be promoted in various ways. In large and medium-sized cities, provinces and districts where ministry-affiliated enterprises and local enterprises are more densely concentrated, some sort of loose integration must be carried out when conditions permit. Those that are already integrated should explore ways to become economic complexes.

4. *Establish sound management structures so as to obtain good results from invigorating the economy and increasing economic efficiency.* The main points are as follows:

1. The management system should be rationalized. It is necessary to organize economic activities according to the principles of social mass production and economic rationality.

2. Management methods should be improved so as to combine administrative management with economic management, making the latter the dominant factor and introducing administrative methods, as needed. The work of economic legislation should be strengthened with a view to combining economic efficiency, economic profit and economic responsibility.

3. Investigations of the market should be carried out through organizational construction and actual studies so as to make technically based

forecasts of both domestic and foreign markets and bring the role of market adjustment under the guidance of planning work.

4. The powers of self-decision granted to the enterprises should be further expanded, giving them more vitality.

5. Marketing centres and sales networks of the electronics industry should be established. Electronic appliances corporations located in various districts will shift their focus to selling products and gradually become marketing centres. Our target is to set up sales networks and points of sale in all large and medium-sized cities throughout the country in two or three years.

6. Technical services will be greatly strengthened, and various technical service corporations and service stations will be established so as to develop such services as product popularization, equipment installation and adjustment and training of technical personnel.

5. *Set up a rational system of ranking cadres and workers to meet the requirements of the Four Modernizations.* First of all, education work must be readjusted and strengthened in order to allot a suitable proportion of education in colleges and universities for training senior and middle class personnel and basic workers. School conditions must be improved to allow key universities to enroll students according to their capacity and the building of more key technical secondary schools. And it is necessary to realize the potential of setting up factory-run technical schools and of converting factories that have suspended operation, but have the proper facilities, into schools.

Secondly, specialties should be properly adjusted and the ones that are lacking should be made up. Special attention should be paid to the training of qualified personnel in the fields of computer software, economic management, machinery, information and foreign trade, with a view to ensuring that experts of various specialties are available.

Thirdly, a relatively regular educational system for staff personnel and workers should be established to raise their political and ideological levels, develop their competence in science, culture, the professions and economic management through various channels, thus creating a larger pool of people who know well their own professions and work and who are familiar with the modern economy, modern science and technology and modern management. The proportion of young and healthy leading cadres, specialists and skilled workers who understand technology and

management must be increased year by year. The ranks of cadres must gradually be filled with younger people familiar with the professions and

knowledgeable about various specialities. The cultural and technical levels of staff and workers must be raised.

21. CHINA'S METALLURGICAL INDUSTRY

By Chen Lei and Zhang Xinchuan

*Research Institute of Metallurgical Economy,
Ministry of Metallurgical Industry*

I. History of the Metallurgical Industry

China is rich in coal, iron, non-ferrous metal and hydropower resources. Its proven iron ore reserves amount to over 40,000 million tons. In addition to the four big mining areas — Anshan and Benxi, Jidong (East Hebei Province), Pan-zhuhua and Xichang, Ma'anshan and Nanjing — many provinces and autonomous regions also have numerous iron mines. Its reserves of tungsten, antimony, tin and rare-earth metals are the largest in the world. Reserves of zinc, lead, copper, aluminium, nickel, molybdenum, manganese, tantalum, niobium, mercury and titanite, as well as gold and silver, are among the second and third largest in the world. These vast mineral deposits are one of the basic factors in the development of the metallurgical industry in China.

Ancient Period. China's metallurgical industry has had a long and brilliant history. From vast quantities of unearthed bronze utensils and excavations of metal-smelting and casting sites, we know that the smelting and casting of bronze utensils began early in the Shang Dynasty, about 3,100 to 3,700 years ago. Among these objects, "Simuwu," a large, square tripod unearthed from the Yin Dynasty ruins in Anyang, weighed 875 kg. Many of these utensils have fine patterns and distinctive characters, showing that the smelting and casting techniques of the Shang Dynasty were very advanced.

At the old mining and smelting site of Daye and Tonglushan (from the Spring and Autumn and the Warring States periods until the Song Dynasty), a mine pit more than 50 m. deep has been found. The site contained various kinds of copper-smelting shaft furnaces and underground furnaces and over 400,000 tons of dregs. It is estimated that nearly 100,000 tons of copper had been produced there. This discovery clearly demonstrates that copper-smelting in ancient China was carried out on a large scale and employed sophisticated techniques.

Iron-smelting came into existence 2,500 years ago, during the transition between the Spring and Autumn Period and the Warring States Period. By the Han Dynasty, the smelting and casting techniques of pig iron and of steel-smelting had developed rapidly. The Han iron-smelting site in Guying

County, Zhengzhou, has an area of over 60,000 sq. m.; the surface area of the hearths of two iron-smelting furnaces measured 8.5 sq. m., and the reserved iron in the furnace hearth weighed more than 20 tons.

By the Han Dynasty, even the technique known as "iron tempered one-hundred times" had appeared. A sword "tempered thirty times," 111.5 cm. in length, was unearthed in 1974 in Cangshan, located in Linyi Prefecture, Shandong. According to chemical and physical tests, its steel structure was rather homogeneous, containing a moderate amount of carbon, with a cutting edge of little inclusions (impurities) after being quenched. Engraved inscriptions on this sword record that it was made in 112 A.D., showing that, early in the Eastern Han Dynasty, we already practiced very sophisticated iron- and steel-smelting and forging techniques.

Our ancestors were already using gold and silver several thousand years ago. Even before the Shang Dynasty, there were gold utensils. Gold disks had been used as currency in the kingdom of Chu. The "gold-embroidered jade dresses" found in the Western Han Dynasty tomb of Prince Liu Sheng and his wife, the Princess Zhong Shan Jing Wang, were made of pieces of jade strung together by gold strands 0.14 mm. in diameter. The two dresses contained 1,800 g. of gold thread. The use of so much gold and the delicacy of the workmanship were both noteworthy at that time. Liu Yuxi, a Tang Dynasty poet, even wrote a poem in Guizhou, which read:

Sunshine over Chengzhou clears up river fog,
gold diggers — girl partners over the riverside
crowd; all beauty decorations and lords' signs
come from the depths of waves and
sands.

This famous poem vividly recorded the scene of Chinese workers in ancient times washing out gold on a large scale.

Slow Development. After the Opium War, China's metallurgical industry stagnated during the period of semi-feudal and semi-colonial rule. To provide materials for building railroads, the Hanyang Iron Plant (later reorganized as the Hanyang Daye-Pingxiang Co.), the first modern iron and steel plant in China, was set up in 1890 by Chang Zhidong, the Governor-General of Hubei and Hunan. But due to various policy errors with re-

gard to mineral analyses, site location and selection of equipment, the period of construction was too long, the technique inapplicable, and the economic effects even worse.

From the 1890's to 1948, about half a century, the cumulative steel output was less than 7 million tons. The highest yearly output (in 1943) was only 923,000 tons. The output of copper, tungsten, antimony, tin, mercury and other minerals was also small. Moreover, the refining industry had not been created. At the time of the founding of the People's Republic of China in 1949, the country ranked 26th in the world in output of steel, with only 158,000 tons. At that time, the total output of copper, lead, zinc, tin, antimony and other non-ferrous metals was very small, and, there was no indigenous production of aluminium, nickel and many other important non-ferrous metals.

Growth Since 1949. Despite this poor heritage, the country's metallurgical industry, under the leadership of the Chinese Communist Party, and relying on the efforts of hard-working people, has established an extensive integrated network of large, medium and small enterprises. The tremendous achievements we have made, unimaginable in old China, fully testify the superiority of socialism. The following are some major features of this development:

1. *Substantial rate of growth.* Between 1949 and 1979, iron production totalled 430 million tons, steel 397 million tons and rolled steel 278 million tons. In 1979, steel output reached 34.48 million tons, ranking fifth in the world. Compared with the 1.35 million tons produced in 1952, the average growth rate per year was 12.8%. During the same period, average growth rate per year in output of 10 non-ferrous metals reached 10.6%.

2. *Considerable improvement in industrial distribution.* While developing the metallurgical industry in the coastal areas, we simultaneously developed the inland metallurgical industry. While building big key enterprises, we simultaneously built medium-sized and small ones. The annual steel production potential of the large iron and steel enterprises in the coastal areas is currently as follows: the Anshan Iron and Steel Company, about 7 million tons; Shanghai, 5 million tons; the Capital Iron and Steel Company, the Tangshan Steel Plant, the Tianjin Steel Plant and the Benxi Iron and Steel Company, each more than 1 million tons. The inland iron and steel enterprises — such as the Wuhan Iron and Steel Company, the Baotou Iron and Steel Company, the Taiyuan Iron and Steel Company and the Panzhihua Iron and Steel

Company — each produced from 1 to 3 million tons. In all, we established more than 10 major new and enlarged iron and steel enterprises, more than 10 special steel plants, dozens of medium-sized plants and nearly 100 small iron and steel plants throughout the country.

The development of non-ferrous metals follows the same general pattern. Take the aluminium industry for example. We have built not only large new aluminium oxide plants and electrolytic aluminium plants, but also several large new aluminium processing plants. These large aluminium plants are located in Liaoning, Heilongjiang, Shandong, Inner Mongolia, Henan, Guizhou, Sichuan, Gansu, Ningxia and other places. In addition, many provinces, municipalities and autonomous regions have established their own small aluminium plants.

3. *Considerable improvements were made in the variety and quality of products.* Old China could produce only 100 kinds of common carbon steel; but now we can smelt more than 1,000 kinds, including high-temperature alloy steel for aeronautical use and pure iron for use in high-energy particle accelerators as well as precision alloys. Based on the special features of our own resources, we have set up a regime of alloy steels containing silicon, manganese, nickel, tungsten, molybdenum, vanadium, titanium, niobium, boron and rare-earth metals. In 1953 only about 400 specifications of steel materials could be rolled; now more than 20,000 specifications can be rolled.

Not only have we solved for the first time the problem of supplying a wide variety of and different qualities of many metal materials needed in the production of railroads, automobiles, airplanes, ships, agricultural machinery, heavy machinery, power stations, large factory buildings and light industry products, but we also have made many breakthroughs in the field of research and development of materials for sophisticated equipment. The materials needed to make atomic bombs, hydrogen bombs, missiles, artificial satellites and nuclear submarines can basically be produced by the domestic industry.

4. *The level of technical equipment in the metallurgical industry has been greatly advanced.* From 1950 to 1979, the total amount of state investment for basic construction in the metallurgical industry was 73,000 million yuan (including 55,700 million yuan for the iron and steel industry). By the end of 1979, the gross value of fixed assets of the metallurgical industry was 55,110 million yuan, and the net value was 39,450 million yuan. The total weight of equipment in the

industry reached 6.52 million tons.

Although some of the equipment is old and backward, dating to the 1950's and 1960's, the general metallurgical technical equipment level has been greatly improved. In mineral mining, we now have large rotary drills, large electric shovels and electric-drive wheel trucks. For making iron, we have a 2,580-cubic-metre blast furnace at the Anshan Iron and Steel Company, and a No. 2 blast furnace, with such advanced techniques as bell-less top and top combustion stove, at the Capital Iron and Steel Company. In steel-making, our largest basic oxygen converter reaches a maximum of 150 nominal tons; open hearth furnaces, 500 nominal tons; electric furnaces, 50 nominal tons; and our oxygen-making machines generate 35,000 cubic metres per hour. In steel-rolling, the highly automatic 1,700-mm. cold and hot continuous rolling mill of the 1970's has been introduced by the Wuhan Iron and Steel Company. At the same time, the Benxi Iron and Steel Company has installed a 1,700-mm. continuous rolling mill designed and made in this country.

5. *A huge corps of workers and cadres has been established.* By the end of 1979, China had a total of 3,107 metallurgical enterprises and business units; 2,313 productive enterprises, 219 basic construction units, 66 scientific research institutions and branches and 61 metallurgical colleges and universities. The total number of workers and staff in the metallurgical industry increased from 380,000 (at the end of 1952) to 3,810,000 (at the end of 1979). That figure includes: industrial production staff, 2,960,000; construction and installation staff, 480,000; geological survey staff, 112,000; survey project personnel, 35,000; scientific research staff, 39,000; and personnel in colleges, universities and technical schools, 36,000. Of the 3,810,000, 600,000 were cadres, of which 190,000 were engineers and technicians (including 110,000 university graduates).

While we have realized the achievements enumerated above in the past 30 years, we have also experienced an uneven road. Owing to sabotage by Lin Biao and the Gang of Four, and to the mistakes committed in our work, our metallurgical industry has been interested repeatedly and has suffered great damage. Otherwise, our achievements would undoubtedly have been even greater.

II. Forging Ahead in Readjustment and Restructuring

The correct line formulated at the Third Plenary Session of the 11th Party Central Com-

mittee and the policy of readjustment, restructuring, consolidation and improvement for the national economy put forth later by the Party Central Committee, pointed the way of advance for the metallurgical industry. For quite a long period of time, influenced by the guiding ideology of impetuosity and too-rapid advances, there existed in the metallurgical industry, particularly in steel, a number of problems. These included too much emphasis on the importance of basic construction while overlooking current production; achieving higher and quicker indexes but neglecting better and more economic results; focusing on smelting and mining while paying little attention to mineral mines; and stressing ore mining but overlooking driving in (stripping), etc.

It follows naturally that we have not attached adequate importance to economic gains, workers' livelihood, production security and environmental protection. In 1977 and 1978 some unduly large projects and high targets beyond the national ability were initiated. We rushed into construction of the Baoshan Iron and Steel Complex with indiscriminate purchases of imported equipment. All these undertakings were in violation of the principle of "acting according to one's capability," thereby aggravating the imbalance within and without the metallurgical industry.

It is urgent that we correct this state of affairs. The economic management system of "sharing alike without taking account of different contributions" has to be gradually reformed. The still very backward enterprise management, sabotaged during the 10 years of turmoil, needs even more vigorous consolidation and improvement. The metallurgical industry is confronted with an arduous task of readjustment and restructuring.

III. Major Achievements of 1980

Under the correct leadership of the Party Central Committee and the State Council, with the efforts made by all the workers and staff in the metallurgical industry and with assistance from various fronts, new achievements were made in the metallurgical industry. Some encouraging changes marking a significant turning point appeared in 1980. In that year, the metallurgical industry forged ahead in readjustment and restructuring. Following are some of the major achievements in 1980:

1. *Major branches of metallurgical production attained peak economic targets, with some attaining the best results ever achieved.*
2. *Product structure of the industry began to*

change, shifting gradually to production of consumer goods. In the past, as undue stress was placed on the development of heavy industry in the national economy, many enterprises did not grasp the idea of shifting metallurgical production to serving agriculture, light industry, the civil construction industry and the market; nor did they attach sufficient importance to producing metallurgical products of high quality and reasonable price so as to meet the needs of different sectors of the national economy. As a result, some

put of the four main kinds of products that had fallen short of demand — wire, small bars, sheets and welded tubes — went up from 12.08 million tons in 1979 to 15.51 million tons in 1980, representing an increase of 3.43 million tons, or 28.4% over the previous year. In 1978, the output of these four kinds of products accounted for only 44% of the total output of rolled steel, while increasing to 57% in 1980. In the meantime, the total output of three kinds of rolled steels whose production had exceeded demands — i.e., heavy

Table 1. 1980 Production of Some Key Metals

Items	Actual output in 1980 (in thousands of tons)	Compared with previous year	Historical comparison
Rolled steel	27,160	+8.8%	Best historical level
Crude steel	37,120	+7.7%	Best historical level
Of which:			
LD steel	15,090 (40.7% of total output)		
Open hearth steel	11,890 (32.0% of total output)		
Electric furnace steel	7,110 (19.1% of total output)		
Miscellaneous	3,030 (8.2% of total output)		
Pig iron	38,020	+3.5%	Best historical level
Total value of metallurgical industry output	43,027 million yuan	+4.9%	Best historical level

products badly needed by the state and the people fell short of demands in their variety, quantity and quality. For example, the supply of steel strips for making bicycles, tin plate for cans and wire for housing fell short of demand, with the result that portions or even most of the supply had to be made up from imports. On the other hand, heavy rail, steel for railway wheels and tires, and large-sized sections and plates which were unsaleable at the moment became goods whose supply exceeded demands.

In 1980, some encouraging changes began to take place in the metallurgical industry. These included readjusting product structure, increasing products in short supply, cutting down products that exceeded demands, raising product quality and fostering the idea of serving customers. In the case of rolled steel, for example, in 1980 27.16 million tons, or 2.19 million tons more than in 1979, were turned out. Of this quantity, the out-

puts, large-sized sections and plates — dropped to 4.23 million tons, a decrease of 560,000 tons or 11.7% compared with the previous year. The product orientation in the industry began to shift in 1980 to suit the market, with the following goals:

(1) To gear the products to demands, especially those of light industry and the market. For instance, the Shanghai No. 1 Steel Plant, No. 3 Steel Plant and No. 10 Steel Plant have increased production of 19 manganese steel strip by several thousand tons for the manufacture of high-grade and medium-grade bicycles; the Shanghai No. 5 Steel Plant raised the output of steel springs for clocks and watches to meet the needs of clock and watch manufacturing industries throughout the country; and the Shanghai Iron and Steel Research Institute succeeded in producing in large amounts a degasifying agent that prolongs the life of Chinese-made TV sets from 2,000 to 8,000 hours.

In the first year that the 1,700-mm. rolling mill at the Wuhan Iron and Steel Company came into commission, the hot rolling plant produced 880,000 tons of hot-rolled sheets, the cold-rolling plant produced 260,000 tons of cold-rolled sheets and the silicon steel plant produced 48,000 tons of steel sheet. Included in this production were products badly needed in light industry such as galvanized sheets (70,000 tons), tin plates (20,000 tons), enamel sheets (10,000 tons), steel strips for bicycles (44,000 tons), silicon steel sheet (13,000 tons), ship-building plates (45,000 tons) and plates for automobiles (150,000 tons). Besides supplying more than 1,000 customers inside China, nearly 50,000 tons of these products were exported. Although the new mill's production capacity is far from being fully utilized, its management level still rather low, and its product quality not up to customers' demands, it undoubtedly has great potential for shifting rolled steel to consumer goods production and serving the technical transformation of the national economy.

In the past, stainless steel sheets for making guide-rollers and winches used in enterprises under the Ministry of Textile Industry were all imported. However, after interviewing customers, the Fushun Steel Plant has trial-produced and tested such sheets successfully, and customers have begun to order the domestic product. Non-ferrous metal materials, which were used mainly in heavy industry and in production of military hardware in the past, have found new uses in the light and textile industries since 1980. For example, production of eight kinds of materials badly short of demand in light industry, such as aluminium foil, extra-thin aluminium sheets and copper antenna casings, increased by 42% in 1980 over the previous year. The Northeast Light Alloy Processing Plant, the Southwest Aluminium Processing Plant and some other plants also successfully trial-produced a wide variety of new civilian products, such as aluminium bicycles, aluminium doors and windows, aluminium sections for building and aluminium pipelines for agricultural irrigation sprinkling systems.

(2) To improve product quality continuously according to customers' needs. In 1980, 17 kinds of metallurgical products were awarded quality prizes by the government, and 158 kinds of products were chosen as high-quality products by the Ministry of Metallurgical Industry. Some of the gold-medal products — such as the "Yan" (Swallow) Brand super-surface aluminium sheet produced by the Southwest Aluminium Processing Plant and the shipbuilding plates and bars made by The Shanghai No. 1 Steel Plant, the Wuhan Iron and Steel Company and the Anshan Iron and Steel

Company — won favourable comment from customers abroad. In 1980, more than 90 key task teams were set up in the Anshan Iron and Steel Company to tackle problems relating to product quality. They concentrated on six common failings — i.e., impure steel, inferior properties, inaccurate dimensions, dim surface, indistinct markings and bad packaging. The quality of rolled steel was universally raised through the adoption of such measures as second refining and on-line testing. All of the workers and staff of the Northeast Light Alloy Processing Plant were mobilized to tackle quality problems associated with 227 kinds of products; in just one year, problems associated with 210 of them were solved. The three main problems — the oxidized film on forged pieces, the properties of magnesium alloy thin-walled shapings, and the surface corrosion of shaping material after more than 10 years — were all solved. The number of products honoured for high quality increased from 16 in 1979 to 55 in 1980. One such product, the heavy, deep-drawing 08 rolled steel plates for automobiles was awarded a gold medal by the government. The extra-fine aluminium powder was awarded a silver medal. Nevertheless, judging from the overall situation, the quality of many of our metallurgical products is still not as high as that of similar products produced by the advanced nations and there remains much room for improvement.

(3) To visit consumers and to make market surveys and economic forecasts aimed at serving consumers. In 1980 the Ministry of Metallurgical Industry arranged an investigation and forecast on the supply of and demand for rolled steels. A group led by a vice-minister and directors of the departments in charge of the specified work visited customers in the textile industry and other light industries. Sales or market survey departments were set up in key enterprises and under the bureaus of metallurgy of the provinces, municipalities and autonomous regions, and many visits to consumers, surveys, forecasts and customer services were organized.

For example, a sales section staffed by engineers and technicians who specialize in market surveys and customer service was set up in the Shanghai Smelter in 1980. During the year they edited more than 20 issues of a market information newsletter and solved a great number of problems put forward by customers. On learning that powder of aluminium-clad nickel could not yet be produced in China and had to be imported, the team earnestly went about studying and experimenting, and finally succeeded in turning out the material in quality up to world standards and supplying 52 customers throughout the country.

The Fushun Steel Plant set up a technical service section, under the leadership of its director, especially geared to the needs of customers and staffed by a number of engineers and career experts. It offered such technical services as: advising customers on how to select desirable materials, helping customers make technological innovations, solving problems concerning product quality, meeting customers' specific needs and undertaking product finishing for customers. By doing all this, the plant closely integrated production technology with demand, gained respect and opened up new markets.

3. *Energy consumption was further reduced, and the industry strived for new growth by saving energy in metallurgical enterprises.* The metallurgical industry, especially steel, is a major consumer of energy. In 1979 the amount of energy consumption in the industry totalled 83.26 million tons of standard coal (of which the steel industry consumed 72.69 million tons), representing 14.2% and 12.4%, respectively, of the total energy consumption of the entire country. The overall energy consumption per ton of steel was as high as 2.28 tons, almost double the amount consumed in production of steel by advanced methods abroad. The average overall energy consumption per ton of steel in key enterprises was as high as 1.57 tons.

Such high consumption was something the country could hardly afford. It was detrimental not only to the development of light industry and the national economy as a whole but also to the development of the metallurgical industry itself. Only by steadily reducing energy consumption can the metallurgical industry make further progress.

In 1980 most of the metallurgical enterprises made great efforts to save energy. Energy management was enhanced, technical reforms and structural reconstruction were initially centred on energy-saving, and a preferential energy supply policy was put into practice. As a result, while steel output in 1980 increased by 2.64 million tons over 1979, total energy consumption (70.9 million tons) decreased by 1.79 million tons of standard coal. An increase in output was thus achieved with less energy consumed.

In 1980 the average overall energy consumption per ton of steel in key enterprises dropped to 1.47 tons, and the charging coke ratio per ton of iron decreased from 553 kg. in 1979 to 539 kg. in 1980. Among the large integrated iron and steel works, the Anshan Iron and Steel Company did better than others. Its overall energy consumption per ton of steel dropped to 1.225 tons of standard coal and its comparable energy consumption to 1.014 tons of standard coal. The Hangzhou Iron and Steel Plant was the best among the medium-

sized integrated iron and steel works. Its overall energy consumption per ton of steel declined to 1.433 tons of standard coal and its comparable energy consumption to 1.101 tons of standard coal. Both plants succeeded in saving energy while increasing output.

In the non-ferrous industry, a total of 400,000 tons of standard coal was saved in 1980 as compared with the previous year. The electrical energy consumption per ton of aluminium in key aluminium plants was reduced from 15,820 kwh in 1979 to 15,432 kwh in 1980, the lowest level ever attained. The electrical energy consumption per ton of aluminium in the Fushun Aluminium Plant, the Zhengzhou Aluminium Plant and the Baotou Aluminium Plant even fell below 15,000 kwh.

4. *The economic viewpoint was strengthened, and much importance was attached to economic results in the metallurgical industry.* For a long time there has been considerable waste and undesirable economic results in the metallurgical industry. From 1950 to 1979, total capital investment of 73,100 million yuan was granted by the state to this industry, while total profit and tax revenues of the industry amounted to merely 90,700 million yuan. In other words, the amount of profits and taxes for each yuan invested averaged only 1.24 yuan (only 1.1 yuan for the iron and steel industry). This was less than half of the average return (2.8 yuan) achieved by all industrial sectors of the country during the same period. Calculated by profit and tax rate of capital —

$$\frac{\text{profit}}{\text{net value of fixed assets} + \text{holding amount of circulating capital}} \times 100\%$$

— the figure for the metallurgical industry was only 11% in 1979 against 16.5% for all industrial sectors of the country. This wide gap was due mainly to inadequate attention to economic results in the past.

In 1980, the economic point of view was universally strengthened and great efforts were made to increase income and reduce expenditures. Remarkable economic results were achieved. The net profit of the entire metallurgical industry was 6,825 million yuan in 1980, increasing by 17.7% over 1979 and exceeding the growth rate of output value (4.9%) for the same period by a large margin. It was also higher than the growth rate of the output of steel (7.7%), of 10 kinds of non-ferrous metals (8.9%), and of gold (15.9%) for the same period.

Enterprises that achieved a large increase in output value (annual growth rate over 20%) included the Benxi Iron and Steel Company, Xiang-

tan Iron and Steel Company, Baotou Iron and Steel Company, Wuhan Iron and Steel Company, Capital Iron and Steel Company, Chongqing Iron and Steel Company, Hebei Provincial Metallurgical Bureau, Kunming Steel Plant, Hangzhou Steel Plant, Anyang Steel Plant, Yunnan Smelter, Baotou Aluminium Plant, Shaoguan Smelter, Daye Non-ferrous Metals Company, Southwest Aluminium Processing Plant and Zhuzhou Smelter.

The Hangzhou Steel Plant incurred long-term losses in the past, and by the end of 1977 its net losses totalled 86.06 million yuan. It then began to make up deficits and increase surpluses and realized a profit of 19.31 million yuan in 1978, 33.81 million yuan in 1979 and 47.52 million yuan in 1980 (up by 41% over 1979). In 1980, the profit margin of capital for the Hangzhou Steel Plant was 27.3%, showing that all the capital investment can be returned in three years and eight months.

In 1980, because some small and medium-sized local iron and steel enterprises with poor economic results stopped production, closed down, merged with other enterprises or shifted to make other products, and because management and administration were improved, the long-term losses of the past were reversed. The net loss of 292 million yuan in 1979 changed to a net profit of 474 million yuan in 1980, marking a fundamental turning point. For the metallurgical industry as a whole, both the profit and tax rate of capital and the profit margin of 100 yuan output value rose in 1980 as compared with the previous year, while the holding amount of 100 yuan circulating capital decreased. In the same year, seeking to make gainful use of idle hours, some capital construction teams ("seeking rice for cooking"), contracted projects valued at 520 million yuan from other sectors, thus making a contribution to the national economy.

It is worth noting that economic research organizations were set up in 1980 by the Ministry of Metallurgical industry, by provincial bureaus and by metallurgical enterprises. The Research Institute of Metallurgical Economy was founded under the ministry at the end of 1979. Economic research institutes were set up in the Anshan Iron and Steel Company, Benxi Iron and Steel Company, Taiyuan Iron and Steel Company, Wuhan Iron and Steel Company, Baotou Iron and Steel Company, Shenyang Smelter and Fushun Aluminium Plant. Economic research offices were set up by the Chongqing Iron and Steel Company, Qiqihar Steel Plant, Fushun Steel Plant, Xinfu Steel Plant, Kunming Steel Plant, Chengdu Seamless Steel Tube Plant, Changzhi Steel Plant, Lianyuan Steel Plant and Shenyang Metallurgical Machinery Plant. The Huludao Zinc Plant organiz-

ed an economic research group. Economic research offices or groups were also set up under the Shanghai Municipal Metallurgical Bureau and the metallurgical bureaus of Hebei and Jilin provinces. By integrating various professional groups with the broad masses and focusing on achieving better results in the industry and in enterprises, these economic research organizations combined theory with practice, implemented readjustment policy as the heart of their work and carried out investigations aimed at meeting specific needs. As a result of these steps, they began to play a definite role in providing reference information to leading cadres for decision-making and to those who are in direct charge of economic work.

5. Initial reforms of systems and structures in the metallurgical industries were carried out to continue expanding decision-making powers in some enterprises on a trial basis and to stimulate the enterprises. By the end of 1980, 277 metallurgical enterprises had been given expanded powers of self-management on a trial basis. Although they represented only 12% of all existing metallurgical enterprises, their output value accounted for over 70% and their total profit more than 80%. Experience to date shows that the reforms were correct in orientation, the results were remarkable and the economy and management of these enterprises were enlivened.

First of all, the reforms stirred the enthusiasm and initiative of workers and staff members of the enterprises. By assigning more financial power to enterprises and by linking power, duty and profit on an economic basis, the state gets more revenue, the enterprises receive a greater share of profits, and the workers and staff members earn more. The above-mentioned enterprises whose profit growth was over 20% in 1980 were all enterprises that undertook self-management on a trial basis. This policy resulted in increasing income and reducing expenditure.

For instance, by implementing the rule of sharing the increased profits among all its enterprises and factories, the Shanghai Metallurgical Bureau yielded a profit of 1,345 million yuan in 1979, a 20% increase over 1978. In 1980 this bureau showed a profit of 1,470 million yuan, 31.2% over that for 1978. During these two years, a total profit of 2,580 million yuan was turned over to the state (340 million yuan more was collected by the state). Consequently, the Shanghai Bureau will no longer ask the state or local authorities for capital investment, funds for renewal of equipment and funds for trial production.

Secondly, we discarded the dictum that "means of production are not commercial goods."

As a result of implementing the policy of combining regulation by planning with market regulation, some enterprises have been encouraged to sell their own products under the guidance of central plans. Some large enterprises, such as the Chongqing Iron and Steel Company, the Taiyuan Iron and Steel Company, the Southwest Aluminium Processing Plant and the Chengdu Seamless Steel-pipe Factory were all languishing because orders from the state amounted to only 40%–60% of their production capacity. The policy that producers could sell their own products not only saved the above enterprises from having to cut down production but also increased the variety of products, promoted quality, improved service and raised the level of management.

In 1980, key state-owned steel enterprises were able to sell 2.5 million tons of steel products on their own in addition to fulfilling the production quotas set by the state. Their independent sales accounted for 14% of total sales. The 2.5 million tons, together with 8.57 million tons produced by local medium- and small-sized enterprises (whose products are distributed by local authorities instead of the state), amounted to 11.07 million tons, about 40.8% of total steel products. Likewise, sales of non-ferrous metal products by the producers in 1980 was about 42% of total output, and that of rare metal products, 80% of the total.

Thirdly, the Ministry of Metallurgical Industry established the China Metallurgical Import and Export Corporation (CMIEC) in April 1980. Under the guidance of the unified foreign trade policy, the enterprises and companies can engage in foreign trade. By the end of 1980, CMIEC signed more than 300 contracts for exporting various metallurgical products. With total sales of over US\$200 million, it received US\$62 million in foreign exchange. Products exported included pig iron, rolled steel, ferro-alloys, iron castings, steel castings, various non-ferrous metal and rare metal products, bauxite and graphite electrodes. CMIEC has done business with over 120 customers in 16 countries.

The high quality of certain export products, such as pig iron, sponge titanium, titanium ingot, Swallow Brand aluminium sheet with superior surface, etc., has been recognized by some foreign traders who honour these products as "credible" products. This foreign trade system, which brings producers into direct contact with trade circles and brings together production with needs, was well-accepted by foreign businessmen for the convenience that both buyers and sellers were familiar with production techniques.

The above reforms are but preliminary steps. Because of a lack of experience, some short-

comings and faults could be found in the past. However, we have taken the right way forward, as indicated by the achievements and results. As long as the reforms are advantageous to readjustment in the future, we will keep on making them and build on our experiences for further improvement.

6. *The metallurgical industry made further efforts to enhance gradually the tasks in ore mines, improved the management of enterprises and raised the level of science and technology.* In 1980 the industry also carried out the training of personnel in whole establishments, attached more importance to safety measures and environmental protection, as well as gradually raising the level of the workers' material and cultural well-being. It was a year in which achievements were made in all sectors of the metallurgical industry.

IV. Outlook for the Industry

Over the past 31 years, the metallurgical industry has had a history of twists and turns, with positive and negative experiences. One lesson is clear, we must proceed from China's actual realities and capabilities and strive for real and practical results. In the past we took a route not in keeping with our national strength, anxious to gain success, blindly seeking to fulfil quantitative targets, regardless of the need for scientific integrated balance, and paying no attention to the variety, quality and economic effect of products. This approach led to heavy investment, wasteful consumption, high costs, poor quality, low efficiency and little profit.

Experience has proved that this approach was impractical and should be avoided. From now on, we should adopt a new approach that sets targets and speed within our reach. The variety of products should be suitable (in terms of serving the consumer, the technical improvement of the national economy and national defence); their quality should be reasonably better; consumption (especially energy consumption) should be relatively lower; efficiency should be higher; and the economic results much larger and less costly.

Weakness in the Industry. The iron and steel industry and the non-ferrous metals industry fall into the category of industrial raw materials, essential to the national economy and the people's livelihood. They are crucial to the development of the national economy and the realization of the Four Modernizations. Our current metallurgical industrial products, with respect to their variety, quality and quantity, are not suited to the deve-

lopment of the national economy.

From 1949 to 1980, imports of all types of steel materials totalled about 70 million tons, approximately equal to 23% of the country's output during that period. Imported copper and aluminium were approximately equal to 48.7% of the output of this country during that period. These figures indicate that our self-sufficiency in metallurgical products is still very low.

In keeping with the changes in the national economic structure, demands for iron and steel may be lower than in the past, but the requirements in the range of variety and quality will be much stricter and higher. Therefore, as national strength permits, it is still very important to pay adequate attention to developing the iron and steel industry and the non-ferrous metals industry, especially with regard to the range of variety and quality. But, for the purpose of reducing the burden on our country's financial, material and energy resources, we must first consolidate the present foundation and realize its full potential.

Readjustment Goals. The readjustment of the metallurgical industry is a very difficult task, impossible to accomplish in one or two years. We

must do our utmost to complete the readjustment during the Sixth Five-Year Plan. With regard to the metallurgical industry itself, in addition to the cutbacks in basic construction in 1981, the main points of readjustment should be the following: (1) the weakest link, the condition of mines, must be readjusted and improved; (2) the range of products and product quality must be improved; (3) energy sources must be further conserved; (4) the non-ferrous metal industry must be emphasized; (5) the level of management must be raised; (6) scientific and technological work must be strengthened considerably; (7) training and education of personnel must be energetically addressed; and (8) we should raise the standard of living of workers and cadres, see to safety in production and environmental protection.

When readjustment is completed, by 1985, the metallurgical industry is expected to have a much more solid material foundation, especially in terms of mines, the variety and quality of products and energy savings, and great progress should have been made in technical levels and enterprise management. By that time, the output of non-ferrous metals and rolled steel should also have been raised.

22. CHINA'S CAPITAL CONSTRUCTION IN 1980

By Kang Zhixin

*Institute of Economic Research,
State Capital Construction Commission*

Capital construction is an important means of expanding reproduction in socialist society. Its present task is to expand the existing scope of fixed assets and form new fixed assets through the economic activities of construction, expansion, reconstruction, restoration and purchase. Thus, it is an important component of socialist accumulation. Capital construction not only provides new productive capacity and advanced equipment and technologies to various material-producing departments — including industry, agriculture, communications, posts and telecommunications, construction and commerce — but also affects the industrial structure and the rational distribution of the productive forces in different parts of the country. At the same time, capital construction furnishes a material basis for social development and improvement in the living conditions of the people.

I. The Effects of Large-Scale Capital Construction

Since the founding of New China, the country has successfully engaged in capital construction on a large scale and has played an important role in the development of the national economy. Between 1950 and 1979, China invested 651,700 million yuan in capital construction and added new fixed assets amounting to 454,100 million yuan. Hundreds of thousands of factories, mines, railways, harbours, highways, post and telecommunication facilities, water conservation projects, and commercial, scientific research, cultural, educational and medical establishments have been put into operation or service. There are now 400,000 industrial and transport enterprises owned by the whole people or collectively owned, more than treble the number in 1949.

Broad Achievements and Changes. Large-scale capital construction has increased the productive capacity of China's modern industry. The new fixed assets of industry in the 30 years ending in 1979 were 21 times those accumulated in old China for nearly 100 years. By 1979, steel-making capacity had increased 35 times, ranking fifth in the world; coal mining capacity had increased 10 times, ranking third in the world; power generating capacity had increased 29 times; and

the number of cotton yarn spindles had increased more than 3 times. Gone are the days of old China, when the output value of modern industry accounted for only 10% of the total industrial and agricultural output value.

China's economic structure has been changed by large-scale capital construction. Many industries or trades that had not existed or had been backward in old China were built or expanded, and an independent and all-embracing national economic system began to take shape. The metallurgical, machine-building, chemical, petroleum, power and coal industries grew rapidly, putting an end to old China's dependence on other countries for many heavy industrial products. The light and textile industries also expanded considerably. Many new industries, such as motor vehicles, tractors, airplanes and electronic computers, were established.

The total length of new railways and highways rose 2.3 times and 11 times, respectively, since 1950. Water conservation projects were built on a large scale. Progress was made in efforts to bring the Haihe and Huaihe rivers under control. China built 164,000 kilometres of dikes and dams and 82,000 water reservoirs that can hold more than 40 million cubic metres of water and irrigate 45 million hectares of farmland, or 45.2% of the country's total farmland.

Large numbers of scientific, cultural, educational and medical establishments, urban public utilities and housing estates sprang up. Total floor space of new housing built in the urban areas in the 30 years was 594,280,000 square metres; newly laid running water pipes totalled 27,000 kilometres; and urban roads totalled 18,000 kilometres. All this contributed to the development of social undertakings and to the improvement of the material and cultural life of the people.

Large-scale capital construction changed the geographical distribution of China's industry. In the past 30 years, about 40% of China's capital investment went into the construction of projects in the hinterland and in areas inhabited by minority people. Investment in the hinterland accounted for 54% of total investment in 1979, compared with 39% in 1952. The number of factories and mines operating in northwest and southwest China increased from 300 in 1952 to 80,000 in 1979.

Compared with 1952, the proportion of the

fixed assets of state-owned industrial enterprises to the national total rose from 27.1% to 53.6%, the proportion of steel increased from 14.2% to 34.4%, coal from 52% to 63.9%, electric power from 35.7% to 45.3% and cotton yarn from 17.5% to 37.2%. The growth of industry in the hinterland that began almost from scratch introduced a change in the exceptionally irrational geographical distribution of industry left over from old China.

The programme of large-scale capital construction has tempered and expanded the ranks of workers and technicians. In 1979, workers and staff members employed in the state-owned construction enterprises throughout the country totalled 4.63 million, of which 268,000 were surveyors and designers. The two figures were 5 times and 11.6 times, respectively, as large as in 1952. These employees have undertaken the design, construction and assembly of hundreds of thousands of projects, as well as many major overseas projects. The 156 large and medium-sized projects built during the First Five-Year Plan period (1953-1957), the Panzhihua Iron and Steel Complex built in the 1960's, the dozen imported chemical fertilizer and fibre plants built in the 1970's and the Gezhouba Hydroelectric Station (the first key water-control project on the Yangtze River, now under construction) all reached fairly high levels of speed and quality. Construction workers and technicians have become one of the important props for the development of China's national economy.

Major Problems. However, there also were major setbacks in capital construction under the influence of "Left" deviationist mistakes.

The outstanding problems in that period were:

(1) The scale of investment was over-extended. For many years the scale of capital construction squeezed national economic capabilities, resulting in a high rate of accumulation. There were financial deficits in a number of years. Not only did this strategy aggravate the imbalance among agriculture, light industry and heavy industry, but it also seriously hampered the improvement of the people's livelihood.

(2) The investment was not properly distributed. Of the total investment in the past 30 years, investment in agriculture accounted for 11.2%, light industry 5.9% and heavy industry 50.9%. This resulted in a lopsided development of the national economy. Within the heavy industry sector, the proportions of investment between the metallurgical, machine-building and chemical industries and the fuels, power, building materials

and communications industries were not properly balanced. Industries in the coastal areas were not fully utilized and developed, while the development of new industries in the hinterland was over-emphasized. As a result, a large number of projects failed to operate at full capacity.

(3) The returns from investment declined. The proportion of newly added fixed assets to investment fell from 83.7% during the First Five-Year Plan period to about 70% in recent years, and the average period of construction rose from six years to ten years or even longer.

In short, we overemphasized capital construction and gave inadequate attention to production, high accumulation rate and low efficiency in the more than 20 years after 1958. The problems did not receive any attention until the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party adopted the policy of readjusting the national economy and initialled measures to solve them.

II. Implementing the New Policy

The focal point of capital construction in 1980 was to implement the policy of readjustment, restructuring, consolidation and improvement of the national economy. Total investment amounted to 53,900 million yuan, and the newly added fixed assets totalled 42,700 million yuan, of which 79.2% was put to use. New projects completed included 82 large and medium-sized multi-item projects and 216 large and medium-sized single-item projects. The new capacity for major products included: 8.29 million tons of coal, 5.75 million tons of petroleum, 2.87 million kilowatts of electric power, 2.74 million tons of iron ore, 3.38 million tons of rolled steel, 60,000 tons of chemical fibres, 1,008 kilometres of railways, 8.14 million tons of handling capacity at harbours and 807,000 cubic metres of petroleum tanks for commercial departments.

Major projects that began operation in 1980 included: the Maotiaohe Hydroelectric Station in Guizhou; the Tianshenggang Power Plant in Jiangsu; the Yaomeng Power Plant in the Pingdingshan coal mines in Henan; the Lanzhou Vinyon Plant; the Dandong Chemical Fibre Plant; the railroad between Changping, north of Beijing, and Tongliao in Inner Mongolia; two coal mines, each producing 600,000 tons per year, in Shanxi and Henan; part of the installations at the Liaoyang Chemical Fibre Plant and the Sichuan Vinyon Plant; and sections of the Xiangfan-Chongqing, Shijiazhuang-Taiyuan and Longhai

railroads now being electrified. These new projects have helped to ease the shortage of energy, consumer goods and transport capacity.

Important Steps Taken. In 1980 the projects under construction were reexamined, the scale of investment within the framework of the state budget was reduced and the proportions of investment among the different branches of the national economy were readjusted. In 1979, 295 large and medium-sized projects and 1,600 small projects were halted or postponed, and 584 projects were partially halted or postponed. The reduction of investment in these unfinished projects amounted to 11,500 million yuan.

In 1980 another 120 large and medium-sized projects and 839 small projects were halted or postponed, and 406 projects were partially halted or postponed. The investment reduction in these projects amounted to 9,800 million yuan. By the end of 1980 the number of large and medium-sized projects under construction had dropped to 904, from 1,187 at the end of 1979.

At the same time, some of the provinces, municipalities and autonomous regions also halted some of their local projects that had been arranged as technical measures to increase the current year's production but actually had the character of capital construction. Some departments and local governments invited technical and economic specialists to discuss the feasibility of some vital projects from the standpoint of their impact on the overall development of the national economy and society, as well as of their impact on construction and production conditions in specific sectors and locales.

Preliminary readjustments were made in 1980 to the disproportionate distribution of investment among the different departments, industries and localities, which had been a long-standing problem. The proportions of investment for the light, textile and energy industries, communications and non-production projects were raised, and priority was given to investment in projects in the weak branches of the national economy and projects that directly concern the people's livelihood.

The proportion of investment in the light and textile industries rose from 6.4% in 1979 to 9.1% in 1980, and that in heavy industry dropped from 45% to 42.7%. Within heavy industry, the proportions of investment in the national defence, chemical and machine-building industries also declined markedly. The proportion of investment in productive projects dropped by 6.7% as compared with 1979, while that in non-productive projects rose from 27% to 33.7%. Investment in housing projects increased from 14.8% in 1979 to 20%, and the total floor space completed was 82.3

million square metres, 31.6% more than in 1979 and a new record since 1949. Investment in cultural, educational, medical and scientific work also increased. The floor space of new buildings for universities and colleges totalled 2.83 million square metres, basically enough to meet the needs of new students enrolled in 1980. A number of professors and other college teachers moved into new homes.

Urban public utilities and urban construction also grew rapidly. The shortages of water, power, urban transport, commercial establishments and warehouses were eased in some cities. Moreover, the government strengthened its leadership over the construction of housing in the rural areas and supplied more construction materials and housing designs to the peasants. About 5 million peasant families built new homes or rebuilt their homes in 1980, with a total floor space of 300 million square metres. The readjustment of the capital construction programme greatly helped the government to reach the goal of readjusting the national economy.

Management Changes. Progress was made in restructuring the management system for capital construction in 1980 by building on past experience and improving the experimental work. During the year the experiment of replacing government allocations with bank loans in capital investment was introduced in 28 municipalities, provinces and autonomous regions and in more than a dozen industries covering power, textiles, coal and petroleum. The number of projects financed with bank loans increased to 4,414, with a total value of 2,650 million yuan.

In the past, capital investment was made in the form of government allocations without compensation, and the economic liabilities, results and interests were not directly linked. As a result, the units that needed new construction were very energetic in applying for investment, but showed less interest in increasing returns from that investment.

In 1979 the State Council decided to introduce a new method of issuing bank loans in capital investment for state-owned enterprises. The Bank of Construction issues loans to enterprises that have the ability to pay back, and the enterprises are required to repay the loans with interest from the shares of profits they retain or from other revenues under contracts they sign with the Bank of Construction after the projects begin operation. After the new method was introduced, all units requiring construction had to select their best construction plans and watch their spending. This helped to put an end to the construction of unnecessary projects and to careless spending of

investment funds without regarding to economic returns.

The experiment of expanding the power of management was begun in construction enterprises in all provinces, municipalities and autonomous regions and in some industrial ministries. The earning of legal profits by the construction industry, which had been cancelled for many years, was restored. The construction enterprises in Liaoning and Shanghai introduced the practice of sharing part of the profits in excess of specified amounts to be turned over to the state. The bureaus of construction industry in some provinces, municipalities and autonomous regions were changed to bureaus of enterprises. Commercialization of construction products began in housing construction in some cities.

These preliminary steps improved the management of the construction enterprises, providing them with the incentive to run production more efficiently, and laid the foundation for gradually turning the construction industry into a genuinely independent material-producing department of the national economy.

Ninety survey and design units began to organize their work along business lines. Units that received more assignments greatly increased their output, and those that were given fewer assignments gained the initiative to contract for more projects to balance their revenues and expenditures or to have a small surplus. By charging for what they design, the design units have enhanced their sense of responsibility and at the same time retained part of their profits for buying new instruments and equipment and improving the livelihood of their workers and staff.

Other Reforms Undertaken. The reform in the system of capital construction involves a number of other reforms in economic management, such as the state planning system, the financial system and the supply system. The situation is complex, however, and new experience has to be absorbed and more experimental work done in a planned way.

Great efforts were made in the reorganization and consolidation of the construction ranks and enterprises. A nationwide survey of construction enterprises, the most extensive since the founding of New China, was conducted in 1980. Most of the provinces, municipalities and autonomous regions issued licences to the qualified enterprises. Work is now being done to survey, register and check the survey and design units and issue them certificates.

Many localities and departments have strengthened the leadership of enterprises in the construction industry, reassessing the professional competency of engineers and technicians, giving them titles and promotions and thus upgrading the

technical management system. Many professionally competent engineers and technicians were promoted to leading positions at different levels. Technical training was provided in many localities and departments, and a large number of leadership of construction departments and enterprises attended advanced study courses. The training of specialized personnel will help raise the management level of the construction industry in China.

An incentive drive aimed at building top-quality projects was started in some of the construction enterprises, greatly helping to improve enterprise management and the practice of economy. In some parts of the country, the enterprises were given more management authority and began to introduce a contract system.

Total construction and assembly by the construction enterprises throughout China in 1980 was valued at 36,700 million yuan, up 10.6% over 1979. The total floor space finished in 1980 was 145 million square metres, 20.8% more than in 1979. The per-capita labour productivity of the state-owned enterprises was 4,240 yuan, 6.2% more than in 1979. At the same time, all construction enterprises strengthened the education and training of their staff and workers to lay an even better foundation for a new construction boom.

III. Problems Caused by Over Extension

Progress was made in capital construction in 1980, but as a whole economic returns on the investment in capital construction did not increase much, and in some instances even declined. Only 8.3% of the large and medium-sized projects under construction were put into operation, compared with 9.7% in 1979. Annual targets for new capacity were reached in only 18 of the 34 major projects. The productive capacity of 27 projects was less than in the preceding year.

The principal factor affecting economic results was the over-extended scale of capital construction. This was manifested in the fact that while investment in the state budget was cut by 24.9% as compared with 1979, investment not included in the state budget — namely, capital funds pooled by the local governments, ministries and enterprises in various forms — increased by 56.2%. The actual annual investment totalled 53,900 million yuan, 7.8% more than in the peak year of 1979.

Roots of the Problem. The three main causes of the over-extended scale of capital construction in 1980 are as follows:

(1) Some of the major projects that should have been halted or postponed were not halted early enough. While the number of large and medium-sized projects under construction was reduced by 283, the scale of large and medium-sized projects started was so great that the overall capital construction programme was by no means reduced. An additional investment of 130,000 million yuan would be needed to complete all the large and medium-sized projects still under construction at the end of 1980. Assuming an annual investment of 21,800 million yuan, it would require six more years to finish all these projects. As a matter of fact, total investment in the coming years will be cut greatly, and therefore even more years would be needed.

(2) As the policy of maximizing advantages was not correctly understood in some areas, construction of unnecessary projects became a serious problem in the absence of guidance and overall balance in state planning. For example, by the end of 1979, there were 16.6 million cotton yarn spindles, but if all those were put into operation there would be a shortage of one million tons of cotton to supply them. Despite this excess capacity, new cotton mills with 2.6 million spindles were built or were being built in 1980.

The problem was even more serious in the wasteful construction of small tobacco factories, small wineries, small silk mills and other small enterprises. Statistics showed that more than 6,100 small projects, each with an investment of 100,000 yuan, were started in 1980. This not only directly extended the scale of capital construction, but led to competition with large and old factories for raw materials and electric power. The small factories replaced the large ones and backward processes replaced advanced ones, affecting the economic returns of the existing enterprises.

(3) Because funds not included in the state budget for capital construction could be obtained through more and more channels and no proper measures were taken to achieve an overall balance, the scale of capital construction not covered by the state plan got out of control. It was estimated that more than 40% of the funds set aside for technical innovation and revamping of outmoded equipment, as well as medium-term and short-term bank loans for replacing old equipment, were used to build new projects. In some cases, circulating

funds and major overhaul funds were used for capital construction, thus disrupting existing production process. Not only was simple reproduction affected, but expanded reproduction became virtually impossible.

Because the scale of capital construction exceeded the capacity of the nation's financial and material resources, and because of other problems, the rate of accumulation remained as high as 32% in 1980. Even more serious, a large financial deficit had to be maintained to keep capital construction going, thus aggravating imbalances in the state budget, credits, supplies and foreign exchange reserves. The bank issued more currency for financial reasons and money in circulation exceeded the supply of commodities leading to a price rise and potential danger to China's economy. If this situation were to continue, the benefits gained by the workers and peasants would be lost again.

The Road Ahead. It is essential, therefore, to eradicate vigorously the influences of the "Left" deviationist mistakes in capital construction by taking practical and effective measures to reduce the scale of capital construction to a level suited to the nation's current capabilities and by halting a large number of projects. At the same time, it is also necessary to deal properly with problems arising from the cessation of the projects, reducing the losses to a minimum, and using the capital funds mainly for speeding the construction of projects that are vital to the national economy and to the people's livelihood. This is a task of paramount importance for capital construction in China.

At the end of 1980, the party and government decided to readjust the national economy further. It was made clear that the scale of capital construction would be further reduced in the course of economic readjustment. Looking ahead, we are confident that, as long as we draw lessons from the economic work over the past 30 years and firmly adhere to the policy of readjustment, restructuring, consolidation and improvement of the national economy, we will find a new road in capital construction based on the new foundation, a road that requires less investment but yields greater returns, so as to make further contributions to the steady improvement of the material and cultural life of the people.

23. CHINA'S BUILDING MATERIALS INDUSTRY

By Zhong Jianwen

Research Office,

Ministry of Building Materials Industry

I. Development of the Building Materials Industry in Modern China

China has a long history in the production and use of building materials. However, up to the time of Liberation, the building materials industry was underdeveloped — there being only a few enterprises, all of whose equipment was out of date and mostly operated by manual labour — characterized by low productivity, poor product variety and quality. The building materials used for foreign style multi-storied buildings before Liberation were almost entirely imported. In 1949, there were only some 40 small enterprises turning out cement, sheet glass and ceramic sanitary wares. Output of cement was only 660,000 tons; sheet glass, 1.07 million standard crates (10 sq. m. of glass with a thickness of 2 mm. is counted as one standard crate); and the total value of building materials in the entire country was only a little more than 50 million yuan (statistics given above do not include Taiwan).

Since the founding of New China, the building materials industry has developed greatly in line with progress throughout the national economy. Between 1952 and 1980, national investment in building materials totalled 8,000 million yuan. In this period, more than 100 large and medium-sized new factories were set up, 40 large and medium-sized old factories were expanded, and construction was underway on dozens of new plants. In addition to the enterprises built with state investment, many smaller enterprises were set up with investments from local governments and people's communes.

Today, there are 46,000 plants of all sizes turning out building materials in China; they employ a total of 3,800,000 workers and staff. Of the 46,000 plants, 5,300 are owned by the whole people — i.e., state-owned — employing 1,600,000 workers and staff, and 40,000 are collectively owned, with 2,200,000 workers and staff. In 1980, the output of cement was 79.86 million tons, a total increase of 121 times over 1949, or an average increase of 16.7%. The output of plate glass was 27.71 million standard crates, a total increase of 25.7 times over 1949, or an average annual increase of 11%. The total value of building materials in the entire country in 1980 was 18,180 million yuan, an increase of 361 times over 1949.

Not only the output but also the variety of

building materials and non-metallic mineral products has increased remarkably. New lightweight building materials have been developed and successfully produced. The geographical distribution of factories has been rationalized to a great extent. Scientific and technological levels in the industry have risen significantly. Today, the building materials industry occupies an important place in the raw materials industry within the national economy; it plays a vital role by providing materials for industrial and agricultural construction, for residential buildings in rural and urban areas and a range of non-metallic products and new inorganic materials for use by various sectors of the national economy.

The Post-1978 Readjustment. Since the Third Plenary Session of the 11th Central Committee of the Party held in 1978, the building materials industry has undergone readjustment in accordance with various principles and policies, and has yielded excellent results. In 1978 and 1979, production increased steadily. The total value of the building materials industry in 1979 increased by 8.7% over 1978, and in 1980 it increased by 5.5% over 1979. The output of principal products exceeded the quotas set by the national plan.

Cement output in 1979 increased by 13.3% over 1978, and by 8.1% in 1980 over 1979. The quality of products has been improved on the whole. High-grade plate glass accounted for 77.8% of the total output of plate glass, an increase of 4.92% over 1979. In the last two years, the state has awarded prizes for high quality to 21 building materials plants; 3 received gold medals and 16 received silver medals.

In 1980 about 2.5 million tons of standard coal were conserved throughout the country. In large and medium-sized cement enterprises, the rate of consumption of standard coal per ton of clinker produced dropped by 0.62 kg. from the 1979 rate. Consumption of coal per crate of plate glass produced in 1980 was 1.54 kg. less than that in 1979.

The efficiency of converting losses into profits was evident. In 1980, profits earned by enterprises under the management of the Ministry of Building Materials Industry were 23.2% higher than those of 1979. The percentage of enterprises operating at a loss dropped from 27.2% to 19.5% in 1980, while the volume of losses decreased by 45%. The

plan for capital construction investment was overfulfilled in both 1979 and 1980. Some new plants were constructed and put into production. The newly added production capacity of large and medium-sized cement plants was 1.4 million tons. In 1979 the volume of exports of 10 categories of building materials products increased by 8.6% over the previous year; in 1980, it increased by 12% over 1979.

II. Increase in Variety of Products Since 1949

Since the establishment of New China 31 years ago, the building materials industry has developed into a multi-branch, multi-variety industry, turning out 500 different types of products under the management of the Ministry of Building Materials Industry. These products may be divided into the three following categories:

1. *Building and construction materials (excluding timber and steel).* In this category are: cement, plate glass, ceramic sanitary ware, bricks and tiles, sand, stone, building blocks, waterproofing and heat-insulation materials, gypsum board, aerated concrete, plastics for building use, wallpaper and wall cloth and various types of new lightweight building materials.

2. *Non-metallic minerals and their processed products.* In this group are: asbestos, mica, graphite, gypsum, diamonds, limestone, quartz sand, marble and granite.

3. *New non-metallic minerals and products processed or made using materials from Groups 1 and 2 as raw materials.* These include: fibreglass, graphite fibre, fibreglass-reinforced plastics, special technical glass and ceramics, quartz glass, cast stone, cement boats, cement railroad sleepers and cement electricity poles.

All the materials and products in Group 1 are used for building and construction, while only a portion of those in Groups 2 and 3 are used for this purpose. Most of the materials and products in the two latter groups constitute important raw materials for the metallurgical, chemical, electronic, aviation and national defence industries. Materials in Group 3 have been developed since the late 1950's and have made positive contributions to the advancement of China's industry, science and technology.

Following are historical surveys of the development of the cement, plate glass and non-metallic minerals industries.

The Cement Industry

Prior to Liberation, China's cement industry was characterized by its poor foundation, slow rate of development, low output, limited variety and highly irrational geographical distribution of cement plants. In the 43-year period from the establishment of China's first cement plant at Tangshan in 1906 to the founding of New China in 1949, only 35 small cement plants were set up in the entire country (excluding Taiwan). These plants were concentrated in the coastal areas of north-eastern China, and the highest annual output of that period was 2.29 million tons. Cement output in 1949 was only 660,000 tons.

Post-Liberation Expansion. During the first three years after the founding of New China, the main task for the cement industry was to repair and rehabilitate plants that had been destroyed or closed down. In 1953, the cement industry began to develop on a large scale according to state plans. By the end of 1980, more than 4,200 cement plants had been constructed and put into production. They employed more than 700,000 workers and staff and turned out 79.86 million tons of cement per year. Of these 4,200 plants, 50 were large and medium-sized enterprises with a combined output of 25.59 million tons and employing about 100,000 workers and staff. The 4,533 small-sized plants had a combined output of 54.27 million tons. The large and medium-sized plants were built with investment from the central government, and their products were sold under the management of the central government. The small plants were set up with investments from local authorities and collectively owned units and these plants sold their own products.

The geographic distribution of cement plants in the country has been improved. All provinces, municipalities and autonomous regions — except for Tibet, Ningxia and Tianjin — now have large and medium-sized plants, while small plants are scattered over 80% of the counties throughout the country.

The varieties of cement produced have expanded from a single silicate system to a system of phosphate and alumina. China now produces five major categories of cement — silicate cement, slag cement, common cement, pozzolanic cement and fly-ash cement and several dozen other categories. Production of special cements, such as oil-well cement, dam cement, quick-hardening cement and coloured cement, is now adequate to satisfy domestic demand.

Advances in Technology. The scientific and technological levels of cement production have

been raised. In the 1950's, most of the key equipment installed was imported. Plants which used small- and medium-diameter kilns for wet processing and semi-dry processing, as well as plants that used different types of mechanical shaft kilns, were equipped with products made in China. In the mid-1950's, China experimented with a cyclone preheater; from the 1960's on, cement production lines using multi-stage cyclone preheaters and shaft-preheaters were set up successively in four cement works.

During the early 1970's, studies were conducted on the new pre-calcining process, and experimental production lines using the pre-calcining process with coal and oil as fuels were set up. In 1977, a production line using the pre-calcining process and with an output of 4,000 tons per day was imported and assembled.

Small-Scale Cement Plants. The development of small-scale cement works equipped with shaft kilns is of special significance. In its initial stages of development, the small-scale cement industry had to meet the demands of capital construction for agricultural purposes and of restoration of residential dwellings in the countryside. The industry has greatly expanded with the aid of local investment and through self-reliance and hard work. The small-scale cement industry has not only played an important role in the development of the country's agriculture, but has also made considerable contributions to the development of local industry, transport and communications, as well as to important national projects.

In 1980, there were 4,533 small-scale cement plants in the country, with a combined output of 54.27 million tons, or about two-thirds of the country's total output for that year. Of the 54.27 million tons, 47 million were turned out by state-owned enterprises above the county level and 7 million were turned out by enterprises owned collectively by the communes and brigades.

In the beginning, small-scale cement enterprises were plagued with problems such as poor product quality and high costs. These problems were due to poor equipment, weak technical capabilities and ineffective management. The situation has improved enormously as a result of readjustment, personnel training and technical guidance over many years. Since 1979, in particular, management at various levels of building materials plants has seriously implemented the policy of "readjustment, restructuring, consolidation and improvement" and has made great efforts to improve quality, reduce costs, elevate technical and management levels and increase economic efficiency.

As a result, conditions have changed for the

better. According to a survey of 2,186 small-scale cement works, the quality of finished products has greatly improved. In 1980, the percentage of quality cement produced by all factories was 85%, an increase of 12% over 1978. Of the quality products, No. 400 cement and grades above it accounted for 95% of total output; production of No. 500 cement increased from 2.64 million tons to 8.80 million tons.

Industry profits increased and losses declined. From 1979 to 1980, the proportion of factories above the county level operating at a loss declined from 42% to 23%, while the number of provinces, municipalities and autonomous regions that increased their profits rose from 14 to 28. In 1979 and in 1980, annual cement output increased by an average of 6 million tons, an annual rate of increase of 11.3%. Output in each of the eight provinces of Jiangsu, Shandong, Hebei, Henan, Hunan, Liaoning, Sichuan and Guangdong exceeded 3 million tons.

China has a vast territory and a large population, but a weak scientific and technological foundation and backward economy. While it needs more large and medium-sized cement works to serve as the backbone of the building materials industry and to meet the demands of major projects, it also needs more small-scale cement works which make use of rich local limestone resources. Future development must be done in ways that take account of local conditions, meet the demands of agriculture and make up for the inadequate supply of cement from large and medium-sized works.

The development of small-scale cement works in conjunction with large and medium-sized ones has brought about prosperity characterized by the joint development of enterprises run by both central and local governments. The results show that this is the correct path and one eminently suited to China's unique conditions.

The Plate-Glass Industry

Early Development. The first sheet-glass factories in China, the Qinhuangdao Glass Works and the Yaohua Glass Company Ltd., were constructed in 1922 and began production in 1924 with outputs of 400-500 standard crates daily. By 1949, prior to Liberation, there were three sheet-glass factories with a combined output of 1.08 million standard crates per year. Since Liberation, nine plate-glass factories have been set up and three old factories have been expanded with state investment. Now there are 12 large and medium-sized factories in all, employing over 30,000 workers and staff.

Because of the serious shortage of plate glass during the last two years, some factories in other

industrial sectors have been converted to produce plate glass following the readjustment of the national economy. Thus, the number of small-sized glass works has increased to 100, double the previous number.

In 1980, the output of plate glass was 27.71 million standard crates, an increase of 18.9% over 1979. Of this amount, 17.66 million standard crates were produced by the large and medium-sized works, while 10.06 million were produced by small-sized works. The varieties of plate glass have increased and their uses have been expanded. Prior to Liberation, China could produce only ordinary window glass, frosted glass and sandblasted glass and in small quantities at that. Today, in addition to window glass of various thicknesses, China can produce several dozen kinds of plate glass — such as ground glass, laminated glass, wired glass, figured glass, tempered glass, safety glass, heat-absorbent glass, electricity-conducting glass and bullet-proof glass. These products are used widely in light industry as well as in the motor vehicle, aviation, chemical and instrument and meter industries, and also in agriculture.

At present most glass works use the Fourcalt process; their productivity is more or less equal to that of glass works in foreign countries. In 1971, China set up its first production line for float glass on an experimental basis. Today, some large and medium-sized works using the float process are under construction.

The Non-Metallic Minerals Industry

Non-metallic minerals have been known and used for a long time and are still widely used throughout the world. China has proven reserves of 80 kinds of non-metallic minerals. Its deposits of iron pyrite, gypsum and barytes rank first in the world, while its deposits of asbestos, fluor spar and bentonite rank second in the world. Deposits of phosphorus, talc, pyrophyllite, graphite, kaolin, magnesite, salt, perlite, limestone and mica are nearly as significant. Prior to Liberation, however, China had only a few sulphurous iron and phosphorus mines and turned out only small quantities of asbestos, gypsum and talc. At that time, the non-metallic minerals industry was virtually non-existent.

Non-metallic minerals with special properties such as resistance to high temperatures, to acid, oxidation, and X-rays, and with qualities such as high strength, extreme hardness, heat insulation, sound-proofing and lubrication, are indispensable raw materials for modern industry, national defence, modern science and technology.

Since the founding of New China, the Chinese

government has attached great importance to the mining and processing of seven key non-metallic minerals: asbestos, gypsum, graphite, kaolin, talc, mica and diamonds. During the 31 years since Liberation, China has set up 281 state-owned non-metallic mineral enterprises; they are above the county level and employ 124,000 workers and staff. Of these, 50 are large and medium-sized enterprises employing a total of 74,000 workers and staff. Output of non-metallic minerals has increased greatly. In 1980, China's output of asbestos, gypsum, graphite and talc was 131,700 tons, 3,348,000 tons, 160,000 tons and 915,000 tons, respectively. These amounts represented increases of 219 times, 341 times, 178 times and 398 times, respectively, over amounts produced in 1949.

III. Current Problems and Future Prospects

Demands Still Exceed Supplies. In the past 31 years, China's building materials industry has made significant progress in development of quality, quantity, variety, productive technology and research, thereby making positive contributions to the development of the national economy and raising the people's standards of living. However, the rate of development is still not great enough to meet the needs of the national economy and the needs of the people's livelihood. A big gap still exists between supply and demand.

The principle problems are out-of-date technical equipment, relatively low efficiency and the poor quality of scientific research, design and equipment manufacture.

The average rate of growth of the building materials industry during 1952-1978 was 11.5%; a rate lower than that of heavy industry. The rates of increase of some major products, such as cement and plate glass, were notably lower than the average rate of increase of the industry as a whole, except during the First Five Year Plan period and during 1962-1964. Except for a few products such as mica, fibreglass and quartz glass, all main products of the building materials industry are in short supply. The supply of cement turned out by large cement works for the use of major capital construction projects and urban maintenance work is several million tons short of requirements. More serious is the situation with plate glass. Current output of plate glass can only meet about 40% of the needs of capital construction and urban use; very little of it is supplied to the countryside. Output of ceramic sanitary ware can only meet one-third of the demand; asbestos can meet only 70% or so of demand; and long-fibre asbestos only 30% of demand.

The blame for this situation can be traced to the mistakes of "Left" deviations in the guiding ideology for developing the national economy. There was insufficient appreciation of the importance of the position and role of the building materials industry. As a result, the rate of development of the building materials industry did not match that of the national economy. During the 27-year period from 1952 to 1978, investments in the industry accounted for only 1.7% of total state investment in capital construction — a much smaller percentage than the investment in other sectors of heavy industry. Hence, the building materials industry has long been a weak link in the national economy.

The Course for Future Development. Since the Third Plenary Session of the 11th Central Committee of the Communist Party, held in 1978, the Central Committee and the State Council have attached major importance to the development of the building materials industry, pointing out that this industry, like the coal, electric power, oil, transport and communications industries, is a pioneer industry in the national economy. They also stressed that research in this industry should be carried out with due account being taken of the needs of China's 1,000 million people. Since building materials are in short supply, the industry must accelerate its pace of development in line with the readjustment of the national economy. So, in accordance with the instructions of the Party Central Committee, the building materials industry should carry out further the policy of readjustment and take active measures to raise production so as to keep pace with the development of the national economy and with the needs of housing construction in both urban and rural areas.

The major points to be stressed for future development are as follows:

1. *We should run existing enterprises well.* Today there are more than 46,000 enterprises in the building materials industry, providing a solid foundation for further development. In order for the industry to achieve steady and significant progress, we must readjust the existing enterprises, carry out technical transformation and renewal of equipment, adopt new technologies, raise technical and management levels, fully tap potential and improve economic efficiency. We must improve the quality and increase the variety of products, reduce costs, and try to develop products needed by the market. We should also cut down on energy consumption, pay attention to the needs of environmental protection and ensure safety in production.

We should attach importance to the readjust-

ment and consolidation of small-sized enterprises. In small-sized enterprises that enjoy favourable resource and production conditions, we must carry out technical improvements and raise efficiency in a systematic way. Small-sized enterprises that lack adequate supplies of raw materials and fuel and those that have incurred losses for years and have turned out poor quality products at high cost should be merged with other enterprises or converted to production of other materials.

2. *Great efforts should be made to produce primary building materials products such as cement and plate glass.* Given China's actual conditions, it will be a considerably long time before large quantities of timber and steel will become available for use in building and construction. Although clay bricks and tiles have long been used — and are still widely used — for construction purposes, the use of these materials for building walls and roofs is costly and consumes a great deal of energy. Furthermore, the large-scale use of clay for the manufacture of bricks and tiles destroys farmland. So we should shift from producing clay bricks and tiles to production of cement, reinforced concrete, plate glass and ceramic sanitary ware, supplemented by new lightweight building materials. In addition, we should step up the search for energy-saving substitutes, which China has in abundance. While China's total cement output is high, its annual per capita consumption of cement is only 80 kg., considerably lower than the world average of 230 kg. and figure of over 700 kg. for Japan. To speed up the production of cement and plate glass, we must stress technical transformation and expansion of old plants, while setting up of new plants should be moderate.

3. *We must produce and supply more building materials to fulfil the needs of the countryside.* In the past few years, economic conditions in the countryside have improved overall and the income of peasants has risen. The current surge of housing construction in rural areas has not been matched since the early years of New China. In 1980, 5 million farm households either renovated their dwellings or added new buildings. The floor space of new buildings was over 300 million sq. m. For a long time, whenever we drew up and balanced the plan for building materials, we considered chiefly the needs of capital construction and gave little consideration to the need for building materials in rural areas. This oversight has led to an acute shortage of building materials in the countryside. In 1980, the state, the provinces, municipalities and autonomous regions supplied rural areas with about 100,000 tons of steel for making reinforced concrete and 900,000 standard crates of plate

glass. These were enthusiastically received by the peasants. From now on, it is expected that the state will supply increasing quantities of steel and plate glass to the countryside.

The scale of housing construction will become larger and larger hereafter, and more materials will be needed. As China is a vast territory, conditions of climate, geography, resources and customs vary widely from place to place, while levels of economic development are uneven. Thus, we must proceed from the realities, stick to the principle of using local materials, making good use of such resources as river mud, earth mounds, minicement, bamboo, stone, etc., and use industrial wastes to manufacture bricks, tiles and small building blocks. We must no longer make bricks and tiles using clay taken from fields under cultivation.

4. *We must energetically develop new lightweight building materials.* Since the early 1960's we have undertaken research in the production of lightweight building materials and have set up several aerating plants. Since 1975, we have carried out extensive systematic research and production of new building materials. From 1976 to 1980, new lightweight building materials were used in the construction of 500,000 sq. m. of office buildings and dwellings in 23 cities. By 1980, 38 new production lines were set up, and 36 kinds of new

materials were in mass production; in addition, two small production centres were established and seven large and medium-sized centres were under construction.

The advantages of constructing buildings with new materials are evident. The dead weight is less; the function of integration is better; construction time is shorter (since all the components can be prefabricated and erected *in situ*); less intensive labour is required and labour efficiency is higher, as compared with construction using traditional methods and traditional materials. Another advantage is that the new lightweight building materials can be manufactured from industrial wastes.

The development of new lightweight materials is essential to the future development of the building materials industry. However, the technology and technical equipment required for producing such materials is relatively complicated. Thus, our policy is first to select some large and medium cities as experimental sites for the construction of dwelling complexes, then make technical-economic analysis and comparisons and, finally, disseminate the new methods systematically. At the same time, we must strengthen research and trial-production in order to solve the difficult technical problems that we face in applying new methods and materials.

24. CHINA'S BUILDING INDUSTRY

By the Research Office,
General Administration of Building Construction

During the 31 years since the founding of the People's Republic, great developments have been made in the building industry. A total of 1,880 million sq. m. of industrial and civil construction has been completed in the whole country at a cost of 421,800 million yuan, of which 95,000 million yuan was spent on 666 million sq. m. of buildings executed by enterprises of the construction industry. The large masses of workers and staff members working in this field have laboured diligently in the rehabilitation and development of the national economy, making great contributions to the country's socialist construction.

In 1980, movements to increase production and to improve the economy were launched in construction enterprises in many different localities, centring on an emulation drive to construct buildings of good quality. Administration and management were strengthened to obtain better economic results. State-owned construction enterprises had a workforce numbering 1.7 million and collectively-owned enterprises above the county level had a workforce of 1.3 million. The total building area completed by the former in 1980 increased by 12.5% over that of the previous year. The amount of labour expended in 1980 increased by 18% and 7.3%, respectively, over that of 1979. Labour productivity per capita in state-owned enterprises amounted to 5,013 yuan (an increase of 8.9%) and in collectively-owned enterprises to 3,965 yuan (an increase of 6.8%).

The duration of construction projects has been shortened. A great number of large and medium-sized projects were completed on schedule. The Lanzhou Vinylon Fibre Plant, the Jiaying Woollen Mill, the Dandong Chemical Fibre Plant, the expansion of the Shizhuishan Power Plant, the Sichuan Chemical Works, the Xiangxiang Cement Plant in Hunan and the Harbin Cold Storage have gone into operation. Some factory buildings with imported equipment, e.g. the Shaanxi Tricolor TV Tube Factory, the Pingdingshan Cord Fabric Factory, the Shanghai Petrochemical Works, the Yantai Leatherette Factory, and the Zhejiang Chemical Fertilizer Plant, are in the finishing stage, with installations under test run, while others are under construction. The speed at which civil buildings are being constructed has also been increased. According to statistics obtained from a number of provinces and municipalities, the time required for constructing a single project of 2,500 sq. m. has been shortened by 28

days, 10% less than that of the previous year.

A high quality of workmanship has been obtained in building construction. The percentage of construction appraised as being of good quality has reached 61.4% of all projects carried out by the state-owned construction enterprises and 80-90% of all projects carried out by the municipal enterprises of Beijing, Tianjin and Shanghai. To meet the demands of the population as far as possible, emphasis has been placed not only on the quality of structural work, but also on decorative work; not only on structural design, but also on functional design. When projects were handed over, they were ready for immediate use by consumers, with everything cleaned and in order, including interior finishings, installations, the surrounding areas and roads. Some of the construction enterprises have even set up a system of return visits and one-year repair service free of charge.

I. Emulation Drive for Excellent Workmanship

An emulation drive for excellent workmanship between construction enterprises of Beijing, Tianjin and Tangshan started in 1978. In 1980, the area of completed buildings appraised as having excellent workmanship increased, reaching 1.77 million sq. m. in Beijing, 1.01 million sq. m. in Tianjin and 940,000 sq. m. in Tangshan. The percentage of increase over that of the previous year was 51%, 135% and 570%, respectively. Emulation drives were also conducted between Shanghai, Nanjing and Hangzhou, as well as between construction enterprises in other provinces, municipalities and districts. Building construction bureaus in 29 provinces, municipalities and autonomous regions and six building construction bureaus directly under the General Administration of Building Construction altogether executed more than 12 million sq. m. of construction of excellent workmanship, amounting to 27% of the total. Municipal and provincial building bureaus in Beijing, Tianjin, Shanghai, Liaoning, Jilin and Yunnan all achieved percentages above 40%. In many localities model projects have been set up.

II. Housing Development

In the readjustment of investment in capital

construction, priority has been given to housing. The enthusiasm of local authorities and enterprises as well as individuals for housing construction has been encouraged. In 1980, the total amount of housing completed in all cities and towns reached 82.3 million sq. m., a record-breaking figure. Of that amount, Beijing had accounted for 3.36 million sq. m., an increase of 870,000 sq. m., or 34.9%, over the previous year. The ratio of completed housing construction to the total amount of construction in the city increased from 61% in 1979 to 68.8% in 1980.

Unified planning, investment, design and construction of large-scale housing developments has been adopted in many cities. In some large cities, simultaneous development of utility services such as gas, water, sewage, electricity and roads, as well as public buildings such as schools, kindergartens, shops and post offices, have been carried out. In the construction of two housing estates, Jinsong and Tuanjihu in Beijing, attention was paid to complete sets of utility services so that the buildings were ready for habitation shortly after completion. By the end of 1980, 420,000 sq. m. of the two estates had been completed and put in use. Dalian paid attention to the design and construction of complete sets of utility services so that 710,000 sq. m. of building area out of the 780,000 sq. m. construction (90.7%) were ready for use right after completion.

The percentage of high-rise apartment buildings has increased. In 1980, 400,000 sq. m. high-rises were built. The Lixin Zhonggu Housing Estate, the first large-scale rehabilitation project in Guangzhou, occupies an area of 96,000 sq. m.; the first stage of construction work has been completed.

The state has given encouragement and support to individuals and overseas Chinese to build housing. Private houses built during 1980 amounted to some 1.8 million sq. m., of which 400,000 sq. m. was in Guangdong Province. Construction projects started in 1980 included the Yinhai Housing Estate in Zhuhai, Guangdong, a group of garden houses jointly invested in by the municipal authority of Zhuhai and businessmen of Hong Kong and Macao; and the Overseas Housing Estate in Shantou, Guangdong, jointly invested in by the municipal authority of Shantou and Hong Kong businessmen.

III. Reconstruction Work in Tangshan

Reconstruction work in Tangshan, following the earthquake, has been proceeding rapidly, spurred by the deep concern of the party and the State

Council. Preparation for reconstruction started in 1978 and comprehensive large-scale construction was carried out in 1979. By the end of 1980, 7.69 million sq. m. had been completed, with 4.11 million sq. m. of residential buildings, constituting 53.4% of the total residential building area, still to be reconstructed. More than 500,000 families in the city have moved into their new homes. In 1980, the emphasis was placed on residential buildings and public facilities. Total building area completed in that year amounted to 2.6 million sq. m., of which 1.95 million were residential buildings.

Reconstruction work in Tangshan has been energetically supported by local authorities throughout the country. To assist the people of Tangshan in rebuilding their new homes and resuming production, large contingents of builders were sent from Hebei, Liaoning, Jilin, Heilongjiang, Shanghai, Shaanxi and the Second Construction Bureau of the General Administration of Building Construction.

In the reconstruction of Tangshan, attention was given to constructing public buildings, service facilities and municipal works as well as residential buildings.

IV. Hotels and Buildings for Tourists

A total of 890,000 sq. m. of hotels, facilities for tourists, cinemas, gymnasiums and exhibition halls were constructed in 1980. Hotels have been built at scenic spots and in cities with historic ruins to meet the demands of the growing tourist trade. These hotels are designed to function efficiently, and to have a beautiful appearance and modern equipment.

Among the hotels completed in 1980 is the 22-storey Yanjing Hotel in Beijing, the tallest building in the city. It is 66.7m. high and covers a total area of 40,000 sq. m. Large amounts of marble, glazed tiles, plastic flooring and plastic wallpaper were used in the interior and vinyl-ethylene paint was used on the exterior. Construction of the hotel took 15 months.

The Tourist Centre at the Zhongshan Hot Springs in Guangdong Province, jointly invested in by the Zhongshan Branch of the China Travel Service and the Chinese-Australian Construction Investment Company, occupies a plot of 130,000 sq. m. and has a total building area of 30,000 sq. m. Built in a combination of traditional Chinese style and local style, it comprises five hotels and ten villas, with a total of 200 rooms and 400 beds. Hot spring bathhouses and other tourist facilities are provided. Construction was started in Novem-

ber 1979 and completed at the end of 1980.

Other hotels completed in 1980 were the Dunhuang Hotel in Gansu and the Taishan Hotel in Shandong. Among hotels currently under construction are the Xiangshan Hotel, the Huaqiao Hotel, the Jianguo Hotel and the Great Wall Hotel, all in Beijing. Together, they will have 10,000 rooms and a total area of over 800,000 sq. m. The 28-storey White Swan Hotel under construction in Guangzhou, using foreign investment and modern equipment and management, has a total area of approximately 80,000 sq. m. The 37-storey Jinling Hotel which is being built in Nanjing with investment from overseas Chinese will be the tallest building in the country. Its top floor will feature a revolving tearoom from which one can enjoy a panoramic view of the city.

V. Buildings for Education, Scientific Research and Health Services

Educational Buildings. Construction of educational facilities in China broke all records in 1980. A total of 3.25 million sq. m. was constructed: 280,000 sq. m. in Sichuan; 260,000 sq. m. each in Shandong and Jiangsu; 220,000 sq. m. in Liaoning and 110,000 sq. m. in Inner Mongolia. In 1980, 38 institutions of higher learning directly under the Ministry of Education added 600,000 sq. m. of lecture halls, dormitories and buildings for research and athletics to meet the urgent need for improved education. Large numbers of middle and primary schools were also built in many cities.

Scientific Research Buildings. In 1980, 1.62 million sq. m. of buildings to house scientific research activities were completed. The Beijing Meteorological Centre accounted for 14,000 sq. m. and the Shanxi Broadcasting and Television Technical Centre accounted for 20,000 sq. m. Among other recently completed buildings are research facilities for the State Seismological Bureau, the Guangxi Institute of Pharmacology and the Plateau Atmosphere Research Institute.

Buildings for Health Services. A total of 2.46

million sq. m. of buildings for health services were completed in 1980. These included the out-patient department of the No. 1 Hospital at Beijing Medical College, in-patient buildings for the Beijing Traditional Medicine Research Institute, the No. 2 Hospital in Tianjin and the People's Hospital in Dalian.

VI. Experimental Centres for Industrialization

In order to transform outdated modes of production and to adopt socialized mass production, experimental centres were set up in Changzhou (Jiangsu Province) and Nanning (Guangxi Autonomous Region) in 1978. Initial results obtained in these two cities show that construction capacity in Changzhou increased from 180,000 sq. m. in 1977 to 400,000 sq. m. in 1980, while in Nanning it increased from 350,000 sq. m. in 1977 to 650,000 sq. m. in 1980.

Ten production lines have been set up in Changzhou for mass production of wall panels, floor slabs, roof slabs, building blocks, premixed concrete, steel windows, etc., increasing China's construction capacity by 280,000 sq. m. within three years. Of the 700,000 sq. m. of residential buildings constructed within those three years, 33% were constructed by this mechanized process.

The most conspicuous improvements brought about by the industrialization of building construction were the speeding up of construction and the realization of quick returns on investment. It now takes only three months to construct panel apartment houses of 2,000 sq. m., four months to construct apartment building blocks and less than one year to construct factory buildings of 10,000 sq. m. or residential complexes of 100,000 sq. m. Garden Village, a new residential complex in Changzhou, took ten months to complete — only one-half the time formerly required for a similar job.

The major technical-economic indices in the cities of Changzhou and Nanning have risen significantly since industrialization, as shown in the following table:

City	Labour Productivity (in yuan per capita)	Increase of Labour Productivity (%)	Increase of Building Area Completed as Compared with 1977 (%)	Area Completed Per Capita (sq. m.)
Changzhou	7,219	31	79	63
Nanning	4,158	62	58	42

The results show that building industrialization not only speeds up the process of construction and increases the amount constructed in a given period, but also produces buildings of better quality. Industrialization is the most effective approach to the reform and development of the building industry.

VII. Architectural Design and Research

After the criticism of "Left" errors committed in the past, Chinese architects have produced more and better architectural designs. From 33 design institutes above the provincial level, construction drawings for projects covering 27.85 million sq. m. were completed in 1980, 1% more than were produced the previous year. To meet the demand for building industrialization, 1.96 million copies of "National Unified Building Design Drawings" were distributed during the year.

All of the design institutes have raised the quality of their design. Now 90% of their work is considered of "good quality." And some designs have reached a new level of excellence in structural design, functional arrangement and architectural treatment. Designs for residential buildings prepared in Beijing and Tianjin show improvement in plan arrangement, lowering of storey height and enlargement of usable space. In the design of the Chengdu Gymnasium prepared by the Southwest Building Design Institute, suspension cables without tension rings, lightweight roofing, cantilevered platform slabs and inclined frames combine to produce a satisfactory functional arrangement that is pleasing in appearance and relatively low in construction costs.

In the field of building research, emphasis has been placed on applied technique. Techniques that are already practiced and proven satisfactory include: building silicate wall panels with fly-ash as adhesive; fly-ash admixtures; seasoning wood with far-infrared rays; curing concrete with solar energy, erecting prefabricated wall panels *in situ*; standardized steel forms; various admixtures; and equipment for diaphragm walls.

The number of buildings of modern design increased significantly, reaching a total area of 22.54 million sq. m. in 1980 (an increase of 55% over the previous year). Of that total, 9.83 million sq. m., representing 22%, was begun in 1980. Buildings constructed with large forms were the most popular, accounting for 3.15 million sq. m. (an increase of 1.17 million sq. m. over the previous year) and 32% of all buildings of modern structural design. Prefabricated panel buildings also became more popular, accounting for 2.31 million sq. m. or 23% of total construction. This

technique, integrating design and construction, has been systematized in Beijing, where 58% of the buildings constructed with forms had brick exterior walls and *in situ* cast interior walls. The average cost of such construction is 127 yuan per sq. m., which is about the same as that of mixed construction.

Construction using prefabricated panels has proven to be even more popular in Guangxi, Yunnan and other regions. In Guangxi, hollow panel construction accounted for 68% of all buildings of modern structural design in that region. This technique calls for less labour and less consumption of wood, cement and steel. The unit cost of such construction is nearly the same as that of construction using brick and concrete.

Industrialized construction of single-storey factory buildings, which offers the advantage of arranging standardized components in flexible combinations, has been adopted in some cities.

VIII. Contracts for Construction in Foreign Countries

Since its establishment in 1979, the China Construction Engineering Corporation (CCEC) has negotiated construction contracts with more than 120 firms in 22 countries. By 1980, it had signed 15 agreements of intention and 88 contracts covering design, construction or labour with the governments or independent firms of Iraq, North Yemen, Kuwait, Sudan, Italy, France, the United States, West Germany, Japan and Hong Kong. Eighteen projects, including hospitals, residences, hotels, restaurants, etc., have been completed in North Yemen and other countries.

CCEC, a large enterprise which contracts for construction jobs in foreign countries, has its own staff for exploration and design and more than 100,000 workers involved in construction and installation. It also has a number of well-known architects serving as its technical staff or advisors. In addition to its branches in 19 provinces, municipalities and autonomous regions, CCEC maintains overseas branches in Hong Kong, North Yemen, Iraq, Kuwait, Thailand and Macao, as well as branches which specialize in building metallurgy and landscape architecture. Cooperative firms jointly established by CCEC and foreign construction enterprises include: Companhia de Construção e Fomento Predial Hwashan, Lda; China-Tai Construction & Engineering Co. Ltd.; Yemeni-China Construction & Engineering Co. Ltd.; Gulf Realty Construction, Inc.; Carino Realty Company Limited; and Watson Architectural, Engineering & Design Consultant.

Projects constructed by CCEC have been com-

pleted on or ahead of schedule and have won praise from clients and relevant parties.

IX. Problems and Trends

Since the founding of the People's Republic, innumerable buildings of various types have been constructed and hundreds of cities and towns have been renovated and expanded. This has provided an important basis for establishing an independent and integrated national economy, a solid national defence and a better standard of living for the people. However, many problems still plague the building industry, owing in part to the interference and sabotage of Lin Biao and the Gang of Four and in part to the limitations of the current system of economic management.

The main problems are as follows:

1. *Decentralized management and multi-headed leadership.* The present organization and management of construction enterprises according to the administrative system not only leads to blindness in development, but also to a lack of communication between building departments and local authorities and between the different enterprises themselves. The net result is a great waste of productive energy.

2. *Irrational supply system of building materials.* The present system allocates building materials to clients, according to the system of investment, rather than to the constructors, according to the specific project. Constructors have to request materials from their clients in batches. Materials cannot be centrally controlled and regulated, seriously hindering effective organization of production on the part of constructors.

3. *Productive activities of construction enter-*

prises are not listed in the state plan. The building industry is not considered an independent productive sector in the national economic plan and in national economic statistics. Construction is not assigned a planned value of output nor a planned amount of output. Articles like watches, cigarettes and bicycles are all assigned plans for projected output. However, there has never been a plan for housing. In balancing the state economic plan and local plans, the items to be balanced include personnel, finances, materials, production, supply and marketing. However, the same items in the building field have never been considered. The building industry is, nevertheless, one of the productive sectors of the economy. Thus, its output value and major products (housing, schools, hospitals, etc.) should be included and balanced in the state economic plan.

The development of the building industry is closely related to the prosperity of the national economy. The task of developing it is a difficult one. In a country of 1,000 million people, a large and strong building industry is indispensable for modernization. The building industry needs readjustment as well as transformation. In addition to resolving the three problems mentioned above, efforts must be made in years to come to change the present practice of small-scale production in building construction. Construction should be undertaken in groups and blocks with unified planning, so that buildings become commodities to be sold or rented by the unit. Efforts should also be made to organize development companies to handle real estate, site levelling, municipal facilities and building construction. A unified management is needed to run overall development and construction. SACE and the Construction Bank have jointly organized the China Building Construction and Development Corporation, which will undertake some experimental projects in order to find a way to rapidly construct more buildings of good quality with less capital and materials.

25. CHINA'S PHARMACEUTICAL INDUSTRY

By Jin Tongzhen and Ma Ding

State Pharmaceutical Administration

The pharmaceutical industry in China comprises both the production and distribution of traditional and Western drugs and of medical instruments. It is involved in commercial management as well as in industrial, agricultural and various other types of production. Financially, the industry contributes to our socialist economy; socially, it serves the health and welfare needs of the people. Throughout history, the development of the pharmaceutical industry has made contributions to the propagation of our peoples and to the prosperity of our country; it continues to play an important role in ensuring public health during the current period of socialist construction and modernization.

I. A Brief History of the Industry

Since the founding of the People's Republic, the pharmaceutical industry, under the leadership of the Chinese Communist Party and the people's governments, and by relying on the efforts of workers and staff members in this field, has expanded tremendously. It has produced medicines in quantities sufficient not only to meet the needs of the people, but with surpluses for export. Prices of pharmaceuticals have been lowered by significant amounts several times to lighten the financial burden on the people, thus making important contributions to health care, family planning and general well-being.

Traditional Chinese medicine, which has a history of several thousand years, is one of the valuable legacies of our motherland. The production and use of traditional medicines is an art unique to China, one which has enjoyed great fame throughout the world. However, under the reactionary government of old China, this art was on the verge of extinction prior to Liberation. Since the founding of the People's Republic, the party and the people's government have paid great attention to the production of traditional medicines.

At present, there are more than 5,000 kinds of traditional drugs in use. Five million mu of arable and non-arable land were allocated by the state for growing medicinal herbs. With established farms being continually improved and new farms under development, about 150 commonly used varieties of drugs are now being produced. Drugs derived from wild plants and animals have been gathered in a planned way so as to preserve the

environment and natural resources. Moreover, experiments have been carried out to cultivate the roughly 800 drugs most frequently used in China. For example, Tianma (*Rhizoma gastrodiae*) and some 50 other drugs have been successfully cultivated. Certain valuable drugs, such as Renshen (*Radix ginseng*), Sangqi (*Radix notoginseng*) and Lurong (*Comu cervi pentotrichum*) are produced in sufficient quantities to meet health service needs.

The "southern drugs" — called thus because they were, in the past, imported from countries that were our sole source of supply — are now successfully cultivated in our country. Among the 20 kinds cultivated, Muxiang (*Radix Aucklandiae*) and Bingpian (*Borneolum*) are produced in sufficient quantities for our own use as well as for export.

In the years immediately after Liberation, traditional Chinese remedies were still prepared by hand in crude workshops. These workshops were later transformed into mechanized and semi-mechanized factories. Today, there are about 800 such factories employing a total of 66,000 workers and staff and producing more than 3,000 different drug categories and prescriptions. Traditional medicines are available in various forms, ranging from pills, powders, plasters and pellets to more modern dosage forms such as injections, tablets, mixtures and aerosol sprays. Traditional Chinese preparations and drugs are not only used in China, but are also sold to more than 70 countries and regions throughout the world, where they have received an enthusiastic welcome.

Under the semi-feudal and semi-colonial rule of old China, the pharmaceutical chemical industry was relatively backward. Nearly all bulk pharmaceuticals were then imported. Since Liberation, the pharmaceutical industry has been developed in a careful and systematic way. We have given priority to the production of the most extensively used pharmaceuticals, such as antibiotics and sulfa drugs, and to those remedies indispensable for the treatment of common and frequently occurring endemic diseases. We have made significant progress on this score. The output of bulk pharmaceuticals in 1957 was more than ten times greater than that of the early years after Liberation.

Since 1958, we have not only steadily increased the output of pharmaceuticals, but also expanded the range of products. We have pro-

duced successively different kinds of vitamins, steroid hormones and biological products. Now we are capable of producing approximately 1,000 different kinds of bulk pharmaceuticals in annual quantities of 40,000 tons (excluding glucose) and more than 3,000 standard preparations. In other words, we are able to produce most of the standard pharmaceuticals we need. We have also created effective new drugs for the treatment of cancer, cardiovascular diseases, bronchitis and malaria. Our pharmaceutical industry now comprises more than 1,500 pharmaceutical and chemical factories of different sizes employing a total of 250,000 people — a nationwide production network of considerable scope.

In the early years after Liberation, we produced virtually no medical instruments. Most of our medical instruments were imported. From the old regime we had inherited only a few workshops that repaired and made copies of imported hospital equipment. In the last 30 years we have progressed from repairing to manufacturing such equipment, advancing from simple to more and more sophisticated models. In the process, we have developed a new, versatile and comprehensive branch of industry. At present, China has more than 300 factories, with a total workforce of over 50,000, engaged in the manufacture of medical instruments. These factories produce more than 1,500 items with 5,000 specifications — items ranging from conventional apparatuses to specialized precision instruments.

Production techniques have advanced from manual labour to mechanized and semi-automatic operation. Production lines for the more commonly used products have been set up to turn out packages of these products for supply to thousands of medical units at the grassroots level. The quality of some of our products is now up to advanced world standards. For example, we are now capable of producing electronic equipment for nuclear medicine and laser treatment, as well as for monitoring purposes.

Along with the development of production, we have made great strides in distribution. There are now more than 2,600 wholesale units in the country operating at three levels, and a nationwide retail network; together they constitute an integrated system for distribution of pharmaceuticals in both urban and rural areas. The total workforce engaged in procurement, storage, transportation and marketing of pharmaceuticals now exceeds 300,000. As compared with 1955, procurement of all medical commodities has increased nine-fold in value; domestic sales, seven-fold; and exports, more than 20-fold. Since Liberation, prices of pharmaceutical products have been significantly reduced eight times. The current retail prices of

pharmaceuticals average only one-fifth of the prices prevailing at Liberation. Traditional drugs retail for about two-thirds of their former prices. Prices for medical instruments have also been reduced repeatedly. Birth-control pills and devices are provided free of charge, as are drugs for some endemic diseases, thus lessening the financial burden on the masses and improving the country's general health standards. In contrast to the old days, when there was a popular saying, "Medicine is more valuable than gold," and when workers were left to suffer from disease and pestilence, the superiority of the socialist system cannot be disputed.

For a period of ten years, however, the production and distribution of pharmaceutical products were severely disrupted by the actions of Lin Biao and the Gang of Four and by the influence of "Left" policies. At that time, we blindly pursued quantity goals and overlooked the importance of quality and variety in production, resulting in woeful neglect of the people's needs for treatment and health care. Over-anxious to achieve quick results, we set ourselves impossibly high and totally unrealistic production targets; we overlooked the unique features of the socialist commodity economy and the effects of the law of value, paying little attention to economic results, management and administration. We downgraded the positive role of science, technology and intellectuals and ignored the training and rational placement of technical personnel. Chaos existed in the administration, management and production of pharmaceuticals. Factories were set up at random and pharmaceuticals were produced without government approval. Valuable drugs that were in short supply became commodities for speculation and quacks took the opportunity to make and sell sham remedies. The balance between production and distribution was upset, with shortages of items in some places while huge stocks existed in others. Science and education were held back, with the result that production technology could not advance. All of these actions not only brought economic loss to the country but, most importantly, undermined the health of the people.

II. Establishment of a Unified Pharmaceutical Administration and Other Improvements

After the Third Plenary Session of the 11th Party Central Committee, the State Council, in an effort to bring order out of chaos and to eliminate the influence of "Left" policies, created a single department to replace the multitude of leadership

groups involved in the administration of the pharmaceutical industry. The State Pharmaceutical Administration thus formed was empowered to supervise the national production and distribution of pharmaceuticals and medical instruments, related activities with foreign countries, research and development, education and the dissemination of scientific information.

In the past two years, pharmaceutical organizations at all levels have, in accordance with the party's ideological, political and organizational line, implemented the policy of readjustment, restructuring, consolidation and improvement and made remarkable achievements in every aspect of their work. In 1980, production, sales and exports of pharmaceuticals increased; stocks of pharmaceutical goods became more balanced; co-ordination between production and sales improved; and, as a result, various targets were surpassed. The output value of pharmaceuticals (including traditional drugs and preparations and medical instruments) in 1980 rose to 7,830 million yuan, representing a 7.5% increase over that of the previous year. After measures were taken in accordance with the principle of "cutting surpluses to make up shortage," the total output of 12 principal categories of pharmaceutical chemicals — including antibiotics, sulfa drugs, antipyretics, vitamins, etc. — increased to 39,400 tons, exceeding the original target by 6.5%. The output of traditional drugs and preparations alone rose to 76,400 tons, exceeding the original target by 9.4%. In 1980, total sales of pharmaceuticals and medical instruments amounted to 7,800 million yuan, with exports yielding US\$545 million — increases of 5.15% and 18.35%, respectively, over 1979 sales.

In implementing the policy of readjustment in 1980 we have given special attention to the following five aspects of our work:

1. *Vigorously adopting measures to consolidate pharmaceutical factories.* To fulfil the needs of the people and to end the chaos of setting up factories at random and producing drugs indiscriminately, we have required that all production of pharmaceuticals be carried out in strict accordance with the conditions specified in the (tentative) "Rules for Pharmaceutical Administration." All pharmaceutical products had to comply with the Pharmacopoeia and other official standards; otherwise, their production, sale, procurement and use were not allowed. Toward this end, we have undertaken extensive investigations and consolidation measures in all existing factories, while local authorities have jointly organized special task forces. For example, leading cadres in public health and pharmaceutical administration

departments in Guangdong, Henan and Heilongjiang, among other places, have worked with local authorities to establish effective guidelines for carrying out consolidation. At the end of 1980, consolidation had taken effect nationwide, except in certain outlying districts.

According to reports from 20 provinces, municipalities and autonomous regions, 317 unlicensed factories that lacked satisfactory production facilities have already been ordered to suspend operation, merge with others, or shift to another type of production. Some provinces and municipalities have already taken resolute steps to ban those units which unlawfully produce and sell drugs. For example, 196 so-called factories in Anyang District and 49 in Xuchang County, both in Henan Province, and 54 units in Juacheng County, Shandong Province, have been banned. Bureaus of public health, pharmaceutical administration, public security and industry and commerce in 15 provinces, municipalities and autonomous regions, such as Sichuan, Shandong, Guizhou, Zhejiang, Henan and Inner Mongolia, have acted in close coordination to issue public information on the importance of pharmaceutical administration and to check the illegal production and sale of drugs, as well as false advertising.

Licences have been granted to factories that have good management and have passed inspection by the authorities. Eighteen of the provinces, municipalities and autonomous regions have organized discussions to review the clinical efficacy of locally produced drugs and have made preliminary suggestions to eliminate certain items. In other localities, the chemical composition of pharmaceutical products have been circulated to members of the medical profession for analysis and approval.

2. *Improving the quality of pharmaceutical products.* Since pharmaceutical products directly affect the life or death of patients, they must be made perfectly safe. A "quality month/year" campaign has been launched to encourage factories to give priority to quality control, strengthen management and tighten inspection procedures so as to bring out "best quality" products that are up to advanced world standards. In 1980, a total of 135,000 workers and staff joined in the training programme for quality control. At the same time, 1,600 quality monitoring groups were organized in more than 400 enterprises and statistical analyses were applied to rationalize management of production.

The quality of most pharmaceutical products has improved during the past two years. Thirty traditional and Western drugs and medical instruments have won national quality prizes. These

award-winning products included "Lishizhen" Brand Angong-Nuihuang-Wuan (pills); "Camellia" Brand Yunnan-Baiyao, Liushen-Wuan (pills) produced by the Shanghai No. 1 Traditional Chinese Pharmaceutical Factory and the Suzhou Leiyunshang Drug Store; tetracycline hydrochloride made by the Shanghai No. 3 Pharmaceutical Works; sodium penicillin G manufactured by the North China Pharmaceutical Industry; Rigampicin made by the Sichuan Pharmaceutical Factory; "Huatao" Brand acupuncture needles; and "Crane" Brand slit-lamp microscopes. Hundreds of products have been judged "best quality" products by the State Pharmaceutical Administration and the authorities of provinces, municipalities and autonomous regions. The bulk pharmaceuticals produced have all met and surpassed the requirements of the Chinese Pharmacopoeia.

3. *Emphasis placed on "production according to need, supply according to demand" and the practice of economy.* The surplus production of pharmaceutical products was cut back while production of pharmaceuticals in short supply was encouraged. Thus, output targets for ten pharmaceutical chemicals with a production surplus have been reduced by 22.8%; while those for seven bulk pharmaceuticals produced for export have been increased by 25.7%. Owing to the change in the kinds of pharmaceuticals produced, the annual output of pharmaceutical chemicals in 1980 increased in value by over 7%, though it dropped in weight by 5.1% compared with the previous year.

As regards traditional drugs, the area under cultivation for 30 state-controlled drugs in short supply increased by 9.3% over the previous year, while procurement increased by 4.7%. With increased production, the number of items previously in short supply has dropped from about 100 to 80. Meanwhile, the area allocated to cultivation of state-controlled items that were in surplus has been reduced by 48% from the previous year and the procurement of these items decreased by 50.2%.

Owing to the readjustment of production and sales, stocks of pharmaceutical products dropped by 7% in 1980, while their turnover obviously accelerated.

4. *Improving the marketing of pharmaceutical products to ensure adequate and steady supplies.* As the living conditions of the people, especially the peasants, improved and purchasing power increased, the demands for pharmaceutical products rose steadily. In 1980, the major increase

in the sales of all pharmaceutical products occurred primarily in the countryside. Below the county level, sales increased by 10.88%; at levels above the county, there was no notable change in sales. Sales of traditional drugs in their various forms set an even better record, increasing by 15.89% over 1979.

An unexpected development in the pharmaceutical market has been the constantly increasing interest of the masses in healthful and nutritious medications. This trend was particularly noticeable in the countryside of Beijing, Shanghai, Guangxi, Hunan, Zhejiang, Anhui, Fujian, Jiangsu, Jiangxi, Guangdong and Hubei. For example, sales of Renshen and Lurong in Shanghai increased by 53% over 1979. In Shaoxing County, Zhejiang Province, the sales of Renshen extract, Royal Jelly preparations, medicinal liquors and other traditional tonics in the first eight months of 1980 exceeded sales during the same period in 1979 by 48.7%; during the peak month of October, sales of Renshen and Baimuer (*Tremela*) showed a further increase of 54.4% over the previous month. In Jiangxi Province, sales of expensive items such as Tianqi, Lurong, Royal Jelly preparations, *Tremela* and Renshen exceeded sales during the same period in 1979 by 50%.

Traditional Chinese dietotherapy, which has a history of more than 2,000 years, has been enjoying a revival in recent years. Health drinks, wholesome food and nutritious candies were reportedly in great demand in Guangxi, Beijing, Tianjin, Shanghai and Chengdu.

5. *Greater attention was paid to research and development.* A number of new drugs, new preparations and medical instruments, as well as new production technologies, have been developed through the joint efforts of research institutes, medical units and production concerns. During 1980, 40 new pharmaceutical items and 30 types of medical instruments were approved for use. Chemical syntheses of homoharringtonin, amidarone and phosphonomycin, and production technologies for the optical fibre gastroscope and the artificial kidney dializer have been successfully developed.

In the domain of crude drug cultivation, the sexual propagation of Pingbeimu (*Bulbus fritillariae ussuruensis*), the artificial breeding of ground beetles (*Eupolyphaga sinensis* Walk. or *Steleophaga plancyi* Bol.) and improvement in the production of Chenxiang (*Lignum aquilariae resinatum*) have been successful.

At present, pharmaceutical organizations at all levels are continuing to carry out the policies adopted by the party at the Third Plenary Session

of the 11th Central Committee, taking into account specific local conditions. In this way, the organizations are moving closer to their goal of further economic readjustment and the realization of political stability. They are making efforts not only to eradicate the problems resulting from the impact of "Left" policies, but also to correct the imbalance in the industry by combatting disorder and strengthening the country's unified pharmaceutical administration.

III. Goals for Future Improvement of the Pharmaceutical Industry

We have gained much experience during the development of our pharmaceutical undertakings. The evaluation and analysis of this experience will be of enormous value to the further modernization of the industry as well as to the larger economic readjustment of the country.

1. *It is of utmost importance to improve the quality and guarantee the safety and efficacy of pharmaceutical products and medical instruments.* Pharmaceuticals and medical instruments are vital for the treatment and prevention of disease. They differ fundamentally from common household commodities in that they can save lives if they are safe, effective and exact, or take lives if they do not have those qualities.

Mindful of the health of the people, the Party's Central Committee and the State Council have always paid great attention to the quality of pharmaceutical products. However, there have been two periods after Liberation when this concern was not in evidence. One was in the early 1960's, when pharmaceutical factories were set up at random and pharmaceuticals and medical instruments were indiscriminately produced in many districts. Therapeutic accidents caused by bad quality drugs occurred frequently in that period. In 1964, an exclusive National Corporation was created to provide management for the pharmaceutical industry. Standardization of medical instruments was enhanced and models, specifications, raw-material requirements and methods of testing were unified. At that time, the Ministry of Public Health and the Ministry of Commerce jointly devised standards and grading specifications for 54 varieties of traditional drugs. The quality of pharmaceutical products improved and stabilized.

The second deviation occurred during the "cultural revolution," when quality control departments at all levels were disbanded, technical personnel were sent away to perform manual labour, and regulations that had proved effective for quality control were ignored. As a con-

sequence, the quality of pharmaceutical products declined a second time. It was only after the smashing of the Gang of Four that quality control of pharmaceutical products was restored. At present, departments of pharmaceutical administration and health authorities at all levels are doing their utmost to improve the quality of pharmaceutical products, to introduce well-known brands of certain products to foreign countries and to provide the people with the highest quality health care.

2. *Our pharmaceutical administration system should be characterized by unified leadership, multi-level management and better collaboration between production and sales.* The administration of pharmaceutical production and sales has undergone many transformations since Liberation. In the early years, production and sales of Western drugs and medical instruments were supervised by the Ministry of Public Health, while those of traditional Chinese drugs were handled first by the Ministry of Trade, then by the Ministry of Light Industry, and then by the Ministry of Commerce. In 1956, the Ministry of Chemical Industry took over the production of bulk pharmaceuticals and their dosage forms; the First Ministry of Machine Building assumed responsibility for the production of medical instruments; the Ministry of Commerce took charge of controlled sales of pharmaceutical products; and the Federation of Supply and Marketing Cooperatives took charge of procurement, processing and sales of traditional drugs. The latter two functions were later transferred to the Ministry of Health. Thus, there were five central departments involved in the administration of the pharmaceutical industry.

At that time, the country's economic foundations were relatively weak, and dispersed management allowed opportunities for development according to individual situations. Nevertheless, shortcomings in the system of multiple leadership and the lack of overall planning handicapped harmonization among the different departments. When the National Corporation was formed in 1964 as an experiment in industrial management, centralization was strengthened. Closer coordination was realized as a result of unification of pharmaceutical production throughout the country. But there was little flexibility in this arrangement, and the initiative of local authorities was not given full play.

By contrast, during the "cultural revolution" in the 1960's, when overall management was disrupted and the various sectors of the industry were run locally, lack of unified planning resulted in discrepancies in production and sales. Because quality control was slackened, profiteering and

smuggling in pharmaceutical products occurred and fake remedies proliferated.

From experience, we may conclude that inflexibility and over-centralization are equally inimical to the development of the pharmaceutical industry. The ideal system should be characterized by unified leadership, multi-level management and close coordination between production and sales. In June 1978, the State Council decided to set up the State Pharmaceutical Administration at the national level. Together with local administrations in all provinces, municipalities and autonomous regions, it supervises production, supply and use of all pharmaceuticals, drugs and medical instruments throughout the country. This major improvement in the administration of the pharmaceutical industry was made on the basis of past experience. In two years, the system has already demonstrated its value in terms of promoting production, supply and research work in the pharmaceutical field. With continuing improvement, this system is expected to demonstrate its superiority even further.

3. *The accelerated development of the pharmaceutical industry requires overall planning, the reasonable distribution of production sites and full utilization, renovation and reform of existing enterprises.* Pharmaceutical products must serve all the needs of medical practice. Owing to the diversity in demands for the prevention, diagnosis and treatment of diseases, as well as the exigencies of emergencies, the variety of pharmaceutical products in stock at any one time has to be large. However, some indispensable products may be needed only in small quantities; others may have a limited shelf-life; and still others may require special preparation techniques. It is both impossible and unnecessary, therefore, for every locality to be self-sufficient in all kinds of products. Furthermore, owing to variations in the extent to which epidemics, catastrophes and emergencies related to national defence may occur, it is common for annual requirements to fluctuate. Consequently, production targets cannot be set arbitrarily, solely with the aim of achieving "high speed." Comprehensive planning and overall balance in production and supply must be considered in order to have well-balanced development with a reasonable distribution of production sites. Specialization, collaboration and coordination will have to be emphasized to ensure a free flow of supply. From experience, we should have learned that defective planning, repeated bad investments and production practices and profiteering result in heavy losses to the state.

As mentioned above, there are altogether about 2,700 factories in China manufacturing

pharmaceuticals, traditional drugs and medical instruments. In order to develop faster, better, more economically and more comprehensively, emphasis must be placed on full utilization. renovation and reform of existing facilities. The potential for development is immense. Take the North China Pharmaceutical Industries, for example. Since its establishment, it has realized a 20-fold increase in production of antibiotics mainly through efforts made in strain selection and innovative technology, which raised the yields both in fermentation and extraction. The quality of its products was upgraded as well. The net profit and tax it paid to the state over the years was equivalent to 24 times the total investment.

The Northeastern General Pharmaceutical Works may serve as another example of successful development according to the principles of full utilization, renovation and reform. The enterprise was established some 40 years ago. Since 1969, with few additions in personnel and equipment, it has increased annual production six-fold in volume and four-fold in variety. Net profits turned over to the state by the enterprise increased eight-fold simply as a result of stressing better industrial management, adopting new technology and developing new product lines. Although it is an old operation, it is continuously making new contributions. These examples demonstrate that, along with the improvements made in the administrative system and the enlargement of self-management powers, the principle of full utilization, renovation and reform of existing facilities can give further impetus to the development of pharmaceutical undertakings.

4. *Adopting and pursuing appropriate economic policies according to the law of value will ensure a planned and well-balanced development of pharmaceutical production.* Production and supply of pharmaceutical products, especially of traditional crude drugs, which are diverse in variety, complicated in nature and scattered in origin, require selective application of economic policies. Traditional drugs are closely associated with agriculture, forestry, animal husbandry and fishing and are closely concerned with the interests of collectives as well as of individuals. Experience has proved that whenever justifiable policies were practiced, production thrived, whenever unreasonable policies were practiced, production declined. In the early 1960's, the production of herbal medicines dropped precipitously as a result of national turmoil. Later, when the state implemented appropriate pricing policies and adopted measures to encourage productivity, production recovered quickly. At that point, the state required that the income peasants derived from production of her-

bal medicines be no less than that obtained from sideline occupations in which they might otherwise be engaged. Indeed, the peasants should be allowed to derive slightly more profit from the production of certain drugs which call for more demanding techniques or more restrictive seasonal requirements. As regards the production of items in short supply, awards were given in the form of supplementary quotas of grains, fabrics, and fertilizers. To encourage the production of new varieties, losses incurred during the experimental stage were partially compensated by the organizations concerned with procurement. In this way, communes and brigades were motivated and production increased.

During the "cultural revolution," when emphasis was placed exclusively on the production of staple foodstuffs, the cultivation and collection of drugs were prohibited as activities that "fostered capitalism." Production was hampered to such an extent that crude drugs were out of stock even in the localities of origin. Not only did the peasants incur a loss, but the practice of traditional medicine also suffered seriously because prescriptions could not be filled.

After the Third Plenary Session of the 11th Central Committee, proper economic policies regarding rural areas were fully enforced. Under state guidance, brigades and peasant families were organized to take part in the cultivation and collection of drugs. The production of traditional drugs has prospered ever since.

It is also important to adopt appropriate pricing policies in the procurement and marketing of other pharmaceuticals and medical instruments. During the early years of the People's Republic, the state supported the newly developed pharmaceutical industry by providing subsidies so as to hold down the prices of domestically produced drugs. Imported drugs were procured in bulk by the state and turned into dosage forms at a low profit. The principle at that time was "let marketing shoulder the loss of procurement." However, along with the progress in production technology and the lowering of costs, prices were adjusted accordingly. As regards pricing, we insisted on "planning according to demand, overriding costs." We adhered to the principle of serving the interests of the people and approaching the goal of marginal profits. Rational adjustments in prices were made from time to time and, in exceptional cases, losses were tolerated by the state.

However, discrepancies are inevitable whenever the law of value is not properly observed, whenever prices are not reasonably set and corrections are not made in time because of the inflexibility inherent in an over-centralized system. Under these circumstances, production of items

with a surplus may not give way to production of items in short supply, and obsolete factories may not give way to modernized facilities. This kind of anomaly could last for some time. Higher profit ratings set on prescription drugs as compared with bulk pharmaceuticals induced haphazard production of dosage forms; lower profit ratios set on marketing as compared with production reduced the incentive of distribution organizations. All of these problems will be resolved step-by-step during the readjustment period.

5. *Intensified efforts in scientific research, development and education are keys to future progress.* Looking back over the past 30 years of development, we can conclude that whenever research and development were emphasized, pharmaceutical undertakings flourished; whenever they were neglected, pharmaceutical undertakings floundered. In the first years after Liberation, the party and government provided general support for research departments of pharmaceutical industries, allowing them to devote their efforts first to the work of development, thereby stimulating production. Thus, a vast amount of experimental data was collected on the technology of manufacturing antibiotics, sulfa drugs, vitamins, steroid hormones, etc.

This data served as the basis for projection, design, and manufacturing activities in the years that followed. For example, the Hunan Institute of Pharmaceutical Research, formerly the Beijing Institute of Pharmaceutical Research, which was disbanded during the "cultural revolution," completed more than 200 research and development programmes from the time it was established in the early 1950's. Among those programmes, about 40 were considered competitive with then prevailing practices. They were only part of the research and development contributions that paved the way for rapid advances in the production of pharmaceuticals and medical instruments.

Industrial development provided material for further study, as for example in pharmacology and in medicinal chemistry. So far, encouraging results have been obtained in analyzing and improving traditional formulas, as well as in the preparation of new herbal remedies and dosage forms. In searching for new drugs, some very interesting structural varieties were found to possess characteristics that had hitherto gone undetected.

On reflection, our pharmaceutical activities, except in the domain of new drug research, were not far below advanced world standards in 1966. Then, the ten years of disaster under the Gang of Four set back our pharmaceutical research by at least 20 years. It is especially dismaying to realize that even in the field of traditional Chinese

medicine our studies lagged behind those of Western countries. Bitter experience has taught us that research and development is the key and education the foundation for further development. What we must do now is strengthen the work of research and development and education. By adhering to the principle of "serving the interests of the masses," by combining Western and traditional Chinese medicine, by associating pharmaceutical research more closely with clinical practices and manufacturing processes, we may begin to bring our pharmaceutical industry up to the advanced standards of the West.

6. *The principal objective of pharmaceutical supply is to meet the needs of the people.* The practice of medicine and the supply of pharmaceutical products have always been closely intertwined. Both are essential in the struggle to conquer disease. In China today more than 80% of pharmaceutical supplies are dispensed on a prescription basis. So it is natural for medical practitioners and pharmaceutical suppliers to collaborate closely in the common interest of serving the people's health needs. In localities where this collaboration is successful, medical departments give advance notice of their needs to the distribution units so as to facilitate the flow of supplies. Distribution units, for their part, organize physicians, nurses and pharmacists with the support of the medical departments, to discuss and evaluate pharmaceutical products. They also take the opportunity to inform the medical departments of the composition, the characteristics and the supply situation of new products. The distribution units also organize training courses for health care personnel at the grassroots level, enabling them to identify and gather herbal drugs, supplying them with seeds and seedlings and coordinating them in support of the cooperative medical system.

The supply of pharmaceutical products allows for no waste of time. In certain circumstances, time means life. There should always be a ready supply of pharmaceuticals for people who need them. In the past, supplies of pharmaceuticals and medical instruments have met needs in time. Experience has shown that we should always maintain, in addition to regular stocks, emergency supplies for serious accidents, epidemics, natural

disasters or outbreaks of war. To do so, wholesalers at all levels should strengthen collaboration by allowing for free distribution of commodities according to needs, reducing costs of distribution and thus speeding up the distribution process. The problem of inadequate storage facilities and retail outlets should also be attended to.

In addition to seeing that domestic needs are satisfied, we must be concerned with developing production of pharmaceutical products for export. We should seek to increase the proportion of export commodities that bring in high foreign exchange earnings, such as traditional Chinese drugs and preparations and other pharmaceuticals in dosage forms. In order to render our products more competitive on the international market, we must improve the quality of production and packaging and advertise the effectiveness of our products more widely.

We live in a socialist country. Our task is to serve the interests of one billion people by providing them with good quality pharmaceuticals at a price within their means, thus promoting their health. We must resolutely institute the policy of readjustment, restructuring, consolidation and improvement, taking into account the current limitations of the pharmaceutical industry and the needs of the Chinese people. Factories will have to be consolidated and unsatisfactory products eliminated. The standards of all pharmaceuticals and medical instruments will have to be raised. The relationship between the production and supply of pharmaceuticals will have to be coordinated according to the principle of "cutting surplus to make up shortages" and overall planning will have to be improved. Unified systems of administration to supervise personnel training programmes, research and development and education in the field of pharmaceuticals will have to be developed. The style of leadership and working methods will have to be modified. And development of political thought must continue.

With readjustment, we will advance and overcome the chaotic states of industrial management and pharmaceutical administration within three to five years. Then, we shall be able to set an even faster pace in the modernization of our socialist country.

26. CHINA'S COMMUNICATIONS AND TRANSPORT

By the Institute of Comprehensive Transportation,
State Economic Commission

Transportation is an important part of the national economy, a tie connecting social production, distribution, exchange and consumption, as well as a key link between town and country, industry and agriculture, one region and another, China and other countries. Since the founding of the People's Republic of China, there has been a great development in transportation under the leadership of the Chinese Communist Party and the government. Over a period of 31 years (1949-1980), passenger traffic volume increased 25 times, freight traffic 15 times, transportation facilities developed steadily and the distribution of transportation was considerably improved. All of this made great contributions to the development of production, ensuring socialist construction, strengthening national defence and improving the life of the people.

I. Growth of the Transport Network

By the end of 1980, the total length of the national transport network had increased consider-

ably as against 1949 (see Table 1). Of the 51,900 km. of railways opened to traffic, over 8,000 km. were double-tracked. Of the 875,800 km. of highways, there were 110,000 km. of national trunk lines, more than 130,000 km. of inter-provincial and provincial lines and 630,000 km. of county-commune lines. Roads of high-quality and medium-quality road surface totalled about 151,000 km., 17.2% of total highway distance. The growth rate

II. Distribution of Transportation

Before Liberation, the vast southwest and northwest areas of China were hard to reach and backward in production. Since Liberation, however, the conditions of transportation have greatly improved. Railway mileage in these areas increased from 5.5% of the total national mileage in 1949 to 24.8% in 1979. All the provinces, municipalities

Table 1. Growth of Various Means of Transport (in 1,000 km.)

Mode of Transport	1949	1980	Increase Multiple (compared with 1949)
Railways	22.0	51.9	2.36
Highways	80.7	875.8	10.85
Inland waterways	73.6	107.8	1.46
Civil aviation	11.4 (1950)	191.7	16.82
Pipelines	...	8.6	...
Local railways	...	3.4	...

ably as against 1949 (see Table 1). Of the 51,900 km. of railways opened to traffic, over 8,000 km. were double-tracked. Of the 875,800 km. of highways, there were 110,000 km. of national trunk lines, more than 130,000 km. of inter-provincial and provincial lines and 630,000 km. of county-commune lines. Roads of high-quality and medium-quality road surface totalled about 151,000 km., 17.2% of total highway distance. The growth rate

and autonomous regions except Tibet are now accessible by railway. These lines pass through high mountain ridges, deep rivers and narrow canyons, and construction conditions are extremely difficult.

Highway mileage in the southwest and northwest areas also increased, from 24.2% of the national total in 1950 to 31.9% in 1979. All the counties except Maituo County in Tibet and

Derong County in Sichuan Province have highways, and 90% of the rural communes are accessible by bus and truck service. As for inland navigation, great efforts have been made to dredge the waterways in Sichuan Province and other major rivers. The improvement of transportation has played an important role in speeding up the development of the inland economy.

The northeast and coastal areas have always been the primary regions of industry and transportation. Over the past 30 years, the railway and highway networks were further expanded. Coastal and river navigation of these areas also was developed. On some railway trunk lines with heavy traffic, technical reconstruction was carried out.

In the development of civil aviation, priority has been given to setting up airline networks in distant and remote areas. In the early 1950's the Tianjin-Chongqing line was opened, and in the early 1960's the Beijing-Lhasa line was opened. At present, scheduled flights connect 80 large and medium-sized cities, including some border areas in Yunnan, Xinjiang and Tibet. Air service plays an active role in the development of the border areas.

Pipelines offer unique advantages, such as larger traffic volume, lower cost, less loss, smaller area of land used and economy of investment. In 1979, crude oil transported by pipeline accounted for 61.27% of the total crude oil traffic volume, thus saving nearly 4,000 tank wagon loads per day. This reversed the situation in which crude oil transport mainly depended on railways, thus reducing the burden on the rail lines.

With the increase of international exchanges and the growth of foreign trade, China's ocean shipping transport also has developed substantially. To date, China has established business relations with 101 countries and regions and 427 ports.

In summary, during the past 30 years the rational distribution of transportation in China played an important part in developing the econo-

mic superiority of the northeast and coastal areas, in exploiting inland areas, in comprehensively utilizing the five modes of transportation (railway, highway, waterway, air and pipeline) to form a nationwide unified transport network, in strengthening national defence and in linking China with the rest of the world.

III. Transport Facilities

The number of locomotives and railway carriages in 1979 were 2.5 times and 5.6 times, respectively, those in 1949. China has designed and built fairly large locomotives and carriages on its own. At present, locomotives of 2,200 tons and over make up 60% of the total number, and large carriages of over 50 tons account for 81.4% of the total. Railway lines laid with ties of over 50 kg, cover 42.4% of the total length of railways, and 91.7% of railway lines have automatic and semi-automatic block systems. An initial renovation was carried out in traction power, with diesel and electric locomotives now accounting for 22.2% of the total. Mechanization of loading and unloading equipment reached more than 40% of the total.

In water transport, the horsepower of river towboats increased 9.7 times during the period 1950-1980, and the loading capacity of barges and self-propelled vessels increased 42.4 times. The proportion of self-propelled vessels in total water traffic volume increased from 68% to 88%. The number of coastal vessels in 1980 increased by 19.5 times over that of 1949. The large and medium-sized ports were basically mechanized for loading and unloading. In highway transport, automobiles for civilian use in 1980 were 46 times greater than the number in the early days of Liberation. The mileage of all-weather roads increased from 42% of the total in the early days of Liberation to 67.5% in 1979.

Table 2. Passenger Traffic Volume (in millions of persons)

Year	TOTAL	Railways ¹	Highways	Water	Air

IV. Passenger and Freight Traffic

Since 1949, the volume of both passenger and goods traffic has increased substantially. By 1980, the volume of passenger traffic had grown by 25 times, and that of freight traffic, 15 times.

In 1980, the heavy volume of passenger traffic reached a total of 3,418 million persons, an increase of 18% over 1979. An average of 9.36 million passengers were carried each day (7.94 million passengers per day in 1979). The growth of passenger traffic was due principally to the economic readjustment that created a very brisk market,

an increase in peddlers, purchasing agents and salesmen, an increase in passengers visiting relatives and friends, a considerable income rise for workers and peasants and the rapid development of tourist services.

Compared with 1979, the volume of freight traffic was reduced by 3% in 1980. This was because of the continuous reduction in capital construction and in traffic volume related to heavy industry during the readjustment.

Turnover Volume. Compared with 1949, the passenger turnover volume in 1980 increased 15 times and freight turnover, 45 times.

Table 4. Passenger Turnover (in millions of passenger-km.)

Year	TOTAL	Railways	Highways	Water	Air
1949	15,500	13,000	800	1,500	200
1979	196,800	121,600	60,300	11,400	3,500
1980	228,060	138,300	72,900	12,900	3,960
Increase multiple from 1949 to 1980	14.71	10.64	91.13	8.60	19.8
Average annual growth rate 1949-80	9.1%	7.9%	15.6%	7.2%	...

Table 5. Freight Turnover (in millions of ton-km.)

Year	TOTAL	Railways	Highways	Water	Pipelines	Air
1949	25,547	18,400	814	6,312	...	21
1979	1,090,772	559,803	26,826	456,420	47,600	123

1949 to 1980	45.08	31.07	31.33	80.05	...	6.71
Average annual growth rate, 1949-80	13.1%	11.7%	11.8%	15.2%	...	6.3%

Table 6. Average Passenger Haulage (in kilometres)

Year	TOTAL	Railways	Highways	Water	Air
1949	113	126	44	97	685
1979	68	142	34	47	1,174
1980	67	151	33	49	1 153

Table 7. Average Freight Haulage (in kilometres)

Year	TOTAL	Railways	Highways	Water*	Pipelines	Air
1949	159	329	10	248	...	848
1979	440	500	33	1,056	420	1,538
1980	479	514	34	1,184	467	1,586

*Note: The tremendously rapid increase of average water haulage was due to the development of ocean transport in recent years, average oceanshipping freight haulage being as much as 8,246 km.

Average Haulage. The average passenger haulage distance travelled was the highest in 1949 but has been reduced every year since. By contrast, the average haulage of freight has increased in distance by 10.3 km. per year.

Changes in Proportions of Travel Modes. Over the past 31 years, the major changes in proportion were as follows:

(1) *Passenger traffic.* Highway passenger traffic volume increased quite rapidly, reaching about two-thirds of total traffic volume; railway and water traffic volume decreased to a certain extent,

totalling about one-third. The share of passenger turnover of highway traffic also registered a rapid increase, accounting for 30% or more of the total, whereas that of railways remained at 60% because of the large number of long-distance passengers.

(2) *Freight traffic.* Railway traffic volume increased steadily, amounting to 46% of national traffic volume, while its turnover volume was half of the national turnover. The proportion of inland water traffic volume was reduced, but the water turnover volume increased to 43.9% of the national turnover because of the abrupt rise of ocean-shipping transport.

Table 8. Changes in Proportions of Different Modes of Transport (in %)

Year	Passenger Traffic Volume					Passenger Turnover Volume				
	TOTAL	Rail	Road	Water	Air	TOTAL	Rail	Road	Water	Air
1949	100	75.2	13.2	11.4	0.2	100	83.9	5.1	9.8	1.2
1979	100	29.8	61.7	8.4	0.1	100	61.8	30.6	5.8	1.8
1980	100	27.0	65.2	7.7	0.1	100	60.6	32.0	5.7	1.7

Year	Freight Traffic Volume						Freight Turnover Volume					
	TOTAL	Rail	Road	Water	Pipeline	Air	Total	Rail	Road	Water	Pipeline	Air
1949	100	34.7	49.5	15.8	100	72.0	3.2	24.7	...	0.1
1979	100	45.1	32.9	17.4	4.6	...	100	51.3	2.5	41.8	4.4	...
1980	100	46.3	31.6	17.7	4.4	...	100	49.6	2.2	43.9	4.3	...

If the result of conversion of passenger and freight traffic is taken into account, the proportions of different modes of transport in the total converted turnover volume are as follows:

Year	Total Turnover	Rail	Road	Water	Pipeline	Air
1949	100	76.5	3.9	19.1	...	0
1979	100	52.9	6.8	36.3	3.7	0
1980	100	51.46	7.13	37.55	3.56	0

Composition of Freight Traffic. China's freight traffic has consisted mainly of energy fuel materials, followed by capital construction materials and mineral and metallurgical materials. The proportion of agricultural products is smaller.

In 1979, the fuel traffic volume accounted for about 40% of the national total. Coal and oil accounted for 43% of railroad traffic volume and 52% of water traffic volume undertaken by the various enterprises directly under the Ministry of Communications.

The reason that energy transport represents such a great share is due to the uneven distribution of energy resources in China. Coal and oil are concentrated in the west and the north. In the ten provinces south of the Changjiang River, only 17.7% of China's coal and 1.4% of its total industrial output value is produced. As a result, coal in the north is shipped to the south, while the coal in the west is shipped to the east; oil in the north is shipped to the south. In other words, coal needed

in the east, the northeast and the central-south areas has to be conveyed from the north, the northwest and the southwest, involving a great deal of traffic volume over long distances.

Port Capacity. The freight-handling capacity of ports also increased rapidly. The capacity of coastal and Changjiang River ports in 1950 was 13.84 million tons (including 8.29 million tons for sea ports and 5.55 million tons for Changjiang River ports). In 1980, the volume handled increased to 306.86 million tons (including 217.31 million tons for sea ports and 89.55 million tons for Changjiang River ports), representing an increase of 22.2 times over 1950. Of the total volume handled, coal, oil and minerals accounted for two-thirds. Of the volume handled by sea ports, materials and products accounted for by foreign trade made up one-third.

V. Transportation Efficiency and Main Economic Indices

A comparison between transport efficiency indices in 1979 and 1980 and those in 1950 is illustrated below as follows:

Indices	Unit	1950	1979	1980
Railway freight-car turnover time	days	3.34	3.00	3.02
Freight-train locomotive, daily output (gross ton-km. per locomotive per day)	10,000 ton-km.	43.4 (1952)	72.3	72.3
Yearly output per ton-ship of shipping enterprises directly under the Ministry of Communications.	ton-km.	29,066 (1952)	39,447	41,401
Ship layover time at major coastal ports	days	3.0 (3.1 in 1957)		2.9
Layover time at major coastal ports for foreign vessels	days	4.0	8.2	7.7
Yearly trucking output of highway transport enterprises (per ton-car)	ton-km.	6,424	43,600	39,382

In 1980, all transport departments stressed improvements in operations and management. Railways placed emphasis on organizing rail operations strictly according to the train working diagramme, on strengthening planned and smooth flow of transport, on improving transport priorities and on securing transport safety. The average speed of freight trains rose to 28.7 km./hr., somewhat higher than in 1979. The average layover time for a single freight operation came to 13.1 hours, or 0.2 hours less than in 1979. The punctuality rate of passenger and freight trains reached 94.2% and 91.7%, respectively, an increase of 1.3% and 2.3% over 1979.

Ship layover time at major coastal ports in 1980 was 2.9 days, 0.2 days less than in 1979; the average layover time for foreign vessels was 7.7 days, or 0.5 days less than in 1979.

Due to the great demand for vehicles by various enterprises and institutions not normally involved in mass transport, the transport departments are short of materials. Consequently, the yearly road transport output (ton-km./ton-car) in 1980 was reduced by 9.7% from 1979.

VI. Coordinated Transport and Container Traffic

Shortly after the founding of New China, some transport agencies and shipping offices were established to handle goods consignments, transfers and deliveries for clients. In recent years, with the development of the national economy, coordinated transport has improved significantly. In 1980, more than 48 million tons of materials and products were brought into the national railway-waterway coordinated transport plan, involving roughly 4% of total rail traffic volume and 40% of total water transport volume undertaken by the transport enterprises directly under the Ministry of Communications. Most railway stations handled the railway-waterway trunk line coordinated transport services. A total of 97 ports handled land-water coordinated transport services, and 227 ports handled river-sea coordinated transport services.

In April 1980, the government ratified the Yangquan-Qingdao-Shanghai water-land coordinated transport programme for coal, which was carried out quite well. In recent years, various types of coordinated transport lines have been opened within and between various provinces and cities. Some of the provinces or cities have even promulgated rules and regulations for coordinated transport. The Shanghai-Dalian-Northeast land-water coordinated transport line for general merchandise and foodstuffs has been operating for more than

10 years, saving 46 million yuan of distribution costs for the commercial departments. Coordinated transport services for passengers, which is mainly booked through tickets, developed to some extent in 1980.

There was some development in container transport in 1980, when 78,700 containers were available throughout the country, an increase of 25% over 1979. A total of 178 railway stations, as well as major ports on the seacoast and along the Changjiang River, were equipped to handle container transport. The container traffic volume in 1980 was 2.03 million tons, an increase of 108% over 1979. Domestic waterway container transport volume amounted to 22,500 tons, an increase of 180%. International container traffic (handled in the five major ports of Shanghai, Tianjin, Qingdao, Huangpu and Dalian) totalled 64,286 containers, a 96% increase. The trucking departments handled 1.05 million containers of "door-to-door" conveyance. In air transport, a small-sized container of 1.5 tons was put on trial use for domestic and international air routes.

VII. Urban Transport

A key problem in urban transport concerns passenger traffic. Among China's 216 cities, 202 are now provided with public transport facilities. The public transport routes total 52,000 km.; 32,000 vehicles, including 26,000 buses, are in use. Since the 1960's there has been a rapid growth of trolley buses, now totalling 3,300 in 24 large and medium-sized cities. Trams (streetcars) are being gradually eliminated, and at present only 310 trams are operating in four cities in the northeast. Some cities located along rivers provide ferry passenger transport services. Thirty-two cities have organized taxi services. In 1980, urban public transport enterprises handled a traffic volume of 17,800 million passengers.

In addition to the development of public transport, there has been rapid growth in other motorized vehicles. For example, Beijing now has 170,000 vehicles for civilian use (including trucks and buses). In addition, the number of bicycles has increased sharply; there are more than 3 million in Beijing and 2 million in Tianjin.

With the rapid development of socialist construction since Liberation, and the lax control of population growth, the urban population has expanded sharply. At present, urban transport has become a critical problem in urban construction and management for two reasons: (1) existing buses and cars are unable to cope with the increasing demand due to the rapid growth of passenger traffic, so that the buses are generally over-

crowded and seriously overloaded, thus affecting the transport order especially during rush hours; and (2) most of the existing urban roads, except a few that were newly built according to a planned design, are narrow and in poor condition. Except for a few in Beijing, the roads are intersected by grade crossings. All this results in low traffic capacity, slow speed and frequent accidents. This problem can be solved only through the coordination of all departments concerned and an integrated plan. It will be necessary to redesign urban trunk roads, improve road surface quality, widen the old roads, reconstruct the road crossings, strengthen transport management and improve the traffic control system.

China has built its first subway in Beijing. The first phase of the project is 23 km. long, passing through 17 stations. The whole line is provided with automatic signal and centralized traffic control systems. The trains travel at 80 km./hr., and the minimum interval between trains is 1.5 minutes at peak hours. The completed section was officially opened to traffic in 1973. In 1980, subway passenger volume reached 53.2 million. The second phase of the project — the first round-the-city subway line — is now under construction.

VIII. Three Outstanding Problems

Although China has achieved great successes in transportation in the past 31 years, transport facilities are still inadequate to meet the demands of the national economy. This is a major weakness, clearly manifested in the following three problems:

(1) *Insufficient transport capacity in major railway sections.* In the last 31 years, railway goods traffic turnover volume increased 31 times, but railway mileage increased only 2.36 times, locomotives 2.5 times and railway cars 5.7 times. Thus, the growth of transport capacity lags far behind that of traffic volume. On the major trunk lines at present, more than 10 "limited sections" have been formed, with a carrying capacity capable of meeting only 50-70% of total demand.

The shortage of railway capacity resulted principally from inadequate investment for a certain period of time and the less than rational distribution of existing investments. Too much emphasis was put on the construction of new inland lines to the neglect of the reconstruction of old lines in coastal areas. The population in the northeast and coastal areas represents 77% of China's total population, and the railway goods traffic volume in those areas amounts to 80% of the national total. Investment in these old lines, however, accounted for only 20.2% of total invest-

ment in 1950-1978 (reduced to 10% in the past ten years or so), which caused the old coastal lines to become even more insufficient than before. Furthermore, the economic results of the investment were far from satisfactory. The construction costs of new railways increased from 500,000-600,000 yuan per km. in the 1950's to 2 million yuan. Construction management in the 1980's was inadequate, with considerable waste.

The insufficiency of transport capacity is strikingly evident in coal transportation. Railways are the principal means of transporting coal, moving 67% of the country's total coal output. In recent years the supply of coal has been insufficient, particularly in the east, northeast and central-south areas, thus hampering, to a certain extent, the development of production.

In 1980, the main effort in railroad construction was focused on the reconstruction of some heavy traffic sections of existing lines; the investment ratio of the old lines to the newly built lines was 1.6:1. New double-track lines increased by 151.6 km., and electrified lines by 642 km., helping to speed up coal transportation. In 1980, the coal traffic volume in Shanxi Province was more than 70 million tons, 10 million tons higher than in 1979, yet still falling short of demand. The gap in 1981 was still larger. In the near future, railway construction will continue to stress coal transport by strengthening renovation of the "limited sections" — i.e., building double-track lines, electrifying existing lines, etc. At the same time, more locomotives and railway cars must be built and the organization of transportation must be improved.

2. *Shortage of berths in major coastal ports.* The overstocking of cargoes and the length of ship detention in harbours are serious problems, resulting mainly from the fact that China has long remained a "closed-door" country, ignoring harbour construction and suffering from careless planning and poor management. Over the past 31 years, the handling capacity of the ports increased 26.2 times, but the number of coastal wharves only doubled while deep-water berths increased by about 4 times. At present, the handling capacity per berth in China's major ports is the largest in the world, and total volume handled by the 15 major ports exceeds the approved handling capacity by 16%. However, port-handling is still slow. In 1979, the layover time for foreign ships in Chinese ports was as long as 8.2 days, and in 1980, 7.7 days. In the port of Shanghai there are often nearly 100 foreign ships waiting for berths, sometimes for weeks. In 1980, the ship demurrage losses for all the major ports were estimated to be as high as U.S.\$200 million.

3. *Inadequacy in passenger carrying capacity.*

In the past 31 years, China's passenger traffic volume increased 25 times and passenger turnover volume, 15 times. Especially since the second half of 1980, both water and land traffic volume throughout the country has increased rapidly. However, the number of railway passenger coaches has increased only about 4 times, ship passenger seats and berths only about 3 times and highway buses only 13 times, obviously far short of current needs. The results have been severe crowding in buses and ships, overcrowding in harbours and stations, great disorder and problems in booking tickets, getting on board, dining and lodging, public hygiene and security.

The capacity of the 41 major railway stations throughout the country has already been saturated, and it is too difficult for the 25 trunk lines to add more passenger trains. In 1980, the number of railroad passenger coaches increased by 1,000 and highway buses by 4,000, but the expanded capacity is still too small to alleviate the problem. Although a number of emergency measures have been taken, such as using boxcars for makeshift passenger cars, refitting some ships for passengers and scheduling extra buses and night-shift buses, the growing demand has not been met.

IX. Problems and Prospects

During the readjustment of the national economy, transportation remains a weak link, requiring rapid development so that it can catch up with the pace of development of the overall economy. Meanwhile, it is necessary to regulate various proportional relationships between different modes of transportation, as well as between different departments within each mode of transportation, and to form an efficient and mutually coordinated comprehensive transport system. Such a system would be capable of not only meeting current transport demands but also maintaining enough reserve capacity to place transportation in the vanguard of the national economy. The following are important steps that should be taken to strengthen transportation in China:

1. *Speed up construction to expand transport capacity.* China's railway freight traffic volume reached 11.99 million tons in 1980, ranking second in the world. The average handling volume of each berth at coastal harbours was the highest in the world. Therefore, tapping the potential of existing facilities will not be enough; the way to solve the above-mentioned problem is to

create new capacity.

The construction period for new railways and ports is quite long. Construction of new lines, old lines and berth buildings often requires 3-5 years. Consequently, such projects should be undertaken as early as possible under a unified plan.

The key investments in the near future will be directed to strengthening the technical renovation of railway "limited sections" and to constructing more port berths and passenger traffic facilities. In view of China's limited financial and material capabilities, it is not advisable to proceed on a very large scale; investments should be focused on places where the need is urgent. Efficiency in construction should be strongly emphasized; unnecessary or duplicate construction should be avoided at all costs. Attention must be paid to integrating the construction of land, water, air and pipeline transport, as well as that of vehicles, vessels, harbours and stations so as to achieve a unified, comprehensive productive force.

2. *Readjust the structure of transportation and exploit the advantages of different modes of transportation to allow more comprehensive utilization.* For medium- and long-distance transport of domestic goods in large amounts within China, railways are most advantageous because of their relatively low cost, low energy consumption and high speed. However, the building of railways involves sizeable investments, long construction periods and great difficulties.

China has over 5,800 natural rivers, with a total length of more than 430,000 km., and more than 18,000 km. of coastline. It is thus in a good position to make use of water transportation. Water transportation is low in cost and energy consumption. But for various reasons, the superiority of China's water transportation has not been brought into full play; on the contrary, the navigable distance on inland rivers in 1979 was a third less than in 1962. At present, the density of freight traffic on China's inland rivers is far less than that in the developed countries. There is a considerable potential to be tapped.

Urgently needed at the moment are measures that will exploit the advantages of the Changjiang River, the Zhujiang River, the Grand Canal and offshore waters. In general, all goods suitable for water transport should be transported by water as often as possible. For example, part of the freight flow of the Beijing-Guangzhou and the Tianjin-Shanghai railway lines could be diverted to sea transport; the Huaihe River and the Grand Canal are able to bear part of the coal transport from Yanzhou in Shandong Province and Xuzhou in Jiangsu Province; and the Xinjiang River can be

dredged to open a new channel for coal transport from Guangdong and Guangxi provinces.

At present, the short-distance freight traffic volume borne by railways is too large. According to statistics, freight traffic volume with hauls shorter than 100 km. accounts for 23% of the total, and with hauls shorter than 50 km., 14%. Such short-distance traffic greatly increases the burden on various railways and station operations and raises transport costs.

In order to achieve comprehensive utilization, part of the short-distance freight traffic should be transferred to waterways and highways. Both highways and local waterways now have surplus transport capacity. If a rational division of labour can be ensured between railways, on the one hand, and highways and waterways, on the other, both types of transport will benefit. For this purpose, it is necessary to draw up a unified plan, readjust a number of policies, improve highway and local waterway transport conditions and, in particular, make some necessary changes in freight traffic.

At present, the short-distance freight rate on railways is 1/17 as much as on highways, lower than the actual cost. Provided that the difference between the two freight rates can be reduced, and that highway transport can provide convenient door-to-door service (generally, transshipment has to be done at railway terminals), the highways can surely absorb part of the flow of railway freight.

Local railways — those that are built, managed and used by local authorities — also play an important role. Local railways began operating in 1958, and their total operating trackage at present is 3,381 km. The construction cost of local railways is one-sixth that of national railroads, their average

transport cost being 0.065-0.07 yuan per ton-km. More flexible than the national railways, local railways can make use of old rails and other equipment discarded by the national railways. If conditions permit, it is advisable to build more local railways.

Pipeline transportation has quite a bright future. Besides extending crude oil pipelines, we must make certain that refined oil pipelines also grow appropriately.

Civil aviation, too, must steadily expand so as to handle more long-distance passenger traffic.

3. *Improve management and tap the potential of existing facilities.* The state-run transport enterprises which are the mainstay for fulfillment of current transport tasks, now possess fixed assets of 80,000 million yuan. In order to use and manage these enterprises more effectively, it is necessary to strengthen our political and ideological work, study scientific methods of production management and research proper technical policies. Problems in the existing management system have to be solved step by step during the readjustment of the national economy.

The country has a number of other transport enterprises — e.g., automobile, animal-drawn cart and wooden sailing-boat enterprises — as well as loading and unloading organizations. All these enterprises and organizations are collectively owned. These collectively owned transport enterprises must be effectively utilized and made to operate as a supplementary force of the national transport enterprises. The collectively owned transport enterprises will require assistance in such problems as obtaining funds and fuel supplies.

27. CHINA'S RAILWAY TRANSPORTATION

By the General Office,
Ministry of Railways

Since the founding of the People's Republic, China's railway transportation has developed considerably. Features of old China's railways, such as inadequate stocks of poor-quality, outdated technical equipment and uneven distribution of rolling stock, have begun to change.

From 1949 to 1979, the country's railway routes increased from 22,000 km. to over 51,000 km., an increase of 2.4 times. In old China, there were no railways in six provinces — Tibet, Xinjiang, Qinghai, Ningxia, Sichuan and Fujian. Now, with the exception of Tibet, all provinces and autonomous regions are linked by railways.

The layout of the railway network has also changed. In 1950, railway lines west of the Beijing-Guangzhou Railway made up 19.5% of the total lines in the country. In 1979, that figure rose to 45.3%. Thus, the earlier concentration of railways in the northeast and eastern coastal areas has undergone a change. Railway technical equipment has also been improved. Double tracks have been expanded from 866 km. to 8,221 km., an increase of 9.5 times. The construction of electrified lines, starting from scratch, reached 1,301 km. by 1979. Lines equipped with automatic block systems increased from over 100 km. to nearly 6,000 km. Between 1949 and 1979, the number of locomotives increased by 2.5 times, while passenger cars

and wagons increased by 3.4 times and 5.7 times, respectively.

Since 1949, the railway industry has developed from a system that was capable only of repairs to one basically equipped with complete facilities capable of repairing and manufacturing in all phases. Today, the railway industry is able not only to manufacture steam locomotives, general passenger cars, wagons and special railway equipment, but also to mass-produce diesel locomotives, electric locomotives, large freight cars and luxury passenger cars for domestic use as well as for export.

Both passenger traffic and freight traffic have increased continuously. Passenger traffic rose from 102.97 million per-passenger/trips in 1949 to 856.11 million in 1979, an increase of over 8 times. Freight traffic rose from 55.89 million tons in 1949 to 1,090 million tons in 1979, an increase of 19.7 times. Railways handle more passenger and freight traffic than any other means of transportation in the country. They have made significant contributions to economic construction, national defence and the enhancement of the people's livelihood.

In 1980, the railways made remarkable achievements in increasing transport, industrial production and capital construction through im-

Table 1. Development of Railway Transportation in China, 1949-79

Item	Unit	1949	1979	% Increase, 1949-79
Route length	km.	21,989	51,500	134.3
Passengers carried	100,000 passengers	10,297	85,611	731.4
Passenger-km.	100,000,000 passenger-km.	130	1,214	833.9
Goods transported	10,000 tons	5,589	109,495	1,859.1
Freight turnover	100,000,000 ton-km.	184	5,588	2,937.0
Average number of standard gauge cars loaded per day	freight car	5,762	62,789	989.7

plementing the policy of readjustment, restructuring, consolidation and improvement.

I. Transport of Passengers and Freight

In 1980, railway passenger traffic throughout the country exceeded 910 million per-passenger/trips, 56.35 million more than in 1979. The rate of increase was 6.6%, the highest on record. Passenger-kilometres totalled 138,300 million, an increase of 13.7% over 1979. Because of the increased passenger flow, railway departments raised the capacity of passenger traffic as much as possible by running more trains and putting more cars on each run.

To accommodate the large increases in passenger flow during holidays and festivals — especially during Spring Festival — regular trains are supplemented by special passenger trains. Around Spring Festival time, over 300 special passenger trains are placed in operation throughout the country each day.

At present, Beijing is connected by train to all provinces, municipalities directly under the central government and autonomous regions, except for Tibet. Many passenger trains run by or through such large cities as Shanghai, Tianjin, Guangzhou, Shenyang, Harbin, Wuhan and Zhengzhou every day, forming a nationwide passenger traffic network with Beijing as the centre. The network serves the domestic population as well as the development of tourism.

With the large increase in passengers, the passenger traffic staff has continuously upgraded its services. Services such as booking tickets by telephone, advance booking and door-to-door service are now provided at railways stations in all China's large cities. Furthermore, improvements have been made in food service, in the procedures for checking luggage and parcels and in sanitation.

At present, diesel or electric locomotives are used to haul passenger trains running on trunk lines from Beijing to Guangzhou, Beijing to Shanghai, Beijing to Shenyang, Harbin to Dalian, Shanghai to Hangzhou and Baoji to Chengdu. This modern equipment has made train travel more comfortable, shortened travel time and speeded up the turnaround of cars. Express trains run between Beijing and Shanghai in 18 hours, 58 minutes — an average speed of 77 km./hr. Express trains running between Beijing and Shenyang have shortened the travel time to 8 hours, 55 minutes — an average speed of 94 km./hr. (the highest speed in the whole system). Some trains running between Guangzhou and Shenzhen and between Beijing and Shanghai have been equipped with air conditioning.

Freight Traffic. In 1980, railway freight traffic reached 1,080 million tons, a decrease of 0.8% compared with the all-time record of 1979. The decline was mainly due to the reduction of capital construction, lower consumption of energy and raw materials and changes in the composition of freight traffic following the readjustment in the national economy. The volume of ores and mineral construction materials transported in 1980 was less than that in 1979, but coal transport set a record, increasing by 0.4% over 1979. As a result of improved conditions for coal transport, the railways can handle the entire annual production of many mines as well as over 800,000 tons of backlog.

The volumes of cement and timber transported in 1980 increased by 8.1% and 7.2%, respectively, compared with 1979. In line with the readjustment of the national economy, railway departments have given priority to all phases of shipment of light industrial products, textiles and agricultural products. The total traffic volume in 1980 increased by 7.8% compared with that in 1979. In 1980, because of the increase in the proportion of long-distance freight traffic, the overall volume of freight traffic declined; but the number of freight ton-kilometres increased by 2.1% over 1979, reaching a total of 571,000 million.

In 1980, there were 4,630 stations and 11,264 pieces of loading and unloading equipment in the railway system. Of the 4,630 stations, 59% had freight sidings and ramps and 70% had warehouses. Mechanized loading and unloading accounted for 46% of the annual volume. Container traffic has also developed. In 1980, over 75,000 containers were handled by 178 stations. Container traffic in that year exceeded 2.035 million tons — twice as much as that of 1979 and 10% of the total part-load traffic.

Indexes Fulfilled. With the change in composition in freight traffic, long-distance hauls of goods increased and the work of coordinating stations over some districts also increased. Although the change brought more difficulties, the majority of employees in the railway departments made every effort to increase efficiency. They fulfilled not only various indexes of quantity for the year but also various technical and economic indexes with better results.

The turnaround time of freight cars was 3.02 days, meeting the planned requirement. Average time of detention of local cars in one operation was 13.1 hours, 0.2 hours less than that in 1979. Average transit time per car was 3.6 hours, the same as in 1979. The average speed of freight trains reached 28.7 km./hr., 0.1 km./hr. faster than that in 1979. Freight locomotive-kilometres

Table 2. Main Goods Transported by Rail in 1980

Item	1980 (10,000 tons)	% of plan	% Increase/Decrease over 1979
Total volume	108,584	106.5	- 0.8
Coal	41,478	102.7	+ 0.4
Petroleum	5,563	105.0	- 6.2
Smelting materials	19,357	103.0	- 3.4
Mineral construction materials	15,843	108.8	- 4.9
Cement	2,363	110.9	+ 1.1
Timber	4,241	114.6	+ 7.2
Textiles & light industrial products supporting agriculture	13,466		+ 7.8
Chemical industrial products	3,321		+ 10.1
Industrial machinery	541		- 17.0

per locomotive day reached 415 km., 3 km. more than in 1979. Daily locomotive output reached 723,000 ton-kilometres. Punctuality of departing passenger trains was 99.3%, and of running trains, 94.2% — an increase of 0.2% and 1.3%, respectively, over 1979. Punctuality of departing freight trains was 93.6%, and of running freight trains, 91.7% — an increase of 0.8% and 2.3%, respectively, over 1979.

Safety in the whole system was further improved in 1980. Serious and major accidents were reduced by 38.6% compared with 1979. The number of accidents during the year was at the lowest since 1965. Accidents involving freight traffic were reduced by 19.3% compared with 1979. Compensation for every 10,000 yuan of freight traffic revenue was reduced by 50.9% compared with 1979.

Fuel Savings. In 1980, employees in locomotives departments saw to it that trains ran safely and on schedule, hauling more and running faster. They also further reduced the consumption of coal and fuel in locomotives. The consumption of coal in steam locomotives for every 10,000 ton-km. was 106.4 kg. in 1980, 3.1 kg. less than in 1979. Coal conservation was carried out in 80% of the steam locomotives throughout the system.

The consumption of fuel in diesel locomotives for every 10,000 ton-km. was 35 kg., 0.7 kg. less than in 1979. Fuel conservation was achieved in 40 diesel locomotive depots throughout the system. The consumption of power in electric locomotives for every 10,000 ton-km. was 129.8 kwh., 12.2 kwh. lower than

targeted in the plan. Total savings of power in the year exceeded 20 million kwh. Power conservation was practiced in all electric locomotive depots.

Maintenance. In 1980, 2,581 km. of rails were replaced, marking a new high in rail replacement. Intermediate maintenance of track covered 3,175 km. Replacement of reinforced concrete sleepers totalled 3.9 million. Since Chinese railways started to produce and lay concrete sleepers in 1956, 50 million sleepers have been produced and laid (including concrete sleepers with prestressed wire Model 69, produced by the Fengtai Bridge Factory, which received a silver medal from the state in 1980). In 1980, 749 km. of jointless track were laid, 111 km. more than in 1979. Since Chinese railways laid the first jointless track in 1957, a total of 7,900 km. has been installed so far.

Major maintenance and technical reforms were carried out in 1980 on automatic block systems in the districts — namely, Zhumadian-Guangshui, Zhengzhou-Anyang, Jinzhou-Masanjia and Harbin-Suihua — and on electric centralized interlocking systems in 20 stations such as Fengtai Western, Tangshan and Nanxiang, as well as in three districts, including Xi'an-Baoji. A total of 658 km. of long-distance cable was laid and 657 km. of overhead open lines were given major maintenance.

In 1980, cab signals and automatic alarm devices were installed on 1,288 locomotives, 44 of which were also equipped with automatic stop devices. In addition, 974 stations received ground equipment for alarm devices.

Table 3. Main Indexes of Railway Transport in 1980

Item	Unit	1980	% of plan fulfilled	Increase/Decrease over 1979
Passengers carried	100,000 persons	91,246	108.6	+ 6.6
Passenger-km.	100 million passenger-km.	1,380		+ 13.7
Goods transported	10,000 tons	108,584	106.5	- 0.8
Freight turnover	100 million ton-km.	5,707		+ 2.1
Average daily car loading	freight car	61,298	104.2	- 2.4
Wagon static load	ton	48.0	102.1	+ 1.3
Turnaround time of wagon	day	3.02	100.0	+ 0.02 day
Travel speed	km./hr.	28.7		+ 0.1 km.
Locomotive-km. per locomotive day	km.	415	101.7	+ 0.7
Punctuality of departing passenger trains	%	99.3	-	+ 0.2
Punctuality of running passenger trains	%	94.2	-	+ 1.3
Punctuality of departing freight trains	%	93.6	-	+ 0.8
Punctuality of running freight trains	%	91.7	-	+ 2.3

II. Railway Capital Construction

The focus of railway capital construction in 1980 was on the technical transformation of existing railway lines; investment for technical transformation was over 40% of total investment in railway capital construction. A total of 24 large and medium-sized projects required technical transformation during the year. The main object of technical transformation was to facilitate transport of coal out of Shanxi Province and to increase the passenger carrying capacity of trains serving the coastal areas, harbours, and the southwest and northwest regions. New double tracks were constructed in the eastern section of the Lianyungang-Lanzhou Railway, the Jinan-Qingdao Railway, the Shijiazhuang-Dezhou Railway, the Tainjin-Nanjing Railway, the western section of the Beijing-Baotou Railway, and the southern section of the Beijing-

Guangzhou Railway. Electrification was carried out on the Shijiazhuang-Taiyuan Railway, the Xiangfan-Chongqing Railway, the western section of the Lianyungang-Lanzhou Railway and the eastern section of the Beijing-Baotou Railway. Also in 1980, the Beijing and Zhengzhou junction terminals were expanded, and 10 projects involving technical renovation of existing operating lines were completely or individually begun, accounting for 41.7% of the projects under construction. Investments made in 1980 achieved better results than at any time in the recent past.

The amount of capital construction work done in 1980 included: 33.08 million cu. m. of earth and stone work on subgrade; 17,000 m. of tunnels; 17,000 m. of major and medium-sized bridges; 277 km. of track laid on newly constructed lines; 386 km. of newly built double track; 502 km. of sidings in stations; and 3.45

million sq. m. of floor space in buildings. Placed in operation were 1,007.9 km. of new new lines, 158.4 km. of double tracks and 642.6 km. of electrified railway. The electrified lines placed in operation were as follows:

(1) *The Xiangfan-Ankang (eastern) section of the Xiangfan-Chongqing Railway.* The third line to be electrified in China, it has a total length of 372 km. Construction began in 1975 and was completed in October 1980. The terrain over which the line is laid is complicated; nearly half of the line runs through tunnels or over bridges. The carrying capacity of the line was greatly increased after electrification.

(2) *The Shijiazhuang-Yangquan section of the Shijiazhuang-Taiyuan Railway.* The first electrified double-track line in China, it has a total length of 119 km. Electrification, begun in 1974 and completed in September 1980, more than doubled the line's carrying capacity, increasing its capacity for transporting coal out of Shanxi Province.

(3) *The Baofu-Tianshui section of the Lianyungang-Lanzhou Railway.* Electrification of this key, 151.6-km. section began in January 1977 and was completed in December 1980.

Double-track construction in 1980 included: the 187.5 km. Zhengzhou-Xuzhou section of the Lianyungang-Lanzhou Railway (now in operation); a 123.8 km. stretch of the Datong-Baotou (northern) section of the Beijing-Baotou Railway; part of the Shijiazhuang-Dezhou line (126.5 km. of double tracks laid, of which 100.8 km. have been placed in operation); and 74.9 km. of the Jinan-Qingdao Railway.

Also in 1980, preparation for construction of bridges and tunnels on the southern double-track section of the Beijing-Guangzhou Railway was underway. In addition, parts of the renovation projects at the Zhengzhou, Beijing and Jinan junction terminals were completed and put into operation.

III. Locomotive and Rolling Stock Repair and Manufacturing

In 1980, factories of the railway locomotive and rolling stock industry repaired and manufactured more locomotives, passenger cars, freight cars and cranes than were called for in the plan, thus amply meeting the needs of railway transport. The output of new steam locomotives, passenger cars and the output of repaired freight cars increased by 10%, 17.1% and 3%, respectively, in

comparison with 1979, while the output of new electric locomotives remained the same as that of 1979. The gross industrial output value in 1980 was 1,600 million yuan. Above and beyond their fulfillment of the state plan, all factories undertook to repair and manufacture locomotives and rolling stock for enterprises other than the railways. The quality of products in 1980 was higher than in 1979 while production costs were lower.

The 25.5-m. air-conditioned coaches with soft reclining seats produced by the Sifang Rolling Stock Factory have been used on express passenger trains running between Guangzhou and Kowloon and between Beijing and Shanghai. The coach is safe, comfortable and attractive and has a maximum speed of 160 km./hr. Inside are 68 revolving seats with backs that can be inclined to three different positions. Temperature inside the coach is maintained at 24°C to 28°C in summer and 18°C in winter.

The Wuchang Rolling Stock Factory began mass production of B19 mechanical refrigerator units in 1980. Each refrigerated train set is composed of five cars, of which four are for freight and one is for power generation and for the train crew. The tare weight of each freight car is 39 tons, and the loading capacity is 40 tons. Each car performs five functions: refrigerating, heating, thawing frost, maintaining constant temperature and ventilating. The cars can be controlled centrally or individually. When the outside temperature is 40°C, the temperature inside an empty car can be brought as low as -18°C. When the outside temperature is -45°C, the temperature inside the car can, with the help of an electric heater, be maintained at 15°C.

Among the high-quality products turned out by the factories are: the exciter manufactured by the Yongji Factory, the 500 A heavy-duty silicon cells produced by the Dalian Factory, the hydraulic torque converter produced by the Sifang Factory and the 25.5-m. dining car produced by the Puzhen Factory.

IV. Railway Science and Technology

With the implementation of the party's policy on intellectuals, the country's scientific and technical personnel have been reactivated and scientific and technical work related to the railways has speeded up. In 1980, the Ministry of Railways appraised 43 important scientific and technical achievements and awarded prizes for excellence to 32 of them. Two other achievements received the state's 1980 award for outstanding inventions.

Table 4. Repair and Manufacture of Locomotives and Rolling Stock in 1980

	Item	Units produced in 1980	% of plan
Repair	Steam locomotives	2948	101.7
	Diesel locomotives	290	105.1
	Coaches	2425	100.4
	Freight cars	42951	101.0
	Cranes	347	103.3
	Steam locomotives	342	105.2
	Diesel locomotives	130	108.3
	Electric locomotives	40	100.0
Manufacture	Coaches	1002	100.2
	Freight cars	10571	105.7
	Cranes	57	114.0

Major achievements in scientific research in 1980 were as follows:

(1) Heavy duty test bench for diesel locomotive jointly developed by the Dalian Diesel Locomotive Research Department, the Dalian Rolling Stock Factory, the Beijing February 7th Locomotive Factory and the Zhuzhou Electric Locomotive Factory. Inspection, measuring and data processing are done by computers. The automation is quite high and the functions are relatively complete. The adoption of computers for inspecting, measuring and data processing enables the device to test mechanical, thermomechanical and braking capacities of various diesel locomotives between 1,000 and 1,670 mm. track gauge at speeds of 0 to 200 km./hr. and to simulate their performances. It has provided an important means of testing for improved performance and quality of diesel locomotives in China, and was awarded second prize for scientific research results by the ministry.

(2) The Qiqihar Rolling Stock Factory succeeded in developing the QNY1002 diesel rail crane with a lifting capacity of 100 tons. Its advantage is that it can start faster than steam cranes, an important factor in rescue operations. It is highly regarded by users.

(3) Spring fastenings for concrete sleepers and prestressed concrete switch sleepers were developed and trial-produced by the bridge and sleeper factories and related design and scientific research departments, and then were appraised and placed in mass production.

(4) The Communication and Signalling Company studied the command system of subway train operations and the automatic control system for train operations. The Scientific Research Institute of the Ministry of Railways and other departments studied the JP2 approach continuous cab signal, the ZTL-1 locomotive automatic stop device and the DY-1 remote-controlled signal for large stations.

All of this equipment played a role in improving transport organization, raising transport efficiency, ensuring the safety of train operations and improving working conditions.

V. Railway Organization

By the end of 1980, the whole railway system was divided into 20 railway administrations, namely: Qiqihar, Harbin, Jilin, Shenyang, Jinzhou, Beijing, Huhehot, Taiyuan, Zhengzhou, Wuhan, Jinan, Shanghai, Nanchang, Guangzhou, Liuzhou, Chengdu, Xi'an, Lanzhou, Urumqi and Kunming. Under each railway administration, railway sub-administrations or offices have been established according to the volume of transport and track conditions. There are a total of 60 railway sub-administrations and 3 offices throughout the system. Each railway administration has established several professional districts or depots in accordance with the requirements of transport. By the end of 1980 there were 167 locomotive depots, 116 vehicle depots, 235 engineering districts, 176 signalling and communications districts and 65 train crew districts.

The following are other main areas of railway organization:

(1) *Industry.* There are 68 factories directly subordinated to the railway system, including 33 locomotive, rolling stock, machinery and electric machinery factories; 10 bridge and sleeper factories, 4 engineering and freight-handling machinery factories; 9 signalling, communication and electrical apparatus factories; 8 timber preservation factories; and 4 permanent route materials and spare parts factories. All these factories undertake the repair and manufacturing of locomotives, rolling stock and various equipment for the entire railway system.

(2) *Capital construction.* There are nine engineering and construction bureaus: the First, Second, Third, Fourth and Fifth Construction Bureaus, the Plant Engineering Bureau, the Electrification and Automation Engineering Bureau, the Tunnelling Bureau and the Major Bridge Engineering Bureau. In addition, there are five design institutes: the First, Second, Third and Fourth Survey and Design Institutes and the Specialized Design Institute. These engineering and construction bureaus and design institutes undertake the design and construction of railways. Seven material procurement and supply divisions are in charge of supplying materials for transport, industry and construction.

(3) *Research work.* There are eight research/planning institutes or departments: the Scientific Research Institute of the Ministry of Railways, the Railway Planning Institute, the Dalian Diesel Locomotive Research Department, the Sifang Rolling Stock Research Department, the Qishuyan Locomotive and Rolling Stock Technology Research Department, the Zhuzhou Electric Locomotive Research Department, the Labour Hygiene Research Department and the Wuhan Engineering Machines Research Department.

(4) *Education.* There are eight universities or institutes: Northern Jiaotong University, Southwest Jiaotong University, the Shanghai Railway Institute, the Dalian Railway Institute, the Lanzhou Railway Institute, the Changsha Railway Institute, the Nanjing Railway Medical Institute and the Shanghai Railway Medical Institute. Eastern China Jiaotong University, Suzhou Railway Teachers' College and Xi'an Railway Teachers' College are under construction.

There are also 41 secondary technical schools, 32 professional workers' schools and 1,527 railway middle and primary schools subordinated to the railways.

VI. Challenges Facing China's Railways

China has a vast territory and rich resources. But because the distribution of resources is uneven, the distribution of factories is also uneven, most factories being located in the coastal areas. The extraction industries are usually far away from the processing industries. Civil aviation and highway transport are comparatively weak. For these reasons, passenger traffic and long-distance transport of bulk goods are undertaken mainly by railway. Therefore, railway transport is in the vanguard of the socialist modernization of China. At present, railway lines in China are still few in number, and technical equipment is backward and unevenly distributed. In order to meet the requirements for the Four Modernizations, railways in China must develop substantially.

The carrying capacity of existing rail lines in areas along the coast is strained, and the main trunk lines are overloaded. This is the main problem in railway transport. In the future, most of railway freight traffic will continue to be concentrated in areas along the coast and in the northeast region. Hence, efforts must be focused on improving existing lines and the appropriate construction of new lines.

Expansion of Capacity. In the short term, the expansion of carrying capacity depends primarily on tapping potential and upgrading efficiency. In the long term, the basic way to increase carrying capacity is to build new lines and strengthen technical transformation of existing lines. This requires funds and time. Therefore, to ease the current shortages in transport, we need to mobilize the masses, tap the potential of existing lines and raise the carrying capacity.

We also need to strengthen the organization of transport, implement transport schedules and increase the proportion of night operations. In remote areas and districts, it is imperative that we exploit existing capacities to the full so as to meet the transport requirements of various fields. We must make use of existing railways such as the Shacheng-Tongliao, Xindian-Tai'an, Jiaozuo-Zhicheng, Zhicheng-Liuzhou, Zhuzhou-Guiyang, Goubangzi-Haicheng and Beijing-Yuanping lines and organize traffic patterns so as to ease the strain on the Beijing-Guangzhou, Tianjin-Nanjing, Beijing-Shenyang, Jinan-Qingdao and Lianyungang-Lanzhou lines.

As for railway tractive power in China, steam locomotives are, and will be for a comparatively long period, the main force of transport. While we tap the full potential of steam locomotives, we must also vigorously develop electric and diesel locomotives.

In the area of railway technical equipment, it is imperative to modernize gradually such equipment as coaches, freight cars, track, bridges, communications and signalling, to mechanize loading, unloading, track maintenance and rolling stock repair and construction, and to develop automation in train control and operations management. Expanding carrying capacity, ensuring safety and improving working conditions should be considered primary goals in the current phase of railway development.

Necessary Steps. At present, passenger traffic is growing continuously. Many passenger trains are overloaded. It is necessary to achieve a balance between passenger and freight traffic, increase the number of passenger trains as much as possible in districts with heavy traffic, increase investments

accordingly, build more passenger cars and improve passenger traffic facilities. In order to improve and expand passenger service, it is equally necessary to develop commuter transport in large cities.

Responsible transport should be strengthened, loading, unloading and management of freight yards improved and container traffic positively developed. Through trains and freight-car groups should be utilized as much as possible for the transport of bulk goods (such as coal, iron, steel, mineral construction materials, timber, petroleum, etc.) and wagons with special features should be developed for the transport of toxic materials, chemicals, grain, cement, livestock and fresh produce, so as to ensure safety in transport and reduce damage and loss of goods enroute.

28. CHINA'S HIGHWAY TRANSPORTATION

By Cheng Yinghua

Highway Administrative Bureau, Ministry of Communications

Before the founding of the People's Republic of China, highway transportation was extremely backward. In 1949 the 80,000 km. of highways open to traffic were mostly concentrated on the plains and rolling countryside in the inland and coastal regions. The mountains and border regions that cover over two-thirds of the country's total area, and inhabited mostly by the national minorities, had scarcely any roads at all.

I. Development of the Highway System in New China

After Liberation, highway construction developed fairly rapidly. By the end of 1980, the routes open to traffic totalled about 870,000 km., nearly 11 times that of 1949. At present, almost all the counties and more than 90% of the people's communes have been brought into the highway network. Even many of the mountainous border regions, inaccessible in the past, now have roads.

A beginning has been made in forming a nationwide network of highways, with Beijing at its centre, linking up the provinces, municipalities, autonomous regions, large and medium-sized cities, major ports and railway junctions.

After Liberation, countless miles of highways were built over the Qinghai-Tibet Plateau, known as the "roof of the world." The most well-known of the highways is the Sichuan-Tibet Highway, built in 1950-1954. It runs more than 2,400 km. at an average elevation of 3,000 m. above sea level from Chengdu in Sichuan Province to Lhasa, the capital of the Tibet Autonomous Region. The highway passes through such towns as Ya'an, Ganzi and Maniganggo, climbs high mountains such as the Erlangshan, Zheduoshan and Qiaoshan and crosses swift-running rivers such as the Dadu, the Jinsha, the Langsang and Nujian. The high elevation, low atmospheric pressure, very changeable weather and difficult topographic and geological conditions made the building of the highway one of the most arduous engineering feats in China's history of highway construction, rarely equalled even in world records.

Higher Quality. As the distances of roads increased, their quality and engineering techniques greatly improved. In the early days after Liberation, most of the highways did not rate even in the lowest class because they were low-lying, had nar-

row subgrades and lacked bridges and drainage culverts. Moreover, their poor alignment produced sharp curves and steep grades. Today, almost all highways in the country meet the requirements of different classes specified by national standards, and about 73% of these highways are paved.

By the end of 1980 there were 151,000 km. of asphalt roads, compared with only 315 in 1949. In the construction of first-class highways, priority has been given to access roads of large and medium-sized cities and to connecting roads. Some examples are: the Beijing-Miyun Highway, with a total length of 71.3 km. (39.1 km. of which feature a centre separation strip), subgrade width of 25-28 m., surface width of 21-25 m.; the six-lane Shenyang-Fushun Highway, total length 27 km., subgrade width of 29 m., surface width of 25 m.; and the Nanjing-Liuhai Highway, total length 24.7 km., subgrade width of 23 m., centre separation strip of 1.5 m., with a surface width of 10 m. on either side.

Bridge Construction. Following Liberation, highway bridges were also built at a high rate. In old China, bridges were largely timber or stone structures with small spans, and ferries were usually needed to cross large rivers. At present, there are more than 120,000 bridges with a total length of over 3 million linear metres; 92% of the bridges are permanent.

Several bridges now straddle the once impassable chasm of the mighty Changjiang River, which is over 5,000 km. long. The Changjiang River Highway Bridge in Chongqing, opened in July 1979, is a pre-stressed concrete, T-shaped, rigid-frame bridge, with an overall length of 1,121 m., main span length of 174 m. and deck width of 21 m. The Huanghe River is now crossed by more than 30 bridges, one of which is the longest highway bridge ever built in China — the Luoyang Huanghe River Highway Bridge, in Henan Province — with an overall length of 3,400 m. Both the construction scale and the techniques of design and construction of these bridges are relatively advanced.

Maintenance. In 1980 the highway engineering departments improved the maintenance work on existing highways, stressed technical improvements for the trunk roads and built some new roads at key points. In that year, with better maintenance work, trunk roads in good technical

condition increased by 6%. A number of trunk roads have been brought up to second-class standard, e.g., the Huhehot-Wuyuan Highway, passing through Baotou in Inner Mongolia; the Taiyuan-Yuanping Highway, passing through Xinxian County in Shanxi Province; the section of the Beijing-Fuzhou National Highway in Zhejiang Province; the Fuzhou-Xiamen (Amoy) Highway in Fujian Province; and access roads to many large cities.

Other New Construction. Two new trunk roads have been built and opened to traffic. One is the Qinghai-Xinjiang Highway, east from Chaka, Qinghai Province, to Hetian, in the Xinjiang Uygur Autonomous Region; the other is the highway from Guanghua to Fangxian in Hubei Province. Major highway bridges have also been built, including the Hanjiang River Bridge at Guanghua in Hubei Province, a T-shaped, pre-stressed concrete, rigid-frame bridge with an overall length of 2,000 m. and main span of 90 m.; the Fujiang River Bridge at Santai, Sichuan Province, a pre-stressed concrete, cable-stayed bridge with an overall length of 560 m. and main span of 128 m.; and the Dongjiang River Bridge at Huiyang, Guangdong Province, a reinforced concrete box arch bridge with an overall length of 805 m. and main span of 75 m. About 20,000 km. of county and commune highways were also built in 1980.

Growth of Road Transport

As the length of highways open to traffic increases steadily and the motor vehicle and petroleum industries develop, road transport is growing at an even faster pace. In 1949 there were only

50,000 motor vehicles; by the end of 1980 there were 1,700,000 in civilian use (including 1,300,000 freight trucks, 110,000 buses and 140,000 freight trailers), about 35.6 times that in 1949. The number of motor vehicles under government transport departments totalled 199,000 (including 159,000 freight trucks and 40,000 buses), about 11% of the total number of vehicles in civilian use. Almost every county now has its own motor transport service, accommodating more than 90% of the people's communes. Container transportation has started, and a certain amount of carrying capacity for extra-large freight has been provided, with a maximum single load capacity of 600 tons. The greatest length of freight carried has reached 70 m.

In 1980 highway transportation handled a volume of freight amounting to 760 million tons and a volume of cargo of 76,400 million ton-km., and carried 2,230 million passengers (about 6 million passengers daily). Of those vehicles under government transport departments, the percentage of freight trucks maintained in good condition was 86.5%; ratio utilized, 73.1%; average distance per vehicle daily, 172 km.; and percentage of utilized loading capacity, 61.5%. The volume of truck and trailer combinations averaged more than 39,000 ton-km. per truck-ton annually, and the volume of cargo reached 255 million ton-km. All these figures were higher than those of previous years.

Although highway construction and motor transport have greatly developed, they remain unable to meet the needs of the developing national economy in which they are still a weak link. At present, in the course of carrying out the policy of readjustment and restructuring, the task of speeding up highway construction and expanding motor transport capacity continues to be of great importance.

29. CHINA'S WATER TRANSPORTATION

By Sui Qiren

Bureau of Water Transport, Ministry of Communications

China has very favourable natural conditions for water transportation, with a long coastline of over 18,000 km., thousands of offshore islands and more than 900 large and small inland lakes. Most of the ocean bays and rivers are ice-free year-round and suitable for building ports. In China, there are many rivers, abundant in water, with a total length of 430,000 km. A general survey of inland waterways conducted recently shows that the navigable distances of these rivers is 108,000 km. The Changjiang River, which is the longest in China and the third longest in the world, is more than 6,300 km. long. Its main stream of 2,958 km. is navigable year-round, and its trunk stream and tributaries of 18,000 km. are navigable for steamers.

In the 31 years since Liberation, China's coastal waterways, inland waterways and ocean transport have been developing rapidly. At the same time, much progress has been made in building ports and wharves, dredging waterways, erecting navigational markings and manufacturing cargo-handling machinery, as well as in communications, navigation, and rescue and salvage.

I. Coastal and Inland Water Transport

The coastal waters of China are divided into two shipping areas: one, under the charge of the Shanghai Coastal Shipping Administration, is called the Northern Shipping Area and extends from Xiamen in Fujian Province to the mouth of the Yalu River in the north; the other, which covers the coastal waters from Xiamen to the mouth of the Beilun River, is the Southern Shipping Area, administered by the Guangzhou Coastal Shipping Administration. The Changjiang River Shipping Administration is responsible for trunk line transport on the Changjiang from Shanghai to Chongqing. In addition, provinces and autonomous regions situated along the coast or with navigable rivers all maintain their own coastal or river shipping authorities, engaging in local transportation and collecting and distributing cargoes from and to the main shipping lines.

The hub of Chinese coastal water transport is Shanghai, from which vessels can sail to all ports along the Chinese coast. Ships of 10,000 tons can directly enter the mouth of the Changjiang River and moor there. A water transport network linking both rivers and sea, and consisting of trunk lines

and branch lines that are interconnected, is gradually taking shape.

Progress Since Liberation. Just after Liberation, there were only 23 coastal freighters totalling 34,000 tons and 61 deep-water berths in all the Chinese ports and harbours, and cargo handling was mainly done manually. At that time, boats and ships plying the Changjiang River totalled no more than 200,000 tons; ports on the river were uncared for; and many of the vessels used in inland navigation were old, poorly maintained junks.

Since the founding of New China, however, important progress has been made in marine and inland water transport. The number of coastal ships has increased rapidly, and more and more large and special-purpose freighters have been put into use. In recent years, shipyards in China have supplied the coastal shipping fleet with a number of 25,000-ton bulk cargo ships and 24,000-ton oil tankers. The average carrying capacity of the ships owned by the Shanghai Coastal Shipping Administration increased from 2,000 tons in the initial post-Liberation days to more than 9,000 tons at present.

Great changes also have taken place in inland water transport. In 1949, 70% of inland water traffic volume was handled by sailing boats, which were rowed or towed manually. Now, the number of steamers and barges on inland rivers has increased over 10 times from that of the early post-Liberation period. Motor barges can handle 88% of the traffic volume, while the largest tug-barge flotilla steaming in the lower reaches of the Changjiang River is able to carry nearly 10,000 tons of cargo.

In the past, a round-trip between Wuhan and Shanghai by passenger ship took 12 days, but now it takes only 7 days (if by fast liner, only 5 days). Just after Liberation, along the Changjiang River there were only 17 ports and 72 wharves, without a single piece of cargo-handling machinery in use. Now there are 25 port authorities, over 200 shipping stations, more than 400 wharves and over 3,000 pieces of loading and unloading machinery. Generally speaking, mechanization and semi-mechanization have been realized for cargo handling.

New Procedures. In recent years, advanced transport techniques, i.e., an integrated barge and towing system, have been popularized on a large

scale for inland water transport on the Changjiang, the Heilongjiang and other large rivers. The aggregate tonnage of all the section barges in China is over 300,000 tons, with the carrying capacity of a barge ranging from 200 tons to 1,000 tons. The largest pushing boat we now have, with an engine output of 4,000 hp, is able to move 12,000 to 15,000 tons of cargo. In organizing transport, bulk cargo and cargo requiring long-distance shipment are moved in special liners on rivers and along coastal waters. In addition, container transport is in wide use, thus speeding up the shipment and improving the quality of freight transport.

The Changjiang River Shipping Administration has opened more than 30 special routes for a new method of shipment, known as the "five fixednesses" — fixed ships, fixed shipping periods, fixed berths, fixed loads and fixed kinds of cargo. In this way, the administration has increased total traffic volume by over 60%. In order to ensure the transport of general cargo from Shanghai to the three provinces in Northeast China by way of Dalian, a coordinated transport process has been operated since 1965 by the Shipping Administration, the port authorities, the commercial departments and the railway bureaus concerned. In so doing, the Shipping Administration and the port authorities are responsible for maintaining ships, berths, loads and shipping schedules while the railway departments arrange train wagons. This system has brought excellent results during the last 10 years or so.

Advances in 1980. A number of new passenger ships with over 9,000 places were added to the fleet in 1980; cargo ships increased by 1,124 (totalling nearly 400,000 tons); and five 10,000-ton berths, two 5,000-ton berths and the Dalian Passenger Shipping Station were built to augment coastal and inland water transport capacity. In that year, 350 million tons of cargo and 260 million passengers were transported by river and sea, an increase of 0.2% and 9.1%, respectively, over 1979. Priority was given to the shipment of farm produce, light industrial products and textiles, coal, oil and other key materials.

In 1980, further advances were made in coastal water transport and in shipping on the Changjiang River, with more and more container ships coming into use. Consequently, an international container traffic business was begun in the five ports of Tianjin, Shanghai, Qingdao, Dalian and Huangpu, handling over 60,000 containers totalling 380,000 tons of cargo — an increase of 96% and 133%, respectively, over 1979.

In the 1960's, in coastal waters and on the Changjiang River, "inter-port unitized transport" was introduced. Since then, 59 shipping routes have

been designated for that kind of transport, and 5 million tons of cargo have been handled that way. Because internal transport was running smoothly, several coastal freighters, with a carrying capacity of 500,000 tons, could be transferred to foreign trade shipping. Also in 1980, shipping services for foreign trade were started in the seven ports of Nanjing, Nantong, Jiujiang, Wuhu, Wuhan, Huangshi and Chongqing, which handled over 200,000 tons of cargo. At home, two "fixednesses" special routes were opened to ship general cargo from Shanghai to Fuzhou and Wenzhou.

II. Ocean Transport

Before Liberation, China had virtually no ocean transport of its own. The few foreign shipping companies operating in Shanghai and Tianjin had long monopolized all foreign shipments.

After the founding of New China, China and Poland jointly set up the Sino-Polish Shipping Company in 1951, the first step in developing China's own ocean transport service. In the 1950's, China shipped its foreign trade materials mainly by chartered vessels. In the early 1960's, however, China, on the basis of self-reliance, began to build and then to expand its own ocean maritime sector systematically and in a planned way. Accordingly, the China Ocean Shipping Company (COSCO) was set up in 1961. In April of that year, the first ocean-going passenger ship, the *Guanghua*, made her maiden voyage to Indonesia. After that, two Chinese-built freighters, *Peace* and *Friendship*, sailed to Burma, Sri Lanka and Guinea in West Africa.

When it was formed in 1961, the ocean-going merchant fleet owned only 20 vessels with a combined dead-weight capacity of 190,000 tons. But the number of ships has increased year by year, especially in the 1970's. By the end of 1980, China's ocean-going merchant fleet had 431 ships with a total dead-weight capacity of 7.92 million tons, an increase of approximately 40 times in 20 years. Now, merchant vessels flying China's five-starred red flag sail to more than 400 harbours in over 100 countries and regions, constituting the mainstay of China's ocean transport.

In 1980, 33.9 million tons of cargo were shipped and 14,300 million ton-miles handled. The merchant fleet also entered the international shipping market and began to transport cargo for third parties. In so doing, it made positive contributions to the development of China's foreign trade, socialist economic construction and friendly relations with other countries.

With headquarters in Beijing, COSCO has ship-

ping companies in Shanghai, Guangzhou, Tianjin, Qingdao, Dalian and elsewhere. In addition, shipping companies jointly owned by China and other countries have been set up, such as the Sino-Polish Shipping Company, the Sino-Tanzanian Joint Shipping Company and the Sino-Sri Lanka Joint Shipping Route. In Hong Kong, we have the China Merchants Steam Navigation Co., Ltd. In 1980, the China Ocean Shipping Company, together with the local authorities in Jiangsu, Zhejiang, Hebei and some other provinces, established joint ocean shipping companies.

The Chinese merchant fleet owns not only general cargo vessels of various types and classes, but also a considerable number of bulk cargo ships and oil tankers. In recent years, additions to the fleet have included some newly built and technically sophisticated roll-on/roll-off ships, container ships and multi-purpose ships, some of which are equipped with automatic control systems for unattended engine rooms.

China began to engage in container shipping in 1973. At that time, the container ships used were merely ordinary cargo liners loaded from Xingang and Shanghai, carrying no more than 100 containers and used only for freight forwarding. In 1978, the sea route between China and Australia was opened up, with two semi-container ships carrying over 200 containers each sailing monthly between Shanghai, Xingang, Sydney and Melbourne. Since January 1980, two roll-on/roll-off ships have replaced the semi-container ships and sail this route four times a month by way of Hong Kong, where more cargo is taken on. In June of 1980, a shipping route between Huangpu and Europe was opened for container vessels sailing twice a month, also by way of Hong Kong where more cargo is loaded. In November, a regular line between Shanghai and ports along the coast of West Africa went into operation, with Chinese cargo liners sailing once a month via Hong Kong.

With the rapid development of ocean transportation, China has made much headway in recent years in enhancing friendly ties with other countries and promoting international economic cooperation. The China Ocean Shipping Company has set up the Transoceanic Shipping Agency in Amsterdam, the Consur Shipping Agency Co. Nv in Antwerp and the Five Star Shipping and Agency Co. PTY Ltd., with ship brokers or shipping agents of the Netherlands, Belgium and Australia, respectively. In addition, it has started the Chung Ling Marine Service Company, Ltd. with Japan and the Yuan Tung Marine Service Company, Ltd. with the Netherlands to provide each vessel with essential ship supplies.

III. Waterway and Harbour Construction

When the People's Republic of China was founded in 1949, navigable inland waterways extended for only 73,600 km. Of the total, only 24,200 km. were fit for steamers, and most rivers were in a poor natural state. Along the coast, only six major ports and harbours with a total of 119 berths were operational.

Since the founding of New China, there has been a fairly rapid development both in waterway dredging and harbour construction. By 1961, the navigable length of inland waterways had been increased to 172,000 km., 2.3 times that in the early days after Liberation. Then, because of construction of locks and dams, the length was reduced considerably in the last decade. As a result, only 108,000 km. of waterways remained, but this is still 47% more than in the early days after Liberation.

Waterways. In the opening up and dredging of waterways, China has experienced both positive and negative results. From 1958 to 1960, the policy of "unified planning, comprehensive utilization and construction by stages" led to great achievements. For example, the Grand Canal, navigable for 404 km. in northern Jiangsu and fit for a barge fleet with a carrying capacity of 2,000 tons, was dredged in only three years. In addition, 10 sluices and other water conservation facilities were built successively. Thus, navigation in that region has been greatly improved; the capacity of passage has been raised by 11 times, and the total quantity of cargo shipped has reached 20 to 25 million tons. This has helped reduce the load on rail transport in the southern section of the Tianjin-Pukou Railway and has supported irrigation, flood-prevention and drainage, contributing greatly to the development of agriculture and industry in the area.

The Lianjiang River in Guangdong Province, which flows 262 km. through a mountainous region, could serve as another example. It has numerous shoals and zigzags, a sharp gradient and very swift waterflow. From 1959 to 1975, however, canalization was realized, with 10 cascades built in the section from Lianzhou to Hanguang and rubble dams constructed downstream. Chuanjiang, 660 km. long, a section of the Changjiang River between Chongqing and Yichang that runs through hilly areas with many high mountains and steep gorges (including the well-known Three Gorges), has 128 dangerous shoals with turbulent currents. From 1953 to 1978, 101 shoals were ameliorated, and the former 2.1 X 33 X 440 m.

shipping lane, suitable only for seasonal navigation, was expanded to 2.9 X 60 X 750 m., permitting day and night navigation for a barge fleet of 1,000-ton carrying capacity.

Since the 1960's, greater importance has been attached to the maintenance and construction of waterways and to comprehensive water conservation. With more than 2,000 sluices and locks built, many sections of the navigational lanes were blocked by silting, resulting in a 2.5% annual decrease in navigable distance. By 1970, a total of 63,000 km. had been lost. A typical example is the Peijiang River in Sichuan Province: with the setting up of 10 hydroelectric power stations, the former 500-km. shipping lane was no longer navigable.

Harbours. In the area of coastal harbour construction, China devoted its main efforts in the 1950's to the recovery and reconstruction of the old ports and harbours of Shanghai, Tianjin and Qinhuangdao, as well as the construction of a number of deep-sea berths in a few harbours such as Zhanjiang. Since 1960, with the immense growth of foreign trade, the shortage of wharves in coastal harbours has become a critical weak link in the development of the national economy.

In 1973, China decided to raise port handling capacity by expanding port construction. In a few years, a great number of terminals for bulk cargo, general cargo, petroleum and passengers, as well as numerous port facilities for water and bunker supply, were built. Now, there are more than 300 wharves, 139 with deep water for berthing ships up to 10,000 tons.

In the past, China had only one oil terminal of the 20,000-ton class — in Dalian. Now there are quite a number of oil terminals of the 100,000-ton class, 50,000-ton class and 20,000-ton class in four ports, with a yearly oil delivery capacity of 41 million tons. The handling capacity of coal and general cargo terminals has also been raised considerably. In addition, container terminals are being built in the ports of Shanghai, Tianjin and Huangpu, and will soon be placed in operation.

IV. Water Transport Industry

In the early years after Liberation, the water transport industry in China was very weak. The total output value of all water transport enterprises under the Ministry of Communications in 1950 was only 10.9 million yuan. There were merely 450 metal-cutting machine tools and six small dry docks, permitting only simple repairs and the building of a limited number of barges. As for the local water transport industry, it had only a few shipyards that were barely capable of build-

ing junks. All cargo-handling machinery was imported.

In 30 years, the water transport industry has made great progress in such fields as ship repair and shipbuilding and the manufacture of cargo-handling machinery, spare parts and complete sets of equipment. In 1980, water transport industry enterprises under the Ministry of Communications had more than 8,300 metal-cutting machine tools, 24 repair docks of over 3,000-ton class (15 dry docks, 9 floating docks), among which 15 are of over 10,000-ton class, the largest being of the 50,000-ton class. There were 61 shipways and shipways of varying sizes. The total output value in 1980 was 613 million yuan, which is 56 times the total in the early years after Liberation. Most local water transport industry enterprises are now able to build steel ships, and some of them can construct cargo ships of 3,000 to 5,000 tons.

Importance of Ship Repair. The ship repair and building industry follows the policy of "repair and build, taking repair as the main task." The ship repair industry is being developed in a planned way and in concert with the development of water transportation. There are ship repair yards in every major port and harbour along China's coast and the Changjiang River to ensure the timely and convenient repair of ships when they arrive. In order to shorten repair time in the yards, improve quality, reduce costs and render better service, the yards have been improving management in recent years, thus enhancing both repair efficiency and quality.

Meanwhile, advanced repair technology and equipment have been introduced, e.g., removing rust with water jetting, ship-side crawling magnetic rust-removing, airless paint spraying, shipside electric hanging scaffolds, laser measurement and chemical washing. In the field of mechanization of bench work and pipe processing, hydraulic and pneumatic tools have been employed, and flame pipe-bending machines and medium-frequency pipe-bending machines have been successfully developed in a number of yards. The mechanization of pipe processing has been basically realized.

As regards the organization of ship repair, the arrangement of production according to workers' trades, which has been practiced for years, is being successfully reformed. The aim is to organize production in conformity with technological processes and to establish a system in which each worker will know several trades.

Shipbuilding Capability. In shipbuilding, China can now design and build its own ocean-going cargo ships of the 10,000-ton class, tugs of 4,000 h.p., passenger-cargo ships of various kinds

navigating in the Changjiang and along the coast and barges of the 5,000-ton class. In September 1978, the Shanghai Shipyard built the first ship for export, a 14,000-ton oceangoing cargo ship named *Shaoxing*, for the Sino-Polish Joint Shipping Company. The main engine, a low-speed diesel engine Model 6ESDZ 76/160, with a continuous output of 9,000 hp, was built in the Shanghai Shipyard. The hull, power machinery, navigation aids and communication facilities were all in compliance with China's steel ship construction rules and regulations and the requirements of international conventions. In sea trials, the ship proved worthy and its performance won praise from the user.

In 1980, water transport enterprises under the Ministry of Communications repaired 1,128 Chinese ships and 20 foreign ships and built ships totally 183,000 deadweight tons, including four tugs of 900 hp for Romania, 10 barges of 1,000 tons each for Hong Kong shipowners and a 5,000-ton passenger-cargo vessel named *Tianhu* for trading on the Bohai Sea.

Cargo-Handling Machinery. The cargo-handling industry was set up in 1960. Now, after 20 years' development, a complete system is taking shape. At present, there are eight factories in which various mobile machines, such as wheeled cranes, fork lifts, tractors, single-bucket loaders and two-way bulldozers, can be designed and built. Also being manufactured are various rubber-tyred transferring cranes, bulk-loading machines, grain-sucking machines, container lifts, container tractors, derricks and rotary floating cranes, bulk grab buckets, electro-magnetic loading devices, etc.

In recent years, the cargo-handling machinery built in these factories, besides meeting the needs of China's harbours and enterprises, is beginning to be exported. Among the equipment shipped abroad are 1-cu. m. single-bucket loaders, buckets of various kinds and 30-ton, 40-ton, 63-ton and 150-ton shore cranes.

V. Rescue, Salvage and Towage

Rescue and salvage in China was initiated and developed only after Liberation. The People's Salvage Company was established in 1951 with only one tug of 150 hp and 37 divers. Since 1975, the China Salvage Company, China Towing Company and China Ocean Engineering Services were formed, operating on a joint basis and with offices in Beijing, Guangzhou, Shanghai and Yantai. These companies have entrusted Wah Tak Marine Engineering Co., Ltd. in Hong Kong to act as their agent and have signed cooperative arrangements

with salvage companies in seven other countries, including Japan and the United Kingdom.

By the end of 1980, China's rescue and salvage organizations comprised 600 divers, 800 technical personnel and 121 ships of various types, including the largest tug (20,800 hp), a floating crane with a lifting capacity of 2,500 tons, and a self-propelled engineering ship of 3,200 GRT and several deck barges of 5,000 tons. In addition, there were numerous diving and salvage facilities and equipment of different types. With personnel and equipment, these companies now have enormous capabilities in rescue, salvage and towage operations, as well as in rendering ocean engineering services.

The China Salvage Company has conscientiously fulfilled its international obligations in sea rescue by setting up 11 permanent rescue stations and a number of seasonal ones along China's coast, where round-the-clock service is available and immediate dispatch of rescue ships and personnel can be made at any time. In the past 30 years, the companies rescued more than 4,800 persons and 730 ships, of which 106 were from over 20 foreign countries.

Some Notable Successes. In 1979, the Guangzhou Salvage Company rescued — under extraordinarily severe weather and sea conditions and in a particularly difficult sea area called the Langhua Reefs in the Xisha Islands — the U.S. cargo vessel *American Sioux*, which had run aground. The successful operation won high appreciation and wide admiration in international salvage circles.

In recent years, wreck removing techniques have been raised to new levels. The method of refloating a ship by pumping out oil in holds to use their inherent buoyancy succeeded in 1976 in the case of the 10,000-ton *Nan Yan* oil tanker. In 1977, the salvage operation of a Japanese cargo ship, the *Awa Maru*, which sank during World War II, was a highpoint in the history of salvage in China. The work was initiated in order to clear the fishing grounds off Niushan (Ox Mountain) in Fujian Province. The operation took 400 arduous days and proceeded in the face of tremendous difficulties, such as great sea depth, strong monsoons, rough gales and turbulent currents. It was successfully completed with the raising of the ship's fore part. More than 5,000 tons of cargo were salvaged, and the remains of over 300 Japanese seamen were recovered and turned over to the Japanese government. The operation was significant not only in the tempering of salvage personnel but also in the strengthening of friendship between the Chinese and Japanese peoples.

In 1979, experience was gained in salvaging a complete section of a broken ship by means of

pontoons in an operation involving the 15,000-ton cargo vessel *Han Yin* in the Bohai Sea. With some 910 ships of different sizes salvaged in the past 30 years, the China Salvage Company has made an impressive contribution to waterway clearance and navigational safety.

With the use of high-powered tugs, the China Towing Company undertakes both domestic and international towing operations. A total of 419 towing operations involving drilling rigs, VLCC, cargo vessels, barges, engineering ships, floating cranes, floating docks and heavy equipment on deck barges have been performed between Singapore, Japan, India and China in recent years. On one occasion, a 3,600-hp tug was manned and sailed by the company all the way from Japan to Mauritania. The company has been commended time and again by clients for its safe, reliable and on-schedule service.

Engineering Achievements. Ocean engineering services have been expanded continuously along with the development of offshore oil exploration. Since 1979, the China Ocean Engineering Service has towed giant jack-up and semi-submersible rigs 14 times between Japan, Singapore and China; contracted to tow, transport and inspect offshore rigs for the BP Oil Company and China's Ministry of Petroleum Industry and Ministry of Geology in the Yellow Sea, China Sea and South China Sea; undertaken salvage of sunken objects dropped from rigs in water as deep as 76 m.; and engaged in inspection work on rig supports. In addition, the

China Ocean Engineering Service has been involved in diving operations and cable- and pipe-laying in harbours and bays, reservoirs, mine wells and hydraulic power plants.

Equipment and Research. The manufacturing of diving equipment has been growing rapidly in the course of the development in salvage and towage operations and ocean engineering services. Equipment for scuba, helmet-type diving and heliox helmet-type diving, facilities for underwater cutting, welding and illumination, as well as working tools produced in the Shanghai and Wuhu diving equipment works not only meet domestic needs but are also exported.

Scientific research in connection with salvage has been well advanced. Experience in air diving has been gained; a simulated test of heliox diving at a depth of 156 m. succeeded in 1975; and practical work at around 100-m. depths is currently being performed. Meanwhile, new techniques of underwater welding, cutting, directionary blasting, grabbing and magnetic lifting have been fully utilized.

In 1980, in line with the policy of "salvage and towage, taking salvage as the main concern," 60 ships were rescued, 50 ships salvaged and 85 towing operations completed. As the country's shipping and offshore industries continue to grow, it is expected that salvage, towage and ocean engineering services will also develop at a fairly rapid pace.

30. CHINA'S CIVIL AVIATION

By Wu Erer

General Administration of Civil Aviation of China

I. Thirty Years of Development

Civil aviation is a modern branch of transportation. Characterized by speed, manoeuvrability, versatility and efficiency, civil aviation is also a means of production, serving directly the needs of industry and agriculture. In old China, civil aviation grew very slowly, and was far from being well established. Air service in China first began in 1929, but up to 1949 the volume of traffic transported by air totalled only 200 million ton-km. The Civil Aviation Administration of China (CAAC) was established in 1949 and began scheduled flights and aerial work activities in 1950 and 1951, respectively. In 1962, CAAC was expanded and reorganized into the General Administration of Civil Aviation of China. The General Administration has under its jurisdiction six regional administrations — Beijing, Shenyang, Shanghai, Guangzhou, Chengdu and Lanzhou — which in turn control their respective sub-regional administrations in the provinces, municipalities and autonomous regions and at airports.

Comprehensive Growth. Civil aviation in China made rapid progress after the founding of the People's Republic. Air transportation has increased at an average rate of 20% per year. The volume of traffic transported each year is now up 430 million ton-km., which is 2.1 times as much the total volume of traffic carried in the 20 years before Liberation. Aerial work has increased an average rate of 15% per year, and actual flying time has reached 43,000 hours per year. Through 30 years of growth, our civil aviation has laid a solid foundation and is playing an increasingly important role in improving national economic construction and the well-being of our people.

CAAC now operates 182 routes, which, measured without duplication, total 210,000 km. Of these routes, 159 are domestic, with a total length of more than 110,000 km., while the rest include 23 international routes and some regional routes, with a total length of more than 90,000 km.

Our domestic air routes now link more than 80 cities. With Beijing as the centre, a domestic network connecting different provincial and regional capitals and important cities has been basically formed. The ratio of air transportation to all forms of transportation has increased from year

to year. All the benefits of air transportation, such as safety, speed, comfort and economy, have been increasingly appreciated by the people. The government has attached great importance to the development of air services in the regions populated by minority nationalities and the border areas. CAAC flights have now become an important mode of transportation to Tibet and Xinjiang. There are direct scheduled flights from Chengdu, Xi'an and Lanzhou to Lhasa. The direct flight from Beijing to Urumqi takes only three hours, thus greatly shortening the distance between the coast and the interior. Ten air terminals in the Xinjiang Uygur Autonomous region form a regional network in that area.

International Air Service. Along with the rise of China's international standing and the development of its economy and tourism, the international services of CAAC also have experienced rapid growth. There is now an international network of air services linking China with 21 cities in 18 countries in four continents — namely, Pyongyang in the Democratic People's Republic of Korea, Rangoon in Burma, Moscow in the Soviet Union, Tokyo, Osaka and Nagasaki in Japan, Karachi in Pakistan, Paris in France, Tehran in Iran, Bucharest in Romania, Frankfurt in the Federal Republic of Germany, Addis Ababa in Ethiopia, Belgrade in Yugoslavia, Zurich in Switzerland, Sharjah in the United Arab Emirates, Baghdad in Iraq, London in Great Britain, Manila in the Philippines, Bangkok in Thailand, and New York and San Francisco in the United States.

CAAC has concluded aviation agreements with more than 40 countries and has set up agency relations with airlines in 180 countries and regions. In November 1971, the 74th Council of the International Civil Aviation Organization (ICAO) passed a resolution to reinstate China as a member of that organization. In September 1974, at the 21st Congress of the ICAO, China was elected a Council member of ICAO and, accordingly, it has set up a Permanent Representative's Office at ICAO. China is also party to the Hague Convention (for the suppression of unlawful seizure of aircraft) and the Montreal Convention (for the suppression of unlawful acts against the safety of civil aviation).

Aerial Work Services. CAAC has set up a fairly comprehensive aerial work system. Aerial work

services started with insecticide spraying, and have since expanded to include aerial photography, aerial prospecting, aerial survey, offshore operation and rescue services, aerial sowing, top dressing of fertilizer, weeding, pest and plant disease control, forest sowing, forest patrol and fire fighting, forage grass sowing, artificial rainfall, etc.

The work areas of our aerial services now extend to all provinces, municipalities and autonomous regions (with the exception of Taiwan), and the flying time for these services has increased 44 times since the early years of the People's Republic. In these 30 years flying time for aerial prospecting and aerial photography totalled 200,000 hours, and the serviced areas for pest control and forest seeding totalled over 500 million *mu* and 160 million *mu*, respectively. In some areas, the seeds sown by CAAC planes years ago have now grown into full-sized trees and have begun to provide the people with timber.

Airports. Over the years, the government has built, expanded and reconstructed more than 80 airports. Among them, Capital Airport in Beijing, Hongqiao Airport in Shanghai, Baiyun Airport in Guangzhou, Diwopu Airport in Urumqi, Jianqiao Airport in Hangzhou, Zhanguizhuang Airport in Tianjin, Luogang Airport in Hefei and Yanjiagang Airport in Harbin can all handle take-offs and landings of large jet aircraft under difficult meteorological conditions.

Adequate communications, air navigation and meteorological services have been provided at all airports and on all air routes. At major airports with comparatively high densities of scheduled flights, enroute surveillance radar and landing aid radar are used to guide plane movements in co-ordination with the control towers for high-medium- and low-altitude flights. Reliable weather forecasts are also furnished by meteorological observatories at the airports. In recent years, CAAC has strengthened the planning and construction of its air route network and provided air route services for more than 10 foreign airlines.

Variety of Aircraft. CAAC now operates a mixed fleet of more than 20 types of aircraft. Boeing-747s, Boeing-727s, 11-62s, Tridents and 11-18s are mainly used for international and domestic route flights, while AN-24s, AN-12s, Viscounts are used for medium- and short-distance flights and Yun-5s, Li-2s, 11-14s, Skylarks, An-30s, Twin Ottors and Bell-212s are used for aerial work flights.

Maintenance. CAAC has its own maintenance system. The maintenance base in Beijing and the repairs works in Shanghai and Chengdu, with their

up-to-date maintenance equipment and well-qualified engineers and technicians, are capable of performing airframe and engine overhauls for such types of aircraft as 11-18s, An-24s, 11-14s, Li-2s and Yun-5s. At airports under regional administrations and provincial, municipal and autonomous sub-regional administrations, there are maintenance crews for repair plants handling line maintenance or ground checks for transit aircraft on both international and domestic flights.

Training, Research and Safety. CAAC attaches great importance to the educational and training of its personnel and to scientific research work. The Chengdu Flight Training School and the CAAC Tianjin Professional Training School conduct education and training programmes for air crews and ground personnel (in navigational control, telecommunications, meteorology, transportation services, maintenance, management and administration) to meet the needs of civil aviation organizations and other production, operational and technical departments all over the country. The six regional administrations of CAAC in Beijing, Shanghai, Guangzhou, Chengdu, Lanzhou and Shenyang all have their own training bases and schools for technicians and workers, chiefly responsible for the training of skilled maintenance workers and for the short-term training of various kinds of technical and operational personnel.

The airport design and research organization of CAAC is now competent to design on its own a large, modern airport. For example, Capital Airport in Beijing and Hongqiao Airport in Shanghai were both designed by CAAC personnel. The scientific research work of CAAC has made valuable contributions to the cause of civil aviation in our country, and the State Science and Technology Commission of the People's Republic of China and the Science and Technology Commission for National Defence of the Chinese People's Liberation Army have honoured CAAC for its development and manufacture of instrument-landing equipment and UHF ADF items, respectively.

CAAC has conscientiously carried out the late Premier Zhou Enlai's directive — "Ensure safety first, improve passenger services, and strive for flight regularity" — and has educated its staff and workers to devote their primary attention to flight safety and to always give it top priority. CAAC has a work force of well-trained air crews and a set of strict rules and regulations for flight control and the execution of other duties, and its achievement in flight safety is already well known throughout the world.

Flight Group 1 of the Beijing Regional Administration, in charge of international and

main domestic flights, has flown large numbers of scheduled flights and important special missions and chartered flights to more than 180 cities in more than 90 countries all over the world, and has maintained its flight safety record for 24 consecutive years. With more and more large, modern aircraft and advanced communications and navigational equipment coming into use, the flight regularity of scheduled services in our country has been improved correspondingly. CAAC always gives great attention to the improvement of its passenger services, and therefore has been steadily increasing its service facilities, enlarging the scope of its services, and sharpening the professional skills of its personnel.

II. Readjustment and Reform in 1980

In 1980, CAAC conscientiously implemented the policy of readjustment, restructuring, consolidation and improvement of the national economy. It vigorously and steadily carried out its readjustment and reform according to the state's requirement that civil aviation is to develop into an enterprise. Beginning in March 1980, CAAC was placed under the direct control of the State Council, with all its subordinate organizations — the regional administrations, the sub-regional administrations in the provinces, municipalities and autonomous regions, and the airports under their respective jurisdictions — under the dual control of the CAAC system and the local governments concerned. The management system and organizational structure mainly under CAAC's vertical control were consolidated in line with the requirements for enterprises.

To comply with the demands set on administrative executives by the state, young and energetic persons with better understanding of ideology and policy, as well as technical know-how and experience in business management, were promoted to strengthen the managing bodies of the different units. The units, economic accounting and business management structures were also consolidated. The regional administrations began to operate independently on a profit-making basis, and, in time, the sub-regional administrations will also become responsible for economic accounting. All these changes greatly raised the morale of executives at different levels, promoted the development of production and enhanced the economic results. The entire civil aviation system exceeded the state's production plan and made the greatest gains since the founding of the People's Republic.

Production Targets Exceeded. The total

volume of traffic in 1980 reached 430 million ton-km. or 107% of the annual plan, an increase of 14% over 1979. The total number of passengers carried was 3.3 million, 118% of the annual plan, an increase of 12% over 1979. The total volume of cargo and mail transported amounted to 83,000 tons, 117% of the yearly plan, and 8% in excess of 1979. The number of hours flown by the aerial work service reached 42,792, or 143% of the annual plan, and an increase of 8% over 1979.

Operating revenues in 1980 amounted to 440 million yuan or 114% of the annual plan, and 16% more than in 1979. Net profit realized in 1980 was 62.4 million yuan, of which 37 million or 12% of the state target, was turned over to the Treasury. Foreign exchange revenues for the year netted US\$144 million. The average rate of labour productivity was 14,500 yuan per capita, 12% higher than in 1979.

International Traffic. In 1980, CAAC opened up five international routes: Beijing-Sharjah-Baghdad, Beijing-Karachi-Baghdad, Beijing-Guangzhou-Bangkok, Beijing-Frankfurt-London and Shanghai-Osaka. In addition, three more regional routes were opened: Beijing-Hong Kong, Guangzhou-Hong Kong and Hangzhou-Hong Kong. During the year, international flights carried 297,000 passengers and 15,000 tons of cargo and mail, an increase of 101% and 57%, respectively, over 1979. The number of charter flights for passengers and cargo doubled since 1979.

Beginning in April 1980, three Boeing-747s were placed in service. This wide-bodied aircraft can carry 291 passengers and is equipped with such advanced devices as an automatic braking system, colour weather radar, proximity warning, all-range auto throttle and over-rotation takeoff warning, and flight manoeuvrability is power-controlled. The 747s have an average speed of 950 km. per hour and can fly 15 hours without stopping for refuelling.

Extension of Aerial Work. The year 1980 saw the aerial work service adopting new equipment and new technology, as well as extending its experiment of new service items. All of this was done with good results. For instance, remote sensing was used in searching for subterranean hot water, and general investigations were made on environmental pollution and soil planning. An advanced ultra-low-volume spraying technique was adopted for the prevention and control of plant diseases and the elimination of pests. The area covered by each flight increased from 300-500 *mu* in routine operations to 8,000-10,000 *mu*, and the amount sprayed on each *mu* was reduced from a constant amount of 4 *jin* to below 0.66 *jin*. Foliage dressing

and spraying of plant hormones such as PIPA and petroleum stimulant, together with the prevention of tropical cyclones and the development of strains of wheat with resistance to low-temperatures, made agricultural production increase over large areas.

In 1980, the area serviced by CAAC's farming-forestry flights reached over 37 million *mu*, of which forest sowing accounted for 10.76 million *mu*; rice sowing more than 0.1 million *mu*; forage grass sowing, 0.31 million *mu*; prevention and control of plant diseases and elimination of pests, 18.84 million *mu*; fertilizing agricultural crops, 4.13 million *mu*; and weeding, 1.59 million *mu*. The quality of all these operations was improved.

New Airfields and Auxiliary Facilities. Expansion of Beijing's Capital Airport began in 1974 and the main engineering work was completed after seven years. The new facility opened on January 1, 1980. The new west runway is 3,200 m. long, 50 m. wide and 38 cm. thick. It can support a weight of 350 tons, and is capable of accommodating the largest aircraft in the world, such as the Boeing-747, the DC-10 and the Concorde. Lengthening of the old east runway was due to be completed in 1981. This runway will be 3,800 m. long, 60 m. wide and 42 cm. thick. It will bear a weight of 500 tons and will be able to accommodate the landing and takeoff of the world's largest transport planes, which weigh up to 150 tons more than the largest planes flying today.

The new terminal, capable of accommodating 1,500 passengers at peak hours, has an overall area of 59,500 sq. m. The east and west wings of the main buildings are connected to two "satellite" waiting halls by an automatic walkway 100 m. in length. These waiting halls are, in turn, connected to the aircraft by an automatic passenger bridge. Around each "satellite" waiting hall, there are eight parking spaces for large and medium-sized aircraft. Inside the waiting halls are the most advanced passenger service facilities, including telegraph, telephones, post offices, banks, taxi service and electronic screens for flight information, as well as advanced installations for traffic control, such as closed-circuit TV, teletypewriters, etc.

Capital Airport is the largest operational centre in the country. In 1980, it recorded a turnover of 1,088,000 passengers and 38,000 tons of cargo and mail. The modern ATC Centre, in the Flight Control Building, was due to begin operations by the end of 1981.

Aircraft Maintenance. In 1980, the aircraft repair works and the aircraft maintenance departments at different levels strengthened both their

quality control and technology control. The three repair works repaired and released 97 different types of aircraft and 448 aircraft engines, and finished the modification and special repair for 11 large and medium-sized aircraft, such as the Boeing-707, 11-62, An-12 and An-30, with an output value of 32 million yuan. To tap the full potential of existing equipment and technical capability, the organization of aviation maintenance was reformed. The maintenance department of Capital Airport was merged with the Beijing Aircraft Repair Works to form the Beijing Maintenance Base, which will serve as the maintenance centre for large and medium-sized civilian aircraft in China.

To meet the growing demands of civil aviation in China, The China Aviation Supplies Corporation was formed with the approval of the government on October 1, 1980. The functions of the firm are to place purchase orders at home and abroad for various kinds of aviation supplies and ground equipment, including aircraft and aircraft engines, and to sell and dispose of domestically manufactured aviation supplies, as well as surplus materials. It also acts as an agent for buying and selling aviation supplies. The corporation has six regional offices — for the North, East, Central-South, Northwest and Northeast. These were formed to organize and carry out in their respective regions the work of placing orders and procuring and furnishing aviation supplies, thus greatly expediting operations.

Educational Work and Technical Training. In 1980, the CAAC Chengdu Flight Training School graduated 120 flying cadets out of an initial enrollment of 200. The CAAC Tianjin Professional Training School opened 28 classes with an enrollment of 900 students. Another 1,000 candidates were enrolled at six technical schools. These institutions turned out a total of 15 Boeing-747 flying teams, ensuring that the new aircraft will begin operations on time.

Of CAAC's total flight personnel, more than 700 were either promoted to the position of captain for different types of aircraft, transferred to different instrument ratings and the position of right-seat instructor or passed for solo flight. The different organizations attached major importance to the in-service training of staff members. A total of 114 short courses were given, with 2,300 trainees enrolled, thus effectively enhancing the staff members' technical and professional competence.

Flight Safety and Service Quality. In 1980, CAAC launched successively the "Safety Month," "100-Day Emulation" and "Quality Month"

drives, each of which placed top priority on safety. To implement the directive of the Central Committee of the Party and the State Council, namely, "ensure the safety of all types of aircraft" CAAC adopted 10 forceful measures, including orders on flight safety and service quality, flying regulations, flight control working rules, flying accident investigation regulations, air navigation regulations, etc. CAAC also re-established the system of co-ordination — which had been abolished during the 10 years of turmoil — whereby dispatching is centralized under the direction of the senior officer on duty; thus, flight safety was once again ensured both organizationally and institutionally.

Meanwhile, flight planning and its execution was strengthened as was the professional training of flight personnel. The functional role of the captains was brought into full play, and the flight crews' ability to cope with any situation under extraordinary circumstances was enhanced. Of the 24 flying groups in the system, 21 had no fatal flying accident during the year. The Boeing-747 Flying Group under the Beijing Regional Administration achieved a good safety and faultless performance record for 400 consecutive days.

In 1980, CAAC operated in all 26,243 scheduled flights, 78 special flights and 3,403 charter flights. The punctuality of scheduled flights and the turnaround time of planes at airports both improved over 1979. The monthly on-time rate of international scheduled services reached an all-time high of 99.3%.

CAAC has repeatedly instructed its staff members to serve whole-heartedly both domestic and foreign passengers and cargo owners. In 1980, an "If I Were A Passenger" drive was launched among CAAC flight attendants and other service personnel to underscore and improve their professional training. CAAC also sent employees abroad to observe and learn the service operations of foreign airlines. It also modified its service work, and thus upgraded service quality.

As approved by the government, duty-free shops were set up at the international airports in Beijing, Shanghai and Guangzhou. In these shops, a variety of domestic products and handicrafts of distinctive national character are sold for foreign currencies. The shops are a great convenience for foreign passengers and compatriots from Hong Kong, Macao and Taiwan.

The Beijing Aviation Food Company, a joint venture between CAAC's Beijing Regional Administration and Hong Kong Aviation Catering, Ltd. opened for business in May 1980. With advanced equipment and efficient management, the company can prepare food not only for all the international and domestic flights originating from Beijing, but also provide high-quality meals for the

10 foreign airlines that make regular flights to China's airports.

III. Challenges of the Future

China's civil aviation has made considerable progress in the 30 years since the founding of the People's Republic. But compared with the air transport industry in the developed countries, we still lag far behind both in the volume of traffic carried and in carrying capacity. In our country, the proportion of the volume of traffic carried by air transport to the total volume of traffic of all modes of transportation is very small. Many small and medium-sized cities and tourist sites are still in want of scheduled air services. CAAC's system of management, labour and wage systems, etc. also cannot meet the requirements of a state enterprise, and further readjustment, restructuring, consolidation and improvement remain to be done.

Higher Economic Targets. The Four Modernizations and growth of tourism have imposed new and greater demands on civil aviation. The government's policy to develop civil aviation in the course of the readjustment of the national economy is entirely sound and correct. Accordingly, the various economic targets of civil aviation for several years to come will be raised to new levels. CAAC, as a state enterprise, is required to attain an overall balance in its management. It must reform its system of administration and the style and method of management.

As of 1981, CAAC adopted the following targets: a fixed amount of financial contributions to be raised; a fixed amount of profit to be turned over to the government; excess profit to be shared proportionally between the government and the enterprise; and no subsidy or compensation for deficits. In an effort to strengthen the enterprises' internal cooperation and coordination, to raise the load factor of scheduled flights and improve economic results, the principal regional administrations are required to operate jointly on domestic route flights. The labour system also has to be reformed; and existing temporary employment system for a few categories of employees will be changed to regular employment so as to stabilize the workforce. We shall expand further our international air routes and readjust our domestic air routes.

To meet the needs of tourism growth, we shall also build, expand and reconstruct a number of airports, open new air routes and increase the frequency of scheduled flights. The expansion of Guilin Airfield was completed in May 1980, and the airfield is now capable of handling large types

of aircraft. Other airfields under expansion include Fuzhou Airfield and Tunxi Airfield. Changsha Airport, Dalian Airport and Nanchang Airport will also be reconstructed. New airports, airfields or new stations are planned for Dunhuang, Datong, Qingdao, Quanzhou, Lushan, Sanya and all major tourist sites.

Further Measures. We must give special attention to the fostering of talented personnel and their training in technical skills. We must strengthen the work of our institutions of higher

learning and scientific research. We shall seek the approval of the State Council for changing the status of the Tianjin Professional Technical School to that of a college. We shall also make every effort to establish a centre for advanced training of CAAC technical and operational personnel during the period of the Sixth Five-Year Plan.

We shall continue to do our utmost to ensure flight safety, to enhance flight regularity and to improve passenger service. In this way, we shall further strengthen the competitive position of our civil aviation to service the Four Modernizations.

31. CHINA'S POSTS AND TELECOMMUNICATIONS

By the Research Office,
Ministry of Posts and Telecommunications

I. History of Post and Telecommunications Services in New China

In the early days after Liberation, there were some 26,000 post and telecommunications offices and about 400 old mail trucks in the entire country. The telecommunications network was in a state of total confusion. Under the leadership of the Chinese Communist Party and the People's Government, however, postal and telecommunications workers took up the task of rehabilitation and, within a very short time, constructed a postal and telecommunications network that radiated from Beijing to connect cities and rural areas throughout the country. The guiding principle was to serve the needs of the people and national defence, both politically and economically, and to coordinate various crucial tasks. The financial target of balancing expenditures with revenues, leaving some reserve, was realized. What had been formerly a bureaucratic structure was reorganized into a socialist undertaking to serve the people.

During the First Five-Year Plan period, post and telecommunications authorities started working on the technological transformation and expansion of telecommunications services. Key centres with modern equipment were built, e.g., the Beijing Telegraph Building, the No. 1 Radio Transmitting Station in Beijing, the International Radio Station in Xinjiang and a number of other installations. Rural communications were reorganized and strengthened, and the foundation of a socialist communications system was essentially established.

A Series of Setbacks. In the years after 1958, posts and telecommunications networks were further expanded and the sphere of services further enlarged. The industry for manufacture of telecommunications equipment was started as well. But some of the projects were too ambitious and impractical to provide real benefits. Thus, from 1961 to 1963, some readjustments were made to enable post and telecommunications undertakings to grow in a more stable and sure manner. During the "cultural revolution," posts and telecommunications work suffered severe interference from Lin Biao and the Gang of Four, but the ranks of postal and telecommunications workers stood firm, assuring that services remained normal

at all times and even producing some new advanced equipment.

Mail Services. In the past 30 years, with the growing pace of socialist construction, much has been accomplished through post and telecommunications undertakings. At the end of 1979, the total length of mail routes reached more than 4 million km., which was 6.8 times that of 1949. The number of service offices increased overall by 88.6%; the growth was even more significant in rural and remote border areas where mail service, under old China, had been extremely backward.

The railroad mail routes, which are the main carriers of mail, have increased eight times in total length since 1949, and directly operated motor truck mail routes have increased 32 times. New equipment and devices for handling mail have been put into use. There are 34 offices in the larger cities and towns where parcel sorting is done with mechanized equipment; lift trucks and traction cars are used at the more important mail transfer centres along rail lines. The volume of mail has increased greatly since 1949; letters have increased by more than 6 times, parcels by 26.5 times and postal money orders by 28.4 times. The volume of newspapers and periodicals distributed increased by 55.8 times between 1950 and 1980.

Telecommunications. The basis of a national telecommunications network has been established with open-wire and shortwave radio as the chief means of transmission, supplemented by cable and microwave systems. With the growth in telecommunications, responsibility systems have been set up and improved for equipment maintenance, operations and administrative duties. Construction of the first 1,800-channel medium coaxial cable carrier system was begun in October 1973 and was completed and put into operation in March 1976. This achievement is significant in that it provided the technical basis for construction of national trunk lines. Microwave routes now connect 26 provinces, municipalities and autonomous regions, using the 960- and 600-channel systems. Total capacity of urban exchanges has increased more than seven times over that of 1949. Telegraph circuits are now three times those of the period just after Liberation, and long-distance toll circuits are seven times greater.

In international communications, three earth

satellites in Beijing and Shanghai are now handling international traffic via the Intelsat satellites over the Pacific and Indian oceans. The jointly operated China-Japan submarine cable began operating in October 1976. At present, China has direct telecommunications circuits with 46 countries and regions and direct postal relations with 111 countries and regions.

Equipment and Training. Post and telecommunications equipment manufacturing, technological research and personnel training also have made steady progress in the past 30 years. The equipment-manufacturing industry, which started from scratch, developed from the manufacture of parts and assembly to the production of complete modern systems. In research and development, there are two scientific research institutes of posts and telecommunications and 38 research laboratories, with a number of auxiliary workshops.

For personnel training and education, there are four college-level institutes of posts and telecommunications and two polytechnical schools in addition to the departments in various universities which offer courses in telecommunications engineering. Post and telecommunications administrations in provinces, municipalities and autonomous regions also sponsor vocational schools for the training of their staff. College correspondence courses, various training classes and televised teaching programs are also available for the in-service training of personnel.

Technical Advances. The technological level of post and telecommunications plants and installations is being upgraded continuously. In postal services, the motorized transport of mail rose from a ratio of 13.5% in 1949 to 33.4% in 1979. In telecommunications, carrier systems advanced from the single, 3-channel and 12-channel open-wire and the 60-channel balanced cable systems to the 1,800-channel transistorized coaxial cable system. Radio equipment has evolved from the 60- and 600-channel electron tube microwave systems to the 960-channel microwave system using transistorized equipment. Crossbar and semi-electronic local exchanges, coded crossbar exchanges for automatic switching of toll calls, facsimile transmission systems, low- and high-speed telegraph and low- and medium-speed data transmission systems are all being used efficiently, and our factories are capable of producing this equipment.

Compared with advanced world levels and the objective needs of the country, China's post and telecommunications services are, at present, still quite backward. However, as a result of development and construction efforts during the past 30

years, post and telecommunications networks now extend in all directions from Beijing to all the provinces and districts, and service offices are located throughout the country. As a vital part of the national economy and as an important element of social productivity, post and telecommunications services are playing a larger and larger role in socialist construction and in the life of the people.

II. Growth and Development of Posts and Telecommunications in 1980

The provision of good-quality communications services was the principal task of the post and telecommunications departments in 1980, with special importance placed on readjustment. During the year, enormous efforts were made in the following areas: enhancing communications capabilities, improving quality, expanding services, increasing revenues, cutting expenditures and readjusting enterprises. All these steps contributed to the satisfactory achievement of national economic tasks.

Total revenues from communications services in 1980 were 1,330 million yuan. Traffic volume included 3,310 million letters, 71.53 million parcels, 135 million postal money orders (giro), 160 million issues of publications, 17,098 million copies of newspapers and periodicals, 140 million telegrams and 210 million outgoing toll-call bills. By the end of the year, there were 1.34 million urban telephone subscribers and 799,000 telephone subscribers in rural areas.

Gains in Capacity and Service. Readjustment significantly enhanced communications capabilities. In 1980, the capacity of automatic telephone exchanges in large and medium-sized cities increased by 65,000 lines, toll circuits increased by 1,700 lines and productive floor space in metropolitan areas increased by more than 20,000 sq. m. The microwave transmission network is now being used for domestic telephone services, with a gain of 259 additional long-distance voice circuits. On some circuits connecting Beijing with 19 cities, automatic or semi-automatic toll dialling systems have been installed.

Service quality has been improved through a variety of means. In the past year or two, the post and telecommunications authorities reactivated and/or expanded several types of postal services. These included: (1) acceptance of commercial parcels, retail sales of publications, stamp collection services, express delivery of parcels and postal money orders; (2) urban telephones, public telephones, private-line telephone service and international service; (3) data communications,

recorded-image communications, telex, subscriber facsimile services, international express mail, intracity mailing of confidential correspondence, advertising agency services and purchases on subscribers' behalf (on a trial basis). All these services are beneficial to the development of the national economy and are of great convenience to the public.

In 1980, telegraph circuits provided by the post and telecommunications administrations completed the linkup of the State Planning Commission's computer centre with a number of the country's principal iron and steel enterprises and 28 provincial planning commissions. The inauguration of the State Planning Commission Data Network produced time-saving and labour-saving results and promoted management efficiency. An experimental recorded-image communications service has been utilized by relevant departments for broadcasting nationwide programmes of sports, news, on-site athletic competitions, lectures and discussions on various professional topics. All of these services were welcomed by subscribers.

Finances Strengthened. By vigorously carrying out the policy of raising production and practicing economy, the post and telecommunications enterprises have greatly improved their financial condition. The Ministry of Posts and Telecommunications demanded that, as of 1980, all provincial administrations implement the policy of reconciling income with expenditures, bearing full responsibility for their deficits and sharing their surpluses. This policy gave incentives to offices at all levels. On the basis of developing advantages, opening various channels and expanding services, the rank and file made every effort to increase income and reduce expenditures. As a result, gross income for 1980 was 17.2% above that of 1979 and gross profit was three times the 1979 figure.

Readjustment. Most of the nearly 3,000 post and telecommunications enterprises were reorganized to varying degrees. The number of advanced enterprises rose, while the number of backward ones decreased. According to statistics from 22 provinces, municipalities and autonomous regions, in the first half of 1980, 220 post and telecommunications enterprises were nominated as advanced enterprises. Chief engineers were appointed in 20 district post and telecommunications administrations and in 27 provincial centres and key-point offices. The leading groups of most of the enterprises were either reshuffled or reinforced. As a result, management was strengthened and service quality was improved.

Postal Code (Zip Code) System. With the goal of mechanizing and automating mail sorting to shorten the letter-processing time cycle, the ministry introduced a six-digit postal code system (on a trial basis) throughout the country on July 1, 1980. In the course of implementing the system, the post and telecommunications authorities received many complaints from the public. After reviewing the criticisms, the authorities decided not to refuse or return mail that was not coded. The ministry called for continued efforts to familiarize the public with the system, teaching letter-writers first to learn their own zip code and then those of the addressees. Obviously, coded and uncoded mail will co-exist for some time to come.

New Issues. The issue of new stamps and services for stamp-collecting expanded considerably. In 1980, there were 11 commemorative issues (totalling 27 stamps) and 13 special issues (totalling 66 stamps). In all, 790 million new stamps were produced, while ordinary stamps totalled 1,300 million. The stamp-collecting service experienced a significant growth, earning US\$3 million in foreign currency during the year. The magazine, *Stamp Collection*, which had suspended publication for 14 years, resumed publication in January 1980. Judging from the circulation, the magazine ranked first among all philatelic publications in the world. In 1980, stamp-trading branch offices and stamp-collecting retail departments were established in 49 cities. In addition, branch offices in six cities, including Beijing and Shanghai, opened mail order services for stamp collectors.

III. Major Problems Confronting Services

Despite the fact that the post and telecommunications enterprises have made significant progress in the past 30 years, their level of service still lags behind the needs of the national economy. Means of communication are backward, capacity is insufficient and the gap between demand and supply is very wide. Post and telecommunications services should be logically in the forefront of the national economy, but in fact they are a particularly weak link, as shown in the following observations:

(1) *The insufficiency of telephones in urban areas, especially in large and medium-sized cities, is conspicuous.* There are only 3.4 telephones per thousand people at present. A great number of requests for telephone installations are denied because of insufficient capacity; currently, there are 300,000 applicants on the waiting list.

(2) *The lack of toll circuits causes serious traffic congestion.* The existing trunk commission network consists mainly of open wires, which are noted for their limited capacity, inferior quality, low connectivity and long waiting time. However, because the local telephone network is growing slowly, the ratio between toll and local junction lines is disproportionate, which has a direct impact on the connectivity rate of both toll traffic and international traffic.

(3) *Post office work areas are overcrowded and services for mail transport and delivery are understaffed and time-consuming.* Since Liberation, the volume of various kinds of mail has increased by several dozen times. The annual volume of newspapers and periodicals sent through the mail has reached 17,000 million copies, while the number of post offices has increased by a mere 3.2 times.

In many major cities, municipal construction planning took no account of post and telecommunications offices, resulting in very limited serving points. Postal operation sites and publication issuing sites are highly congested; all staff have to work in the open air, with trucks parking on roadsides and parcels piling up at train stations. Steamer and vehicle route lengths account for only one-third of the total mail route length in the country. Because the capabilities of postal transport on the main routes are far from sufficient, mail is often stacked up. Both urban and rural postal delivery forces are deficient, and the level of service is low.

(4) *Communications technology and equipment are backward.* In the rest of the world, communications technology has been developing rapidly: long-distance communications mainly utilize underground cables, microwaves and satellites, and the use of optical fibre techniques is spreading. In China, by contrast, open wires are still the principal transmission media, and the potentialities of existing microwave and cable

systems have not yet been fully exploited. In many countries, long-distance direct dialling and automatic telegraph switching have long been in operation, but we are still using manual switching. Stored-programme controlled exchanges have been used extensively in international telephone switching systems, but in China we still have a large percentage of manual-switching telephones, and most of the automatic telephone switching equipment dates from the 1920's and 1930's.

Postal techniques are even more backward. Mail processing is done largely by manual labour. Moreover, with regard to management efficiency, communications quality, economic results, etc., there remain a host of outstanding problems that have to be dealt with in the near future.

Measures Needed. In view of the fact that the post and telecommunications services are a weak link in the national economy, post and telecommunications enterprises will take some steps forward and other steps backward during the course of further readjustment. On the whole, however, there will be progress, with upgrading of services to meet the needs of all sectors of the economy.

First, with communications as the centre, we must carry out basic construction, tap potential, introduce innovation and reform, strengthen weak links and enhance communications capabilities. Second, it is necessary to continue the policy of increasing production and practicing economy, further developing advantages, opening various channels, expanding services, increasing revenues, improving operations and management and stressing economic results. Third, we must emphasize the reorganization of supervisory groups and branch offices, continue to readjust enterprises, strengthen basic-level office work and upgrade management. Fourth, we must continue to study and experiment, working out economical post and telecommunications systems and testing methods. Fifth, we must carry out staff training programmes, emphasizing on-the-job training that will raise technical and managerial proficiency.

32. CHINA'S COMMERCE IN 1980

By the Commerce Research Institute,
Ministry of Commerce

In 1980, China continued to readjust prices and expand commodity distribution channels by implementing its policy of readjustment, restructuring, consolidation and improvement and by developing industrial and agricultural production. Urban and rural markets in China were expanded continuously and improvements were made in the management and administration of commercial departments and their faculties throughout the country.

I. Large Increases in Commodity Distribution and Retail Sales

In 1980, China's agriculture suffered from serious natural calamities, but the losses were minimized by the party and government's implementation of a series of correct agricultural policies and by their encouragement to rural cadres and communes to increase production. Output of many industrial crops, such as cotton, edible oils, sugar beets and sugar cane, as well as sideline products increased considerably, although output of grains decreased slightly. Also in 1980, the total value of textiles and other light industries increased by 18.4% over the previous year. It was on this basis that China's commercial departments developed their methods of buying and selling with a view to expanding the distribution of goods.

Value of Purchases. In 1980, the total value of goods purchased by state-run commercial departments amounted to 226,300 million yuan, a 13.6% increase over 1979. This rate of increase was higher than the average annual rate of increase of 9.4% between 1953 and 1979. Purchases of farm crops and sideline products amounted to 67,700 million yuan, a 15.4% increase over 1979 — the real rate of increase was 7.7%, taking account of price rises.

Farm Crops. Purchases of principal farm crops and sideline products in 1980 were larger than those of 1979. Purchases of cotton in the production year from September 1980 to April 1981 totalled 2.65 million tons, an increase of 24% over the previous production year and up 14.6% from the record 1973 production year. Purchases of edible oils during the production year from April 1980 to March 1981 totalled 1.89 million tons, an increase of 27.3% over the previous production

year and up 24% over the record 1955 production year.

Livestock. The number of pigs sold in 1980 totalled 133.93 million, which was 3.89 million more than in the record year of 1979. The average gross weight per animal was 177.3 catties, up 10.3 catties from the previous year. The total increase in gross weight was equivalent to an additional purchase of 8.26 million pigs.

Purchases of mulberry cocoons, tussah cocoons, tea, goatskins, kidskins, Zhejiang lambskins, sheep wool, feathers, bristles, oranges, straw mats, etc. set records and purchases of ramie, cattle hides, sheepskins and dates also increased.

Industrial Goods. The purchases of industrial goods amounted to 156,760 million yuan in 1980, an increase of 12.8% over 1979. Purchases of consumer goods increased by 17.3% while those of producers' goods increased by 3.1%. Purchases of consumer goods manufactured with industrial products as raw materials amounted to 64,890 million yuan, an increase of 20.2%, while purchases of industrial consumer goods manufactured with farm produce and sideline products as raw materials amounted to 47,190 million yuan, an increase of 13.5%. Among 42 kinds of principal industrial goods, purchases of 34 such kinds increased by comparison with the previous year. Purchases of another eight kinds of goods increased, while purchases of still another eight kinds decreased.

Purchase of cotton cloth went up 17.9% over 1979, while purchase of polyester fibre cloth, woollen fabrics and satins went up 30-96%. In terms of clothing, undershirts and sleeveless undershirts, cotton jerseys and trousers, rubber footwear and other items went up 14-54%. Purchases of articles of everyday use, such as matches, detergent, thermos bottles, wristwatches, etc., went up 3-34%; of TV sets, 40%; and of radios, 87%.

Purchases of some goods previously in short supply increased once the enterprises producing them developed their potential and increased their output. For example, purchases of soap, bicycles and sewing machines went up 11%-28%. Meanwhile, purchases of some miscellaneous manufactured goods also increased at a higher rate. Purchases of some goods that were produced in ample quantities decreased somewhat after their output was readjusted. For instance, purchases of hardware appliances, various kinds of switches and

so forth went down 40-65% and table tennis equipment went down 74% from the previous year.

With respect to agricultural producers' goods, purchases of chemical fertilizer went up 9.2%, while those of pesticides and apparatus for their application went up 34.8%.

The total value of retail sales reached 214,000 million yuan, an increase of 3,400 million yuan or 18.9% over 1979. The real rate of increase was 12.2%, taking account of price rises. Such a growth in the value of retail sales has not been witnessed since the founding of New China.

Retail sales of all consumer goods went up 21.5%, while those of agricultural producers' goods went up 6.8%. Rural retail sales went up 20.8% and urban retail sales increased by 16.6%. Of total retail sales, the value of sales to consumers went up 22.6% while the value of sales to units and groups went up by 13.2%.

Retail sales of important consumer goods — including food, clothing, articles of everyday use and fuel — showed an overall increase over those of 1979. Retail sales of food supplies increased by 20.8%. Of these, grain increased by 10%; edible vegetable oils increased by 20%; pork increased by 5.3% (supplied sufficiently throughout the country); sugar, confectionery, cakes, cigarettes and tea increased by 7.8-9.2%. Retail sales of clothing increased by 22% and the variety, design and quality of clothing have all improved. Retail sales of cotton cloth increased by 7.6%; chemical fibre cloth, polyester cloth, woollen fabrics, silks and satins increased by 25-34.4%; polyamide socks and stockings, cotton jerseys and trousers, mattresses and sheets, wool knitting yarn and so forth increased by 12.5-29.8%; rubber shoes increased by 14.7%; leather shoes increased by 34%; retail sales of some garments of new design, colour and cut doubled and then doubled again. Retail sales of articles of everyday use increased by 22.9% overall. Among these articles, watches, soap, detergent, thermos bottles, enamel basins and so on increased by 10%; sewing machines, bicycles, and watches increased by 23-30%. Retail sales of commodities for cultural and recreational use increased by 32.7%. Of these, radios increased by 66%; TV sets by 50%; cassette recorders by 300%. Sales of publications, newspapers and magazines increased by 40.9%. Retail sales of traditional Chinese medicines, western medicines, medical apparatus and instruments increased by 12.5%; traditional Chinese medicines and traditional Chinese pills increased by 32.4%. Retail sales of fuels increased by 15.1%; of these, coal and kerosene increased by 16.4%.

With the growth in volume of commodity purchases and sales, stocks of commodities increased

correspondingly. Between the end of 1979 and the end of 1980, total commodity stocks held by state-owned commercial departments went up 9.2%. During the same period, enterprises under the Ministry of Commerce increased their stocks by 18.3%, while those under the Federation of Supply and Marketing Cooperatives and the Ministry of Food increased their stocks by 11.8% and 8.1%, respectively.

II. Channels of Commodity Distribution Expanded, Leading to Brisk Urban and Rural Markets

In the early years of New China, the country's commerce was organized into five economic sectors: socialist state-run commerce; collective commerce; state capitalist commerce; private capitalist commerce; and individual commerce. When the socialist transformation of the country was basically completed in 1956, there were still four economic sectors and multiple channels of commodity distribution. Later, under the influence of "Left" ideology, and especially in 1958 and during the "cultural revolution," there was an impatient drive to achieve high-speed development. During this period, the collective commerce sector was weakened and the individual commerce sector and trade fairs were restricted. By 1975, there were 6.27 million workers in the state-run commercial departments; the value of their retail sales accounted for 92.1% of the total value of retail sales. In the cooperative stores and cooperative groups, there were only 1.46 million workers, and the value of their retail sales accounted for 7.8% of the total. In the individual commerce sector, there were only 80,000 traders, and the value of their retail sales accounted for a mere 0.1% of the total value. As a result of these changes, channels of commodity distribution were narrowed and obstructed, production was hindered, the variety of commodities reduced and many characteristics of business disappeared.

Since the smashing of the Gang of Four and especially since the Third Plenary Session of the 11th Party Central Committee, channels of commodity distribution have increased rapidly with the restoration of country-fair trade, the opening of city markets for farm produce and sideline products, the active expansion of collective commerce and the development of individual commerce. By the end of 1979, 33,302 country fairs were restored; 2,226 city markets for farm produce and sideline products were opened; 700 trade warehouses were restored or established in towns and cities; the number of establishments of collective commerce, catering trade and service trade went up to 676,000, employing 28.81 million

workers; and the number of traders in individual commerce up to nearly 300,000.

In 1980 commodity distribution expanded further through various channels and urban and rural markets perked up as a result of the following developments: the abolition of exclusive selling for a large number of industrial goods by state-run commercial departments; the experimentation with a state monopoly for purchase and marketing, planned purchases, order or choice purchases; the implementation of rural economic policies step by step; and the state's encouragement of collective commerce and individual traders by deferring or reducing their taxes, offering loans, or making available supplies of goods.

1. *Collective and individual commerce were quickly restored and developed.* By the end of 1980, there were 763,000 establishments engaged in urban and rural collective commerce, catering trade and service trade — an increase of 13.9% over the previous year — employing 3,334 million workers — an increase of 15.7%. There were 686,000 shops and 897,000 traders in individual commerce, a threefold increase over the previous year. The share contributed by retail sales of urban and rural commerce and catering trade to the total value of retail sales went up from 8.9% in 1979 to 12.6% in 1980.

2. *Direct sales by industrial departments increased greatly.* According to statistics from the Ministry of Commerce, there were more than 11,000 direct selling establishments throughout the country, up 3.7 times, and nearly 80,000 workers, a fourfold increase. The total value of direct sales amounted to 16,500 million yuan, an increase of 59.3% over the previous year. The share in the total value of retail sales increased from 5.8% in 1979 to 7.7% in 1980.

3. *Markets for farm produce and sideline products enjoyed unprecedented activity.* At the end of 1980, there were 40,809 trade fairs, 10,806 more than in 1979, representing a 36% increase. The volume of business amounted to 23,800 million yuan, an increase of 29.4% over the previous year. If calculated in terms of state listed prices, the increase would be equivalent to 8.4% of the total value of retail sales. The increase was 0.7% above the 7.7% of 1979. A breakdown of the trade fairs held showed that there were 37,890 rural fairs whose volume of business totalled 21,200 million yuan, an increase of 24% over the previous year. (This figure surpassed the volume of business done in 1965 before the "cultural revolution.") There were 2,919 city markets for farm

produce and sideline products doing a volume of business of 2,600 million yuan, an increase of 100% over 1979. In 1980, trade fair dates were restored throughout the country and morning fairs, evening fairs, temple fairs, mule and horse fairs, meetings for internal exchange of goods and other forms of exchange were resumed.

4. *Increase in number of trade warehouses.* According to incomplete statistics, there were 1,900 trade warehouses in the urban and rural supply and marketing cooperatives at the end of 1980. Their volume of business amounted to 2,500 million yuan. There were 100 trade warehouses for the pharmaceutical departments; 490 for trust companies under the Ministry of Commerce (actually, the number would be 580 if warehouses run by the collective commerce sector were included); 3,300 warehouses for grain and oil (including centres for exchange and neighbourhood service centres) — an increase of 43% over the previous year.

Wholesale markets for small commodities, wholesale-retail shops, as well as stores associated with a variety of departments and economic sectors were also restored and developed.

III. Unreasonable Prices Readjusted in a Planned Way with a View to Developing Production

For 30 years since the founding of The People's Republic, the general level of prices in China has been stable on the whole. In 1979, the total index of retail prices went up 24% over that of 1952, an annual rate of increase of only 0.7%. However, disparities between prices for farm produce and prices for industrial goods have persisted for a long time. In 1979, in the spirit of the Third Plenary Session of the 11th Party Central Committee, the government sharply raised the state purchasing price of major farm produce and sideline products throughout the country, and in 1980, it again raised the prices of cotton, sheepskin and goatskin, jute and ambary hemp, timber, raw lacquer and tung oil. In addition, the state purchased more farm produce at negotiated prices, and paid higher prices for quantities above the purchase quota. As a result, the total purchasing price index for farm produce and sideline products went up 7.1% over the previous year's, which was 22.1% above that of 1978. In 1979 and 1980, the state raised the mine price, ex-factory price and purchasing price of coal, gold, silver, iron, tin, etc. Appropriate increases in prices for farm produce and mineral products play an important role in promoting the development of agricultural production and of raw material industries.

Retail Prices. Starting in November 1979, the state raised the retail prices of the principal non-staple foodstuffs, such as meat, eggs, poultry, milk, and aquatic products, but it also subsidized purchases of these products. In 1980, the state readjusted the listed retail prices for a number of retail goods in a planned way.

In foodstuffs, the prices of kelp, gourmet powder, Chinese prickly ash, honey, etc. were lowered, while the prices of fresh vegetables, salted vegetables, bean products, some cigarettes, wine, tea, cakes, confectionery, fresh and dried fruits, etc. were raised. In clothing and footwear, the prices of some silks and satins, cotton and polyester khaki, elasticized polyamide socks, blend fabrics, etc. were lowered, while the prices of woollen fabrics, gabardine, cotton clothing, woollen sweaters, leather shoes, etc. were raised. Among articles of everyday use, the prices of aluminium pots, imitation leather bags, fluorescent lamps, plastic film, imported electronic wrist-watches, imported black-and-white TV sets, etc. were lowered, while the prices of manufactured goods, wooden furniture, items of porcelain, fountain pens, ink, diaries, etc. were raised.

Because more prices were raised than lowered, the 1980 list prices for retail consumer goods sold by state-run commercial departments went up 5.2% over 1979, thus causing the general level of retail prices in 1980 to register an average 4.4% increase over 1979. If account is taken of the expansion of the sphere of negotiated prices and of rises in trade fair prices, then the general level of retail prices in 1980 registered an annual average of 6% increase. The average was obtained from the 8.1% increase in cities, the 4.4% increase in rural areas, the 7.1% increase in consumer goods prices and the 1% increase in the prices of means of production for rural use. Among consumer goods, prices of clothing remained the same and prices of foodstuffs remained stable, while prices of non-staple foodstuffs rose 13.8%, prices of articles of everyday use rose 1.2%, prices of commodities for cultural and recreational activities rose 0.7%, prices of pharmaceuticals rose 0.9% and prices of fuels went up 0.7%. To prevent indiscriminate price rises and to stabilize the livelihood of the people, the state has taken measures to maintain retail prices at the level prevailing on December 7, 1980.

IV. Improvement of Enterprise Management and Administration Through Reform and Consolidation

The initial reform of the commercial system,

including the development of various economic sectors and the transformation of the different forms of purchasing and marketing, has played a positive role in promoting the improvement of management and administration of commercial departments. Through such measures as increasing production and reducing waste, expanding buying and selling, organizing properly the transportation of commodities, reducing the stages in their distribution, as well as publicly acknowledging the "best shops" and rewarding sales workers for "excellence," we have achieved continuous improvement in the management and administration of all state commercial departments.

Losses incurred by departments under the Ministry of Food in 1980 were no greater than they were in 1979 even though inventories increased and total wages went up. Profits realized by the pharmaceutical departments in 1980 increased by 15.7% over 1979 profits while expenditures rose by 0.78% and losses of the deficit enterprises dropped by 53%. Compared with 1979 figures, profits made by enterprises under the Ministry of Commerce in 1980 increased by 6.74%, the largest increase since the founding of New China, while profits made by the Federation of Supply and Marketing Cooperatives increased by 13.27%, the largest annual increase since 1956. Expenditures of the departments under the Ministry of Commerce and the Federation of Supply and Marketing Cooperatives rose by 7.79% and 9.87%, respectively, the smallest increases since the founding of New China. In 1980, the annual turnover rate of circulating funds of departments under the Ministry of Commerce was 2.18 times, the fastest turnover rate since 1957, while in the Federation of Supply and Marketing Cooperatives it was 2.33 times, the fastest turnover rate since 1966. Losses of the deficit enterprises under the Ministry and the Federation decreased by 21% and 17%, respectively.

The experiment to broaden managerial powers, initiated by the state commercial departments in 1979, continued in 1980. According to incomplete statistics of the Ministry of Commerce, the All-China Federation of Supply and Marketing Cooperatives and Ministry of Food, the experiment was extended to 9,000 enterprises (including wholesale, retail, catering and service establishments, as well as industries run by the state commercial departments), making up 7% of all accounting units. Overall, these enterprises achieved good economic results. Total sales of the 3,900 enterprises taking part in this experiment increased by 15.1% over the previous year — 2.3% higher than the average general rate of increases, while expenditures decreased by 0.43% — 0.15% lower than the average general rate of decrease.

To hasten the consolidation of commercial activities, enterprises under the Ministry of Commerce implemented on a trial basis the "Regulations Governing the Management of the State's Three-Level Wholesale Enterprises," the "Regulations Governing the Management of the State Retail Enterprises" and the "Regulations Governing the State Catering and Service Enterprises," while the Federation of Supply and Marketing Cooperatives changed its method of profit distribution in the interest of the local cooperatives. The results in both instances have been excellent.

V. Develop the State Commerce Sector in Keeping with the Scale of Commodity Distribution

The development of state commerce must keep up with the enlargement of the scale of commodity circulation so as to achieve a free flow of goods and promote the development of production. For a long time, however, under the influence of "Left" ideology, the importance of production was emphasized while that of distribution was ignored. Thus, the imbalance between the development of commerce and that of purchase and sale of commodities has become a major aspect of the imbalance in the national economy. Thus, state commerce must be developed step by step.

According to statistics provided by the departments of commerce, food, and supply and marketing, total investment in capital construction in 1980 increased by 51.9% over the previous year. New production capacity and additional floor space in new buildings are as follows: 148 cold storage facilities with 1,189,000 tons of refrigeration capacity; 56 oil storage facilities with a capacity of 807,000 cubic metres; storage capacity for 1,820 million catties of grain; 934,000 square

metres of storage capacity for other commodities; 2,624,000 square metres of living quarters for workers and staff; 490,000 square metres for schools and industries run by the state commercial departments. The speed of construction of cold storage and the total capacity added are without precedent.

In 1980, the number of state commercial establishments (including rural purchasing and marketing agencies) increased to 1.1 million, an increase of 4.4% over the previous year; their workers and staff increased to 6.98 million, an increase of 5.9% over 1979.

Commercial education has developed quickly. In 1980, the number of schools and colleges run by commercial departments, cooperatives, food and pharmaceutical departments reached 362 (9 universities and colleges, 198 vocational schools, 155 technical schools), an increase of 43 schools over the previous year. The enrollment was 86,000 more than that before the "cultural revolution." The training of cadres was intensified. According to incomplete statistics, there were 1,000 cadre schools and established training classes in which 25% of cadres of all levels were trained. Spare-time schools for workers numbered 4,890, with 30% of all workers and staff enrolled.

The principal problems with China's commerce in 1980 are: the huge gap between the supply of retail commodities and social purchasing power; shortages of various commodities; and random price increases under various guises in some units and localities. Although channels of commodity distribution were restored and considerably developed some enterprises still lack guidance from the state plan because of the slow pace of administrative work. Although the number of workers in urban areas has greatly increased, there is still a shortage of retail personnel in shops. The scarcity of restaurants, stores, and tailoring services is another problem that needs to be solved.

33. HOW CHINA MANAGES ITS SUPPLIES

By Li Kaixin

State Bureau of Supplies

The management of supplies encompasses the distribution of those industrial products classified as means of production or producer goods. This work has followed a tortuous path during the advance of China's socialist construction in the past 31 years.

I. History of Supply Management

During the period of economic rehabilitation between 1949 and 1952, supply management was placed under the unified control of the Financial and Economic Commission of the Administrative Council. In 1950, eight major materials including rolled steel, timber, coal and cement were allocated directly by the central government or administrative regions, each consisting of a number of provinces. The number of major materials was increased to 55 in 1952 and the state controlled the supply and marketing of all major raw materials and fuels in order to curb speculation and profiteering, thus providing the means for putting an end to old China's runaway inflation and rocketing prices, and for bringing about a normal economic order and for developing production.

Material Categories. In the first five-year plan (1953-1957), the State Planning Commission extended the list of materials under unified allocation. Producer goods fell into three categories: those under unified state allocation, those allocated by different industrial ministries and those allocated by local authorities. Goods in the first and second categories were mainly products of enterprises run by the state at a level not lower than the provincial government or some large-scale, state-private joint enterprises, products of private enterprises entirely purchased and marketed by the state or products produced on state orders, and materials imported by the state. Such materials accounted for 70% to 90% of all producer goods in the country. The rest was allocated by provincial, municipal and autonomous regional authorities.

Products in the first and second categories were not allowed to be marketed by the enterprises themselves. They were to be supplied through a combination of direct planning (planned allocation) and indirect planning (supply through market). The enterprises directly under the central

ministries, large and medium-sized local state enterprises and state-private joint enterprises obtained materials they needed at allocation prices according to state allocation plans. The state earmarked part of the materials under its control and supplied them at market prices to some small local state enterprises, state-private joint enterprises and private enterprises, handicraft shops and collective farming units through the channel of the commercial departments.

By 1957, the types of materials under the first and second categories had grown to number 532. The enterprises received almost all their supplies from their central or local authorities. The goods of the third category were always distributed freely through market channels. Thanks to the great attention given to overall planning aimed at a balanced development of the national economy, the supply of materials was generally in conformity with the demands of production. This assured that both industrial production and construction of major projects would attain sustained growth proportionate to the national economy at a high speed.

Supply Channels. The main problem at the time was that under the influence of the theory that the means of production exchanged between the socialist enterprises owned by the whole people was essentially not a commodity, the supply channels to the market were becoming narrower and narrower. The control of materials was so rigid that it fettered the initiative of local authorities and enterprises. The documents of the Eighth National Congress of the Communist Party of China and Comrade Mao Zedong's "On Ten Major Relationships" had already pointed out the need for correctly handling the relations between the central and local authorities and between the state and enterprises, as well as the means for properly tackling problems arising from the distribution and exchange of the means of production. Unfortunately, these policies were not properly implemented in the succeeding years.

Between 1958 and 1960, there was a serious shortage of materials, chaotic management and frightening waste, all of which caused great difficulties for major production units and construction projects directly under the control of the central authority. This predicament came about because the production targets of industry — heavy industry in particular — were set so high as

to be beyond the capability of the country's economy. To make matters worse, control over allocation and distribution of many kinds of materials in the first and second categories were given over to the local authorities. In 1961, the Party Central Committee and the State Council decided to adopt policies of readjustment, consolidation, expansion and raising standards for the national economy. While reducing the scope of capital construction and readjusting industrial production, the state strengthened its unified control of materials. The number of the materials in the first and second categories increased to about 500.

Controls. Between 1962 and 1965, the question of controlling the supply of materials was discussed on many occasions by the Party Central Committee and the State Council; decisions for work improvements were made. An emphasis was put on giving adequate leeway to authorities for controlling distribution of materials, while strengthening supervision over the implementation of contracts for material supplies. All this helped to bring about gradually a balance between supply and demand.

On controlling the circulation of goods, Comrade Liu Shaoqi's concept of setting up a system of "second commerce" was put into practice. This included establishment of institutions in charge of materials management, i.e., specialized material supply corporations and stations; organizing service teams to keep regular contacts with user enterprises at the grassroots level; setting up many factories and shops for processing materials according to fixed models — shops for repair and remoulding and for recycling waste materials and rental of equipment and tools. A whole set of methods for supplying producer goods was introduced: making direct deliveries of goods from producers to large user enterprises, purchasing in large quantities and supplying in small quantities to small user enterprises and regulating supplies in fixed quantities from producing units to enterprises requiring regular amounts of certain goods; and setting up in major cities supply companies of producer goods and initiating trust service. As a result, there was a marked improvement in the supply of materials.

Disruption. During the ten years of turmoil between 1966 and 1976, however, the supply of producer goods was seriously disrupted. The ministry in charge of that supply was "smashed." Such state institutions in 24 provinces and autonomous regions were suspended and most of the special goods supply companies, service companies and supply stations were either dissolved or

merged. In addition, service teams were disbanded and all colleges and schools which trained personnel specializing in material supply were closed down. Consequently, state control of the allocation and distribution of producer goods was greatly weakened.

During the period of economic readjustment in 1975, particularly after the downfall of the Gang of Four, the institutions in charge of material supply gradually resumed work and some regulations for the management of goods which had proved effective during the 1960's were re-instated. There has been a strengthening of state control for the allocation and distribution of producer goods. Most of the goods in the first category have been placed once again under control of the state organizations in charge of material supplies and they are to supply materials in a uniform way. And there has been an improvement in the methods of supply and service. Meanwhile, local authorities have been enjoying greater power in the control of goods. The goods in the first category under the control of local authorities in 1978 accounted for the following percentages of the national total: coal, 46%, rolled steel, 42%, copper, aluminium, lead and zinc, 36%, timber, 18%, and cement, 71%. In view of the reappearance of adventurism in the country's economic construction as a result of underestimating the serious consequences of the ten years of turmoil, the work of the management of material supply must be closely supervised.

New Policies. After the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, people began to emancipate their minds, seek truth through practice and overcome "Left" errors. The policy of readjustment, restructuring, consolidation and improvement of the national economy has been implemented. As a result of reducing the scope of capital construction and changing the proportion between light and heavy industries, there has been a gradual easing in the distribution of goods. A breakthrough has occurred in the conventional idea that producer goods exchanged between socialist enterprises owned by the whole people are in essence not commodities and are not allowed to be circulated freely. So, under the guidance of the state plans, part of the goods of the first category are regulated by the market. The distribution of goods has become more lively and there has been initial improvement in the management of material supply.

II. Supply of Consumer Goods in 1980

The year 1980 saw a tremendous improve-

ment in the work of material supply. Positive results were made. The artificial tension that had lasted for many years when supply constantly fell short of demand abated. The vicious circle of stockpiling in face of a shortage of goods — and the stockpiling of more goods the greater the shortage — was virtually broken. Never has the circulation of goods been so lively and the economic results so high in the past dozen years or so.

Balanced Distribution of Producer Goods

To meet the needs of readjusting the national economy, efforts have been made to improve distribution of producer goods and the structure for such distributions, namely, to make arrangements in the order of people's livelihood before production and of production before capital construction. A better balance has been achieved and the structure of distribution has improved markedly. Although the sources of major goods of the first category were drastically reduced as a result of the readjustment of the economy and the extension of decision-making power to enterprises, there was still an increase in 1980 in the supply of materials to light industry for repairs and technical innovations, and to agriculture and the fuel, transport and communications industries. For example, the amount of rolled steel under the first category for distribution (including domestically produced, imported and stockpiled) decreased by 8.8% in 1980 as compared with 1979, but the supply of rolled steel for the production of light industrial goods and to commercial departments to be processed into products rose by 8.3%. The maintenance of equipment in production enterprises rose by 11.7%; for technical innovations and transformation of existing enterprises, by 38.6%; for agricultural production and rural house building, by 6.6%. And correspondingly, allocations to the machine-building industry and capital construction decreased by 23.6% and 28.1% respectively in the same period. Major allocations of rolled steel in 1980 as compared with 1979 (in terms of percentages of the total amount distributed by the state) were as follows: light industry, 11.2% (from 9.4% in 1979); maintenance of equipment in production enterprises, 16.4% (from 13.4%); technical innovations and transformation of existing enterprises, 4.2% (from 2.7%); machine-building, 17.4% (from 20.8%), and capital construction, 17% (from 21.5%). This change in patterns of distribution for producer goods was also apparent in the distribution of timber, cement, coal and major non-ferrous metals. The distribution of lorries to most depart-

ments decreased in 1980 as compared with 1979, but it increased 86.3% and 68% for agriculture and specialized transportation departments respectively. Ten thousand lorries were sold to rural people's communes and their sub-divisions according to plan in important commodity grain and industrial crop-producing regions and in major stockbreeding areas. The communes bought the lorries with their own collective funds. Such a scale of distribution of lorries to the rural districts was without parallel in the history of the People's Republic.

Changing the order of priorities was not limited to distribution of producer goods. Priority was also given to textiles and other light industries, the fuel industry and the transport and communications departments in matters such as accepting orders, day-to-day dispatching of goods and marketing of products by producing enterprises. State orders on the supply of producer goods were implemented better than in the past. By the end of 1980, these orders for the supply of rolled steel, timber, pig iron, seven non-ferrous metals, caustic soda, pure soda and rubber to the ministries of textile and light industries had been fulfilled or nearly fulfilled. The actual amounts supplied showed marked increases over that of 1979; among them, pig iron was up 70.4%, caustic soda up 31%, pure soda up 19%, rolled steel up 16% and coal up 1.1%.

Patterns of Distribution of Producer Goods

In compliance with the requirements of the readjustment of the national economy and the reform of the economic system, the circulation of producer goods in 1980 was diversified from the original single form of planned allocation into a number of forms of distribution. The following are their main forms:

(1) *The few important types of producer goods which were in short supply continued to be distributed and allocated by the state according to plan.* The sources of such goods were put under strict control but their method of supply was made as flexible as possible. Take coal for example. In mining areas where coal was placed under unified state distribution schemes, the dispatching departments were asked to increase their supervisory role to ensure that all supplies were allocated strictly in accordance with state plans and contracts. On the other hand, in areas where coal was being used, assistance was given to the users to strengthen their control in the use of coal, to check actual needs, to get supplies of quality coal and to reduce consumption.

As for the supply of non-ferrous metals, sources of supplies were strictly controlled to ensure unified distribution, supplies were organized in such a way as to allow users to place orders to mines located as close as possible within the same administrative regions and "supply coupons" were issued to small users so that they could get their supplies at any time. This arrangement guaranteed timely supplies and thus helped cut back stockpiling. In 1979 and 1980, coupons representing 289,000 tons of copper, aluminium, lead, zinc, and products of copper, aluminium and lead were issued but the users bought only 4,173 tons. And in 1980, 166,000 tons were used from the users' stockpiles.

(2) *Some of the producer goods ceased to be distributed and allocated under a unified state plan but were supplied freely by material-supply departments in accordance with state policies.* In 1980, of the 256 kinds of producer goods originally under unified distribution by the State Planning Commission and the State General Administration of Allocation of Materials, 78 semi-finished metal products, two chemicals and 144 machinery products and electrical machinery units were freed from restrictions. Meanwhile, enterprises handling the supplies of producer goods were given priority to place orders or were encouraged to act as wholesale dealers.

(3) *After fulfilling plans for deliveries of goods to be distributed by the state, enterprises were permitted to market their own products.* In 1980, machine-building plants marketed 22.37 billion yuan worth, or 33.3% of the total value of their products. Metallurgical plants sold by themselves 2.91 million tons of rolled steel, accounting for 11% of their total rolled steel. These products were sold either directly by the producers to users or through material-supply enterprises such as wholesale dealers or agents. Both the unrestricted supply through marketing and sales by producer enterprises themselves help to break up the restrictions of "departmental ownership" and "regional ownership" and enable producers and users to exercise a certain amount of decision-making power in purchasing and marketing producer goods, and enhance economic ties between different enterprises.

(4) *There was some development of the trust business in the supply of producer goods.* Business done by the means of production service companies in various localities in purchasing, marketing and processing such goods in 1980 totalled 4,260 million yuan, or 21.7% more than the previous year. Barter trade of producer goods

organized by the departments in charge of material supply was valued at 3 billion yuan. Compensation trade in producer goods also grew.

(5) *Trading centres for producer goods were set up in large cities to provide organized and flexible marketplaces for free trade in such goods.* There were 68 trade centres of this type set up by the departments in charge of the distribution of producer goods in 1980. Such marketplaces in Shanghai alone did 310 million yuan of business in 1980, or 34% more than in 1979. Within two years such marketplaces have developed from spot transactions into both spot and future trading places which were supplemented by regular trust business, thus forming metropolitan trade centres. A more flexible form and a wider scope in the distribution of goods proved to be useful to spur both production and the distribution of goods.

The diversification of the forms of supply distribution is in fact the trial implementation of what Comrade Chen Yun proposed many years ago, namely, the establishment of a unified socialist market in keeping with the actual conditions of the country and the interests of the people. Such a market will have planned production as its backbone, supplemented by free production, and will have a planned market economy as the mainstay, supplemented by a free market.

Materials Management and Supply Services

As channels for distribution of materials increase, socialist competition emerges among producer enterprises, material-supply enterprises and between the former and the latter. This forces supply departments to change their working style of "bureaucratic commerce" and to improve their management and service. In 1980, material-supply departments in most provinces, municipalities and autonomous regions expanded their business network, adding counters to warehouses in urban and rural areas. Over 470 supply units were set up in Liaoning Province alone, increasing the total number by one quarter. Many material-supply enterprises cooperated with commercial enterprises in starting joint managements or appointing agents for marketing goods. The material-supply departments in Shanghai alone established a marketing network of 1,083 agents in state-run and collective-run commercial enterprises.

Supply Activities. The supply departments in many places reinforced their staff and sent representatives to solicit criticisms and suggestions from factories and rural areas. They supplied

metals and cable cut to order, sold glass, rubber and asbestos plates fashioned as economically as possible, retailed chemicals by pounds and ounces and expanded their rental business in industrial equipment and tools. They provided warehouses for clients to store rolled steel and timber and also provided such materials on a temporary basis. They supplied goods via mail and cable orders. They registered customers' needs for certain goods which were out of stock and supplied them at the earliest possible date. They supplied consumers with galvanized steel tubes, small-sized rolled steel, plastic and wooden products and plexiglass. They gave priority to the supply of glass, bricks and tiles, cement and concrete parts for building rural houses and materials for building marsh-gas pits, greenhouses and fishing boats.

Innovations. Progress was made in 1980 in technical service and in processing. The experience of the Hangzhou Timber Company in timber processing helped to popularize the supply method of furnishing both semi-finished and finished products in accordance with the needs of clients. In coal supply, the Shanghai Fuel Corporation helps consumers to control coal consumption, to train stokers, to remodel boilers and to supply mixed or patterned coal in order to raise the heat efficiency of boilers. In supplying machinery, including electrical machinery, some innovative enterprises provided services such as installing, maintaining and repairing the equipment and allowed clients to defer payment until after trial use. These methods have helped to boost sales.

Some material-supply departments introduced a system of comprehensive supply. They organized specialized material-supply corporations to supply whole sets of machinery, electrical equipment and other materials to enterprises for their technical innovation and transformation. Some supply firms made deliveries to users in accordance with the users' production, maintenance and construction schedules. In managing materials, the old backward practice of buying, selling and stocking materials in bulk was changed in some enterprises. They started to replenish their stockpiles in view of sales according to specifications and requirements and supplied materials as needed by users. The new practice has demonstrated its ability to supply complete sets of materials, to meet the needs of users, to make timely deliveries and to help users and supply enterprises to raise work efficiency and reduce costs.

On the basis of fair competition, joint management has started between material-supply enterprises and between supply and production enterprises by merging their administrative systems

to establish cooperation within the same trade or between different trades. The enterprises exchanged market information, improved market forecasting and geared their purchasing and marketing according to market demand. This has led to a smoother flow of materials. Some provinces, municipalities and autonomous regions have begun to organize the supply of materials according to a system of economic zones. This rationalizes the transport of materials and cuts distribution costs by reducing the transport of the same kinds of materials moving in opposite directions because of the boundaries of administrative units.

Improvements. Many material-supply departments cancelled business transactions in early 1980 because they could not adapt themselves to the new situation. However, with improvement in management and service, both supply and demand have picked up. According to statistics from material-supply departments in the 29 provinces, municipalities and autonomous regions, total sales of all kinds of materials in 1980 were 12.2% higher than in 1979, while the total value of materials in stock was 8.3% lower. The turnover of circulating capital was 13 days faster and the distribution cost of materials was 0.07% lower. All this shows that trade in producer goods could grow rapidly under present economic conditions. The development of this trade, however, is contingent upon replacing the monopoly of "bureaucratic commerce" by good management and better service for users.

Changes in Stock of Materials

For many years, the stock of machinery, electrical equipment and rolled steel had been growing far more rapidly than the amount required for normal distribution. These stocks took up a large part of China's accumulation fund and squeezed out the stock of consumer goods, creating a grave problem for the economy.

Recent Trends. This trend was arrested in 1980. The stock of machinery and electrical equipment registered an average annual increase in value of 5.8 billion yuan between 1977 and 1979. The stock was drawn down in 1980, the first decline since statistics on stocks of such materials were made available in 1975. The stock of rolled steel, which had increased by 2.9 million tons in 1978 and 3.43 million tons in 1979, increased only by 670,000 tons in 1980. It has remained stable since the beginning of 1981.

There was also a change in the structure of

stockpiled materials throughout the country. Among the national stock of rolled steel, users' stock dropped from 77.9% in 1979 to 76.7% in 1980, while that of material-supply departments and steel mills rose from 22.1% in 1979 to 23.3% in 1980. Among the national stock of machinery and electrical machinery, the percentage of users' stock fell from 75.4% to 74%, while that of material-supply departments and producers rose from 24.6% to 26%. Although the change was only a modest beginning, it helped material-distribution departments to play a more effective role in regulating supply and demand and helped users to accelerate the turnover of materials and funds, thus improving the national economy.

The changes in stocks of rolled steel and machinery, including electrical machinery, has been a result of the preliminary readjustment of the national economy and market regulation under the guidance of state planning. It was also due to the measures taken by all departments and enterprises to check their inventories, to set quotas of permissible inventories for distribution and to send surplus materials to other units for use. According to statistics from 59,800 enterprises and undertakings in 28 provinces, municipalities and autonomous regions and 34 central departments, there was a total of 9.61 million tons of rolled steel in stock at the end of June 1980. The permitted quota of stock for normal distribution was 7.291 million tons. Surplus stock totalled 3.185 million tons and accounted for 33.1% of the total stock. In machinery and electrical machinery, the total value of the stock was 31.69 billion yuan; the permitted quota for normal distribution was 21.49 billion yuan; and surplus stock was 13.46 billion yuan, or 42.5% of the total.

Among the surplus of rolled steel, 1.28 million tons, or 40.1% of the total, were used in 1980, fulfilling the target of using 30-40% of the overstock. The target of using 20-30% of machinery and electrical machinery was also basically fulfilled; 3.35 billion yuan worth of products, or 24.9% of the stockpile, were used. Including the use of surplus rolled steel stock in 1979, a total of 2.6 million tons of steel from the stockpile was used, accounting for 81.6% of the total. The total value of machinery and electrical machinery which were put into use in 1979 and 1980 from overstocked supplies was 7.17 billion yuan, or 53.2% of the total.

The rate of use of overstocked materials was even higher in some provinces and departments. For instance, Sichuan Province used 98.6% of its surplus stock of rolled steel and 83.8% of its surplus stock of machinery and electrical machinery. The Ministry of Railways used 96.1% of the surplus stock of rolled steel and 85% of the

surplus stock of machinery and electrical machinery. The rate for Yunnan Province and for the Ministry of the Petroleum Industry was 80.4% and 96.4% respectively for surplus stock of rolled steel and 73.8% and 58.8% respectively for surplus stock of machinery and electrical machinery. The surplus stock of rolled steel and of machinery and electrical machinery would have been much less in 1980 if there had not been additions to surplus stock resulting from the non reduction of capital construction and the fact that goods were returned because some factories blindly produced unnecessary products simply to achieve higher targets for output value.

Saving, Substituting, Recovering and Recycling Materials

Efforts to economize fuel and timber by using their substitutes and efforts to recover and recycle scrap iron and steel produced excellent results in 1980.

Coal and Fuel Oil. In 1980, a total of 23 million tons of coal and 2.17 million tons of fuel oil were saved because industrial fuel consumption decreased, yet industrial production rose in most parts of the country. The state allocated over 400 million yuan in 1980 to subsidize the technical transformation needed to utilize exhaust heat for power generation and other purposes and for improving boilers and processing mixed coal. The state also allocated 130,000 tons of rolled steel needed to implement measures for conserving fuel oil and coal, for multiple use of gangue and for converting oil-burning boilers into coal-burning boilers.

The supply of coal was controlled in 1980 as was the supply of grain. A rationing system was put into effect to conserve coal supplies. All enterprises run by counties and administrative units above the county level in most provinces, municipalities and autonomous regions were allotted fixed quotas of coal consumption; they established a system for drawing down and using coal and gas, storing coal and recovering cinder, and awarding bonuses for saving coal. Over 15,000 people were trained in thermal techniques, and the regulation of heat has begun in 500 enterprises, each consuming annually at least 5,000 tons of coal or 3,000 tons of oil. Forums were held to exchange information on how to save coal in boilers and furnaces and on methods of using exhaust heat.

An emulation drive was launched among fuel-supply corporations in 111 cities in saving fuel and improving service. As a result, four million tons of coal, 400,000 tons of fuel oil and 80,000 tons of

coke were saved. To substitute coal for oil, furnaces consuming annually a total of 2.57 million tons of oil were converted to use coal as fuel.

Substitute Materials. Progress was also made in saving timber and using its substitutes. Through the joint efforts of planning, production, design, consumer and material-supply departments, six million cubic metres of timber were saved in 1980. Of that amount, 3.69 million cubic metres were saved through the use of substitute materials, 101% more than in 1979. The rest was saved through various other ways and was 1% more than the amount saved in 1979. Among the substitutes for timber, steel accounted for 55% of the total. Steel replaced timber in the manufacture of props, mould plates, window frames and furniture. Cement accounted for 42% of total substitutes and was used for making electric poles, railway sleepers and other products. Calcium plastics and small tree branches accounted for 3% of total substitute materials.

Timber. In saving timber, the experience of the Hangzhou Timber Corporation was taken as the model. The corporation raised its timber utilization rate by processing timber in bulk to supply finished and semi-finished products and to allow for multiple-use of the remnants. It raised the wood recovery rate by putting stricter controls on use of timber in packing and in the building industry and reduced the spoilage of wood during the process of unpacking and dismantling mould plates. It also began to rent mould plates, scaffolds and other implements used in construction. The conservation of timber through the use of substitutes played an important role in reducing the high demand for timber to meet production needs.

Scrap Iron and Steel. In 1980, 17.08 million tons of scrap iron and steel were recovered, overfulfilling the annual target by 12.6%, or 1.3% higher than in 1979. A record 3.31 million tons of scrap iron and steel were handed over to material-supply departments, overfulfilling the target by 43.5%, or 20.1% higher than in 1979. The quality of products manufactured with recovered scrap iron and steel was better than in the past and 85% of the total was of first-grade quality, which was from 5-10% higher than in 1979.

III. Current Problems of Supply

Although China's management of materials supply has improved continuously, it is still backward in many respects. Overstocking and sluggish

distribution of materials are still serious problems, with adverse effects on the economy. The main tasks in economic readjustment and restructuring are as follows:

(1) *Achieve an overall balance in important materials.* Experience shows that any plan which causes an imbalance in the supply of materials is not a reliable guide. When the supply of materials is very tight, distribution cannot be smooth no matter what system is used and regardless of measures taken. Therefore, a balance in the supply of materials, similar to the balance in finances and credits, must be one of the basic aspects of the overall balance of the national economy. In achieving a balance, the guiding principle should be that the balance must serve to promote the production of consumer goods to realize the readjustment of the economic structure, so that the structure of a balanced distribution of materials conforms to changes in the industrial structure and in the structure of products.

The method of achieving a balance is to begin by assessing resources of energy and raw materials in short supply, then strike an overall balance between production and consumption of all important materials, taking account of our capabilities and leaving some margin for adjustments. For those important materials vital to the national economy and the people's livelihood, a balance should be achieved not only between supply and demand of the resources under unified state control, but also between supply and demand of all resources in the country. Conditions should be created to solve gradually the problem of drawing up plans too late and making too many changes in the original plans. Meanwhile, reasonable and practical quotas should be worked out for the consumption of materials, stockpiling and the compilation of statistics on materials, market surveys and forecasts.

(2) *Under the guidance of state planning, efforts should be made to improve the supply of materials.* Reform of materials distribution has been correct in orientation and has registered initial successes. However, some new problems have cropped up due to lack of experience. Some products in short supply were sold on the market by producers themselves, thereby disrupting the state allocation plan. The pricing of some materials has gone out of control. The high market price of timber, for instance, has led to the indiscriminate felling of trees. Speculation and profiteering have increased. Appropriate measures should be taken to solve these problems so that regulation through market forces will develop properly under the guidance of state planning.

First, supervision and inspection must be strengthened under the state plan for allocation of materials to ensure an all-around fulfillment of the state allocation plan and contracts for the supply of goods. The enterprises which are allocated materials must be assured they will receive them when they order and the products must satisfy their needs. Producing enterprises must deem the fulfillment of the state plan for the supply of products as their primary task and the selling of their products in the marketplace must be placed under strict state control.

Second, it is necessary to change the situation in which all kinds of materials needed can be obtained only through the application and allocation by the various levels of regional and departmental administrations, regardless of their supply sources, use and quantity. The kinds of materials which are supplied without limitation should be expanded; some kinds of materials should be supplied after check ups and others supplied only upon presentation of coupons. Measures should be flexible so that materials flow smoothly. The procedure should be simple and convenient and the service considerate.

Material-supply departments should strive to organize the market for trading producer goods and to consult and cooperate with industrial departments in order to establish a closer relationship between industry and commerce. They should support and assist producer enterprises in promoting sales of products in demand and should actively support various forms of joint manage-

ment with industrial departments and producer enterprises. They should also promote co-ordination among various provinces, municipalities and autonomous regions in the supply of materials. Without disturbing the basic stability of market prices, it is necessary to readjust prices of some industrial producer goods and improve methods of price control so as to bring into play the regulating role of prices.

Third, it is necessary to improve the legal system, enforce state financial discipline and tighten market control so that the distribution of materials will be controlled — but not too rigidly, so that it will be flexible but not chaotic.

(3) *Strengthen the material-supply departments.* A network of nearly 10,000 shops in cities and less than 20,000 shops in rural areas has been formed. This network falls far short of the needs for the proper growth of industrial and agricultural production. Statistics on materials and transportation and storage facilities are inadequate and technical facilities for the distribution and processing of materials are insufficient. Management personnel have not received adequate political scientific and professional training. Under the leadership of the party and the government, material-supply departments at all levels must take effective measures to bring an end to this backwardness. They must make certain that management of materials meets the need for vigorous growth of the socialist economy and assures the steady growth of the national economy.

34. GROWTH OF CHINA'S FOREIGN TRADE

By Zhang Peiji

*Research Institute of International Trade,
Ministry of Foreign Trade*

I. China's Foreign Trade Since Liberation

Foreign trade is an important component of our national economy. Its task is to conduct economic exchanges between China and other countries and to serve socialist modernization.

In China, a country with 1,000 million people, socialist modernization must be achieved through self-reliance. That is to say, we should carry out economic construction mainly by relying on the labour and wisdom of our own people and by making full use of our own natural resources on the economic foundations we have already established. But self-reliance in no way means self-sufficiency or autarchy.

Trade Policies. Our basic policy is to develop trade relations with other countries and facilitate economic exchange according to the principles of "equality, mutual benefit and making up what the other lacks." With the development of production, our exports will expand. In the meantime, according to actual needs and the ability of our economic system, we shall continue to import certain useful and advanced technology and key equipment, as well as some important materials needed for production and consumption so as to promote economic development, stimulate the domestic market and strengthen our capability of self-reliance.

Foreign trade is an important aspect of our external relations. A variety of business contacts helps to expand friendly cooperation and to enhance mutual understanding and friendship between the peoples of the world. Foreign trade also plays an important role in opposing hegemonism and safeguarding world peace.

Ups and Downs. With the development of the national economy since Liberation, China's foreign trade has grown rapidly — at a higher rate than overall economic growth. The total value of imports and exports in 1979 was 85 times that in 1949, equivalent to an annual average growth rate of 16%, or 12.8% after allowing for price changes. In the same period, total output value (in real terms) of industry and agriculture increased at an annual rate of 9%. But China's foreign trade, like its national economy, has had ups and downs. Complications happened mainly in two periods: the first was during the "Great Leap Forward"

when China's foreign trade declined successively from 1960 to 1962; the second was during the "cultural revolution" when the ultra-"Left" line of Lin Biao and the Gang of Four caused havoc in our foreign trade for several years. Although the causes of the two setbacks were different in nature, they both adversely affected the development of our foreign trade.

Since the downfall of the Gang of Four, foreign trade has made rapid gains. From 1977 to 1979, the total value of our imports and exports almost doubled, representing an average annual growth rate of 17% (in real terms).

Composition of Foreign Trade. Over the past 30 years, the composition of commodities in foreign trade has changed profoundly. In old China, imports consisted mainly of consumer goods, and exports mainly of agricultural and sideline products. Since the founding of New China, priority has been given to the import of means of production or producer goods. With the exception of a few years, capital goods accounted for about 80% of the total value of imports. In export trade, apart from increasing exports of traditional agricultural and sideline products, China has made vigorous efforts to export manufactured goods, with textiles and light industrial products showing marked increases. In 1973, China began to export crude oil and expand exports of heavy industrial products. Between 1953 and 1979, the percentages of different categories of exports changed as follows: agricultural and sideline products fell from 55.7% to 23.1%; textiles and light industrial products rose from 26.9% to 45%; and heavy industrial products increased from 17.4% to 31.9%.

Expanding Trade Relations. Based on the principles of "equality, mutual benefit and making up what the other lacks," China's economic and trade relations with various countries and regions have developed enormously. As of 1980, we have established trade relations with more than 170 countries and regions, of which over 80 have signed bilateral government trade agreements or protocols with us.

Despite the rapid growth in the volume of foreign trade, the total value of foreign trade is still comparatively low — lower not only than that of the industrialized nations, but also than that of some developing countries and regions. In 1979, the total value of China's exports ac-

counted for only 0.8% of world exports. This situation is incompatible with the requirements of China's socialist modernization, with the rapid expansion of foreign trade contacts and with the development of foreign relations. Vigorous measures are now being taken to boost our foreign trade.

II. China's Foreign Trade in 1980

Acting on the resolution passed by the Third Plenary Session of the 11th Central Committee of the Communist Party of China, the emphasis of our work has been shifted to socialist modernization. In June 1979, the Second Session of the Fifth National People's Congress decided to readjust, restructure, consolidate and improve the national economy in order to bring about systematic, sustained and balanced development.

In line with the national economic readjustment, China's foreign trade has undergone further expansion. In 1980, the state plan for foreign trade was carried out satisfactorily, with the total value of two-way trade reaching 56,300 million yuan, 23.6% higher than in 1979. Exports amounted to 27,200 million yuan, an increase of 28.7% over 1979. The value of imports reached 29,100 million yuan, 19.2% above that of 1979.

The main features of the development of China's foreign trade in 1980 are as follows:

(1) *Steady development in our foreign trade.* The growth rate of exports in 1980 was larger than that of imports. The trade deficit was thus reduced significantly.

(2) *As a result of the readjustment of the national economy, imports of raw materials for heavy industry and machinery were reduced and imports of food grains, cooking oils and materials for agricultural use as well as raw materials for textiles and light industries increased.* In 1980, imports of grains, animal fats and vegetable oils, cotton, synthetic fibres, chemical fertilizers, industrial chemicals and woodpulp were 51% higher than in 1979. Their combined share in the total value of imports rose from 41.7% in 1979 to 52.8% in 1980. Imports of steel, non-ferrous metals and machinery and instruments decreased by 3.5% from 1979 and together accounted for only 47.2% of the total value of imports, down from 58.3% in 1979.

(3) *Further changes in the composition of exports.* The proportion of exports of heavy industrial products went up, while that of agricultural and sideline products as well as of textiles

and light industrial products declined. In 1980, the percentages of different categories of exports changed, as compared to 1979. Agricultural and sideline products fell from 23.1% to 18.8%; textiles and light industrial products fell from 45% to 41.8%; and heavy industrial products (including crude oil and refined oils) rose from 31.9% to 39.4%. The value of exports of machinery and transport equipment increased by 44.6% over 1979.

The satisfactory fulfilment of the 1980 plan for foreign trade was made possible by the following measures:

(1) *The implementation of the principle of economic readjustment and various economic policies.* Local production was expanded and so was the supply of certain items for export.

(2) *Opening all avenues of doing business and tapping the potential of enterprises.* We further developed the manufacture of goods using processed imported materials and thus promoted the production and export of commodities that are welcomed by the international market.

(3) *Aiding comprehensive export production bases, special factories and workshops to develop their production and exports and to improve the quality of their products.*

(4) *Adopting various flexible ways of doing business in order to increase export transactions.* In 1980, more trade missions were sent abroad to promote sales and more trade fairs and shows were held at home. The national import and export corporations held 28 mini-fairs for various export commodities in 10 provinces and municipalities while continuing to run the biannual Guangzhou (Canton) Trade Fair.

Some reforms were introduced in 1980 to our foreign trade system. The major ones were: devising special policies and more flexible procedures for Guangdong and Fujian provinces and granting them more freedom in handling foreign trade; transferring responsibility for making business transactions in certain commodities to the provinces and other departments; establishing in some industrial departments and provinces and municipalities in China import and export corporations with the authority to handle foreign transactions in certain commodities. This was an experiment in promoting cooperation between industry and trade. These reforms helped to bring into full play the initiative of localities and other departments in promoting foreign trade by increasing production and expanding exports and in improving management and administration.

Because of our lack of experience and inadequate administrative measures, new problems have emerged in our import and export work. But these are being solved by the departments concerned.

III. Foreign Trade During the Readjustment of the National Economy

During the period of readjustment, the central task of China's foreign trade is to serve the goals of economic readjustment and assure the stability of the national economy. Foreign trade can serve the goals of readjustment in the following ways:

(1) *Promote production and increase the supply of export goods that meet market requirements.* As production is the material foundation for the development of foreign trade, we must speed up the production of export commodities and steadily increase the supply of goods sought by foreign markets.

For many years, the main problems encountered in developing our exports were that we did not produce sufficiently those goods that were wanted abroad and that the quality and styles of our products, as well as their packing and packaging, failed to satisfy foreign customers.

Economic readjustment will surely create more favourable conditions for the development of agricultural and industrial production and the expansion of production capacity. We shall step up our efforts to expand production of export goods, paying special attention to improving the quality of products and their appeal for foreign markets. The government and responsible departments should take effective measures to develop and promote the production of export goods and to encourage people in all fields of work to expand production so as to raise the quality and the supply of export commodities.

(2) *Ensure the smooth progress of the readjustment by securing imports of the most needed materials for our economic stability, enhancing import management and reducing trade deficits.* During the period of economic readjustment, imports of agricultural and industrial materials needed for maintaining economic stability and developing the textile and light industries must be timely and orderly. Imports of technology and equipment needed for upgrading existing industries, expanding energy production, communications and transportation facilities and for advancing science, education and culture must be organized in a planned way. Only in this way can imports serve the goals of economic readjustment.

This does not mean that we shall import everything. In drawing up foreign trade plans, we must take into consideration not only the need for imports, but also our actual export capabilities. Today we are still running a deficit in our international trade balance. Foreign exchange is not easy to earn. From the short-term as well as the long-term point of view, import controls will be necessary. In economic construction, we shall hold to the basic principle of relying mainly on our own efforts and only secondarily on external assistance.

We shall not import those items that can be produced domestically in sufficient quantity and with satisfactory quality. Items that we can make at home but are still importing now will eventually be supplied mainly by domestic production. In this way, we can save our limited foreign exchange for the most essential items and make the composition of our imports more reasonable.

(3) *Make further changes in the composition of our export commodities.* The percentage of manufactured goods — especially machinery and electrical products — in our total exports will gradually increase.

Currently, our major export items are primary products — raw materials, agricultural and sideline products — and textiles and light industrial products of low or medium-grade quality, which are obviously not competitive in the international market. This kind of export structure cannot meet the requirements of the country's economic development.

Following the gradual expansion of production in the readjustment period, our export structure should improve. In order to earn more foreign exchange, China must increase exports of more valuable manufactured goods. Further development of agriculture and textiles and light industries, made possible through readjustment, will make larger supplies of goods available for export. It is expected that while exports of agricultural products, native produce, animal by-products and foodstuffs will increase in volume, they will constitute a smaller percentage of the total value of exports. Exports of certain products might show little increase or even decrease due to the growing demands of the domestic market. Exports of textiles and light industrial products will increase, but we are more concerned about upgrading their quality than seeking large increases in quantity.

China is rich in labour resources, an advantage in the development of processing industries, i.e., industries that process imported materials for incorporation into manufactures destined for export. There is great potential for developing the export of labour-intensive products.

Crude oil is one of our important export

items. There can be no increase in the export of oil in the next few years unless we solve the problems of exploration and exploitation of oil, which will take a fairly long time. From a long-term point of view, the export of coal holds brighter prospects, although coal also presents problems in exploration and transportation.

However, we shall energetically increase exports of mineral and chemical products on the basis of increased production. We have already set up a fairly good foundation for the machine-building industry. In the readjustment period, production will certainly be expanded and techniques improved through the technological reform of existing enterprises. There is much room for improvement in our exports of machinery and electrical products.

(4) *Continue to learn from our experience and reform our foreign trade system step by step in order to promote foreign trade.* Changes in China's foreign trade system constitute part of the reform of the overall economic system, which itself is a long-term task.

Reforms must be subordinated to economic readjustment and must be beneficial to it. Owing to our lack of experience, changes must be con-

tinually studied and tested against China's actual conditions; in this way we will gradually perfect our foreign trade system.

(5) *Further improve the management and administration of foreign trade.* We must firmly reduce inventories so as to cut the costs of management and speed up capital turnover. All enterprises related to foreign trade must pay attention to business accounting, improve their research, marketing and purchasing, acquire a thorough understanding of import and export prices and utilize their potential fully in order to reduce deficits and increase surpluses.

The readjustment of the national economy will undoubtedly bring about a healthy growth in foreign trade because economic readjustment will make the relationships between various sectors of the national economy more balanced and rational, thus giving new impetus to production, to improvement of quality and to expansion of exports. Increased exports will enable China to spend more on imports of advanced technologies and of key equipment needed for further economic readjustment, as well as of important materials and goods for the domestic market, thereby strengthening the weak branches of its economy.

35. CHINA'S IMPORTATION OF TECHNOLOGY

By the Research Department,
State Administrative Commission on Export and Import Affairs

China is a developing socialist country. In the current phase of its modernization, China's long-term strategic policy is to learn diligently about the advanced technologies available in foreign countries and to import in a planned, selective way the practical advanced technologies it urgently needs.

I. History of Imported Technologies

During the 30 years from 1949 to 1979, China imported a total of 851 items of technology and plants with a combined value of US\$16,500 million. In the 1950's, the economic blockade imposed by imperialist powers forced China to import technology and plants mainly from the Soviet Union and East European countries. These technologies and plants, with 156 construction projects as the core, cost about US\$2,700 million; they formed the backbone of China's industrial construction at that time and laid the preliminary foundation for socialist industrialization.

Filling the Gap. In the early 1960's, the Soviet leadership caused tremendous difficulties for the Chinese people, cancelling contracts and withdrawing Soviet technicians. With a view to filling the technological gap, China turned to Japan and Western Europe for sorely needed technology and equipment in the petroleum, chemical, metallurgical, electronic and precision machine industries. On the whole, these imported technologies produced good results. Imports during that period cost US\$280 million. However, from 1966 to the early 1970's, due to the disruptive influence of Lin Biao and the Gang of Four during the "cultural revolution," the importation of technology was in the main suspended.

In the early 1970's, significant changes took place in the international situation and China's diplomatic relations entered a new phase. Braving the interference and disruption of the Gang of Four, the People's Government signed a large number of contracts to import technology and plants from more than a dozen countries, including Japan, West Germany and the United States. By the end of 1977, the volume of transactions totalled US\$3,960 million, covering 26 projects — including 13 chemical fertilizer plants, 4 synthetic fibres plants, 2 petrochemical works, a 1.7-metre rolling mill for the Wuhan Iron and Steel

Complex and 43 sets of automatic coal mining equipment. Items that were intended to boost agricultural output and production in textiles and light industries accounted for 51% of China's total foreign-exchange spending.

Large Scale Imports. After crushing the Gang of Four, China was determined to speed up the Four Modernizations and import more urgently needed technology and equipment. However, the influence of "Left" ideology on our economic work, the lack of overall balance, the failure to act on the principle of "acting according to one's capability" and the rashness of starting projects without careful analysis led to the error of importing on an excessively large scale. In 1978, contracts signed with foreign countries amounted to US\$7,800 million, almost double that of the five preceding years, and were mostly paid for in free foreign exchange. This sum far exceeded China's means of payment and exacted a heavy toll on the national economy. As a result, some projects had to be halted or postponed.

In 1979, drawing a lesson from its experience with the import of technology in the previous year, China began to control the general scale of importation, adjust its priorities and change the practice of importing complete plants on a large scale. The new approach began with investigations into the problems arising from acquisition of technology that was incompatible with China's actual conditions and with the requirements of economic readjustment. In 1979, the total value of imported technology dropped to US\$1,800 million and only four new plants were bought, of which two were power stations.

II. Guidelines for Importation of Technology in 1980

The National Conference on Imports and Exports, convened at the end of 1979, reviewed the experience and lessons learned about China's acquisition of technology and formulated guidelines for future acquisitions. The principal guidelines were as follows: coordinate the acquisition of technology with the readjustment of the national economy and subject it to the requirements of economic readjustment; focus on consolidating agriculture, the textile industry and the weak links in the national economy; combine the acquisition of technology with the development of

energy resources, communications and transportation, the development of basic industries and full utilization, renovation and transformation of existing factories and enterprises, while starting fewer new projects; combine the acquisition of technology with the increase in the capacity of the machine-building industry; reduce the importation of complete plants and import more specialized manufacturing technologies, taking into account the capacity of domestic manufacturing plants and China's general capabilities; strike an overall balance in imported technologies and carry out feasibility studies of these technologies.

Following these guidelines, China radically altered the scale and the methods of its importation of technology in 1980, from the selection of technologies to actual trade negotiations.

Total imports of technology and equipment in 1980 were valued at US\$2,600 million. They differed from imports in previous years in the following ways:

(1) *The importation of big plants was basically controlled.* For a long time, imported plants made up a large proportion of total imports of technology. The proportion had been smaller in the 1950's when subcontracted parts produced in China generally accounted for 40-50% (and in some years, over 60%) of the plants. But from 1973 to 1978, complete plants accounted for more than 80% of the US\$11,700 million in signed contracts. In 1978, only a few single machines were produced under subcontract by domestic machine-building plants.

In 1979, the number of imported plants decreased sharply. In 1980, the total value of imported plants (excluding the Baoshan Iron and Steel complex) was only US\$120 million, or 4.8% of the total value of US\$2,600 million transacted that year.

(2) *The proportion of single-item technologies showed a large increase.* In the past, money spent for the acquisition of technology accounted, on the average, for 3% of the total value of all imports. In certain years, it accounted for only about 1% or even less. The imported items were exclusively equipment, and most of the imported equipment consisted of plants. But in 1980, the situation changed; imported technologies made up 50% of the volume of foreign transactions. The total spent on single-item technology was US\$231 million, or 8.8% of the volume of business transacted.

(3) *The number of duplicated items was reduced.* One of the main problems with regard to imports was the duplication of imported items,

causing great waste. We started to correct this tendency in 1979. Duplication of items among imports of equipment by some ministries was largely eliminated in 1980, although it continued to be a problem in imports by local governments and departments.

In 1980, a good deal of work was done in digesting and absorbing the imported technology, in raising the level of negotiations and in training professional personnel. In addition, temporary regulations and policies or measures governing the acquisition of technology and equipment were drafted. Also in 1980, progress was made in the acquisition of technology and equipment through compensatory trade and cooperative management. Three large projects of compensatory trade, valued at US\$101.42 million, were approved.

III. Policies for the Future

In the years ahead, guided by the principle of relying mainly on one's own efforts and by the lesson learned in 1978 about the disadvantages of reckless large-scale importation of plants, China will import in a steady and moderate way the advanced technologies and managerial expertise suitable to its domestic conditions. It will formulate plans for the acquisition of technology with a view to maintaining overall balance and in conformity with its long-term plan for the development of the national economy, science and technology.

China will undertake serious investigations of conditions at home and abroad and make a feasibility study of each project; it will consider the need for supplementary items and will compare and choose among available technologies to ensure good economic results. We are determined to avoid duplication of imports and will switch over from the import of plants to that of technology. Even if some plants are imported, the proportion of subcontracted parts will be larger.

Imported technology will serve to upgrade production techniques, perfect and transform production processes, lower consumption of energy and raw materials, raise productivity and help modernize existing enterprises. In accordance with the overall reorganization of the country's economic and industrial structure, the proportion of imported technology for energy production, transportation, agriculture, textile and light industry and the chemical and building materials industries will be enlarged.

To achieve greater self-reliance, we must strive to master, digest and utilize those imported technologies that have the greatest potential for promotion of economic development and innovation.

36. CHINA'S ABSORPTION OF FOREIGN INVESTMENT

By the Research Department,
Foreign Investment Commission

Guided by the principle of relying mainly on our own efforts while seeking external assistance and taking account of conditions in China, the Chinese Government is using foreign investment in a positive and steady way to speed up socialist construction. This is long-term strategic policy.

China is a vast country with rich natural resources, huge population and enormous market potential. Politically stable and united, it is determined to carry out the Four Modernizations. China thus offers great attraction for foreign investment and broad prospects for foreign industrial and commercial investors.

I. History of Foreign Investments in China

The absorption of foreign investment started shortly after the founding of the People's Republic of China in 1949. In the face of extremely difficult conditions caused by the economic blockade imposed on New China by imperialist powers, the liberated Chinese people undertook the construction of their country on a grand scale.

Soviet Loan. In February 1950, the Chinese Government and the Soviet Union, then headed by Stalin, signed an agreement under which the USSR would provide China with a long-term loan of 7,400 million old rubles (equivalent to US\$1,900 million) at a 2.5% interest rate. This loan was mainly used for major projects in China's First Five-Year Plan and played a part in establishing China's socialist industrial base. In the early 1960's, however, Soviet Premier Khrushchev's government tore up the contracts, causing severe difficulties for the Chinese economy. But by 1965, the China had paid off the principal and interest of the loan.

Foreign Investments. Beginning in the early 1960's, China turned to Japan and some Western European countries for technology and equipment and adopted the common international practice of deferred payment. According to statistics, this form of payment accounted for about 40% of the total value of imported plants between 1973 and 1977. During this period, the government used foreign exchange deposits at the Bank of China to enable the transportation departments to buy ships for an oceangoing merchant fleet. Meanwhile, small loans of foreign exchange were gran-

ted to other departments and localities in the country.

However, due to the 10 years of turmoil caused by the counter-revolutionary clique of Lin Biao and the Gang of Four, as well as to the influence of "Left" ideology on economic work, China's absorption of foreign investment was confined to two forms in the 1960's and 1970's. After the smashing of the Gang of Four and after the Third Plenary Session of the 11th CPC Central Committee had adopted the open-door economic policy, a new phase began in China's absorption of foreign investment. On July 30, 1979, the 10th Session of the Standing Committee of the Fifth National People's Congress established the Foreign Investment Control Commission. The main task of this body is to work out, in consultation with various relevant departments, the policy and law on the absorption of foreign investment, to formulate regulations on joint ventures, to organize departments to examine and approve the agreements, contracts and rules governing joint ventures and to coordinate the use of foreign funds by various departments and localities.

II. Current Uses of Foreign Investment

In recent years, progress has been made in various aspects of China's absorption of foreign investment.

Absorption of Foreign Loans. By the end of 1979, foreign loan agreements signed between the Bank of China and foreign countries totalled US\$27,586 million, of which US\$11,845 million were in the form of export credits extended by Britain, France, Italy, Canada, Sweden, Australia and Belgium. Only US\$2,986 million were actually used. In 1980, the Bank of China signed an export credit agreement valued at US\$100 million with a Norwegian bank, another one valued at US\$300 million with an Argentine bank and a third, valued at 500 million marks (US\$250 million), with a West German bank. These export credits totalled over US\$12,400 million. China, however, did not make much use of them because it was undergoing economic readjustment and imported only a few plants.

The long-term, low-interest loans offered by foreign governments or international financial institutions were given priority in China's absorp-

tion of foreign investment. In 1980, China reached agreement on loans with the governments of Japan and Belgium. Under the agreements, the Japanese Overseas Economic Cooperation Fund would offer loan to finance six projects: Shijiusuo port construction, Yanzhou-Shijiusuo railway construction, Beijing-Qinhuangdao railway extension, Qinhuangdao port expansion, Guangzhou-Hengyang railway extension and Wuqiangxi hydro-power station. The amount of credit would be determined each year by the two parties concerned in light of the projects' progress. The loan effected for the fiscal year 1979-80 was 106,000 million yen (US\$400 million), at an interest rate of 3%; repayment would begin in the 11th year and the credit would be paid off in 20 years.

The Japanese Export and Import Bank's US\$2,000 million loan, signed in 1979, is for developing energy resources. In 1980, the Japanese paid US\$435 million, mainly to build coal mines and to develop oil fields. The interest rate was 6.25%; the loan is to be repaid in instalments over a period of 15 years after each project comes into operation.

The Belgium government's interest-free loan of US\$31.5 million, to be repaid in 30 years, is earmarked mainly for the purchase of power generating equipment.

With its representation in the International Monetary Fund and the World Bank restored in 1980, China has developed increasingly closer relations with both agencies and has made an investigation in preparation for borrowing funds.

Establishment of Joint Ventures. In July 1979, the Second Session of the Fifth National People's Congress approved and promulgated the "Law of the People's Republic of China Concerning Joint Ventures Using Chinese and Foreign Investment." China welcomes investments by compatriots in Hong Kong and Macao and joint ventures with these and other investors. Since the promulgation of the law, many foreign investors have come to China to consult and negotiate with departments about actual investment projects. At the end of 1979, there were some 100 projects under discussion.

By the end of 1980, 20 joint-venture enterprises have been approved by the Chinese Government; their total investments amounted to US\$210 million, with more than US\$170 million coming from overseas investors. These joint venture projects included 13 industrial enterprises, 3 hotels, 1 catering company, 2 service enterprises and 1 pig farm. The partners in the joint ventures are from Hong Kong, Switzerland, France, the United States and Japan.

In 1980, 12 such enterprises went into formal operation. They included the Beijing Airline Catering Ltd., a joint venture of the Beijing Administration of the Civil Aviation Administration of China and China Air Catering Ltd. in Hong Kong; the China-Schindler Elevator Co. Ltd., a joint venture of the China Construction Machinery Corporation, the Schindler Holding A.G. of Switzerland and the Jardine Schindler (Far East) Holdings S.A. in Hong Kong; the Guangming Overseas Chinese Electronics Industry Corporation Ltd., a joint venture of the Overseas Chinese Enterprise Corporation Ltd. in Guangdong Province and the Electronic Enterprise Corporation Ltd. in Hong Kong; the West Lake Rattan Furniture Corporation Ltd., a joint venture of the Furniture and Fixtures Industry Corporation in Zhejiang Province and the New Arts (Xin Yi) Corporation in Hong Kong; the Yanhua Standard Battery Factory Ltd., a joint venture of the Shijiazhuang No. 3 Radio Factory in Hebei Province and the Standard Battery Factory Ltd. in Hong Kong; the Sino-French Winery, a joint venture of the municipality of Tianjin and the French Remy-Martin Company; the Guangming Pig Farm in Guangdong Province, a joint venture of Overseas Chinese Enterprise Corporation Ltd. in Guangdong Province and the Philippines Overseas United Corporation Ltd.; the Jinhua Watch Dial and Watch Hand Corporation Ltd., a joint venture of the Wrist Watch Industry Corporation in Tianjin and the Wahing Watch Dial Factory Ltd. in Hong Kong.

The technology used by these enterprises has brought about good economic results. For instance, from May 1980 (when the enterprise went into operation) to the end of December 1980, the Beijing Airline Catering Ltd. increased the number of meals it served per day from 600 to 2,100; its monthly sales rose from 370,000 yuan to 540,000 yuan and its net profit was 280,000 yuan. Another example was the Shanghai Elevator Works (one of the partners in the China-Schindler Elevator Co. Ltd. venture). In the second half of 1980 (one year after it began joint operations), the company's production and output values rose by 10% compared with the same period in 1979. The quality of all its products was first-rate. Production for export increased by 200% and profits went up by 60%.

In 1980, China entered into more than 30 joint ventures with businessmen in Hong Kong, Macao and other foreign countries. Their total investment exceeded US\$80 million, half of which was foreign capital. Of these 30 enterprises, 19 have already gone into operation.

Joint Exploration and Exploitation of Off-Shore Oil. In the period 1978-79, the departments

concerned with oil exploration and exploitation carried out investigations and research on the prospects of cooperation in developing offshore oil. They decided to prospect and exploit offshore oil in cooperation with foreign firms under risk-bearing contracts. There would be two phases — first, a survey by geophysical methods; then, prospecting and exploitation.

In 1980, China signed nine agreements for maritime geophysical surveys in the South China Sea, the southern Yellow Sea and Bohai Bay with more than 40 oil companies from the United States, Britain, France and Italy. The contractors went to work between May 25 and late November and all but one finished the processing and interpretation of seismic data and produced reports and maps showing results of the geologic surveys. The costs were borne by foreign investors. On the basis of the surveys, we entered the phase of co-operative prospecting and exploitation of offshore oil. By the end of 1980, four contracts had been signed by the China Petroleum Company with Japanese and French oil companies for joint prospecting and exploitation of oil in Bohai Bay and Beibu Gulf in the South China Sea. Under discussion between the China Petroleum Company and a number of American oil companies was a project for joint prospecting and exploitation of oil in the Yinggehai basin of the South China Sea; invitations to tender were being prepared.

Establishment of Special Economic Zones. In July 1979, the government decided to implement a special policy and flexible measures in Guangdong and Fujian provinces and to designate Shenzhen, Zhuhai and Shantou in Guangdong Province and Xiamen in Fujian Province as special economic zones (SEZ). In these zones, foreign enterprises and individuals, overseas Chinese and compatriots in Hong Kong and Macao are encouraged to invest or establish joint-venture enterprises in the fields of industry, agriculture, commerce, tourism, housing construction and other services.

In 1980, preparations began for the construction of the special economic zones. On August 26, the Standing Committee of the Fifth National People's Congress approved and promulgated the "Regulations on Special Economic Zones in Guangdong Province." A Special Zone Administration was established and economic activities were started. Infrastructure construction — such as land-leveling, water and power supplies, drainage systems, roads, wharves, communications, storage facilities and other public utilities — financed by foreign investment, has been underway in Shenzhen and Zhuhai. According to statistics, the number of joint-venture projects in the

Zhuhai SEZ at the end of 1980 totalled more than 70. The total value of foreign investment in the zone was over US\$80 million; foreign exchange revenues were US\$37 million and revenues from exports were over US\$10 million. Employment was provided for 3,700 persons.

In the Shenzhen SEZ, joint-venture projects that had been agreed to numbered 580, of which 400 have since gone into operation. Foreign investment in the zone totalled over HK\$1,600 million.

Among the projects financed by foreign investors, industry accounts for 68%, agriculture, sideline products and fishing 24%, tourism 2.6%, commercial services about 2.4%, communications and transportation, as well as land and real estate, about 1.2% each. There are 360 projects involving processing and assembling with imported materials, nearly 200 co-production projects, 6 joint ventures, 4 compensatory trade projects and 6 projects with exclusively foreign capital.

Absorption of Foreign Investment by the China International Trust and Investment Corporation. In October 1979, the China International Trust and Investment Corporation (CITIC) was set up to channel, absorb and use foreign capital, to import advanced technology and equipment and to run joint ventures with foreign firms. It was to carry out these tasks under the commission of various regions and departments and in accordance with the "Law of the People's Republic of China Concerning Joint Ventures Using Chinese and Foreign Investment."

By the end of 1980, projects financed by CITIC with foreign capital were the Xiaosigou Molybdenum and Copper Mine, the Zhongyuan Molybdenum Corporation, the Jinning Phosphorus Mine and the Hefei Carbon Factory. The total investment in these four projects was over US\$16 million. CITIC and the Oriental Leasing Company Ltd. of Japan have jointly set up the China Oriental Leasing Company, which is just getting underway. Trust and investment corporations and similar companies have been set up in Guangdong, Sichuan, Liaoning, Hubei, Fujian, Zhejiang, Shanghai, Beijing, Guangzhou, Shanxi, Henan and Tianjin.

Utilization of Foreign Investment in Compensatory Trade and Cooperative Management. As early as July 1978, the government decided to develop external compensatory trade, processing with imported materials and assembling with imported parts. In September 1979, the State Council formally promulgated the "Regulations on External Processing and Assembling and Small and Medium-Sized Compensatory Trade."

The above-mentioned flexible forms of trade

are exempt from tariffs and industrial and commercial taxes. Encouraged by this policy, our small and medium-sized compensatory trade has been booming. According to incomplete statistics, by the end of 1979, 157 small and medium-sized compensatory trade items had been transacted in Beijing, Shanghai, Tianjin, Guangdong, Guangxi, Fujian, Jiangsu, Zhejiang, Shandong, Hebei, Henan, Hunan, Shaanxi, Sichuan and Heilongjiang — altogether, 14 provinces and municipalities and one autonomous region. The imported equipment cost US\$117 million. In 1979, their sellback products yielded US\$24.64 million worth of revenues.

In 1980, 205 compensatory trade items in all were transacted. The imported technology and equipment cost US\$137 million. Sellback products yielded over US\$30 million.

By the end of 1980, China has approved 300 cooperative management projects (contractual joint ventures), involving over US\$500 million, mainly for service trades such as tourism, housing and taxi service. For these projects, no ratio of investment was defined. The profits would not be divided according to capital equity; the parties concerned would share profits and risks as provided in the contracts. (With regard to some contracts, China does not bear the risk.)

In order to meet the demands of the absorption of foreign capital, China has made some progress in its legislation on foreign trade. In 1980, a number of laws were promulgated, including the "Income Tax Law on Joint Ventures with Chinese and Foreign Investment," the "Personal Income Tax Law" — and the detailed rules and regulations for implementation of the two laws, "Regulations on the Registration of Joint Ventures Using Chinese and Foreign Investment," "Regulations and Labour Management in Joint Ventures Using Chinese and Foreign Investment," and the "Provisional Regulations of the State Council of the People's Republic of China Concerning the Control of Resident Offices of Foreign Enterprises."

III. Prospects in the Absorption of Foreign Capital

We have been readjusting our national

economy over the past two years and a long-term economic plan has yet to be outlined. We have only started to accept foreign capital and we still lack experience, but we have made a good start. In the present period of economic readjustment, as well as in the course of future economic development, we will continue to pursue an open-door policy and will positively and cautiously absorb foreign capital.

We welcome all investments by foreign friends, overseas Chinese and compatriots in Hong Kong and Macao. We will give foreign investors equal opportunities and treatment. We will abide by the principle of equality and mutual benefit, ensure the mutual rights and interests of both sides and strengthen our legislation on foreign trade. In 1980, our government signed an investment insurance and guarantee agreement with the US Government, negotiated investment protection agreements with the governments of West Germany and other countries and began to negotiate and conclude tax credit agreements.

At present, various forms of absorption of foreign capital must be subordinated to the economic readjustment which will correct the imbalance in the national economy and rationalize economic structures. We must act according to our capabilities.

Priorities. During the early 1980's, we will give priority to use of foreign funds in the following sectors: (1) development of crude oil, coal and electricity; (2) construction of railways, harbours, telecommunications and infrastructure in urban areas and industrial zones; (3) small and medium-sized projects (which require small investments, yield rapid economic results and help expand exports) in textile and light industries, building materials, chemical, metallurgical, machine-building and electronic industries and tourism; and (4) technical transformation of existing enterprises.

By 1985, we expect to have carried out economic reorganization and technical transformation of existing enterprises according to the principles of specialization and coordination so as to tap their full potential. The methods and directions of China's utilization of foreign capital must help to realize this goal.

37. CHINA'S AID IN DEVELOPMENT PROJECTS TO OTHER COUNTRIES

By Wei Jing

Ministry of Economic Relations with Foreign Countries

Provision of economic and technical aid to other countries constitutes an integral part of China's foreign relations. Since the founding of New China, the Chinese People's Government, adhering to the principles of proletarian internationalism, has provided friendly Third World countries with economic and technical assistance. This has played a positive role in helping the recipient countries to resist foreign aggression and to develop their national economies and in strengthening the unity and friendship between the Chinese people and the peoples of the recipient countries.

I. History of China's Foreign Aid Ventures

China has gradually increased its aid to other countries as it has developed its external relations. In the 1950's, China established economic aid relations with 15 countries. In the 1960's, following Premier Zhou Enlai's visits to a number of Asian and African countries during which he declared the Eight Principles Governing China's Aid to Other Countries, the number of countries that China assisted economically increased to more than 30. Beginning in the 1970's, China further expanded its economic aid to other countries as its external relations developed rapidly. To date, China has provided economic and technical aid to more than 70 countries.

China's foreign aid is provided under the guidance of the Eight Principles. Having successfully carried out its own socialist revolution, China deems it a duty to support the struggles of oppressed nations and peoples the world over. China, therefore, assists those Third World countries that have already won their independence to develop their national economies, to consolidate their political independence and to oppose the aggression, subversion, control and interference of nations practicing imperialism, colonialism and hegemonism.

Aid with Principles. The aim of Chinese aid is to help recipient countries become economically self-reliant. Strictly respecting the sovereign rights of recipient countries, the Chinese Government attaches no strings to the aid it provides nor asks for any privileges. China is firmly opposed to the use of foreign "aid" as a means to control and

plunder recipient countries.

Most loans provided by China are interest-free and the period of use, as well as that of repayment, are generally long. China makes every effort to ensure that its aid is used for projects which require a relatively small investment but bring high returns — projects that enable the recipient countries to increase their national income and accumulate capital for national construction. China supplies recipient countries with the best-quality equipment and materials of its own manufacture at international market prices.

In giving technical assistance, China sees to it that the personnel of the recipient countries fully master the necessary technical skills. The personnel dispatched by the Chinese Government to assist recipient countries have the same standard of living as the technical personnel of those countries. In observing the Eight Principles governing its foreign aid, China has won the deep appreciation of friendly Third World countries.

Complete Projects. Supplying complete projects in its foreign assistance. Over the past 30 years, China has constructed more than 950 complete projects for other countries. In order to promote the development of their national economies, China has gradually increased the proportion of complete projects in its foreign assistance. Over the past 30 years, China has constructed more than 950 complete projects for other countries. Some of the projects are large but most are small and medium-sized ones. These projects cover agriculture, forestry, water conservation, light industry, textiles, foodstuffs, electricity, machinery, metallurgy, chemicals, construction materials, transportation and communications, culture and education, health, posts and telecommunications, broadcasting, geological surveys and public works, etc. Between 1977 and 1980, after the downfall of the Gang of Four, China committed itself to 141 new complete projects, began 173 such projects and completed 181 others.

Aid Personnel. Since 1963, China has sent medical teams to 38 countries; the number of medical personnel dispatched totalled over 5,400. Over 900 Chinese medical people are now serving in 76 medical units in 31 countries.

The number of professionals, engineering and

technical personnel dispatched by China over the past 30 years to render assistance abroad amounted to more than 400,000. They have made useful contributions to the cause of internationalism and the promotion of friendship between peoples.

II. Current Development Projects in Other Countries

The construction of complete projects is a complex and demanding task which requires heavy administration and detailed organization. The Chinese Government and its engineering and technical personnel take their work for recipient countries to heart and regard the national construction of the recipient countries as their own. Before undertaking a development project, they consider carefully the recipient country's development needs and attach importance to feasibility studies to determine whether the proposed project, when completed, will be beneficial to improving the material and cultural life of the people. China is active in undertaking those projects which will benefit recipient countries and which are within China's own capabilities, and it makes great efforts to do them well. As for those projects which are not feasible or are beyond its capabilities, China presents the facts as they are to the recipient countries and advises them not to build such projects or to postpone their construction.

Procedures. Once a particular project is approved, Chinese personnel seriously organize the collection of basic data and information, carry out surveys and produce designs in light of local conditions, select the project site, develop a rational production programme, suggest a reasonable production capacity, determine the appropriate technology and the right specifications of equipment, take care to balance "supply, production and marketing" with the availability of energy supplies, transportation facilities and other conditions, and work out the various economic and technical targets. In short, they try their best to ensure that the project will achieve good economic results after its completion.

In the course of construction, the Chinese team follows the requirements set out in the design and the agreement reached between the two sides by actively organizing the construction or by providing effective technical guidance in order to ensure the quality of the construction and to complete the work and installation of equipment as scheduled. After completion, it organizes trial production and conducts the inspection for acceptability before handing over the project to the recipient country. Chinese personnel may also

continue technical cooperation with the recipient country.

Agricultural Projects. Most of the complete projects supplied by China to other countries are for industrial and agricultural production. With respect to agricultural development, China has followed the principles of "adopting measures suited to local conditions" and of "developing a diversified economy" in assisting African countries to establish farms and agricultural technical stations, to reclaim wasteland and to construct irrigation systems. At the same time, China has also provided recipient countries with necessary agricultural machinery and pesticides and helped them to build plants for manufacturing farm implements and tools and agricultural machinery workshops. All this is conducive to raising agricultural production and the technical proficiency of recipient countries. So far, China has undertaken 45 agricultural projects in Africa, involving about 37,300 hectares (89,520 acres) of land which was either reclaimed with Chinese help or worked under Chinese guidance to popularize agricultural techniques.

Some completed projects have already achieved considerably good economic results. For example, the Mbarali Farm in Tanzania, which consists of 3,200 hectares (7,680 acres) of cultivated land, was set up with assistance from China. In 1980, 2,400 hectares (5,760 acres) were sown with paddy rice and the crop yield totalled over 17,500 tons. It was reported in local newspapers that the output of this farm made up one-fourth of the total rice yield of Tanzania, thus, contributing to the country's effort to ease its food shortage. In Upper Volta, where paddy rice had been grown on a very limited scale in the past, projects developed with China assistance have helped to increase the production of paddy rice. In 1980, the land sown with paddy rice totalled 1,600 hectares (3,840 acres) and accounted for 84% of the total irrigated area in Upper Volta. This means the country will produce about 7,000 tons of husked rice every year. Most of the farmers in the reclamation area have increased their income and improved their livelihood on the basis of this higher production.

Light Industries. China has assisted friendly countries in constructing a number of light industrial projects and projects for processing agricultural produce by utilizing local resources. These include textile mills, garment and knitwear factories, tanneries and leather shoes factories, sugar mills, grain and oil processing factories, cigarette factories, match factories, ceramics factories and brick works. In the past, recipient countries de-

pendent on imports for many of these items, but since these projects went into operation, they have been producing such items in quantities sufficient to meet the demands of home markets and, in some cases, with a surplus for export, thus increasing their income. The cigarette and match factory in Somalia, built with China's aid, has ended the country's total dependency on imports for cigarettes and matches. The factory had recovered all of its investment in capital construction within one year after it went into operation. The raw materials for making matches, i.e. quartz powder and gypsum powder, are both available locally.

Water and Power. China has helped some African countries to sink wells and construct water-supply projects in dry areas in order to end serious water shortages which had plagued the people for generations. When a new well is sunk and the local people have taken their first drink of clear water, they jump with joy and excitement, and call it "Chinese water" or "water of friendship."

The small power stations constructed with China's aid have provided illumination to towns and villages which had never had power supply, and they facilitated greatly the production and livelihood of the local people.

Infrastructure. The railways, roads, bridges and harbours built with Chinese help have contributed to the expansion of transportation and communications in the recipient countries and have stimulated the exploitation of resources and exchange of goods between towns and rural areas. Some well-known projects include the Tanzania-Zambia Railway, the Belet Huen-Burao Highway in Somalia and the dry dock in Malta. The completion of the Tanzania-Zambia Railway was hailed as an epoch-making event in the annals of unity between China and Africa. Extending 1,800 km. in total length, this railway is a magnificent tie linking two friendly, neighbouring countries, Tanzania and Zambia. It provides Zambia with an important passage to the sea and improves communications between Tanzania's inaccessible hinterland with its capital Dar-es-Salaam.

China has also helped some developing countries to construct buildings for civil use, with a total floor space of 650,000 sq. m. Some tall standard buildings, such as the Hall for International Conferences in Sri Lanka, the Friendship Hall in the Sudan and the People's Palace in Zaire, have attracted world-wide attention for their impressive designs and good equipment.

Medical Teams. The medical teams China has

dispatched to African countries have worked untiringly for the health of African people, healing the wounded and rescuing the dying in the spirit of revolutionary humanitarianism. Many teams successfully performed a large number of operations under difficult conditions caused by the simple equipment available and insufficient medicine supply. Some were major operations which had never — or had rarely — been attempted in these countries, such as skull operations, resection of liver tumours, removal of spinal cord tumours and reattachment of severed limbs. Some medical personnel penetrated into remote mountainous areas and villages to help wipe out infectious diseases or to undertake emergency missions to save patients in critical condition. The teams, while performing their medical work, have enthusiastically trained local medical personnel, thus helping to develop and consolidate the medical and health work in the recipient countries.

Transmission of Expertise. The achievement of the best possible economic results by completed industrial and agricultural projects depends on good management and the skilful command of production know-how by the personnel of the recipient countries. With respect to non-productive projects, regular maintenance of equipment and buildings is required for their normal operation and long lifespan. With a high sense of responsibility, the Chinese Government undertakes to pass on all of its technical and managerial expertise to the personnel of the recipient countries. In order that local personnel will play a full role in production, the Chinese engineering and technical personnel begin to give them on-job training in the course of project construction by means of verbal instruction as well as demonstration.

For some complicated types of work, the recipient countries may dispatch their nationals to be trained in similar enterprises in China. When a project is completed, an agreement on technical cooperation will be signed between the appropriate Chinese department and that of the recipient country in order to help the recipient country to further raise its technical and managerial level. In 1980, China undertook 52 technical cooperation projects of this type, all of which proceeded as planned.

The Chinese personnel dispatched to work abroad, whether they are senior experts approaching advanced age or young and middle-aged technical workers, fight on the frontline of production and construction throughout the year, fearing no hardships and braving intense heat. They work alongside local personnel, treat them equally, learn from them and serve wholeheartedly the people of the recipient countries.

During the past 30 years, more than 500 Chinese personnel assigned to work abroad have died at their posts for the cause of internationalism. Their remains were buried in the recipient countries and their names have not been forgotten by the local people.

China has been accorded active cooperation and support in its foreign aid work by the governments and peoples of the recipient countries. Chinese personnel serving in foreign countries have received warm care and attention from the leaders and the people. The completion of every project or the success of every major surgical operation is the result of the friendly cooperation between the Chinese Government and the host government and of the joint efforts of the Chinese technical personnel and their counterparts in that country. Recipient countries speak highly of China's foreign aid. A leader of one friendly country commented: "China is a true friend, a reliable friend in the time of difficulties, and an 'all-weather' friend." The leader of another country said: "Only Chinese aid is most economical, most effective, and suits our conditions best. Cooperation with China is most assuring." The Chinese personnel working abroad have won high appreciation from the recipient countries for their good skills, fine working style and plain life. Some foreign friends said: "We never have the sense of inferiority or feel the difference of colour when we are working with the Chinese experts. We have learned from the Chinese technical personnel not only techniques and skills but also the hard-working spirit. We see a glorious image of socialist China in the Chinese technical personnel." These comments are certainly encouraging to the Chinese technical personnel.

The Chinese Government has consistently held that assistance is always mutual. China's socialist revolution and construction and its just stand in the international struggle have constantly won sympathy and support from the peoples of various countries. Such valuable support has always served, and will continue to serve in the future, as a source of immense strength inspiring the Chinese people in their revolution and construction — and in developing their friendship with peoples throughout the world.

III. China's Contribution to Third World Countries

The Chinese Government consistently upholds proletarian internationalism and supports Third World countries in opposing imperialism, colonialism and hegemonism, and in maintaining their national independence and developing their national economies. China will continue to follow

the Eight Principles governing its foreign aid and to provide friendly countries with certain amounts of aid, depending on its economic capabilities at any given time. China is a developing socialist country and its present economic capacity is limited; therefore, its aid to other countries is also limited. Consistent with the growth of our economy, we are willing to make contributions in various forms to the national development of Third World countries.

Forms of Cooperation. Since attaining independence, Third World countries have developed their national economies to a considerable extent through many years of efforts. Many of these countries are endowed with rich natural resources and considerable financial capabilities. Recently, quite a number of countries have proposed closer economic and technical cooperation with China in a variety of forms, with funds that they themselves will raise. In accordance with international practice and in response to the requests of friendly countries, China has opened up new ways of cooperation, which mainly include: contracting for projects, providing technical services, conducting joint production operations and expanding multi-lateral economic and technical cooperation. These forms of cooperation have obtained initial good results and are expected to be developed steadily in the future.

Project Quality. The quality of all complete projects constructed by China as aid projects or on a contract basis in other countries is good or fairly good. Only a very few completed projects have met with some problems in production and management because of complex reasons. In some cases, things went well at first but problems developed later. These problems either have been solved or are being solved, thanks to the joint efforts of the Chinese government and the countries concerned. China has always monitored with interest the practical benefits a project brings to the recipient country. It not only tries its best to build the projects successfully but also actively gives technical guidance in production, helps to improve project management, and assists in maintaining and updating equipment, as well as ordering replacements and spare parts, so as to ensure that the projects have significant impact on the development of Third World countries.

Along with progress in its friendly relations with other Third World countries, China will extend its scope of cooperation with them in economic and technical fields — and such cooperation should bear ever richer and more varied fruit in the future.

38. CHINA'S CUSTOMS SERVICE

By the General Office,
Customs General Administration

Guarding China's economic gates, the Chinese Customs Service, an organ of the state, exercises powers of supervision and control at the country's ports. Acting in accordance with the Provisional Customs Law of the People's Republic of China, the Customs Service is responsible for the supervision and control of import and export cargoes, currencies, bullion, postal matter, passengers' luggage, means of conveyance and articles carried by their crew; the collection of customs duties, taxes, fees and other charges levied by the Customs Service according to the law, as well as for the prevention of smuggling and the performance of other customs work. In brief, supervision and control, collection of customs revenue and prevention of smuggling are the three basic functions which enable the Customs Service to implement effectively government policies, laws and other enactments on imports and exports, to guard against foreign political and economic infiltration and to prevent smuggling and illicit operations. All these actions contribute to the protection of domestic production, the stabilization of the market, the promotion of foreign economic and trade activities on the basis of equality and mutual benefit and to the enhancement of friendly relations between our people and those of foreign countries.

I. History of the Customs Service

Since 1949, the year when the Chinese people, under the leadership of the Communist Party of China, won the great victory of the New Democratic Revolution, and simultaneously wrested from the hands of the imperialists and Kuomintang reactionaries the Customs Service's administrative rights and tariff autonomy, the key to China's economic gate has been returned to the hands of the Chinese people. This put an end to the long history of humiliation extended over a period of more than 100 years during which Chinese customs had been an instrument of imperialistic exploitation. Under the leadership of the People's Government, the General Customs Administration of the People's Republic of China was set up. It took over the old Customs Service and thoroughly reformed it by abolishing all harmful practices. The new, completely independent Customs Service devotes itself entirely to the task of protecting the socialist economic construction

of our country.

In the 31 years since the founding of the People's Republic, the new Customs Service has made positive contributions to the safeguarding and promotion of socialist economic construction, as well as to the consolidation of the democratic dictatorship of the people.

During the ten years of turmoil, the interference and sabotage of Lin Biao and the Gang of Four severely damaged the work of the Customs Service. It disrupted customs procedures, weakened customs supervision and control over import and export cargoes and interrupted the compilation of Customs Statistical Returns. All this greatly weakened the function and role of the Customs Service.

Since the smashing of the Gang of Four, however, and under the leadership of the State Council, the Customs Service emphatically eradicated the harmful effects of "Left" ideology, gradually restored and improved the system of customs work and consequently strengthened the organization and development of customs working procedures. At a meeting of customs workers from all parts of China held in April 1979, the guiding principle of customs work in light of the general tasks for China's new epoch was formulated: "To safeguard and promote the four modernizations by making full use of the customs' power of supervision and control to collect customs duties, to facilitate the passage of lawful inward and outward traffic and to prevent smuggling and contraband." The guiding principle clarified the correct orientation, tasks and requirements of customs work and has directed and given impetus to that work in the past two years.

II. An Era of Reform

The year 1980 was one in which customs work underwent the greatest reform since the founding of the People's Republic. Under the leadership of the State Council, reforms were made in the administration of the customs system, with emphasis placed on the centralization of customs leadership. Certain customs working procedures were restored and improved, bringing the Customs Service's function of supervision and control into fuller play.

During 1980, the Customs Service performed

its work fairly well: the total volume of import and export cargoes passing through customs was around 89.93 million tons; the number of inward and outward passengers totalled about 12.97 million; the volume of postal matter was about 3.34 million pieces; and revenue collection was fulfilled. The number of cases of seizure involving smuggling totalled more than 36,000.

All these achievements were obtained simultaneously with progress in the readjustment and reform of our national economy and therefore contributed to the safeguarding and promotion of the socialist modernization of our country.

The following reforms were accomplished in 1980:

(1) *Reform of the customs administration with a view to strengthening and centralizing customs leadership.* Since the founding of the People's Republic, the Customs Service's administrative system has undergone several changes. In the early years after Liberation, the General Customs Administration, being under the direct leadership of the State Council, exercised unified control over customs establishments throughout the country. In 1960, because of the changed situation in the country and because of other reasons, the control of customs work was transferred to the authorities at the level of the province, municipality or autonomous region, and the General Customs Administration was made a department in charge of customs affairs under the Ministry of Foreign Trade.

Practice showed that the transfer of staff control to local authorities was not compatible with the nature and tasks of the Customs Service. It affected adversely the correct implementation of relevant government policies and laws and also hampered the carrying out of the functions of supervision and control. It was not good for the training of the professional working staff and staff operations, nor for the customs organization as a whole. The problem became especially acute when the government began to adopt an open-door policy and to introduce reforms in the country's system of economic management.

With a view to remedying this situation, the State Council, on February 9, 1980, decided to reform the customs administrative system by returning the staff to the control of the central government and to restore the General Customs Administration which, being under the direct leadership of the State Council, is empowered to exercise unified control over custom houses throughout the country, together with their staff and operations. According to this decision, all custom houses throughout China are directly supervised by the General Customs Administration

and provincial authorities exercise supervision and guidance only over custom houses established within their area of jurisdiction. The essence of the State Council's decision is to strengthen the centralized and unified leadership of customs work and to give full play to the customs functions of supervision and control so as to give more effective protection to the socialist modernization of our country.

In the past year, customs establishments throughout China have devoted themselves wholeheartedly to the implementation of the decision of the State Council and, with the support of local authorities, have accomplished to a great extent the task of reforming the Customs Service's administrative system. The General Customs Administration has resumed control over the authorized quota of customs staff for the whole country, set up the Guangdong sub-office as an agency of the General Customs Administration, strengthened its leadership of all customs establishments in Guangdong Province and has begun to adjust the composition of the leading groups of various customs establishments and to readjust their internal structures.

The former Shanghai Customs School was replaced by the Shanghai Customs College. And, as part of the effort to provide professional training for customs staff, a training class for leading cadres has been opened in Tianjin.

The reform of the administrative system has not only enhanced the status and role of the Customs Service, but also strengthened centralized and unified leadership, thus pushing forward constructive customs work and ushering in a new phase of development for the Customs Service. The past year's practice has proved that the State Council made the right decision when it reformed the customs administrative system at the very beginning of the readjustment and reform of our national economy.

(2) *Strengthen customs supervision and control over import and export cargoes in order to ensure the effective implementation of relevant government policies, laws and decrees.* In accordance with the provisions of the Provisional Customs Law, import cargo from the time of its entry until release, export cargo from the time of its customs declaration until departure, cargoes in transit or transshipment through our territory from the time of their entry until departure, as well as the import and export of articles for exhibition, advertisement and demonstration are all subject to the Customs Service's supervision and control. Without its permission, cargoes under its supervision and control are not allowed to be loaded or unloaded, to be delivered or to be taken delivery

of, to be unpacked, to be repacked, to be substituted or to be recovered. All import and export cargoes must be declared to the Customs Service and are subject to examination. After examination, customs will only release those cargoes which are found to be in conformity with government policies, laws and decrees on imports and exports. The documents, on the strength of which customs exercises its powers of supervision and control, are the import or export licences or other papers issued by legal bodies having the right of issuance according to the law. Cargoes which according to the law are liable to commodity inspection (including those required by contract), to animal or vegetable quarantine, or to control or restriction are only to be released on the production of relevant documents issued by the offices concerned.

Import cargo is permitted to enter into, and export cargo to leave from our country only after being examined and released by the Customs Service. Hence, the customs' role of supervision and control over cargo traffic is one of the important means by which the People's Government realizes its administrative control over imports and exports. Therefore, the importance of customs in ensuring the effective implementation of government policies, laws and decrees must be emphasized.

In recent years, following the reform of our foreign trade system and the adoption of the policies of absorbing foreign capital and technology and of expanding exports, the enthusiasm of enterprises in various localities has been brought into full play and foreign trade has grown considerably. But a series of new problems has cropped up. Smuggling and illicit activities in imports and exports are on the increase. Especially through the channel of compensatory trade or under the cloak of importing materials and parts for processing and assembly, some persons have sought to evade the payment of customs duties.

Should such unlawful activities not be curbed in time, the readjustment and stabilization of our national economy will be jeopardized. Meanwhile, as more and more business firms have been set up to engage in foreign trade, it is important to centralize administrative control over import and export trade. This further enhances the importance of the Customs Service in supervising and controlling imports and exports and in making our tasks all the more arduous.

III. Customs Work in 1980

In 1980, the General Customs Administration accomplished the following tasks:

(1) *Along with our efforts to simplify customs formalities, to expedite examination and facilitate import and export cargo traffic, we also paid special attention to the lawful entry into and exit from China of cargoes, putting into practice a unified foreign trade policy, a unified plan and a unified principle in dealing with foreigners.* When we say that cargo is lawful in entry and departure, we mean that all documents declared to customs must be complete and correct and also must meet the requirements of related government policies, laws and other decrees. The name, quality, specifications, quantity (or weight), value, country (or region) of origin or destination of cargo declared to customs must be in full agreement with the particulars given in the covering documents. Any discrepancy discovered by customs will be handled according to law and will be dealt with as a case of smuggling or violation of regulations or whatever it may be, depending on the nature of the offence. For the past year, in the sphere of supervision and control of cargo traffic, the Customs Service has drawn up and put into force a unified customs declaration form, with special emphasis on verification of the cargo with its accompanying documents, its examination and the "check-off," thus keeping the entry or exit of imports and exports in full accordance with government policies, laws and other decrees.

To counter new problems arising in recent years, customs has tightened its supervision and control over those import and export cargoes classified as compensation or other flexible forms of trade, chiefly through the examination of relevant business contracts and the checking-off of imported materials and parts against contracts. The examination of business contracts enables customs to ascertain the nature of the trade so as to determine whether the cargo is liable to or exempt from duty treatment, and to prevent illegal importation or exportation and evasion of payment of customs duties under the pretense of processing and assembling cargoes for compensation trade. The amount of materials, parts or components to be supplied by the buyer as stipulated in the contract must be in reasonable quantity required for processing and assembly.

Imports of materials and parts exceeding the amount stipulated in the contract or not required for processing work, as well as the deliberate increase in the percentage of the defective products' allowance, are in contravention to relevant government regulations and will be handled by customs according to the relevant regulations depending on the nature and seriousness of the offence.

Imports for compensatory trade are confined to "technology, equipment" and "necessary materials" required by the compensation trade

items concerned. Export of domestic products to foreign clients in exchange for equal value of equipment, raw materials and component parts, or the import of goods not directly connected with any particular item of compensatory trade, irrespective of their repayment in whatever products, shall not be regarded in the nature of compensatory trade and therefore will be treated as ordinary imports.

Materials or parts used in processing or assembly are in fact temporary duty-unpaid imports of a bonded nature and are subject to customs supervision and control from the time of import until the time of re-export, after which they are finally made into products and can be checked off from the records. This is necessary to guard against materials being diverted for other use, transferred for sale on the domestic market without authorization or otherwise used for unlawful purposes. Within one month after the completion of processing or assembly, the enterprises and firms concerned should apply to customs for checking off the materials against the records; failure to comply before expiration of the time limit will be dealt with according to relevant laws or regulations.

According to prevailing regulations, all products thus processed or assembled are to be re-exported to the supplier of the materials and parts. In case the materials or parts imported for processing or assembling, or the products processed or assembled therefrom, are transferred for domestic consumption for valid reasons, application for completion of import formalities should be immediately made to the Customs Service. On the strength of the import licence or similar document approving the import that is issued by the foreign trade control body, customs will collect the required import duty and other levies and will check off the records concerned.

(2) *Perform our duty conscientiously in the supervision and control of trade with Taiwan.* With the aim of enforcing the basic guiding principle for the return of Taiwan Province to China and the realization of the reunification of our motherland as promulgated by the National People's Congress, the General Customs Administration, under the State Council, in April 1980, established concrete provisions governing customs control of trade, mail and navigation matters between Taiwan and the mainland. Since Taiwan is a province of our country, trade between Taiwan and the mainland is by its nature an interregional flow of goods.

Under present circumstances and with a view to facilitating trade between the mainland and Taiwan, cargoes shipped to and from Taiwan may be declared to customs through the filing of a

declaration form by the trading companies on the mainland. Customs will accept as valid such documents issued by the Taiwan authorities and their subordinate organs. Taiwanese products purchased directly from factories and enterprises in Taiwan or from their branch offices in Hong Kong, Macao or other foreign cities and shipped directly from Taiwan, or transhipped in original packing through Hong Kong, Macao or other foreign ports, will not be liable to import duties. Since Taiwanese products purchased from overseas Chinese, Hong Kong or Macao merchants, or foreign traders who have imported them from Taiwan, are by nature re-imports of domestic products, they are liable to payment of import duties. Shipments of commodities exported directly from the mainland to Taiwan will be exempt from export duties.

Ships belonging to owners of Taiwan public or private enterprises will be accorded by customs the same treatment as ships of our own nationality sailing overseas and therefore are entitled to the exemption of payment of tonnage duties. These duties also will not be levied on foreign ships holding the Certificate of Tonnage Dues issued by Taiwan authorities within the period of validity of the certificate. On its expiration, however, tonnage duties will be levied accordingly.

In 1980, Chinese customs has played a positive role in implementing the government's guiding principles, policies, laws and regulations on foreign trade and in maintaining a unified policy, unified planning and a unified principle in dealing with foreigners by facilitating import and export cargo traffic and promoting trade between the mainland and Taiwan. At the same time it has adhered to the principle of conducting supervision and control of cargo traffic in accordance with the laws and by strictly enforcing them and by seriously tackling unlawful imports and exports, evasion of customs duties, cases of smuggling and illicit outflow or fraudulent purchase of government-controlled foreign exchange, as well as other law-breaking activities.

Moreover, 1980 also witnessed the resumption of compilation of customs statistical returns after a disruption of ten years. The returns are a part of Chinese national statistics and serve as an important basis for the study and formulation of the guiding principles, policies and plans of China's foreign trade. They are also helpful to a certain extent in the examination and formulation of national economic plans. During the past year, the Customs Service overcame all kinds of difficulties arising from the shortage of staff and unfamiliarity with statistical work; established a working system for compilation, giving particular attention to verification and cross-checking of statistical copies of customs declarations for imports and exports; and

successfully accomplished the first year's task of collecting and checking statistical data.

(3) *Strengthen the supervision and control over importation and exportation of non-commercial articles, facilitate normal contacts and curb unlawful profiteering.* The supervision and control of noncommercial articles refers mainly to the supervision and control over luggage and articles carried by incoming and outgoing passengers, and to the importation and exportation of personal mail and printed matter.

According to provisions of the Provisional Customs Law and other enactments, incoming and outgoing passengers, together with their luggage, should pass through entrances where there are customs establishments. Luggage of persons entering or leaving China, whether being carried in person or consigned for shipment, must be declared accurately to customs and are not allowed to be taken delivery of or loaded without being first examined and released by customs officials. The importation and exportation of personal postal parcels or printed matter are usually passed on to customs for examination by the post office. Postal parcels mailed at places where there are no customs offices should be declared by the sender directly to the customs officer stationed in the post office for examination and completion of all customs formalities for export. All incoming and outgoing postal parcels and printed matter may be delivered or mailed by the post office only after being examined by customs and after customs duties have been paid.

The purpose of supervising and controlling noncommercial articles is to prevent the perpetration of unlawful trade and other illegal activities under the cloak of passengers' luggage and postal matter so as to safeguard the effective implementation of the laws and regulations concerning government control of foreign trade and foreign exchange. Meanwhile, the Customs Service must give due consideration to the reasonable requirements of the senders and recipients of postal matter as well as that of incoming and outgoing passengers' luggage, by simplifying customs formalities and expediting customs examination and release, so as to facilitate normal social contacts among the people of different countries.

Under the influence of "Left" ideology, the Customs Service once manifested a tendency of being too strict and too severe in its supervision and control of imported and exported non-commercial articles and put too much stress on restrictions while neglecting the necessity of giving due consideration to reasonable needs and of facilitating normal social intercourse. The rigid manner and working style of our customs staff has

left an unfortunate impression both at home and abroad.

In recent years, the Customs Service has gradually rectified its "Left" ideological inclinations in its supervision and control of non-commercial articles for import and export. It has been made clear that the Customs Service must adhere to the following guiding principle: "Strictly uphold the criterion of personal use; give due consideration to reasonable needs; guard against smuggling and evasion of customs duties; and expedite examination and release." By the "criterion of personal use," it is meant that the articles in question should be confined to those intended for one's personal or family use and do not include those items intended to be sold or brought in for others. By "giving due consideration to reasonable needs," we mean that while setting limits to the quantity and value of goods and fixing duty treatment for different articles allowed to be examined and released by customs officials according to various categories of passengers or of senders or recipients of postal matter, and under the criterion of personal use, the normal and reasonable needs of people should be taken into consideration. Meanwhile, under the prerequisite of preventing smuggling and evasion of customs duties, customs officials are to simplify and expedite the procedures for examination and release so as to facilitate normal social intercourse among people of different countries. In accordance with this guiding principle, the Customs Service has been making amendments to existing procedures governing examination and release of non-commercial articles by relaxing the limitations on quantity, value and duty treatment of certain articles and by simplifying and improving procedures of examination and release, as well as the deportment and working style of the customs staff. For the convenience of incoming and outgoing passengers from Hong Kong or Macao, separate duty-free and dutiable passageways have been set up in Jiulong and Gongbei customs houses.

While strictly implementing the party's guiding policies on the ideological and cultural front, the Customs Service has made adjustments in the supervision and control of printed matter of noncommercial nature. With the exception of reactionary or obscene literature, and of printed matter impairing the stability and unity of our country, every possible facility will be given to the release of printed matter in order to promote normal cultural, scientific and technological interchanges with other countries.

The adjustment of regulations governing customs examinations and the release of non-commercial articles has proved to be helpful in the promotion of social intercourse with

foreigners, the interflow of science and technology and the development of tourism.

There have been cases of incoming and outgoing passengers, as well as of senders and recipients of postal matter, who have taken advantage of the favourable treatment accorded to home-coming compatriots by customs officials and have resorted to such contrivances as undertaking frequent incoming and outgoing trips, assuming other names or using false names and mailing goods in scattered lots. They have perpetrated speculative and profiteering activities by bringing in and out unusually large quantities of goods having large price differentials on home and foreign markets. Such fraudulent practices have considerably weakened our domestic market control, disrupted our socialist economic order, slowed down customs examinations and release of articles, and therefore have impeded the normal interchange of visits and mail. In 1980, appropriate measures were progressively taken by customs to strengthen its supervision and control and to block smuggling and profiteering. This is not only essential to safeguard national interests and to effectively enforce government rules and regulations regarding control of foreign trade and foreign exchange, but it also is necessary to provide convenience to law-abiding passengers on their incoming and outgoing trips as well as to the normal interflow of postal materials.

With a view to implementing our basic policy of returning Taiwan to the motherland and realizing the sacred cause of reunification of our country, as well as to promote visits between compatriots in Taiwan and their friends and family members on the mainland, the General Customs Administration formulated, in April 1980, the Regulations Governing the Control of Luggage Carried by Incoming and Outgoing Taiwan Compatriots and Personal Postal Parcels Mailed from Taiwan. The visits between people in Taiwan and those on the mainland are normal comings and goings between fellow countrymen.

Under present conditions, articles and luggage carried by Taiwan compatriots coming to the mainland to visit their relatives will be released after examination by customs, insofar as they are brought in for personal use and in reasonable quantities. Incoming and outgoing Taiwan compatriots residing abroad, in Hong Kong or in Macao will, on the presentation of their papers, be entitled to the same treatment as that accorded to overseas Chinese or to Chinese from Hong Kong and Macao and will be released by customs accordingly. Personal parcels mailed from Taiwan, including those remailed in transit through Hong Kong or a foreign port, will be released leniently insofar as they are kept for personal use and are in reasonable quantities.

(4) *Implement the tariff policy and bring the role of customs tariffs in the protection and regulation of the national economy into full play.* In accordance with the provisions of the Provisional Customs Law of the People's Republic of China, customs import and export tariffs, as well as the rules governing the levy of import duties on articles and luggage of incoming passengers and personal postal parcels, the Customs Service collects duties on import and export cargoes, postal matter and passengers' luggage.

Our customs tariff policy in force is one of protective tariffs. As pointed out by the former Administrative Council of the central government in the Resolution on Customs Tariff Policy and Customs Work, passed in 1950, our "Customs tariffs should give protection to our domestic production and protect the domestic products against the competition of foreign commodities." The principles governing the drafting of Chinese customs tariffs were also formulated to the effect that the import duty rates of those goods, similar to home-made products needing protection, shall be fixed higher than the difference in costs between foreign goods and those of domestic make; that still higher duty-rates shall be fixed for import of luxury items and of non-necessities; that for the import of those daily necessities or goods which cannot be produced or can only be produced domestically in limited quantities, low duty rates or duty-free treatment shall be provided and that very low export duty rates or duty-free treatment shall be fixed for exports. Meanwhile, it was also provided that the preferential tariff system (i.e., minimum tariff rates) and the general tariff system shall be enforced.

Customs duties serve not only as a source of national revenues but also as a weapon for protecting our domestic production. They are also a lever in regulating the volume of imports and exports in our economic relations with other countries and in foreign trade. The levy of customs duties is therefore an aid by means of which the effective implementation of the policy and laws for the control of our foreign trade is ensured. The levy of, reduction in or exemption from customs duties are stipulated and put in force in the form of laws and decrees and must therefore be strictly enforced.

Consequent upon the development of our foreign trade and the readjustment and reform of our national economy, the role of customs duties has grown in importance. In recent years, in accordance with the national policy of encouraging the import of advanced technology, expansion of export trade and development of tourism in order to realize the four modernizations, the Customs Service, acting in accordance with re-

levant laws and regulations, has granted reduction in or exemption from import duties to those articles imported under medium and small-sized compensatory trade contracts for processing and assembly, to materials imported for processing into finished products for re-export, and to those items imported for building hotels for tourists. For a more effective implementation of the customs tariff policy, the customs tariff of the People's Republic of China was revised in 1980 with the approval of the State Council. This revision, which was the 19th since its enforcement in 1951, reduced the rates of duty on 68 tariff imports and cancelled those of four tariff exports.

In 1980, custom houses throughout China, in their performance of the task of collecting customs duties, conscientiously carried out the customs tariff policy and acted strictly in accordance with the provisions of the customs tariff and its relevant laws; upheld the principle of centralization and unification of the powers to approve of duty reduction or exemption; established and simplified a number of relevant rules and regulations; levied customs duties according to tariff rates and granted duty exemptions and reductions according to law. They thus brought the role of the customs tariff policy in protection and regulation into full play and consequently helped to enforce the national policy of control over trade, imports and exports. Meanwhile, tariff revenue collection also contributed to capital accumulation for the socialist modernization of our country.

(5) *Deal severe blows to smuggling and illicit activities infringing on government laws and decrees.* In accordance with the provisions of the Provisional Customs Law of the People's Republic of China and other relevant laws and decrees, cases of unlawful transport, carriage or mailing of goods, bullion, currencies, negotiable securities, etc. into or out of Chinese territory; evasion of customs supervision and control; illicit outflow and/or fraudulent purchase of foreign exchange; and the evasion of customs duties are acts of smuggling. Economically, acts of smuggling undermine state control over foreign trade and the domestic market, and impair the economic interests and the industrial and agricultural production of our country. Politically, they endanger public security and disrupt social order. Ideologically, they corrupt public morals and degenerate the general environment of our society. Furthermore, smuggling of sham or inferior medicines presents a direct threat to the people's health.

Smuggling is the product of the great disparity in prices of certain commodities on the external and domestic markets and brings enormous profits

to the smugglers. As Karl Marx quoted from T.J. Dunning, the British labour activist: "With adequate profit, capital is very bold. A certain 10% will ensure its employment anywhere; 20% certainly will produce eagerness; 50% will make it ready to trample on all human laws; 300%, and there is not a crime at which it will scruple, nor a risk it will not run, even to the chance of its owner being hanged . . . Smuggling and slave trade have amply proved all that is here stated." Since the founding of the People's Republic, smuggling has gone up and down, but it never ceases to exist and will continue to exist for many years to come. In the past 31 years, the Customs Service, relying on the leadership of local government, with the support of the masses and working in close collaboration with the government departments concerned, has dealt severe blows to smuggling and illicit activities, thus ensuring the implementation of government policies, laws and regulations governing the control of imports and exports. Customs supervision and control and the collection of customs duties have contributed to a certain degree to the consolidation of the democratic dictatorship of the people and to the stabilization of socialist economic order.

In recent years, smuggling activities have been especially rampant along the coast of southeastern China. Gangs of smugglers and other lawless elements in Hong Kong and Macao have attempted to evade customs supervision and control at open ports by concealing, falsely declaring, and masking contraband articles, as well as taking advantage of the flexible patterns of trade, or under the false declaration of "gifts," "donations," etc. They have even organized ships specially built for smuggling to sail along the coast of Guangdong, Fujian and Zhejiang provinces. Smuggling across the frontier of the border regions, especially in Yunnan and Tibet, has also been a serious problem.

Large consignments of industrial consumer goods, because of large price disparities on foreign and domestic markets, have flooded in, while large quantities of gold, silver, jewellery, antiques, and precious Chinese drugs have flowed out. Such a state of affairs has not only gravely undermined state control of foreign trade and foreign exchange, affected government revenues, disturbed public order and upset market controls, while inflicting tremendous economic loss upon our country, but it has also corrupted the minds of some government cadres and workers, exerted adverse influence on social morale, disrupted our industrial, agricultural and fishing activities, and directly endangered the political stability and the unity of our country.

The causes of stepped-up smuggling activities are manifold. Aside from the economic factor of

gaining huge profits in smuggling, a main cause is that, following the adoption of an open-door policy by our government which has given rise to a sudden increase in the volume of import and export traffic and in the number of passengers, the necessary controlling measures have failed to cope with the situation, especially in certain regions where border control and supervision of domestic markets still leave many loopholes to be plugged. During the ten years of turmoil, unhealthy tendencies have developed both in the party and among the people and the conscientiousness of discipline also has flagged. Certain members within the ranks of government cadres and employees have tolerated and even participated in the unlawful activities of smuggling and disposal of contraband.

In 1980, the seriousness of increased smuggling and its accompanying evil consequences have gradually been understood by government leaders at various levels and by the people. Under the unified leadership of the State Council and following the concrete measures taken by local government authorities, a nationwide anti-smuggling campaign is being waged. Customs houses in various localities have been most conscientious in performing anti-smuggling duties, have readjusted and strengthened their anti-smuggling forces and have intensified the search for smugglers and the investigation of special cases. Meanwhile, in regions along the coast and frontier, where smuggling activities have become rampant, the Customs Service, in close coordination with the departments concerned and under the leadership of the local government authorities, has embarked on joint operations against smuggling with remarkable success.

In conclusion, we have to point out that under the leadership of the State Council, with the support of local government authorities and departments concerned, and through the joint efforts of the whole customs staff, customs houses throughout the country have fulfilled their task satisfactorily and have made definite contributions to the guarding of China's economic gate and to safeguarding and promoting the four modernizations of our country. But there is still room for improvement. For example, customs laws and regulations, as well as certain decrees of an economic nature formulated by the departments concerned, need to be perfected; the supervision and control of articles imported under flexible patterns of trade are not sufficiently strict; and the blows dealt to smuggling and illicit activities are not heavy enough, etc.

Today, the rapid development in our economic and trade relations with foreign countries sets higher demands on the work of our Customs Service. Hereafter, we should conscientiously carry out the important guiding principle of further readjusting the national economy and achieving political stability, bring the customs' role of supervision and control into fuller play, guard with greater care China's economic gates and wage a relentless and effective struggle against all kinds of unlawful activities which sabotage our economic readjustment and undermine our stability and unity. On the other hand, we must facilitate the passage of law-abiding inbound and outbound traffic so as to promote friendly relations between the Chinese people and people of other countries and to better serve the socialist modernization of our country.

39. CHINA'S FINANCIAL SYSTEM

By Shen Jingnang and Chen Baosen

Finance Research Institute, Ministry of Finance

China's financial system has grown tremendously since the founding of the People's Republic. In 1950, the first budget year, revenues were only 6,500 million yuan while expenditures totalled 6,800 million yuan. In 1980, state revenues amounted to 106,000 million yuan, more than 16 times that in 1950, and state expenditures were 118,700 million yuan, or about 17 times what they were 30 years ago. This growth of revenues and expenditures is an indication of the rapid development of China's national economy and remarkable growth of its economic strength.

A powerful lever of distribution controlled by the socialist state, the financial system has played a major role in changing the relations of production and developing productive forces.

Initial Tax Policy. During the period of the socialist transformation of agriculture, the state enforced a programme of progressive taxation and rational tax reduction and exemption to promote agricultural cooperation. It also made allocations in the form of cooperative funds to help poor peasants overcome difficulties in starting co-operatives. Even after people's communes were set up, the state continued to appropriate huge sums to help poor communes and brigades to consolidate their new-born collective economy.

To facilitate the socialist transformation of the handicrafts industry and small tradesmen and peddlers, the state provided funds and granted tax cuts. Taxes on cooperative shops and groups, on account of the nature of their business operations, were kept relatively low so that these groups could raise their living standards and become more enthusiastic about production and commerce.

As capitalist industry and commerce were undergoing socialist transformation, the state followed a tax policy that was helpful to their transformation. Rates of taxation on different industries were graduated according to each industry's usefulness to the national economy and to the people's livelihood. The profits of industry and commerce were apportioned into income tax going to the state, accumulation funds for enterprises, welfare funds and bonuses for workers and dividends for capital. This was what we called "four horses sharing the forage." The former owners of capitalist enterprises received a fixed amount of interest for their capital in 1956 when

joint state-private enterprises were set up.

With the completion of the socialist transformation of the society, China's financial system began to base itself on two types of ownership for its source of revenue. It also began to display its power in laying the material and technical foundations of socialism.

Capital Construction. In the past 31 years, the state has allocated a total of 650,000 million yuan for capital construction. The fixed assets of state-owned enterprises totalled more than 400,000 million yuan. From 1952 through 1980, the state appropriated huge sums, totalling 188,000 million yuan, to support agriculture. This brought about a considerable development in farmland improvement projects, water conservation, meteorology and all branches of agronomy — thus laying a solid foundation for the country's modernization programme.

Financial Setbacks. But over the past 31 years, it was not plain sailing for the development of China's finances, just as it was not for the national economy as a whole. Generally speaking, the First Five-Year Plan succeeded brilliantly, with state revenues growing year by year and economic results improving. Our financial work suffered its first setback during the three years of the "Great Leap Forward" — whose consequences became apparent only in 1961 — and did not recover until after the subsequent three years of economic readjustment. The second setback came during the ten years of turmoil from 1966 to 1976. The two setbacks resulted in a drastic drop in revenue and the poorest economic performance in 30 years. During the First Five-Year Plan period, 35 yuan out of every 100 yuan of national income was saved, but the rate dropped to 26.16 yuan per 100 yuan by the time of the Third and Fourth Five-Year Plan periods.

The root cause of these setbacks was the influence of "Left" ideology, which manifested itself in the overanxiousness to achieve quick results in disregard of objective laws. Funds were allocated wrongly or excessively. Since the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, these "Left" errors have progressively been overcome and the country has followed a policy of readjustment, restructuring, consolidation and improvement.

Recent Reforms. Economic reforms have been carried out, bringing about industrial and agricultural growth, improvements in the people's living standards and a thriving domestic economy. However, rashness was not totally eliminated; we still lacked a matter-of-fact attitude and carried out capital construction and other undertakings beyond our actual capabilities — so much so that we ran huge deficits in 1979 and 1980.

The Party Central Committee and the State Council detected the latent dangers in the situation in good time and decided to make further readjustments in the national economy beginning in 1981. They resolved to reduce the scope of capital construction and to cut back defence and administrative spending in an effort to balance the state's debits and credits and to stabilize prices. This policy decision removed the hidden danger and created favourable conditions for the healthy development of the national economy.

II. The 1980 State Budget and the Necessity and Possibility of Balancing the Budget

The 1980 state budget approved by the Third Session of the Fifth National People's Congress set revenues at 106,290 million yuan and expenditures at 114,290 million yuan, leaving a deficit of 8,000 million yuan. The actual budget performance, however, resulted in revenues of 106,610 million yuan (320 million yuan more than projected) and expenditures of 118,720 million yuan (443 million yuan more than planned), leaving a deficit of 12,100 million yuan.

The revenue target for 1980 was met and targets for various taxes were all exceeded. The industrial, transport and commercial enterprises all achieved their revenue targets, but the food departments suffered great losses because of the readjustment made in the base price for state purchases, while the foreign trade departments also suffered losses because of changes in the variety of commodities and of price increases in the international market.

The large deficit showed that there was still much to be done in economic readjustment. In 1979 and 1980, following the policy of economic readjustment, we raised the prices of farm and sideline products by a large margin, extended employment, raised the wages of factory and office workers and introduced the bonus system. Three measures played an important part in firing the enthusiasm of the workers and peasants and in boosting the country's industrial and agricultural production.

But when expenditures for the improvement of the people's livelihood increased by a large margin and state revenues declined, the budget allocation for capital construction was not adequately reduced. Various administrative expenses, including defence spending and operating expenses of the state organs and undertakings, continued to rise. Consequently, total spending for capital construction and various other expenditures exceeded state revenues.

China is a developing country. What is more, she went through ten years of great turmoil. Many things need to be done immediately to satisfy the needs of the people. However, it is beyond the capability of the country to do all these things at once. China can only do what is within her power. This reality was not given due consideration when the 1980 national economic plan and state budget were planned and carried out — an indication that "Left" influence has not been eliminated from the country's financial work.

The large deficits in 1979 and 1980 and the consequent growth of the money supply played a large part in pushing up prices of various commodities, with detrimental effects for the national economy and political stability.

Late in 1980, the State Council studied the financial and economic situation and decided to take measures to achieve a rough budget balance and a credit balance. Can we achieve this goal? We argue that it is both necessary and possible for us to do so, if we only recall our financial work in the past three decades and understand how we time and again overcame financial difficulties.

Basic Budget Policy. China's basic budget policy is to maintain an annual balance between revenues and expenditures with a little surplus. This policy is aimed at ensuring a continuous and steady growth of the national economy and a real improvement in the people's livelihood under a stable economy.

We do not condone budget deficits because China's social system is different from that of Western countries. Unlike Western countries, China does not have economic recessions caused by overproduction and insufficient investment, so there is no need to use a budget deficit to stimulate the growth of China's economy.

Under our social system, a budget deficit shows that the distribution of national income exceeds the production of national income and that development programmes exceed the country's financial capabilities. The inevitable result is inflation, price fluctuations and a drop in the real income of the workers.

Although we do not condone budget deficits, it does not mean that we have never had financial

deficits. Deficits have occurred several times. There have been two kinds of budget deficits. One kind was the objective result of wars and natural disasters; the 1950 deficit was of this kind. The other kind was due to subjective errors – in particular, rashness; the deficits that occurred after 1956 were of the second kind.

In 1956, carried away with the tremendous successes we had achieved in socialist transformation and construction, we quickened the speed of construction. That year, our investments in capital construction increased by more than 50% and our expenditures and agricultural loans exceeded their planned levels. As a result, we incurred a budget deficit of 1,800 million yuan and a deficit in bank credit. These deficits resulted in shortages of both producer and consumer goods, which led to barter trade and profiteering. At that time, our style of working was practical and realistic, so we lost no time in discovering our problems and reviewing our experience.

We recognized theoretically that the scale of construction should conform to our capabilities and that we should maintain an overall balance in the budget, in credit and in the supply of materials. Meanwhile, we took practical measures to increase production and practice economy, to cut back capital construction investment and to control social purchasing power in a planned way. By 1957, we were able to achieve a balance between revenues and expenditures and between credits and debits. Shortages of raw materials and consumer goods were eased, the market stabilized and economic order was restored.

The 1958-60 Debate. During the three years of the "Great Leap Forward," the distribution of national income was again carried to excess. During 1958-60, erroneous tendencies, such as setting overly high production targets, boasting about exaggerated output and enforcing communism, cropped up under the influence of "Left" ideology. In the 1958 budget, the revenue target was more than double that of 1957. Actual revenues in that year totalled 38,760 million yuan, a mere 25% increase over the 1957 figure. Capital construction investment in 1958 was nearly double that of 1957, while payroll expenses escalated out of control. This state of affairs continued until 1960.

The impact of the 1958-60 financial deficits on China's economy was rapid and strong. The over-expenditure of funds and the resultant imbalance between industry and agriculture caused by erroneous economic policies led to severe shortages of raw materials and consumer goods. Speculation ran wild, prices rocketed and even the credibility of the currency was endangered,

causing a decline in bank savings. The people's standard of living dropped. In view of the dangers, people simmered down.

Readjustment. In 1960, China set out to readjust its national economy. Major decisions during the readjustment were to cut back capital construction investment, control payroll expenditures and restore the balance between revenues and expenditures. Capital construction investment was reduced from 38,400 million yuan in 1960 to 12,300 million yuan in 1961 – and again to 6,700 million yuan in 1962.

Meanwhile, 20 million people were mobilized to resettle in the countryside so as to help cut consumer expenditure and increase the supply of grain. Efforts were made to strengthen enterprises – a large number of enterprises running at a deficit were either closed, merged with other enterprises or switched to other types of production. This readjustment helped to balance revenues and expenditures, credit receipts and payments and purchasing power and the supply of commodities. The money supply was reduced and prices stabilized. The chaos in economic life was eliminated and production went up rapidly. Economic results in 1965-66 achieved an all-time high.

Consequences of "Left" Errors. "Left" thinking reached its zenith in the ten years of turmoil between 1966 and 1976. During that period, the view that an overall balance is necessary was criticized by Lin Biao and the Gang of Four as "right deviationist conservative thinking," and once again high targets, high rates of accumulation and expanded capital construction exceeded actual capabilities. In agriculture, the policy of "poverty transition" (forced transition from a lower level to a higher level of collective ownership even when people became poorer) was advocated. In industry, workers were urged to stop production. These measures led to financial deficits for three consecutive years (1974-76) and brought the national economy to the verge of collapse.

Even after the downfall of the Gang of Four, we still did not truly understand the damage that "Left" ideas had done to our economic work. In 1977 and 1978, when we had achieved a measure of success in our economic work, we again became impatient and wanted to "quicken our pace" in construction. In 1978, the scope of capital construction was expanded, various expenditures were increased and the accumulation rate went up to 36.5%, second only to that in 1959. Capital construction investment reached an all-time high of 47,960 million yuan in 1978, a 31.6% increase over the 1977 figure. This rate of increase was not only higher than that of total industrial and agri-

cultural output value and that of the national income, but also higher than that of national revenues. The impetuous advance aggravated the imbalance of the national economy and caused deficits in the following years.

The history of the past three decades shows that "Left" errors were the root cause of China's deficits. Impatience for success led to the over-distribution of funds, giving rise to inflation and price increases. Experience shows that, under socialism, it is not difficult to maintain a balanced budget, a credit balance and a balance between supply and demand, provided we do not exceed our capabilities. As the distribution of revenues is mainly controlled by the state, we can cut back high expenditures, just as long as we adhere to the principle of living within our means. Only by doing so, can we ensure a continuous and steady growth of the national economy.

III. Financial Readjustment and the National Economy

China's state budget covers the greater part of the nation's net social income, so the distribution of funds is important to the establishment of the ratio between accumulation and consumption. The budget has a decisive impact on the proportion of distribution between productive accumulation and nonproductive accumulation and on the proportion of funds distributed among the various departments of the national economy in productive accumulation. It is an important function of our financial work to effect the rationalization of the national economic structure through a rational distribution system.

Accumulation Rates. How can the distribution system be made rational? To understand this question, we must look at the many detours China has taken in the past three decades. On the question of the proportion between accumulation and consumption, since the late 1950's we have laid undue stress on productive accumulation, in the belief that a high rate of accumulation would ensure rapid development. Consequently, the accumulation rate during the Second and Fourth Five-Year Plan periods (1958-62 and 1971-75) exceeded 30%. In 1977 and 1978, after the downfall of the Gang of Four, the rates were 32.3% and 36.5%, respectively.

The facts show that high capital accumulation did not bring good results. In the late 1950's, when the accumulation rate was the highest, 100 yuan of accumulation funds only yielded one yuan of national income, whereas in the First Five-Year Plan period (1953-1957), when the rate was low

(24%), and during the economic readjustment of 1963-65, when the rate was 22%, 100 yuan of accumulation funds yielded 35 and 57 yuan of national income, respectively.

To avoid an unduly high rate of accumulation, we must use finance as a regulatory valve. On the one hand, we must transfer the over-accumulation of national income to workers and peasants, using prices and wages as levers. On the other hand, we must reduce the scope of capital construction to achieve a balanced budget.

Distribution of Investment. As for the proper distribution of investment among economic departments, Chairman Mao, in his "On the Ten Major Relationships," had advanced the thesis that in the long run the greater development of agriculture and light industry will lead to a greater and more rapid development of heavy industry. History proved that this thesis is correct. Between 1952 and 1978, every yuan of investment in China's light industry yielded 10 yuan of profit and tax, while every yuan invested in heavy industry yielded only about 1.2 yuan of profit and tax. In this 27-year period, light industry, which received only one-tenth of the total investment in heavy industry, produced as much in profit and tax as was produced by the total investment in heavy industry. In other words, if we had devoted one-tenth of the investment in heavy industry to develop light industry, we would have accumulated enough funds to double the productivity of heavy industry.

In the late 1950's, we placed undue emphasis on development of heavy industry, especially on development of iron and steel. The investment in heavy industry between 1958 and 1960 accounted for 85.5% of the total investment in China's industry, but the performance of heavy industry was very poor and there was almost no increase in revenues. After 1965, large amounts of investment were spent on building the backward areas of remote and border regions, still laying undue stress on heavy industry. In the decade from 1966 to 1975, capital investment in heavy industry accounted for 91.8% of the total capital investment in industry. But between 1966 and 1970, every 100 yuan of capital investment produced only 21 yuan of profit and tax; and in the 1971-75 period, every 100 yuan of investment produced only 9 yuan of profit and tax. This illustrates the decisive impact of the national economic structure on revenues. To change the irrational structure of the national economy, we must first change the structure of distribution of funds.

As for the relationship between material production departments and nonmaterial production departments, it is what we call a "bone and flesh"

relationship, with "bone" referring to production and "flesh" referring to those departments that serve production — such as urban construction, commerce, service trades, science, education, culture, public health and housing construction. The departments of material production and non-material production are interdependent, just like bone and flesh.

For a fairly long time, however, we took a one-sided approach to the non-material production departments, regarding them as having nothing to do with production. We paid little attention to them and invested too little in them. We paid dearly for this neglect: a host of problems in production, a lower living standard, the backwardness of China's science and education and tremendous obstacles in the way of the modernization of the national economy. These problems arose because we did not understand properly the relationship between material and nonmaterial production, which led to errors in the orientation of investment. To solve these problems, we first had to readjust the distribution structure of investment.

Readjustment Ratios. Since the Party Central Committee and the State Council adopted the policy of readjustment, restructuring, consolidation and improvement of the national economy, much has been done by the financial departments in readjusting the ratio between accumulation and consumption, in balancing the relationship among the various departments of the national economy and in developing energy production, communications and transport and the building industry. Progress has been made in readjusting the ratio between accumulation and consumption, although some problems have not yet been thoroughly solved and some capital construction projects which should have been cut have not been cut.

In readjusting the ratio between accumulation and consumption, we have raised the consumption level of workers and peasants through various channels. In 1979, we raised the state purchasing price of farm and sideline products by a large margin and reduced the agricultural tax in some low-yielding areas so that rural China might recuperate and rebuild its strength. Beginning in the summer of 1979, the state raised the prices it paid for 18 major farm and sideline products, including grains, cotton, edible oils, jute, sugarcane, sugar beets, pigs, cattle, sheep, fish, eggs and silk cocoons. The state paid farmers higher prices for quantities of grains, cotton and edible oils produced beyond the required quota. In 1979, state subsidies for this purpose totalled 10,000 million yuan; in 1980, the figure was even higher.

Also in 1979, the state raised the level of yield subject to agricultural tax in low-yielding and grain-deficient areas. Areas where the per hectare yield was below the new minimum were exempted from tax altogether. In all, taxes were reduced or waived for 2,350 million tons. Furthermore, the state raised by a proportionate amount the level of yield subject to industrial and commercial income taxes for enterprises run by rural people's communes and their subdivisions, as well as extended the period of tax reduction and exemption for new enterprises. Regulations were worked out to exempt from industrial and commercial taxes for a period of five years those enterprises located in counties in national autonomous regions and border regions.

Income and Jobs. Thanks to the growth of farm production and the rise in the state purchasing price of major farm products and sideline products, China's peasants received from the collective in 1979 an average per capita income of 83.4 yuan, or 9.44 yuan more than in 1978. The average per capita income figure in 1980 was 85.9 yuan, or 2.5 yuan more than in 1979.

In 1979, various jobs were given to 9,030 million urban people, including jobless city residents and the 1979 graduates of colleges and technical schools. About 40% of factory and office workers were given wage increases and the wage scales in some areas were readjusted. A bonus system was introduced in state-owned enterprises and subsidies were issued to all workers to compensate for price increases introduced for non-staple foods.

The average annual pay of workers in state-owned enterprises in 1979 was 705 yuan, or 61 yuan more than in 1978. In 1979, 7,500 million yuan from the state budget was allocated for these purposes. In 1980, jobs were given to 9 million people and the average 1980 pay of workers in state-owned enterprises amounted to 803 yuan, or 98 yuan more than the 1979 figure.

Special Allowances. Price allowances and various other allowances have been made to ensure that the people's standard of living would not decline. State allowances for basic consumer goods in 1980, such as grain, cotton, edible oils, meat, eggs, vegetables and coal for home use, totalled 12,000 million yuan. Subsidies for purchases of farm produce (after the state raised the price for farm products produced in excess of the quota) exceeded 5,000 million yuan. Allowances for products classified as agricultural means of production and as aids to agriculture which were sold at preferential prices totalled more than 3,000 million yuan. These allowances reduced national

revenues; but under present conditions, these allowances play a valuable role in ensuring the steady improvement of the people's livelihood.

In readjusting the relationship between production accumulation and nonproduction accumulation, special funds were drawn out of capital investment and, together with the funds of localities and enterprises, were used to expand housing construction for factory and office workers. In 1979, a total of 62,560 million sq.m. of housing floor space was constructed in cities, towns and industrial and mining districts, representing a 66% increase over the 1978 figure. The 1980 figure was 82,000 million sq.m. These were the two years when housing construction was the highest in terms of floor space since the founding of New China.

Flexible Funds. To give localities and enterprises greater financial power, the state allowed them to increase their flexible funds. This was beneficial to stimulating the national economy, promoting production, increasing income and correcting the serious imbalance between the "bone" and the "flesh." In 1979, the state stipulated that 49 large and medium-sized cities might retain 5% of their industrial and commercial profits as funds for urban construction, and that localities might take out a certain proportion of income from industrial enterprises run by the counties to use for their own flexible funds, which thus increased by 2,000 million yuan.

Meanwhile, a system of drawing funds has been introduced to state-owned enterprises and profit-sharing has been carried out on a trial basis in more than 4,000 industrial enterprises, commercial departments and affiliated organizations. Thus the enterprises received 4,000 million yuan of flexible funds. In 1980, this experiment was extended to more than 6,000 state-owned enterprises and their flexible funds were greater than the 1979 figure.

State Aid. In readjusting investment proportions among agriculture, light industry and heavy industry, more funds were allocated to develop agriculture and light industry. In 1979, 9,010 million yuan was earmarked as operating expenses for rural people's communes and various agricultural undertakings. Meanwhile, 1,500 million yuan was given to the light and textile industries to carry out technical innovations and transformation, in addition to 2,300 million yuan which had been given to them for capital construction. Priority was given to them for supplies of fuel, power and raw materials. In 1979, the growth rate of light and textile industries was 9.6%, while that of heavy industry was 7.7%.

Large increases were registered in output of

major manufactured goods that are in urgent demand, including cotton cloth, chemicals, textiles, paper, bicycles, sewing machines, wristwatches, television sets, synthetic detergents and household electrical appliances. In 1980, the state continued its generous financial aid to agriculture and to light and textile industries. Aid to rural people's communes amounted to 8,367 million yuan in 1980 for investment and operating funds. And the 1980 growth rate of China's light and textile industries reached 18.4%. In both 1979 and 1980, the state also made a point to help boost energy production and transport.

IV. Restructuring the Financial and Managerial System

In a vast, unified socialist country like China whose economy is dominated by ownership of land and the means of production by the whole people, the proper handling of the relationship between central and local authorities and between the state and enterprises on the question of how power should be divided among them is a matter of great importance to bringing into full play the initiative of the masses and upholding the centralized and unified leadership of the country. Too much centralization, without giving local authorities and enterprises the necessary decision-making power, would hamper their initiative, inflate the bureaucracy and dampen the enthusiasm of grassroots organizations. Whereas too much decentralization would prevent the state from making overall arrangements for the national economy in the interests of the whole country, cause anarchy among localities and enterprises and make it difficult for the state to concentrate its power and to effect an overall balance for planned economy. For a long period of time, centralization was the main trend.

To overcome it, China undertook to restructure its economy through the decentralization of power, in 1957 and again in 1970. Meanwhile, there was also a certain measure of decentralization in budget control and financial management of enterprises. However, the work did not yield anticipated results because it did not solve the question of achieving an overall balance in a macroscopic sense, nor did it bring into full play the initiative of enterprises in the microscopic sense.

After the overthrow of the Gang of Four, the country decided to break with conventional practice and seek to restructure the economy in conformity with the reality of the country. The following measures have been taken to restructure the financial system:

1. In budget control, a system of "delimiting revenues and expenditures at different levels" was instituted in 15 provinces in 1980. This system is characterized as delimiting revenues and expenditures.

The revenues of the central authorities consist of: (1) fixed income, which includes the income of enterprises and undertakings directly under the control of the central authorities, customs duties, industrial and commercial taxes on imported goods, industrial and commercial taxes paid by railway departments, foreign loans, repayments of loans by foreign countries, and other income; (2) the portion of local fixed income to be handed over to the central authorities; (3) the portion of redistributory income (industrial and commercial taxes) to be transferred to the central authorities; and (4) the portion of basic depreciation funds of local enterprises which is stipulated to be granted to the central authorities by the local authorities.

The revenues of the localities consist of: (1) fixed income of the local governments, including the income of locally run enterprises and undertakings, salt tax, agricultural tax, industrial and commercial taxes (such as the animal slaughtering tax, car and ship license-plate taxes, real estate tax, livestock trade tax, and rural trade fair tax), income from delayed payment of taxes and fines on delays in tax payment, and other local incomes; (2) a fixed proportion (20%) of the income of centrally run enterprises; (3) the portion of redistributory income (industrial and commercial taxes) as stipulated to be given to the local authorities; (4) fixed subsidies given by the central authorities to certain localities; and (5) the basic depreciation fund as stipulated to be handed over to the central authorities.

Expenditures are delimited in a similar way. Expenditures to be paid by the central authorities consist of: (1) allocations and loans for capital construction to be made by the central authorities; (2) additional circulating funds for centrally run enterprises; (3) additional bank credit loans; (4) funds for technical innovations; (5) expenses for developing new products; (6) expenses for geological prospecting; (7) national defence expenditures; (8) aid to foreign countries; (9) expenditures for state reserves of supplies; (10) expenses for national cultural, educational, scientific and public health undertakings; (11) operational expenses in industry, transport and commerce; (12) expenditures to aid agriculture; and (13) other expenses by the central government.

Local expenditures consist of: (1) funds or loans for capital construction undertaken by local governments; (2) additional circulating funds for local enterprises; (3) funds for technical inno-

vations by local enterprises; (4) funds for developing new products by local enterprises; (5) local aid-to-agriculture funds; (6) operational expenses in agriculture, forestry, water conservation and meteorological service; (7) operational expenses in industrial, transport and commercial undertakings; (8) expenditure on urban maintenance; (9) expenses on aid-raid shelters; (10) expenses for resettling urban residents in the countryside; (11) expenses in local cultural, educational, scientific and public health undertakings; (12) social relief and pensions for the disabled and families of the deceased; (13) administrative expenses; and (14) other expenses.

The state makes expedient allocations for disaster relief, flood and drought control and other emergencies.

Determining the limits of revenues and expenditures is accomplished in accordance with the method of delimitation described below. The revenues and expenditures of a certain province over a definite period of time are determined; using these figures as a base, calculations are made to find out the proportion of local income to be handed over to the state, the proportion of local income to be retained by the province or the amount of subsidies to be given by the central government to the province. Once determined, such fixed proportions and amounts of subsidies are valid for five years. This system of "delimiting revenues and expenditures at different levels" was originally meant to be introduced to the provinces, but some provinces have applied it to their counties.

Since its introduction in 1980, the system has yielded some positive results:

(1) it has helped bring into play the initiative of local governments in financial management;

(2) it has helped local governments make overall arrangements and perform their economic tasks in a flexible way;

(3) it has helped to promote the country's economic readjustment;

(4) it has helped to increase income and cut expenditures so as to overcome current financial difficulties; and

(5) it has helped to strengthen financial management.

Some problems have cropped up in the course of implementing this system. The main one is the tendency toward unnecessary duplication of production and capital construction. Another is that,

whereas local governments are supposed to use their surplus income and make up for deficits on their own, some localities still turn to the central government for subsidies when they run a deficit, thus weakening the central government's efforts to balance the state budget.

A "fixed quota system" was instituted for Guangdong and Fujian provinces in 1980. Under this system, the amount to be handed over to the central authorities and subsidies made to them by the central government are fixed for five consecutive years. During these five years, the local government will retain all the increased revenue resulting from economic growth. Under this system the local government gets greater benefits than under the system of "delimiting revenues and expenditures at different levels," by which the local government has to hand over a fixed proportion of increased revenue to the central government. The fixed quota system was designed to give Guangdong and Fujian greater flexibility in implementing special policies. With greater decision-making power in financial matters, the two provinces are able to fully exploit their advantages for more rapid economic growth.

The regions inhabited by national minorities, which are economically underdeveloped, have been granted special preferential treatment. Their budget deficits are subsidized by the central government. In addition, the national autonomous regions enjoy preferential treatment in the following three ways:

(1) The national autonomous regions are entitled to a higher percentage of reserve funds than other regions. The reserve funds for ordinary provinces and municipalities account for 3% of their budgetary expenditure, whereas autonomous regions are entitled to 5%, the autonomous *zhou* (equivalent to a prefecture embracing several counties) to 4% and the autonomous counties to 3%, as against 2% for ordinary counties.

(2) The state sets aside special funds to help national autonomous regions meet their special needs in production, the people's livelihood, culture, education and public health services.

(3) The state sets aside funds for national minorities in autonomous regions to help develop their culture. These funds are equivalent to 5% of all operational expenses of the locality.

In 1980, the financial control of national autonomous regions was brought into line with the principle of "delimiting revenues and expenditures at different levels." This allowed national auto-

nomous regions to keep all revenues derived from industrial and commercial taxes. Other regions, however, only got to keep part of their revenues from industrial and commercial taxes. Not only were autonomous regions allowed to keep all their extra revenue, but the subsidies given to them by the central government from the state treasury were to be increased by 10% each year. Also in 1980, the state set up an economic development fund to aid underdeveloped areas of the country, in which national autonomous regions were included.

2. *The financial management of enterprises constitutes an important aspect of the country's financial management system, which is a feature of the socialist system.* While it is important to reform the budget control system, it is even more important, in a sense, to restructure the system of financial management. The reason is that workers in the enterprises are the real creators of material wealth, and reforms of the superstructure will not promote economic growth unless they are aimed at bringing into full play the initiative of enterprises and their workers.

The financial management of an enterprise is supposed to solve the following major problems:

(1) How can the state, through a proper distribution of funds, ensure that enterprises enjoy optimum conditions for maintaining simple reproduction and a certain measure of expanded reproduction?

(2) What kind of distribution should an enterprise employ to protect the proper interests of the state, the collective and individuals?

(3) What obligations should an enterprise have for using state funds to undertake production?

In short, in order to enable enterprises to undertake reproduction under optimum conditions and to expand reproduction in light of society's needs and objective possibilities, it is necessary to allow enterprises to have the necessary funds and financial power to run their operations. Furthermore, in order that enterprises and their workers care about the results of their management of material interests, they should be entitled to share the economic returns of their enterprises. To this end, a system of enterprise funds was introduced on an experimental basis in 1978. Under this system, an enterprise, after fulfilling its annual planned targets, was entitled to draw on an enterprise fund equivalent to 5% of its total annual payroll. However, because the enter-

prise fund was related only to the total payroll and was proportionate to the number of workers employed in the enterprise, it did not stimulate the enterprise to improve its performance, although this was the intended effect. There was no link between the material interests of the enterprise and those of its workers with the actual performance of the management.

In July 1979, the State Council issued "Regulations Concerning State-Owned Enterprises Retaining Part of Their Profits." On an experimental basis, some enterprises were allowed to retain a fixed proportion of their profits for the purpose of establishing a reserve fund. With the reserve fund, enterprises could set up three other funds — a product development fund, a workers' welfare fund and a bonus fund. Since the reserve fund would grow with the growth of profits, enterprises would be encouraged to cut costs, increase output and improve product quality, thereby accumulating more funds for the state.

The experience of the enterprises that took part in this experiment showed that whereas enterprises which used to have low profits, more manpower and greater potential for increasing their income enjoyed a higher ratio of reserves and more benefits, those enterprises which used to perform well, earned greater profits and employed fewer workers obtained a lower ratio of reserves and less benefits. This was clearly not fair.

To solve this problem and to encourage enterprises to increase their production and income, some changes were made in the system in 1980. Accordingly, an enterprise's reserve fund should be drawn in proportion to both its base profit and increased profit. In other words, when an enterprise's profits in the current year are higher than those in the previous year, only that portion equivalent to the profit of the previous year, in accordance with the verified ratio of the base profit, will go into the reserve fund. Of the increase in profits, only that amount determined in accordance with the ratio stipulated by the state for increased profit will go into the reserve fund. When an enterprise's profits in the current year are lower than those in the previous year, the reserve fund should be made up of the actual profit on the basis of the verified ratio for drawing the reserve fund from the base profit. As a result of this revision, all enterprises, regardless of how much profit they earn, should benefit from profit increases in a more reasonable way.

Along with the profit-retaining practice, experiments were carried out in making payments for the use of fixed capital in enterprises which retained part of their profits in 1980. Payments for the use of capital vary with the rates of profit, which differ in various trades. The monthly rate

for the use of capital ranges from 0.2% to 0.8%. Furthermore, beginning October 1, 1980, all enterprises which had completed an all-round check of their assets began to pay fees for the use of circulating funds at the monthly rate of 0.21%. The two fees are paid out of the enterprise's turnover to the state treasury as part of state revenues.

Profit retaining is an important step in restructuring the financial management system of enterprises. But there is still room for improvement, mainly in the following two aspects: (1) the well-run enterprises will get a lower retaining ratio based on the original funds than poorly run enterprises, and since they have less potential for increased production, they will have greater difficulty drawing reserve funds from increased profits — this is hardly encouragement for well-run enterprises; and (2) grassroots enterprises lack sufficient guidance from departments above them in planning how to use their reserve funds — in certain cases, funds have not been used to full advantage.

In addition, experiments in making enterprises "perform independent accounting, pay taxes to the state and bear sole responsibility for profit or loss" have been carried out in a few enterprises in Shanghai, Sichuan and Guangxi. These pilot enterprises now pay the state taxes instead of profits; whatever is left after paying taxes is at the disposal of the enterprises, to be used with guidance from the state plan. Enterprises which operate well and reap high profits may retain more for their own use. This is a relatively recent experiment in giving enterprises a larger share of decision-making power.

With respect to financial management in capital construction, state allocation was replaced by state loans in 1980.

The restructuring of the financial management system in recent years has proved correct in orientation and has yielded positive results. It has played a valuable role in improving economic performance and in mobilizing forces to overcome financial difficulties. At present, what we should do is to sum up our experiences and consolidate what we have already achieved.

China decided to further readjust its national economy at the end of 1980. This is an important policy decision. To ensure that this primary task is carried out smoothly, the reform of the economic structure must be subordinated to and beneficial to the task of readjustment.

V. Tax Reform and Taxation in the New Historical Period

The state obtains its revenues mainly through

taxes and profits. During the past 31 years, taxation as a control lever of distribution in the hands of the proletarian state has played an important role in accumulating funds for construction, in regulating the incomes of various economic sectors and in developing the national economy in order to promote productive forces.

Taxation in a socialist country is part of the socialist superstructure. It embodies the will of the people and governs the relationship between the state and the taxpayers. It serves as an instrument for consolidating the country's economic base. In the past 31 years, the tax system has reflected changes in the economic base and in the political and economic tasks of the state at different periods.

The main features of these changes are as follows:

1. *During the economic rehabilitation period, we adopted the plural taxation system and levied several categories of tax simultaneously at different points in the production and sales of industrial and commercial enterprises, including an excise tax, a business tax and a stamp tax.* Some of these taxes were levied several times. Such a taxation system was called for by the conditions that then existed. At that time, multiple economic sectors coexisted. There were large numbers of private industrial and commercial enterprises; they varied in forms of management and often evaded taxes. The plural system of taxation helped to implement the policy of utilizing, restricting and transforming capitalist industry and commerce.

2. *China enforces taxation mainly in the fields of production and distribution.* The principal tax category is the industrial and commercial tax, which ranks first in revenue among all other taxes and accounts for at least three-fourths of total tax revenues. The object of such taxation is the turnover.

China levies virtually no income tax on individual property. The income of urban and rural residents is low, so it is not advisable to increase the burdens of the people by levying an income tax. Moreover, in a socialist country like China, personal income is fairly equitable and there is no need yet to regulate the incomes of different strata by levying an income tax.

Only during the period of socialist transformation did we adopt the "four horses sharing the forage" system — dividing revenues from the industrial and commercial income tax on enterprise profits among the state (34.5%), the welfare funds for workers (15%), the accumulation funds (30%) and the dividends for capital (20.5%). That system constituted part of the policy of utilizing, restrict-

ing and transforming capitalist industry and commerce.

3. *After the completion of the three socialist transformation movements, reforms were made to simplify the tax system.* The simplification of the tax system was certainly necessary, but our thinking on this question tended to be one-sided. We thought that because our country was moving in the direction of a system of unitary ownership, the simpler the taxation system, the better. As a result, the categories of tax were reduced and some taxes which ought to have been levied separately were merged with others. While this reform did simplify the tax system, it greatly weakened the role of taxation as a lever for control of distribution.

After the Gang of Four was overthrown, and especially after the Third Plenary Session of the 11th Party Central Committee, China entered a new historical period in which socialist construction has become the central task. The "Left" ideological line that was prevalent during the ten years of upheaval was criticised, confused theories were cleared up and policies were cleansed of the "Left" influence. This brought about profound changes in the economy which, in turn, brought further reform of the tax system.

Between 1979 and 1980, the following reforms were carried out in the system of taxation.

1. *In 1980, the Ministry of Finance selected the city of Liuzhou in the Guangxi Zhuang Autonomous Region for an experiment in tax reform and reform of the financial system of enterprises.* Enterprises in Liuzhou are required to pay four categories of tax and two kinds of fees instead of delivering their profits to the state. Those taxes are:

(1) Value-added tax, levied on products such as machines, equipment and farm machinery and implements. The original tax on the sales of such products has been changed to a tax on what is left after the enterprise deducts the cost of materials.

(2) Resources tax, levied on crude oil, natural gas, coal, metals and non-metallic minerals.

(3) Excess-profits tax, levied according to the amount of profits on sales. When the profit rate of sales is under 15%, no tax is levied; when the profit rate exceeds 15%, 0.6% of tax is levied for every 1% over 15%.

(4) Income tax on state-owned enterprises, levied at a flat rate of 50% on the income of state-owned enterprises. The taxable income of an enterprise is the total income from the sale of

products after deduction of costs, non-operating expenditure, industrial and commercial taxes and the excess-profits tax. Of the total tax, 50% is delivered to the state and the other 50% is retained by the enterprise.

Fees for possessing fixed funds and circulating funds are replaced by the fund dividends method, which retains after-tax profits at a rate ranging from 25% to 60%.

Apart from Liuzhou, small-scale tax experiments are being carried out in Sichuan, Hubei and Shanghai. The guiding principle is essentially the same, but there are minor differences. We shall sum up the experiences of these pilot districts and try to find the best system.

2. *The income tax law concerning joint ventures with Chinese and foreign investment was formulated and promulgated.* In order to expand international cooperation and technical exchange, China encourages foreign firms, enterprises and other economic organizations and individuals to run joint ventures in China with Chinese companies and other economic organizations on the basis of equality and mutual benefit.

The first problem in running joint ventures with Chinese and foreign investment is how to handle the relationship of rights and interests between the state and such enterprises. With a view to defining this relationship, the Third Session of the Fifth National People's Congress adopted in September 1979 the "Income Tax Law of the People's Republic of China Concerning Joint Ventures with Chinese and Foreign Investment."

The range of taxation mainly covers joint ventures with Chinese and foreign investment within China's territory. But in view of future development, the law stipulates that the income tax on the income derived from production, business and other sources by branches within or outside the territory of China of such joint ventures shall be paid by their head offices. It also stipulates that income tax paid abroad by their branch offices may be credited against the assessed income tax of the head office as foreign tax credit. Where agreements on avoidance of double taxation have been concluded between the Chinese government and the government of another country, income tax credits shall be handled in accordance with the provisions of the relevant agreements.

Income from joint ventures is taxed at a flat rate of 30%. In addition, a local surtax of 10% of the assessed income tax shall be levied. The tax rate is lower than those in developed countries and in many developing countries, where rates are 50% and 35-40%, respectively.

The income tax rates on joint ventures ex-

ploiting petroleum, natural gas and other resources shall be stipulated separately. This is so because joint ventures exploiting petroleum and other resources are more complicated than general joint ventures and because such taxation in other countries is generally very high. Some countries even levy a petroleum income tax or a special tax. China is working out such tax rates and tax regulations as best suits its actual conditions.

To encourage foreign investors to reinvest in China their share of profit, the income tax law stipulates that in the case of a foreign participant in a joint venture remitting its share of profit from China, an income tax of 10% shall be levied on the remitted amount and no tax will be levied on the unremitted amount of profit.

The tax law lays down the following preferential treatment toward joint ventures:

- A newly established joint venture scheduled to operate for a period of 10 years or more may be exempted from income tax in the first profit-making year and allowed a 50% reduction in the second and third years.

- Joint ventures engaged in such low-profit operations as farming and forestry or which are located in remote, economically underdeveloped outlying areas may be allowed a 15-30% reduction in income tax for a period of 10 years, in addition to tax exemption and reduction in the first three years.

- A participant in a joint venture which reinvests its share of profit in China for a period of not less than five years may obtain a refund of 40% of the income tax paid on the reinvested amount.

- In addition, two methods shall be adopted to compute the taxable income of a joint venture. One is that in computing depreciation of fixed assets, apart from the prescribed useful life, exceptional useful life may be set in cases where the fixed assets of a joint venture need to accelerate depreciation. This is laid down in the detailed regulations for the implementation of the income tax law. The other method is that losses incurred by a joint venture in a tax year may be carried over to the next tax year, and should the income in the subsequent tax year be insufficient to make up for the said losses, the balance may be made up with further deductions against income annually for a period not exceeding five years.

VI. Enforcement of the Individual Income Tax Law

The main regulations concerning the implementation of the national tax rules, promulgated in 1950, included the provision about

taxation on wages and salaries and on service compensation. But in view of China's low wage system and low individual income, the income tax was not levied.

With the development of the economy, the number of people with high earnings will gradually increase and it is a matter of course that they should contribute more to the state. Moreover, as China expands its economic exchanges with other countries, the number of foreign personnel who derive their income in China will increase gradually and there will be an increasing number of Chinese personnel engaged in economic activities or services in other countries who will have to pay income tax in the countries where they work. In order to protect national economic interests, China has enacted the individual income tax law in the spirit of equality and mutual benefit and in the light of China's actual circumstances. This law was adopted in September 1980 at the Third Session of the Fifth National People's Congress.

The individual income tax law stipulates that individual income tax shall be levied on incomes earned within or outside China by any individual residing for one year or more in China. For individuals residing in China for less than one year, individual income tax shall be levied only on that income gained within China.

Taxable and Nontaxable Categories. The new tax law lists the following categories of incomes to be taxed: wages and salaries; compensation for personal services; royalties; interest, dividends and bonuses; income from lease of property; and other kinds of income specified as taxable by the Ministry of Finance of the People's Republic of China.

It also lists the following categories of income that are to be exempted from individual income tax: prizes and awards for scientific, technological or cultural achievements; interest on savings deposits in state banks and credit cooperatives of the People's Republic of China; welfare benefits, survivor's pensions and relief payments; insurance indemnities; military severance pay, demobilization or demobilization pay for cadres and soliders in the armed forces; severance pay or retirement pay for cadres, staff members and workers; salaries of diplomatic officials of foreign embassies and consulates in China; tax-free incomes as stipulated in international conventions to which China is a party or as stipulated in agreements China has signed; and incomes approved as tax-free by the Ministry of Finance of the People's Republic of China.

Income Tax Rates. The tax law has set two individual income tax rates. One is for wages and salaries in excess of specific amounts; these are taxed monthly at progressive rates of seven scales ranging from 5% to 45%. The other is for income from compensation for personal services, royalties, interest, dividends, bonuses and the lease of property and other kinds of income, taxed at a flat rate of 20%.

For the sake of simplicity and convenience, taxable income is computed according to fixed amounts of monthly income, at fixed rates and with certain deductions. For income from wages or salaries, a monthly deduction of 800 yuan is allowed as daily expenses for the wage earner and his relatives and for other necessary expenses. Only that part in excess of 800 yuan is taxed. After this deduction, the number of people in China who need to pay income tax is very small — and the taxable amount is very small too.

For income from compensation for personal services, royalties or lease of property, the taxable amount is computed by deducting a fixed percentage of 20%. But in view of the fact that the amount of income from compensation and lease of property may vary widely and because the deduction of a fixed percentage might make the range of taxation too extensive, the tax law provides that if the amount in a single payment is less than 4,000 yuan, a deduction of 800 yuan is allowed. This has narrowed the range of taxation and benefits for taxpayers with smaller incomes.

For interest, dividends, bonuses or other kinds of income, the tax law provides that they shall be taxed on the full amount of each payment.

Tax Controls. In regard to taxation control, we mainly adopted the method of controlling tax sources, that is, making the paying units the agents responsible for withholding taxes due and making out payments. Taxpayers not covered by withholding are required to file their own declarations of income and to pay the tax themselves. Any taxpayer who earns income outside China is required to pay the tax due at the end of each year.

The tax law also stipulates that the tax authorities have the right to conduct investigations concerning the payment of tax and, acting at their discretion, may impose fines on those who have concealed income or have evaded or refused to pay tax. Penalties imposed will depend on the seriousness of the offence and may involve bringing the cases before the local people's courts.

40. CHINA'S TAXATION IN 1980

By Liu Zhicheng

General Taxation Bureau, Ministry of Finance

Tremendous achievements were made in China's taxation in 1980 under the guidance of the principles and policies adopted at the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party. This was done with the support of party committees and people's governments at all levels and by conscientiously implementing the policy of readjusting, restructuring, consolidating and improving the national economy.

I. New Taxation Policies

In 1980, as the policy of readjusting the national economy was implemented on all fronts, great changes were made in the sources of taxation. Although many measures were taken to reduce or exempt some enterprises from taxes and many contradictions and difficulties arose in taxation, the taxation departments overfulfilled their 1980 target by displaying the revolutionary spirit of hard struggle. They worked whole-heartedly to implement tax policies correctly, to promote the development of production and to strengthen the control of taxation.

National revenues from industrial and commercial taxes and the salt tax exceeded the 1980 target by 2,200 million yuan, or 5.8% more than in 1979. Most provinces, municipalities and autonomous regions exceeded their quotas. For instance, Shanghai, Beijing, Hubei, Zhejiang, Jiangsu, Guangdong, Liaoning and Henan all exceeded their quotas by 100 million yuan or more each.

In carrying out the policy of readjusting, restructuring, consolidating and improving the national economy, many readjustments and improvements were made in the stipulations of existing tax policies in 1980 to suit the needs of the new economic situation. In order to help young people in the cities to find jobs and to stabilize the social order, the period of tax exemption was extended for new collective enterprises run by students who had left school in the cities. Enterprises which had difficulties in paying taxes on the goods they produced had their taxes reduced or were exempted from taxes.

In line with the policy of allowing the private economy to grow while encouraging the collective economy, taxes were levied only on that part of the income of cooperative shops in excess of

specified amounts at eighth-grade progressive rates — such as in the case of collectively owned handicraft enterprises in urban areas, instead of at the previous ninth-grade progressive rates. Rural co-operative catering, service and repair units which had difficulties in paying taxes had their taxes reduced or were exempted from taxation. It was clearly stated that the system of taxing the whole income at 14th-grade progressive rates would not be imposed on the private economy for the time being and only that part of income in excess of specified amounts would be taxed at eighth-grade progressive rates for collective enterprises in the cities. This was intended to lighten the tax burden on cooperative shops and the private economy. Industrial and commercial taxes levied on matches and tinned foods were properly reduced to encourage increased production of these items after the prices of raw materials were raised.

Industrial and commercial taxes were also reduced or exempted during periods when commercial departments reduced the selling prices of pork in order to keep down the overstocking of meat in cold storage.

Those readjustments in tax policies gave full play to the function of taxation as an economic lever in regulating production and consumption.

II. Reform of the Tax System

Progress was made in reforming the industrial and commercial tax system as part of the effort to restructure the economic management system. Many investigations were made in various parts of China and good initial results were achieved in the experimental work done in some areas. Taxation work received great attention from the leadership at the central, provincial, municipal and regional levels and was widely supported by economists. A brief report was made to the Central Financial and Economic Leading Group on the taxation work in August 1980. Both Premier Zhao Ziyang and Vice-Premier Wan Li gave important instructions on the purpose, requirements, principles, policies and implementing measures in the reform of the tax system. In September, Wang Bingqian, Minister of Finance, also spoke of the reform in his report which was endorsed at the Third Session of the Fifth National People's Congress. Gratifying pro-

gress was made in the reform during 1980.

A value-added tax was introduced in 345 enterprises in Shanghai, Xiangfan, Changsha, Zhuzhou and Liuzhou on an experimental basis. It had positive significance in balancing the tax burdens between enterprises producing everything from raw materials to finished products, and those enterprises with more limited production. The tax benefited industrial reorganization and supported the development of production along specialized lines.

An important change in the relations of distribution of income between the state and enterprises was the replacement of the system of turning over profits to the state by state-owned enterprises with the new system of collecting income tax. Efforts were made in 1980 to begin the experiment, which is now being tried out in more than 200 enterprises in different parts of the country. These include 40 enterprises under the Shanghai Municipal Light Industry Machinery Corporation, 74 enterprises in Liuzhou city and 15 enterprises under the Guanghua County government in Hubei Province, as well as some enterprises in Sichuan Province. The experimental work in 1980 showed that the reform closely integrated the economic rights, responsibilities and interests of enterprises and gave further play to their initiative in management, thus promoting the development of production.

New Income Tax Law. In order to encourage overseas businessmen to invest in China, we undertook serious study and investigation and formulated the Income Tax Law Concerning Joint Ventures with Chinese and Foreign Investors and the individual income tax law. These laws called for light taxes, preferential treatment and simple procedures in the light of international practices. The two laws, adopted at the Third Session of the Fifth National People's Congress, were promulgated and went into effect in 1980. Detailed

rules for the implementation of the two laws were issued by the Ministry of Finance with the approval of the State Council. These laws are very important to the safeguarding of China's national rights and interests and to the promotion of international economic exchanges on the basis of equality and mutual interest.

Staff Training. In 1980, the number of tax officials was increased and their special knowledge was broadened. Guangdong, Shaanxi, Shanxi, Liaoning and Tibet reported an increase of 12,500 new workers in taxation offices. The total number of taxation officials throughout the country reached 170,000. Special training was provided in many places to broaden their vocational knowledge. Two training courses were given at the national level for nearly 200 officials who were equal to or above county taxation bureau directors in rank. Training courses were also offered in the provinces, municipalities and autonomous regions to provide training in taxation, accounting and inspection for section or division leaders.

Many prefectural and county taxation bureaus used different methods to train their staffs. A course in international taxation was held in Dalian, Liaoning Province, where lectures were given by specialists from Harvard University and other American universities. The lectures were attended by 100 people from all parts of the country. In order to train personnel in the methods of collecting taxes from foreigners, a foreign language course was given at the Dalian Foreign Language Institute for selected staff members from the taxation departments of provinces, municipalities and autonomous regions. More and more people working in taxation departments in various parts of China are studying foreign languages in their spare time.

In addition, theoretical research and propagation of taxation policies are under way.

41. CHINA'S BANKING SYSTEM

By the Research Institute of Finance and Banking,
The People's Bank of China

I. Development of China's Banking System

The People's Bank of China was founded on December 1, 1948, on the eve of the country's liberation. The founding of the bank and the issuance of legal tender — Renminbi — marked the beginning of a unified monetary and credit system for New China. Thereupon, the people's government banned the circulation of gold, silver and foreign currencies and started taking out of circulation the old currency issued by the Kuomintang government, exchanging the old currencies in liberated areas for Renminbi. It established thus an independent and unified socialist monetary system.

After Liberation, the People's Bank of China, acting on behalf of the people's government, took over credit institutions which were entirely constituted by bureaucrat-capital, confiscated the shares of the "big four" families in jointly operated state-private banks, and set up numerous branch offices in the cities and countryside, thus forming an extensive banking network across the country.

Over the past 31 years, China has established a more or less integrated banking system, consisting of the People's Bank of China, the Agricultural Bank of China and the agricultural credit co-operatives, the Bank of China and the State General Administration of Exchange Control, and the People's Construction Bank of China.

The People's Bank of China is the central bank, authorised by the state to formulate monetary policies, guidelines, rules and regulations for the whole country; to regulate the issuance of notes, cash flows, trading in gold and silver; and to control the wage fund. At the same time, by means of bank credits and interest rates, the bank mobilizes domestic funds to finance economic construction, to promote and control all economic activities and to regulate and coordinate the activities of economic units. As the hub of all economic entities and the link among different economic sectors, the bank is the nation's centre for clearance and collection and for loans and payments.

The Agricultural Bank of China exercises control over funds serving the needs of agriculture. It grants agricultural loans, supervises agricultural credit co-operatives and promotes bank services in rural areas. Agricultural credit co-operatives are

simultaneously collective credit institutions and the grassroots units of the Agricultural Bank of China; they engage in banking activities in the countryside.

The Bank of China and the State General Administration of Exchange Control specialize in international banking. They exercise unified control over foreign exchange and are responsible for maintaining a balance in China's international payments.

The People's Construction Bank of China specializes in allocating government funds and granting loans for capital construction. It also holds short-time deposits from units engaged in capital construction and grants the units short-term loans.

Since the founding of New China, the People's Bank of China has done a great deal to promote production and marketing and to regulate the nation's economic life. Notably, the readjustment of the national economy in the early 1960's was made considerably easier because the bank took such measures as stressing the centralization of banking operations, strictly regulating bank credit and cash flows, maintaining discipline in settling payments when they became due, drawing a line between government allocations and bank credit and prohibiting the diversion of bank credit to capital expenditure.

Due to the interference and disruption by the ultra-"Left" line pursued by Lin Biao and the Gang of Four during the "cultural revolution," the concept of relying on money, credit and interest rates for economic leverage was rejected. Consequently, the role of the People's Bank in the national economy was considerably weakened. But events took a fundamental turn for the better after the downfall of the Gang of Four. The bank has gained increasing importance in the national economy and has been able to use its powers fully and positively. Its development has been increasingly significant for the readjustment and development of the national economy.

In 1980, China's banking activities were in full swing. In implementation of the policy of readjustment, restructuring, consolidation and improvement of the national economy, the various departments of the banking system engaged in activities aimed at stabilizing price levels and maintaining monetary stability by observing economic laws and by adopting scientific methods. Their efforts have helped greatly to revitalize both pro-

duction and marketing, as well as to facilitate the readjustment of the national economy.

II. Significant Banking Reforms in 1980

Prior to 1980, there were a number of shortcomings and drawbacks in the economic system. The major problems were: (1) industrial and commercial enterprises relied mainly on government grants and very little on bank credit, thus circumscribing the role that the banks could have played; and (2) the bank had little decision-making power and was, in effect, administering a system of "funds allocation." Confronted with these problems, the People's Bank of China undertook some significant reforms in 1980.

The primary purpose of the reforms was to utilize the bank's powers to regulate the national economy in conformity with economic laws; to enable the bank, under the guidance of state plans and in line with established credit policies, to mobilize idle funds in the county and channel them to where they were most needed for the ongoing readjustment of the national economy.

1. *The People's Construction Bank provided loans to enterprises for capital expenditures to replace part of previous government loans.* This reform not only helped to improve economic performance, but also reined in the over-extended scale of capital construction in the interest of readjusting the economy.

The People's Bank began to extend two kinds of loans — short- and medium-term loans for purchases of equipment and loans for specified purposes — primarily to the textile and other light industries. Priority was given to enterprises that would use the funds to tap production potential, renovate obsolete plants and equipment and bring in quicker and larger returns, both at home and in markets abroad, in proportion to the money invested.

According to 1980 statistics, the People's Bank granted a total of 3,980 million yuan in short- and medium-term equipment loans to finance more than 15,000 projects for tapping production potential and for renovations. Over 5,600 of the projects were completed and put into full or partial operation in 1980. The total output value of these projects reached 4,650 million yuan. Loans to textile and other light industries accounted for 58% of total loans; these industries achieved the best results by producing 73% of the total production value of 4,650 million yuan. They not only increased their production of commodities demanded by the market — 690,000 bicycles, 730,000 watches and 440,000 sewing machines — but also improved the quality and

variety of their products and lowered the cost of production. The enterprises thus speeded up the turnover of working capital.

The People's Bank also extended short- and medium-term equipment loans totalling 180 million yuan to finance commercial enterprises in the food industries, such as processing mills for cereals and oils, delicatessens, restaurants and pastry shops, and loans totalling 240 million yuan to finance 530 hydroelectric projects. These loans also achieved good results.

The facts show that the kinds of loans granted by the People's Bank played an active part in readjusting the relationship between light and heavy industries, enlarging the supply of commodities, promoting foreign trade and supporting the technical renovation of enterprises. Bank loans to finance hydroelectric projects contributed to the development of energy resources, the supply of electricity to the countryside and the increase of agricultural production.

Formerly, the bank had granted loans only to industrial and commercial enterprises for working capital, while loans to other sectors had been much restricted. After new regulations were introduced in 1980, the bank could grant loans to cultural and scientific organisations, public utilities and the tourist industry, as well as to collective and individual enterprises run by young people in the cities — so long as their activities conform to government policies and they are able to pay off the loans. By assisting these economic sectors to prosper, the bank helped to meet market demands and to create employment opportunities. By removing restrictions on bank loans, the new regulations enabled the bank to provide more flexible services.

2. *Exercising its decision-making powers, the People's Bank adopted the principle of differentiating among borrowers and giving priority to enterprises that perform well.* Loans were to be made according to the government's credit policy, with particular reference to the purposes for which the loans were to be used and provided that the sum total of loans did not exceed the credit ceiling set by the government. The bank, however, had the freedom to select the borrower and to decide on the amount and term of the loan.

By exercising its decision-making powers, the bank was able to establish priorities of loans in the interest of readjusting the national economy. Priority was given to industries such as textiles, energy, transport and construction materials — which had trailed behind other industries — and to well-managed enterprises within these industries. The bank scaled down loans to poorly managed enterprises producing goods of inferior quality in

an effort to spur these enterprises to improve their management and their product quality. In the interest of national economic readjustment, the bank restricted loans to some enterprises so as to induce them to change their lines of production or even to close down.

In 1980, the People's Bank granted loans primarily to textile and other light industries to help them improve the quality and variety of their products and to increase production of goods in short supply. By the end of 1980, total loans to industrial enterprises had increased by 6,500 million yuan over the beginning of the year. Loans to the textile and other light industries totalled 2,987 million yuan, an increase of 33.53% over 1979, whereas loans to heavy industries rose by only 11.17%. Industrial loans to the collective enterprises in the cities increased by 2,835 million yuan, or 48.91% over 1979.

In 1980, the bank also provided commercial enterprises with working capital to finance the stocking of farm and sideline products, as well as of manufactured goods currently in demand. The bank encouraged a marketing scheme whereby the commercial enterprises dealt directly with suppliers and had as few intermediaries as possible, stocked shops with goods promptly and speeded up sales. According to estimates, the value of manufactured goods purchased directly from suppliers by shops and stores in 1980 was up by about 50% from the year before. As a result, the stores were well stocked and business was brisk.

3. *The reform in the bank's internal administration spurred local banks to raise and utilize loanable funds.* In 1980, the People's Bank put into effect on a nationwide trial basis a new scheme of "multilevel management under a unified plan, linking up loans with deposits and controlling the differential between them." According to this scheme, any branch bank that overfulfilled the norm of the differential between deposits and loans set by the head office was at liberty to grant additional loans to the extent of the additional deposits it had taken in. This scheme aimed to make each branch accountable for its own profit and loss. Hitherto, branch banks had simply passed on their credits and debits to the head office and had not bothered about whether their accounts balanced — which is figuratively called "sharing porridge from one big pot."

The new scheme has given branch banks an incentive to collect more deposits, accelerate turnover and make the most of loanable funds. Moreover, a system of cost accounting was introduced in the internal management of the People's Bank to link the material welfare of the branch banks' staff with their economic responsibility and

business efficiency. As a result, staff members began to show more interest in the profitability of banking operations and in the resources and employment of loanable funds. They took measures to improve the management and administration of the bank by speeding up the turnover of bank funds, raising efficiency and cutting back on expenditure. Thus, the turnover of bank funds was accelerated by 10% in the first half of 1980 as compared with the corresponding period in 1979; work efficiency was increased by 12.3% and cashiers' errors were reduced by 17.4%.

4. *Emphasis was placed on the interest rate as an economic lever.* Enterprises were given more decision-making power and more funds at their disposal. The incomes of urban workers and rural commune members also increased because of wage increases for some workers, the introduction of the bonus plan and increases in the prices the state paid for farm and sideline products. To take advantage of this new situation, the People's Bank again raised interest rates on savings deposits and enlarged the range of interest-bearing deposits to mop up surplus funds in the hands of the public, using interest rates as leverage.

Penalty rates were introduced on loans to industrial and commercial enterprises. The normal rate was to be raised by 20% for overdue loans, 30% for loans tied up in inventories and 50% for diversion of funds to unauthorized uses. The introduction of penalty rates encouraged enterprises to be more concerned about the results of their operations by improving business management. It was very effective in inducing enterprises to speed up the turnover of working capital, to reduce overstocking and to cut down on the amount of money that was tied up.

Individual savings grew very rapidly and the sum total of savings deposits increased substantially in 1980, largely due to increases in the incomes of farmers and city workers. But the increase in interest rates on savings deposits gave them additional incentive to make more deposits. Savings deposits in cities increased by 7,600 million — a record annual increase. By the end of 1980, the outstanding balance of savings deposits of city residents amounted to 27,900 million yuan, up 37% from 1979. There were 180 million savings accounts in 1980, of which 81% were fixed deposits; long-term deposits for 3-5 years accounted for 40% of these fixed deposits. By the end of 1980, savings deposits of rural commune members had risen by 4,200 million yuan to 12,060 million yuan, up 53.8% from 1979. The steady increase of savings deposits in the city and countryside was of great help to withdrawing currency from circulation, raising loanable funds,

relieving pressure on the market that could not keep up with the growing demand and promoting the readjustment and restructuring of the economy. (See Appendix: Current Interest Rates on Savings Deposits.)

III. Flexible and Diversified Banking Services

To keep up with economic progress, traditional forms of bank services formerly provided in China or generally provided by banks in other countries were restored, giving more flexibility and diversity — and hence more vitality — to banking activities.

1. *The domestic insurance business was resumed.* The People's Insurance Company of China is the sole state-owned insurance institution in China. After the national conference on insurance was held in November 1979, and in line with the policy of promoting production and serving the masses, the domestic insurance business resumed in 1980. The company set up more than 300 branch offices throughout the country and increased its staff by about 5,000 workers. Domestic insurance, mainly business property insurance, was resumed in large and medium-sized cities, as well as in counties where industry and commerce were concentrated. Insurance covering merchandise shipments, family property, automobiles, third-party liability, ships, etc. was underwritten in some cities.

The value of insured assets in China amounted to over 130,000 million yuan in 1980. Insurance premiums totalled more than 10 million yuan in nine provinces and municipalities. Total premiums for the country added up to 280 million yuan.

More than 1,300 indemnity cases were settled in 1980. The insurance business expanded at a rate much faster than had been expected. The company put emphasis on the prevention of disaster or attenuation of damage by promulgating various forms of propaganda and by conducting inspection tours of workshops, warehouses, docks and railway stations and by making suggestions. It also helped the insured to salvage property in order to minimize losses to state-owned property. Premiums collected by the company became a source of funds loanable by banks, thus contributing to the withdrawal of currency from circulation.

Progress was made by the company in the foreign insurance business in 1980. Premiums from import and export shipment insurance and other foreign insurance coverage amounted to some 216 million yuan, up 25% from 1979. The number and tonnage of ships insured also increased con-

siderably. To meet the requirements of international business relations as far as possible, insurance coverage was extended to new fields: insurance covering all risks of construction and installations, package insurance on the processing of materials supplied by foreign traders, insurance on compensation trade, insurance on offshore oil exploitation, surety insurance, insurance on foreign responsibilities and obligations and insurance against political risks (including war, legal seizure or requisition and changes in government decrees). More than 300 vessel or cargo surveyors were appointed in over 100 countries and regions to appraise damage on the spot for the purpose of settling insurance claims.

The People's Insurance Company of China gives a substantial share of its insurance to foreign insurance companies for reinsurance and it accepts reinsurance from foreign insurance companies. It has established reinsurance relations with more than 960 insurance companies in 120 countries, from which it collected reinsurance premiums of US\$150 million in 1980, or 20% more than in 1979.

2. *The Agricultural Bank of China was restored to improve rural banking services.* (See Chapter 42: China's Rural Banking.)

3. *The People's Bank of China in some large and medium-sized cities began to handle trust and investment business on an experimental basis and lifted restrictions on some commercial loans.* Within a year of its establishment in October 1979, the China International Trust and Investment Corporation received more than 4,000 visitors from some 40 countries and regions. The corporation negotiated over 100 co-production ventures with foreign firms, of which a dozen contracts have been or are to be signed, and agreements and letters of intent for over 60 joint projects which also have been signed. It has also concluded with a dozen foreign banks and financial institutions special credit arrangements, some of which are already operative.

4. *The People's Bank of China, with the authorization of the State Council, issued four series of commemorative coins in 1980.* These exquisite coins were minted by the China Mint Company and were well received by domestic and foreign collectors. (See Appendix: Varieties and Specifications of Commemorative Coins.)

To add variety to the currency in circulation, the People's Bank, with the authorization of the State Council, has issued since April 15, 1980, metallic coins in denominations of 10, 20 and 50

fen and of one yuan. These are in circulation on a par with banknotes of the same denominations. The four metallic coins were issued mainly to add variety, not to replace paper currency in circulation. (See Appendix: Descriptions of Metallic Coins Issued in 1980.)

The People's Bank of China raised the official purchase prices of gold, silver and platinum as of March 1, 1980, and the quantities of those precious metals purchased have increased considerably. By the end of September 1980, purchases of gold and silver amounted to 3.4 times and 1.5 times, respectively, the quantities bought a year ago. (See Appendix: Old and New Purchase Prices for Gold, Silver and Platinum.)

5. *In line with the development of tourism and of economic and cultural exchanges with foreign countries, the Bank of China, with the authorization of the State Council, issued foreign exchange certificates as of April 1, 1980, in order to facilitate payments by foreign visitors, overseas Chinese and compatriots from Hong Kong and Macao, to tighten exchange controls, to ban circulation of foreign currency in the country and to preserve the integrity of Renminbi.* Like travellers' cheques issued by the Bank of China and like the special Renminbi cheque, the foreign exchange certificate is a kind of payment instrument issued by the bank, not a currency. It is to be used for shopping at designated places for defraying expenses that must be paid in foreign currency. Exchange of foreign currency for the certificates is handled mainly by the Bank of China and a few branches of the People's Bank designated by the Bank of China. Foreign exchange certificates are in denominations of 1, 5, 10, 50 and 100 yuan and of 10 and 50 fen. When giving change for a value lower than 10 fen, Renminbi coins are to be used.

6. *The People's Bank of China also made progress in other fields of activities.* To date, 22 universities and colleges have begun to offer banking as a subject of specialization to over 2,900 students. There are also 22 banking schools below the college level with an enrollment of 8,000 students. In 1980, a national conference was held to chart the course for higher education in banking. Arrangements have since been made for teachers to write textbooks on banking for colleges and banking schools. Bank branches at all levels trained 70,000 staff members of different ranks; these accounted for about 30% of the total number to be trained.

Research on banking theory has been upgraded. By the end of 1980, research departments had been established in virtually all bank branches. Banking societies were set up in 20 provinces,

municipalities and autonomous regions. A veritable army of researchers in banking has emerged. Special studies have been undertaken on such subjects as currency in circulation and the reform of the banking system. Research on banking has contributed significantly to the emancipation of people's thinking, banking reforms, the training of staff members, improved efficiency and better management of economic development.

IV. Current Tasks of the People's Bank

(1) The People's Bank of China should focus its work on the strict control of note issuance, active support for national economic readjustment and maintenance of price stability. Budget deficits over the recent years coupled with over-issuance of bank notes have led to substantial growth in the money supply and, hence, to rising prices. The bank must make greater efforts to collect deposits and mop up excess money in circulation through control of bank credits, the mechanism of settling payments, regulation of cash flows, inducements to save and the stepping up of the insurance business. The bank must further tap the resources of savings deposits, mobilize idle funds as much as possible and exercise strict control of bank loans. Emphasis should also be placed on accelerating the turnover of loanable funds and using them to the best advantage.

(2) Versatility in banking is essential to the emergence of a flourishing economy. Bank loans should be granted to efficient enterprises in the interest of readjusting the economy. Emphasis must be put on the economic effectiveness of loans. Loans should enable borrowers to diversify production, as well as to increase the supply of goods to the market so as to provide the public with the incentive to withdraw money from circulation. The bank should give priority to financing the following sectors:

- textiles and other light industries, for the purpose of boosting production of textiles and other manufactured goods in short supply or of daily necessities;
- projects that tie up little money but bring large returns, thus creating greater wealth for the nation;
- other lines of production essential to the people's livelihood, such as cultural activities, tourism, service industries; and
- heavy industries that shift to the production of consumer goods, so as to increase market supplies and to enrich the economic and cultural life of the people.

(3) In the interest of readjusting the economy, the bank should continue to improve its work. Progress has been made in 1979 and 1980. For instance, the bank has adopted the principle of giving priority to well managed enterprises in granting loans. It has provided a wider range of services to a large number of clients with different needs and has supported cultural activities and service industries. It has provided working capital to collective enterprises run by young people in the cities and to private businesses. It has lifted restrictions on some commercial credit and has experimented with the trust and investment business. Experience has shown that such improvements in banking are beneficial to the overall economic readjustment.

However, bank services should keep up with new developments. Further improvements to be made should primarily serve the interests of readjusting the national economy.

(4) The People's Bank should perform the function of the central bank. In line with the development of the national economy, the banking system should develop into one in which various specialized banks share the work and co-operate with one another under the overall planning and coordination of the central bank. There should be a basic division of labour among specialized banks, although some overlapping is unavoidable.

The head office of the People's Bank of China should carefully examine and determine the ceilings of bank loans for specialized banks. The specialized banks may work out their own plans for bank loans, but their loans are not to exceed the ceilings set by the People's Bank of China. This requirement is necessary for the purpose of maintaining credit and cash balance so as to realize the withdrawal of money from circulation.

APPENDIX:

Current Interest Rates on Savings Deposits

Description		Interest rate per month (%)	Interest rate per annum (%)
Personal savings deposits of urban and rural residents	1. Demand deposits	2.4	2.88
	2. Fixed deposits by instalments	3.6	4.32
	for 6 months	3.6	4.32
	for 1 year	4.5	5.40
	for 3 years	5.1	6.12

Old and New Purchase Prices for Gold, Silver and Platinum*
(Effective March 1, 1980)

Description	Old prices (RMB ¥)	New prices (RMB ¥)
Purchase price at the bank counter:		
gold (per gram)	3.04	13.00
silver (per gram)	0.10	0.20
silver dollar (per piece)	2.50	5.00
platinum (per gram)	9.12	25.00

*Note: All purchase prices are based on net weight.

42. CHINA'S RURAL BANKING

By Cao Jiren

Agricultural Bank of China

In the three decades since the founding of New China, the Communist Party and the people's government have attached great importance to agricultural banking.

History of the Agricultural Bank. To improve agricultural banking and promote agricultural production, the Agricultural Bank of China was re-organized several times. As early as 1949, when Beijing was liberated, the government took the old Farmers' Bank and the cooperative treasury and merged them into the Cooperative Bank of Agriculture. But shortly after that, the Cooperative Bank of Agriculture was merged into the People's Bank of China. On three separate occasions — in 1951, 1955 and 1963 — the Agricultural Bank of China was established, but it was closed down each time for the purpose of streamlining the administrative structure.

On February 25, 1979, the State Council issued a decision reestablishing the Agricultural Bank of China. It is now a specialized bank responsible for agricultural banking in the country and a organization directly under the State Council. Its main tasks are to manage funds for financing agriculture, to grant rural loans, to supervise agricultural credit cooperatives and to develop agricultural banking in the interest of agricultural modernization.

The Agricultural Bank of China has a four-level administrative structure: a head office in Beijing, branch offices in the provinces, municipalities and autonomous regions, central sub-branch offices in prefectures and cities and sub-branch offices in counties.

Under the guidance of the Agricultural Bank, the people's communes have established credit cooperatives, which are at once collective financial entities and grassroots units of the Agricultural Bank. In most production brigades there are credit centres which form an integral part of the credit cooperatives.

Restoration of the Agricultural Bank at all levels has been completed. By the end of 1980, the agricultural banking network, comprising 27,228 offices of the Agricultural Bank and 59,500 credit cooperatives, was distributed throughout China's vast countryside.

Current Tasks of the Agricultural Bank. To enhance agricultural banking, the first national conference of bank managers was convened in October 1979, following the reestablishment of the

bank. At the conference, the managers gained a deeper understanding of party policy by criticizing "Left" thinking, by reviewing the lessons learned from experience and by distinguishing between the right and wrong of our political lines. At the same time, these main tasks were set forth: to foster agricultural banking, to mobilize lending funds, to manage them well and employ them in the best possible way, and to promote the rapid development and modernization of agriculture.

In May 1980, a meeting was convened to exchange experiences in "how to support the production of marketable farm products to stimulate the economy." At the meeting it was declared that the guiding principle of agricultural banking was to support the production of marketable farm products by taking measures suited to local conditions, with emphasis on practical performance, so as to stimulate the rural economy. A separate forum for branch managers was held from June to July 1980 to discuss ways in which to reform the banking system, to reformulate credit policy, to enlarge the range of loans, to provide more flexible services by the bank and credit cooperatives and to achieve greater progress in rural banking.

China has a rural population of 800 million, over 2,000 counties, 50,000 communes, 710,000 production brigades, 5 million production teams, 170 million farm families and 1.5 million enterprises operated by communes and brigades, plus a multitude of state-owned farms and ranches. We see great potential for the expansion of agricultural credit.

Rural Banking Achievements in 1980. With the growth of agricultural credit and the rural economy, progress was made in rural banking in the following five areas:

(1) The Agricultural Bank placed top priority on the mobilization of lending funds and rural deposits grew rapidly. By the end of 1980, deposits with the Agricultural Bank and credit cooperatives totalled 41,800 million yuan, up 9,600 million from the previous year, or an increase of 30%. Of the total, 14,800 million yuan were in savings deposits in the countryside — an increase of 4,900 million yuan, or 49%, over 1979 and the highest annual increase since the founding of the People's Republic.

(2) The Agricultural Bank granted loans with

a quicker turnover and produced the desired results. By the end of 1980, loans granted by the Agricultural Bank and credit cooperatives totalled 31,000 million yuan, or 11,600 million more than the previous year, representing an increase of 59.6%. Repayments amounted to 24,400 million yuan, up 7,400 million from the year before, or an increase of 43.4%. A larger share of the loans were used to encourage the production of marketable farm products by communes, brigades and individuals, and a smaller share for relief or for covering deficits. Loans for rural trade increased by 5,400 million from the year before, an increase of 19.7%. The loans have increased sales in the rural areas and have stimulated trade between the cities and the countryside.

(3) The Agricultural Bank made a preliminary reform of credit control by instituting a

scheme whereby branch offices might make more loans with the additional deposits they have collected. This gave the branch offices a material incentive to collect more deposits, to make the most of lending funds and to speed up their turnover.

(4) The Agricultural Bank achieved good results in unifying its control of lending funds, in supervising government allocations to the agricultural sector, in training accountants for the communes and production brigades and in giving them advice on how to use their funds to the best advantage.

(5) The Agricultural Bank did much work in setting up and staffing branch offices, training staff members, experimenting with cost accounting and procedures and instituting or upgrading some regulatory systems.

43. THE DEVELOPMENT OF CHINA'S INTERNATIONAL BANKING

By the Research Department,
Bank of China

Since the founding of the People's Republic, China's international banking has played an important role in rehabilitating and developing its national economy and in advancing socialist construction.

I. Principles and Policies

China has adhered to the following principles and policies in its international banking:

(1) *Maintain the Bank of China's independence and its centralized and unified management of international banking.* Until Liberation, the financial market in China had been dominated by foreign banks and by Chinese bureaucratic capitalists, landlords and compradors. China's international payments and banking had been manipulated by foreign banks in China.

After the founding of New China, the government took over the Kuomintang's financial institutions and transformed the banks and money shops that were under private ownership into enterprises under joint state-private ownership. The Bank of China was designated by the state as a specialized bank for international banking. Control over the financial market was tightened. The government liquidated foreign banks in China, stripped them of special privileges and put foreign exchange under its centralized control and unified management.

Renminbi was declared the legal tender. Its exchange rates against foreign currencies were officially quoted by the Bank of China. Holders of foreign currencies were required to sell them to the bank within a given time. Renminbi was not allowed to be taken out of China and the free inflow of foreign currencies and foreign capital was banned.

Organizations and individuals are prohibited from dealing in foreign exchange or transferring abroad their funds, property or interests in China without authorization. Unless otherwise authorized, their foreign exchange incomes must be sold to the Bank of China. If they should have need of foreign exchange, they may purchase it from the Bank of China according to official regulations and with the approval of the government.

Individuals are allowed to possess gold and silver, but trading in these metals without autho-

rization is prohibited. The People's Bank of China is the institution which handles such transactions in China and the Bank of China is the institution in charge of such transactions abroad.

Before 1968, foreign currencies had been used exclusively to settle trade payments. In that year, Renminbi was adopted for trade payments on a trial basis between China and Hong Kong and Macao. Payment in Renminbi was extended to countries in Europe such as the United Kingdom, France, Switzerland and West Germany in 1970, thus bringing to an end the era in which trade payments were made exclusively in foreign currencies.

(2) *Mutual benefit and equality guide China's international banking.* In the old days, our international payments were manipulated by foreign banks in China and discriminatory payment methods were imposed on Chinese banks and traders. For instance, Chinese banks could only issue the authority to purchase — instead of letters of credit — to settle payments for imports and had to make 100% down-payments to the negotiating bank when the authority to purchase was issued. Foreign correspondent banks, on the other hand, could open letters of credit to cover their import payments and they made payment only on receipt of the shipping documents.

Since the founding of New China, such discriminatory practices have gradually been eliminated. Upholding the principle of mutual benefit and equality, we improved the terms of payment and speeded up the receipt of export proceeds. In settling payments with Third World countries, we deal as far as possible with their native banks so as to encourage the development of their banking industries.

(3) *Respect contracts and commitments and safeguard the country's credit standing.* It has always been our policy to respect contracts and commitments in international banking. In the 1960's, the Soviet Union reneged on its contracts with China and withdrew its experts, causing a period of economic distress. Notwithstanding these difficulties, we paid off our loans to the Soviet Union ahead of schedule.

The Bank of China is always prompt in settling international payments. It repays the principal

and interest on interbank deposits and on loans when due. The Bank of China is highly regarded in the international money market and it prides itself on safeguarding the nation's international credit standing.

For a long time, the Bank of China had not done as much as it should have done in pooling, investing and accumulating foreign exchange funds. Not until the end of the 1960's did it expand interbank deposits with foreign banks and grant loans to domestic enterprises for the import of essential equipment to advance our socialist economy. Such loans were granted, as an exception, to the transport department for the purchase of freighters from abroad to build up China's ocean-going fleet. But due to "Left" guidelines in economic construction and, in particular, to the disruption caused by Lin Biao and the Gang of Four, foreign capital was used on a limited scale.

II. Recent Developments in China's International Banking

After the smashing of the Gang of Four, China embarked on an ambitious programme to turn itself into a strong, modern socialist country. Because of the shortage of funds and lack of expertise in advanced technology and business administration, China has had to pursue an open-door economic policy based on the principles of self-reliance, mutual benefit and equality. As a result, it has made substantial progress in international banking.

(1) *Upgrading of governmental powers and responsibilities and restructuring of government organizations.* With a view to overseeing the import-export trade and the utilization of foreign capital, the State Council of the People's Republic of China established in 1979 the State Administrative Commission on Import and Export Affairs and the Foreign Investment Commission. It also set up the State General Administration of Exchange Control (SGAEC) and the China International Trust and Investment Corporation (CITIC) in March and October, respectively, of that year and placed these two organizations under its direct leadership.

To give full scope to the role of the Bank of China, the State Council approved the restructuring of the bank's organization and placed the bank under its direct control. Furthermore, in September 1980, the State Council approved the bank's revised Articles of Association, which determined its status as a socialist state-owned enterprise. The bank's capital was also increased from 400 million yuan to 1,000 million yuan.

In line with the expansion of China's economic, trade and financial ties with foreign countries, the Bank of China had broadened its domestic network to 114 branch offices by the end of 1980. Its overseas offices had multiplied to 206, of which 196 are in the Hong Kong and Macao region, 6 in Singapore, 3 in the United Kingdom and one in Luxembourg. The bank established a representative office in Tokyo and preparations are underway for setting up a branch office in New York and a representative office in Paris.

(2) *Discretionary use of foreign capital and the strengthening of financial cooperation with other countries.* To speed up its modernization, China has been prudently absorbing foreign capital and selectively importing the advanced technology and equipment it urgently needs. China's external financial policy is that "self-reliance comes first, to be supplemented by assistance from abroad." Apart from increasing the deposits of the Bank of China, the government signed credit agreements in 1978 with the United Kingdom, France, Japan, Italy, West Germany, Sweden, Canada, Australia, Belgium and Argentina. So far, very little of the credits has been used. The relations of the Bank of China with the United States are growing fast.

By the end of 1980, China had made use of the following forms of foreign credit: low-interest loans from foreign governments; buyer's and seller's credits; interbank loans; compensation trade; joint ventures; cooperative production; leasing; and processing and assembling raw materials or parts supplied by foreign buyers.

Apart from its undertaking to complete formalities with foreign financial institutions for credit arrangements, the Bank of China has stood surety for Chinese enterprises engaged in various joint ventures with foreign firms. In 1980, two financial corporations were set up in Hong Kong, one jointly run by the banks of the People's Republic of China, the United States and Japan (CCIC Finance Ltd.) and the other by the banks of China and Japan (the Kinchong-Tokyo Finance Company). The Hong Kong and London branches of the Bank of China have taken part in international loan consortia. What is more, the head office of the Bank of China, established in October 1980 a trust department which signed reciprocal arrangements with many foreign banks and leasing companies, and so did the trust departments of more than 10 Bank of China branches.

To suit China's present financial conditions, we mainly make use of low-interest or interest-free loans from foreign governments or international financial organizations and some buyer's credits. On the basis of mutual benefit and equality and without detriment to our national sovereignty,

we use foreign capital in various forms customary to international practice. In utilizing foreign capital, the primary consideration is the economic performance the loan will provide. We first study whether the project is feasible and then synchronize its financing, technological requirements and business administration. We accept foreign loans according to our ability to repay and respect international contracts and commitments.

(3) *Resumption of China's representation in the International Monetary Fund and the World Bank and extension of cooperation with the world financial community.* China is one of the founding members of the International Monetary Fund (IMF) and the World Bank, but it was unable to exercise its representation in those organizations for 31 years. Through negotiations with the two organizations in March and April 1980, and with the friendly support of many countries, China's representation in the Fund and the Bank was restored respectively on April 17 and May 15, 1980.

Li Baohua, President of the People's Bank of China, was appointed China's Governor in the IMF and Wang Weicai, Vice-President of the Bank of China, was named Deputy Governor. Finance Minister Wang Bingqian and Vice-Minister Li Peng were appointed, respectively, China's Governor and Deputy Governor in the World Bank.

On September 3 and 26, 1980, respectively, the two organizations passed resolutions increasing China's quota in the IMF and its subscription to the World Bank. We assigned our executive directors and deputy executive directors to the organizations after additional seats were made available to us. In September 1980, the delegation of the People's Republic of China attended the annual meeting of the IMF and the World Bank for the first time. China will exercise its rights and fulfill its obligations according to the charters of the IMF and the World Bank.

The Bank of China has established correspondent relationships with 1,003 banks of 144 countries and regions, including their 2,735 branches. The China International Trust and Investment Corporation has business ties with financial institutions in many countries.

Two foreign banks — the Standard Chartered Bank and the Hong Kong and Shanghai Banking Corporation — and two overseas Chinese banks — the Bank of East Asia, Ltd. and the Overseas-Chinese Banking Corporation — which had operated in China in the old days still remain in business for historical reasons. In 1980, eight foreign banks and three insurance companies received approval to establish representative offices in Beijing. These banks and companies represent

Japan, the United States, France, Italy and the United Kingdom.

Business contacts between Chinese and world banking circles have also increased. China received 156 delegations of foreign bankers in 1980 alone and the range of business discussion was widened. During these visits, we had the opportunity to organize a number of seminars and forums on international financial problems. In 1980 the Bank of China sent 14 delegations to visit the banking communities of the United States, Japan, Canada, Korea, the Philippines, Singapore and Thailand and to attend some international forums on the world economy and China's economy. The Bank of China also sent staff members as trainees to banks in the United States, Japan and the United Kingdom to study international finance.

(4) *Enacting economic legislation to protect China's interests and the legitimate interests and rights of foreign investors.* With the expansion of China's economic, trade and financial relations with foreign countries, it has become a matter of increasing urgency to enact laws that will provide a code of conduct for the Chinese and their foreign partners in joint ventures and to protect their mutual interests.

In July 1979, the Law Concerning Joint Ventures with Chinese and Foreign Investment was promulgated to protect the interests of foreign investors in statutory form. A series of regulations were issued in 1980. The Provisional Regulations for Exchange Control were promulgated in December 1980 and went into effect on March 1, 1981. Supplementary provisions related to these regulations will be made known.

In respect to exchange controls, we will continue to follow the policy of centralized control and unified management. The limited foreign exchange in the hands of the government will be used according to plan and where it is most needed for the improvement of the people's livelihood and for the country's socialist construction.

With the development of our national economy, increased external economic activities and the restructuring of organizations, exchange controls have been extended to new fields. For instance, to encourage foreign investments in China, joint ventures with Chinese and foreign ownership are given some leeway in foreign exchange transfers, provided these are related to normal business activities and are subject to the supervision of the Bank of China. In addition, local governments, government departments and enterprises that have been given larger decision-making powers also have been given permission to retain a portion of the foreign exchange they earn — to be used at their discretion, but in accordance

with the plan and subject to the supervision of the Bank of China. Private individuals are allowed to retain a certain percentage of the foreign exchange they own. The details governing extended exchange controls will be set forth in supplementary regulations.

In the last two years, the open-door economic policy has increased the amount of business handled by the Bank of China. The bank's balance sheet for 1980 showed a rapid increase in business volume: deposits went up 46% from the previous year; remittances increased by 60%; guarantees, trusts and collections grew by more than 28%; and lending rose by over 50% (an increase of 96% if interbank deposits are excluded). The bank's net profits more than doubled.

China is in the midst of readjusting its nation-

al economy, and its international banking activities must be coordinated with overall economic activities. There is no change in our policy of making use of foreign capital, but foreign capital must be used mainly to support the readjustment of the national economy, the production of goods in short supply, the growth of export-oriented industries, the efforts of tapping production potential and renovating old factories, and the improvement of the people's livelihood.

We are confident that through this readjustment, China's economy will develop on a sounder basis. China holds out bright prospects for its economic construction and for still closer economic, trade and financial ties with other countries.

44. PRICES IN CHINA

By Duan Jianke

State Administration Bureau for Commodity Prices

Since the founding of the People's Republic of China, we have adopted the policy of stabilizing prices so as to improve the people's standard of living and to carry out smoothly the country's socialist construction.

I. History of Price Controls

In the early years after the founding of the People's Republic, the government consolidated its control of the nation's finances and the economy by deflating the currency, regulating taxes and strengthening market controls. By controlling the group purchasing power of state-owned enterprises, organizations and army units, the amount of money in circulation was significantly reduced.

At the same time, the government stocked such major commodities as grain, cotton cloth, coal, salt, etc. and sold them at fixed prices in the country's major cities, thus dealing a heavy blow to the speculative activities of the capitalists who were endangering the national economy. This put an end to the chaos of inflation and brought us a decisive victory in the struggle to stabilize market prices. By 1952, price stability was further consolidated with the recovery and development of the national economy.

First Five-Year Plan Period. During the First Five-Year Plan period (1953-1957), the policy of placing state orders for processing materials and manufacturing goods with private enterprises was begun in order to achieve the socialist transformation of agriculture, handicrafts and capitalist industry and commerce. This policy gave the state the monopoly of the purchase and marketing of such basic commodities as grain, cotton, oil crops and pigs, and of the proper application of the law of value. In the exchange of industrial goods for agricultural products, we adopted a policy of exchanging goods of equal or near-equal values. For industrial goods, we also implemented the policy of seeking small profits but rapid returns. For some agricultural products, such as grain, oil, pigs, we raised the state's purchasing price while keeping market retail prices stable. In this way we were able to narrow the price differential between industrial and agricultural products that was the legacy of the old society.

Comparing 1957 with 1952, the purchasing prices of agricultural products increased by 20.2% while retail prices of industrial products in rural areas increased by only 2.2%. The price differential between industrial and agricultural products was thus narrowed by 15%, which meant that peasants could obtain 17.6% more industrial products in exchange for the same amount of agricultural products.

The Difficult Years. During the difficult years from 1959 to 1961, serious natural calamities and our own errors caused industrial and agricultural production to drop by a large margin. Many major consumer goods were in short supply as purchasing power outstripped the supply of commodities. In 1960, the supply of consumer goods was only 87.9% of total purchasing power. Prices at rural fairs went up sharply during this period, averaging three times as much as the list prices in state-owned shops.

Tight Controls. To tighten control over prices, the State Commodity Prices Commission issued on February 25, 1963 a list of 18 commodities considered as daily necessities and stipulated that the prices of these commodities, which accounted for about 60% of the living expenses of staff members and workers, must be maintained at the stipulated level, with no fluctuation permitted. Any losses suffered by enterprises as a result of the stipulations would be subsidized by the state. This was an extremely important government measure to guarantee the standard of living of staff members and workers.

At the same time, in order to make up the losses incurred by enterprises and to narrow the gap between purchasing power and the supply of commodities, the state raised the prices of more than ten kinds of secondary consumer goods. Through the sales of these higher-priced items, several thousand million dollars of purchasing power were absorbed.

During the three years of economic difficulties, market prices rose to a level unprecedented since the founding of the People's Republic. Comparing 1962 with 1957, the general index of retail prices in the country increased by 25.8%, and in 1961 alone an increase of 16.2% was registered over 1960. In 1963-64, the overall economic situation improved, prices at rural fairs dropped signi-

ificantly and market prices as a whole returned to normal.

Market Price Problems. By 1965, the readjustment of the national economy was basically achieved and market prices had returned to normal. The prices of the 18 daily necessities had remained stable and the ratio between prices at rural fairs and prices at state-operated shops had also returned to normal. Most high-priced commodities were selling at parity prices, while other high-priced item had their prices considerably lowered. Nevertheless, there were some outstanding problems with market prices:

(1) The unified selling price of grain in cities and towns was not only lower than the unified selling price of grain in rural areas, but also lower than the unified purchasing price of grain. This resulted in the irrational situation in which people in urban areas could buy grain at lower prices than the peasants.

(2) In northern and northeastern China, where much of the coal is mined, the selling price of coal was low and, as a result, losses were incurred in commercial sales of coal.

(3) The price of cotton cloth had remained unchanged for many years and was incompatible with the new situation. Prices for low-grade cloth were low, so that profits were low and losses were even incurred in sales of some items, thus affecting production and supply. On the other hand, prices for high-grade cloth were high and allowed a large profit to be made, but the prices affected their marketing.

Price Readjustments. The Central Committee of the Communist Party of China and the State Council jointly issued the "Resolution on the Readjustment of Present Market Prices" on January 19, 1965. Its main provisions were as follows:

(1) The unified selling price of grains in cities and towns should be raised on a par with the unified purchasing price of grain. To alleviate the difficulties this would cause to the majority of staff members and workers in the cities, those staff members and workers with low incomes should be subsidized according to the increase in the price of grain, so as to guarantee their standard of living.

(2) The market price of coal should be raised

Table 1. General Price Index for 1979

Index	National retail price	Purchasing price of farm by-products	Retail price of industrial products in rural areas	Composite price parities between industrial and agricultural commodities	
				$\frac{(3)}{(2)} \times 100$	$\frac{(2)}{(3)} \times 100$
	(1)	(2)	(3)	(4)	(5)
Average 1950 prices = 100	138.6	265.5	109.9	41.4	241.6
Average 1952 prices = 100	124.0	218.3	100.2	45.9	217.9
Average 1965 prices = 100	114.3	181.6	98.0	54.0	185.3
Average 1957 prices = 100	102.0	141.3	92.9	65.7	152.1
Average 1975 prices = 100	105.1	127.2	100.3	78.9	126.8
Average 1978 prices = 100	102.0	122.1	100.1	82.0	122.0

Note: In this table, the general price index includes the list price, the negotiated price; the increased price for quantities supplied in excess of purchasing quota and the market price.

by an appropriate amount where losses have been incurred in the commercial sale of coal.

(3) While the general selling price of cotton cloth should remain basically unchanged, the prices of certain low-grade cloth should be raised and the prices of certain high-grade cloth should be lowered; at the same time, regional price differentials and differentials between wholesale and retail prices should be readjusted.

(4) In order to raise the low incomes of grain-growing peasants and to promote the production of grain, a reward system would be set up whereby production teams supplying commodity grain in excess of the quota set by the state would receive higher prices for their grain. Furthermore, the prices of agricultural means of production would continue to go down and the prices of certain manufactured goods for which prices were high but which were supplied in sufficient quantity, would be lowered.

Compared with 1962, the general retail price index for the nation in 1965 dropped by 4.7% and prices at rural fairs went down by 46%.

During the ten years of the "cultural revolution," chaos reigned in politics and in the economy. In order to maintain price stability, the party's Central Committee and the State Council jointly issued the "Provisions Concerning Stricter Economy in Making Revolution, Control of the Social Purchasing Power and Enhanced Control of Funds, Materials and Price," with the intention of freezing prices. But, due to the interference and sabotage of Lin Biao and the Gang of Four, price organizations were practically abolished in 1969, their personnel were transferred to other posts and no readjustments in prices were made. As a result, the unreasonable price parities between industrial and agricultural products, between raw materials and manufactured goods and between new and old products were not corrected for a long time and problems piled up. Compared with 1965, the nation's general retail price index in 1976 showed a drop of 2.2%. Because price discipline was slack during the 10-year period, prices were increased at will and price rises in disguised forms were very common. In 1976, prices at rural fairs were up by 40% over those in 1965, seriously affecting the stability of market prices and the people's standard of living.

II. Recent Developments in Achieving Price Stability

Since the smashing of the Gang of Four, price organizations at all levels have been restored or

established, the number of people working in them has increased and unreasonable prices have gradually been readjusted. In December 1978, the Third Plenary Session of the 11th Party Central Committee, with a view to narrowing the price differentials between industrial and agricultural products, suggested that the State Council take the following decisions: raise the unified purchase price of grains by 20% beginning in 1979, when the summer grain crops reach the market; raise by a further 50% the purchase price of grains supplied in excess of state purchasing quotas; and raise gradually — and by amounts corresponding to different conditions of production — the purchase prices of sideline products, such as cotton, oil crops, sugarcane and beets, animal products, aquatic products, forestry products and so on.

The Third Plenary Session of the Party Central Committee noted, however, that after the increases in the purchase prices of agricultural products, the state should ensure that there is no reduction in the living standard of staff members and workers in the cities and that, therefore, retail grain prices should in no case be raised, while prices of other farm products, constituting the daily necessities of the masses, would also be stabilized. For certain items whose prices must be raised, the recommendation was that appropriate allowances be given to consumers.

Purchasing Prices. It was in this spirit that the purchasing prices of 18 major farm products were raised by a large margin in April 1979. While the general index of purchasing prices of farm products rose by 22% over the previous year, the producer price of plastic film for farm use in some areas, as well as the maximum price for farm diesel oil in remote areas, were lowered. These adjustments played an important role in promoting agricultural production and in improving the living standard of the peasants.

The producer price of coal was raised as of May 1, 1979, so as to end the losses incurred by many coal mines due to the unreasonably low prices that had prevailed for a long time. In addition, the prices of certain non-ferrous metals and mineral products were also raised, while the prices of certain engineering and electronic products were lowered.

The rise in the purchasing prices of farm products and in the producer prices of certain industrial products, such as coal, helped to raise production, enlarge the distribution of commodities, stabilize the market and adjust relations among producers, commercial departments and consumers.

Selling Prices. In September 1979, the State

Council made the following decisions pertaining to selling prices of consumer goods under different conditions:

(1) The selling prices of daily necessities, such as food grains, edible oils, cotton cloth, sugar and coal, would remain unchanged, with the state subsidizing any deficit that might be incurred as a result.

(2) The selling prices of eight nonstaple foods — pork, beef, mutton, poultry, eggs, aquatic products, vegetables and milk — would be raised as of November 1, 1979. In order not to lower the living standards of staff members and workers as a result of these price rises, subsidies for nonstaple foods would be granted at the same time, simultaneous with wage increases and the raising of wage scales in certain regions. After price rises in these eight nonstaple foods, changes in the prices of related products and in charges for repairs and services would be strictly controlled, unnecessary links cut out, large price differentials narrowed, profits on the high side lowered, and the quality of products guaranteed, with any covert price rises forbidden.

(3) The selling prices of other consumer goods in general should not be raised if they could be maintained at the old level. Price rises that must be made should be balanced by the simultaneous lowering of other prices.

With a view to stimulating the production and distribution of small consumer goods and to satisfy market demand, the State Council further stipulated that the law of value should be fully utilized in respect to the small volume of farm by-products and special local products. The function of market regulation should be brought into play gradually to return to the method practiced before 1957: namely, prices can go up and down, products can be purchased and sold at negotiated prices, such that high prices in can be offset by high prices out, and low prices in can be matched by low prices out. The necessary measures of control should be taken in order to avoid serious price fluctuations.

Retail Prices. After the increase in prices of eight major nonstaple foods and of their related products in November 1979, the general index of national retail prices for the month of December — including list prices and negotiated prices — increased by 5.9% compared with that for the corresponding period in the previous year. The list prices of state-operated shops increased by 5.3%, or 1.9% if compiled on an annual basis.

Over the past 30 years, market retail prices in

the cities and countryside have been basically stable. The purchasing prices of farm produce have been raised gradually, while the prices of the agricultural means of production have been lowered, and price differentials between industrial and agricultural products have been narrowed step by step. Comparing 1979 with 1950, the nation's general retail price level — including list prices, negotiated prices and market prices — increased by 38.6%; the purchasing prices of agricultural products rose by 165.5%; and retail prices of industrial products in the countryside were up by only 9.9%, thus narrowing the price differentials between industrial and agricultural products by 58.6%. Peasants now obtain twice as many industrial goods against the same amount of agricultural products.

Curbing Prices. To ensure the stability of market prices and the people's standard of living, the Party Central Committee and the State Council issued on April 8, 1980, the "Circular to Tighten the Control of Prices and to Curb Resolutely Unrestrained and Disguised Price Rises." By this means, the party and government prohibited unauthorized rises in commodity prices under the state plan and unauthorized increases in collection items. Also prohibited were disguised price rises, such as making up deficits, adding to surpluses and increasing bonus funds. Poor-quality products which are the result of shoddy workmanship or inferior materials must be improved within a given time. If quality fails to improve within the given time, the price of the products should be revised, i.e., reduced, accordingly.

In respect to agricultural products, the higher prices paid for supplies in excess of the state purchasing quota and price subsidies should be granted in conformity with the stipulations of the State Council. Not all localities and departments are allowed to increase the assortment of purchases or to enlarge the range of price increases and subsidies.

Commodities whose prices are subject to negotiated purchase and sale are limited to the third category of agricultural products and to small industrial consumer products and to the first and second categories of agricultural products which are allowed to be put on the market after their purchasing quotas have been fulfilled. Negotiated purchase and sale of manufactured goods for daily use in the first and second categories is equally prohibited. The assortment of commodities subject to negotiated purchase and sale is to be specified by the provinces, municipalities and autonomous regions. The price level for negotiated purchase and sale should be set so as to help promote the development of production, to in-

crease the supply of commodities, to activate markets in cities and rural areas and to keep down prices at rural fairs — thus taking into consideration the interests of the state, the producers and the consumers.

After the "Circular" was issued, different localities, departments, enterprises and institutions organized teams to monitor prices.

In the second half of 1980, the national economy was still sluggish. Revenues and expenditures did not balance; the gap between the purchasing power of social groups and the supply of commodities remained large and the prices of many commodities went up. Multi-outlet business operations were encouraged to play an active role in stimulating city and rural markets. However, their activity was not immediately followed by proper measures of control; it set off another round of price fluctuations.

To implement the "Circular" issued by the Party's Central Committee and the State Council and to stabilize the economy and the people's livelihood so as to guarantee the smooth progress of socialist construction, the State Council issued its "Circular Concerning the Tight Control of Prices and the Rectification of Negotiated Prices." The stipulations in this document stressed that the retail prices of industrial and agricultural commodities listed by the state must be held steady, without exception, and prohibited their increase. The retail price of commodities sold at negotiated prices in all cities, industrial and mining districts, county towns and villages must not rise above the level of December 7, 1980. These prices are permitted to go down, but not to rise.

Negotiated purchase and sale of commodities must be carried out according to the principles laid down by the State Council and within the range specified by the governments of the provinces, municipalities and autonomous regions. Means of production allocated by the state plan, including that portion in excess of production quotas and the portion which individuals may sell, as well as the first and second categories of manufactured goods for daily use, must be sold at the prices fixed by the state. The first and second categories of agricultural by-products are not allowed to be marketed at negotiated prices or sold at rural fairs before fulfillment of the state purchase quotas. Also, products produced by collectives are not allowed to be distributed to individuals for resale.

Units which make purchases in areas where production of agricultural by-products in the third category is concentrated must submit to unified control and supply of goods, and the mutual driving up of prices is strictly forbidden. The top limit of negotiated prices should be determined by the people's governments of the provinces, munic-

palities and autonomous regions and these prices should be made public. Resale of goods for profit by any organization, team, army unit or institution is strictly prohibited. Control of rural fairs must be enhanced according to state policy so as to give full scope to its positive role.

Price Investigations. After the second "Circular" of the State Council was promulgated, the State Administration Bureau for Commodity Prices together with a number of related departments jointly organized 14 price inspection and investigation teams to go into different localities throughout the country. The task of these teams was to assist in the implementation of various measures set forth in the "Circular," to correct any violations of the price policy and to study the new situation and new problems.

The initial report of the investigation teams indicated that all localities paid attention to the "Circular" and earnestly carried out the required steps. The prices of commodities managed by state-operated shops and by supply and marketing cooperatives were put under control. Some of the commodities which had to comply with the stipulations relating to negotiated prices were no longer sold at negotiated prices. The level of prices at rural fairs remained stable or even went down a little.

Retail Price Index. Compared with 1979, the general index of national retail prices, including the list price, negotiated price and market price, increased by 6% in 1980. This accounted for increases of 8.1% in cities and of 4.4% in rural areas. The prices of consumer goods rose by 7.1% and the cost of agricultural means of production by 1%.

Implementing Price Controls. In order to further implement the principle of readjusting the economy and to achieve political stability, we must first of all put into effect the State Council's "Circular Concerning the Tight Control of Prices and the Rectification of Negotiated Prices." We must make a great effort to readjust the range and level of negotiated prices of agricultural products. Prices of the means of production allocated under the state plan must be strictly controlled according to state stipulations. Price inspections must be made continually in order to maintain the stability of market prices and of prices for light industrial products.

Following the implementation of the principle of readjustment, restructuring, consolidation and improvement of the national economy, the price system as well as the management of prices should undergo a comprehensive readjustment and re-

structuring on the basis of increased production and a stable economy to the extent permitted by

the financial and material resources of the country.

Table 2. Classified Index of Retail Prices in China in 1980 (1979 = 100)

	General Index	List price index of state-operated commerce
General index of retail prices	106.0	104.4
1. Index of prices of consumer goods	107.1	105.2
A. Foods	110.5	107.4
Grains	103.5	100.3
Nonstaple foods	119.0	113.8
Tobacco, liquor, tea	100.5	100.5
Other foods	106.4	105.5
B. Clothing	100.0	100.0
C. Articles of everyday use	101.2	101.0
D. Articles for cultural and entertainment use	100.7	100.7
E. Medicine	100.9	100.9
F. Fuels	100.7	100.2
2. Price index of the agricultural means of production	101.0	101.0

Note: In this table the general index includes the list price, negotiated price and market price.

45. RAPID DEVELOPMENT OF TOURISM

By the General Office,
General Administration of Travel and Tourism of China

China's tourism grew rapidly in 1980. The volume of foreign tourists, the total number of tourists in all categories and income in foreign currency were the highest in history.

Statistical Summary

In 1980, China's tourist departments and other relevant divisions received 5.7 million visitors. These comprised foreigners, compatriots from Hong Kong, Macao and Taiwan and overseas Chinese who came to China as tour members, on visits, on vacation or on survey trips, or to engage in trade, sports activities and scientific and cultural exchanges. The 1980 figure represented an increase of 1,499,100, or 35.6% over 1979.

Among the visitors in 1980, 529,000, or 9.3% of the total, were foreigners, an increase of 46% over 1979; 34,000, or 0.6%, were overseas Chinese, an increase of 64.6%; 5,139,000, or 90.2%, were compatriots from Hong Kong, Macao and Taiwan, an increase of 34.5%. Over 90% of the total number of visitors who entered China last year were compatriots from Hong Kong, Macao and Taiwan on home visits.

The China International Travel Service received 218,700 foreign tourists, an increase of 33.9% over 1979. The China Travel Service (the Overseas Chinese Travel Service) received 694,700 overseas Chinese, compatriots from Hong Kong, Macao and Taiwan and foreign nationals of Chinese origin, a decrease of 13.8%.

The All-China Federation of Trade Unions, All-China Youth Federation and the State Commission of Physical Culture and Sports received over 20,000 compatriots from Hong Kong, Macao and Taiwan, overseas Chinese and foreign visitors.

In 1980, foreign currency income from tourism rose to U.S.\$617 million, an increase of U.S.\$167 million, or 37.1%, over 1979. Of this total, 36%, or U.S.\$222 million, came from the sales of commodities (the rate in Shanghai was 40%). The average spending rate for commodities was U.S.\$108.1 per person. However, foreign tourists had a higher consumption level, with tourist groups from Europe, America and Oceania averaging about U.S.\$1,000 per person.

The foreign tourists visiting China in 1980 came from 110 countries and regions. Japanese

made up 32% of the total; U.S. visitors were second, with 19.2%.

Tourist Cities and Areas

In 1980, 220 cities and areas were open to foreign tourists. They included:

Beijing; Tianjin (including Dagang and Yangcun);

Hebei Province: Shijiazhuang, Tangshan, Zunhua, Shashiyu, Handan, Qinhuangdao, Chengde, the Zhaozhou Bridge, Xibaipo village, the Gangnan Reservoir, Beidaihe and Zuoxian County;

Shanxi Province: Taiyuan, Dazhai, Yangquan and Datong;

Inner Mongolian Autonomous Region: Hohhot, Baotou and Xilinhot;

Liaoning Province: Anshan, Dalian and Fushun;

Jilin Province: Changchun and Jilin;

Heilongjiang Province: Harbin and Daqing; Shanghai;

Jiangsu Province: Nanjing, Suzhou, Wuxi, Yangzhou, Zhenjiang, Changzhou, Huai'an, Yixing, Lianyungang Port and Xuzhou;

Anhui Province: Hefei, Wuhu, Ma'anshan, Huangshan Mountain and Qingyang (Mt. Jiuhua);

Zhejiang Province: Hangzhou, Shaoxing, Ningbo, Wenzhou, Leqing (Yandang Mountain) and Mt. Mogan;

Fujian Province: Fuzhou, Xiamen, Zhangzhou and Quanzhou;

Jiangxi Province: Nanchang, the Jinggang Mountains, Mt. Lushan (including Jiujiang and Xingzi County) and Jingdezhen;

Shandong Province: Jinan, Qingdao, Shengli Oilfield, Tai'an (Mt. Taishan), Zibo, Yantai, Changwei (Weifang, Anqiu, Linqu) and Qufu;

Henan Province: Zhengzhou, Luoyang, Anyang, Linxian County, Kaifeng, Xinxian, Huixian County, Gongxian County, Sanmen Gorge, Xinyang (Mount Jigong) and Yuxian County;

Hubei Province: Wuhan, Shashi, Xiangfan, Danjiang and Xianning;

Hunan Province: Changsha, Shaoshan, Xiangtan, Hengyang and Yueyang (Lake Dongting);

Guangdong Province: Guangzhou, Zhaoqing, Conghua, Foshan and Hainan Island (Haikou);

Guangxi Zhuang Autonomous Region: Nanning, Guilin, Liuzhou, Wuming, Guiping, Yangshuo and Binyang;

Sichuan Province: Chengdu, Chongqing, Wanyuan County, Leshan and Mt. Emei;

Yunnan Province: Kunming, Lunan (Stone Forest) and Jinghong (Xishuangbanna);

Shaanxi Province: Xi'an and Yan'an;

Gansu Province: Lanzhou, Jiuquan, Jiayu Pass and Dunhuang;

Xinjiang Uygur Autonomous Region: Urumqi (Heaven Lake), Shihezi and Turpan.

Also included was the section of the Changjiang River between Chongqing and Shanghai; and the coast line extending from Shanghai to Qingdao, Yantai, Dalian and Tianjin.

Some areas not included on the above list may receive tourists by special permission. Examples are Lhasa of Tibet and Dazhu of Sichuan.

Beijing, Shanghai, Guangzhou, Hangzhou, Xi'an, Guilin, Nanjing, Suzhou and Wuxi were the most frequented cities. Some 80% of all tourists visited Beijing. In addition to being the national capital, Beijing is a place of scenic beauty; major sites include the Great Wall, the former Imperial Palace, the Ming Tombs and the Summer Palace. Other cities have a similar appeal for tourists.

Development of Tourist Facilities

Hotels. By 1980, China had a total of 39,000 hotel beds for foreign guests.

More than 20 tourist hotels were built or expanded in 1980, and 4,300 beds were added. Eight hotels were built with foreign investment — in Guilin, Nanjing, Suzhou, Wuxi and Zhenjiang — each with 110 rooms. The Yanxiang Hotel in Beijing, with 144 rooms, was also built with the participation of foreign capital. The 250-room Yongzhou Hotel in Nanning was built with state investment. The Huagang Hotel and Zhejiang Guest House of Hangzhou were expanded.

Construction of several large hotels began in 1980 — the Yanjing (515 rooms), Jianguo (528 rooms) and Xiangshan (320 rooms) in Beijing; the Jinling (804 rooms) in Nanjing; and the Baietan (996 rooms) in Guangzhou.

Hotels in traditional Chinese style were built or refurbished in Zhuoxian County and Jixian County, and were well received by foreign tourists.

In 1980, many places of interest were restored following damage during the "cultural revolution." For instance, in Beijing the Tanzhe Monastery, Dazhong Monastery, Dagoba Monastery and Fayuan Monastery were open to Chinese and foreign tourists. The Leshan area of Sichuan has been restored to its former beauty. The home of

Confucius in Qufu, Shandong Province, including his temple, residence and tomb, which are precious parts of the Chinese culture, were restored following serious damage under the rule of Lin Biao and the Gang of Four. Restoration work began a few years ago and was basically completed by 1980. Qufu was opened to visitors in the same year.

Construction was also under way at some famous sites. Work began at Mt. Taishan to install a cableway to the mountain top. This will be of great help to old or infirm visitors and will greatly reduce the time required for climbing. Roads were repaired on Huangshan Mountain, with hotels, restaurants and shops added there.

A few years ago, some famous tourist areas suffered from serious pollution. In 1980, initial successes were gained in pollution control in Guilin and Suzhou. In Jinan, factories consuming large quantities of water were moved out of the city and a number of wells were filled. As a result, the Baotu Spring and Daming Lake were saved. Moreover, the volume of water was increased and its quality improved.

Varied Itineraries for Tourism

With the development of tourism, many new forms have been adopted. Usual activities for a foreign tourist group had mainly consisted of visits to historic places of interest, scenic spots, factories and schools. They went sightseeing from one city to another. This routine often proved dull and monotonous. New varieties were adopted in 1980. Fishing trips were organized on Lake Taihu in Wuxi, Jiangsu Province. The Suzhou tourist service provided facilities for Japanese tourists to visit the Hanshan Monastery on the eve of the lunar new year and to strike the large bronze bell there. Nanjing organized 20 members of the Amagasaki Cyclists Association of Hyogo Prefecture, Japan, to bicycle from Nanjing to Yangzhou and from Wuxi to Suzhou. These activities were much appreciated by the participants. In addition, Chinese shadow-boxing tours, Chinese language learning tours and Grand Canal tours were offered in east China. On-ice tours held in Harbin in winter were mainly composed of compatriots from Hong Kong and Macao. They viewed the ice sculptures and took part with great delight in various activities.

Day Trips. One-day tours were conducted in the Shenzhen and Zhongshan areas. These were mainly organized for foreign tourists and compatriots from Hong Kong and Macao. The Xili Reservoir, 32 km. north of Shenzhen, was opened for use as a weekend campsite. In the midst of

rolling hills and luxuriant vegetation, holiday-makers may enjoy swimming, angling, boating, shooting, riding and cycling. Camp fires are built in the evening and people picnic by their light. Hundreds of people flock to Xili from Hong Kong every weekend.

To accommodate one-day visitors from Macao, Zhongshan County has built a 130,000 sq. m. hot-springs health resort at Yongmo Village, 20 km. from Macao; investment was provided by the China-Macao Construction Investment Corporation. Zhongshan has a guest house with 400 beds, 20 hot-spring baths, a shop, restaurant, music hall, swimming pool and other recreational facilities. The hotel is set in the cool shade of trees and bamboo groves. Rare flowers abound. A fountain spurts high above the rockeries. After taking a hot-spring bath, guests can take a 30-km. excursion to the hometown of Dr. Sun Yat-sen, at Cuiheng Village, and to the scenic area of Shiqi.

Cruises on the Yangtze. A new tourist route leading through the world-famous Three Gorges on the Changjiang River was officially opened in 1980. The *Kunlun*, a luxurious yacht, began plying the river between Chongqing and Nanjing and between Chongqing and Wuhan, and was often fully booked by foreign passengers. It also calls at Jiujiang and Wanxian, and passengers have time to sightsee at Mt. Lushan and Shibaozhai. Last year, the ship made more than 20 round-trips, with this new route becoming one of the most famous tourist excursions in China.

Mountaineering. China began to organize mountaineering trips in 1980. The State Commission of Physical Culture and Sports received 40 teams comprising a total of 228 climbers. Eight peaks have been opened to foreign mountaineers. These are: Qomolangma ["Mt. Everest"] (8,848m.) and Xixiabangma (8,012 m.) in Tibet; Muztagata (7,546 m.), Kongur (7,719 m.), Kongur Jiubie (7,595 m.) and Bogda (5,445 m.) in Xinjiang; Gongga (7,590 m.) in Sichuan; and Anyemaqen (7,160 m.) in Qinghai.

In 1980, the head office of the China International Travel Service and the Beidaihe Tourist Corporation jointly provided services at the coastal resort of Beidaihe for the first international symposium on mine planning and development techniques, thus opening a new field for China's tourism. A total of 310 foreign specialists and their wives, representing foreign firms that took part in the accompanying exhibition, plus members of the working staff, were in attendance. The meeting lasted for five days. The foreign guests visited Beijing and some other places before and after the meeting.

The head office of the China International Travel Service provided services for an international tourist conference, "China - 1980," sponsored by British Travel Promotions Ltd. and other organizations.

Improved Services

International Tourism. Measures were taken in 1980 to improve service quality. These efforts met with a favourable response from tourists. The General Administration of Travel and Tourism of China convened a conference of hotel managers to exchange experiences in management and approved "Basic Requirements for Tourist Hotels." The conference played an active part in improving service quality. The Dongfang Guest House in Guangzhou and the Friendship Guest House in Luoyang have led in this respect.

New measures have been taken by the Beijing branch of the China International Travel Service. These are: coaches serving air-conditioned cold drinks in summer; frequent arrangements for tourists to dine in famous restaurants; a schedule of activities to be provided to tourists upon arrival. Guides were instructed to provide weather forecasts and news headlines at the beginning of the day's activities and to promptly answer questions raised by foreign tourists in the course of the tour.

Efforts were also made to improve service offered by CAAC, China's airline. New flights were put into operation between Beijing and London and Beijing and Hong Kong via Hangzhou. Domestic flights have also been expanded and readjusted, especially those linking tourist cities. Starting in 1980, CAAC gave favourable discounts to tourists coming to China - a 20% discount for off-travel and a 15% discount for CAAC international passengers when travelling domestically in China.

The production and sale of goods for tourists also grew quickly last year. According to incomplete statistics, there are 2,000 factories and 3,000 shops catering to the needs of tourists. The variety of commodities also increased. For instance, 27 new shops were commissioned in Guilin in 1980, selling shell carvings, feather pictures, bamboo carvings, embroidery and other handicrafts products in more than 1,000 varieties. An exemplary bamboo carving, *Liu Sanjie on a Spring Excursion*, is a clever blend of beautiful scenery with popular folk lore. The design is elegant and the figures are vivid. It is always in demand.

Tourists like to purchase low- and medium-priced commodities. However, there are still many who wish to buy high-grade articles of artistic merit. For instance, in October 1980, the em-

broidery, *Spring Outing*, modelled after an ancient painting, was sold to an American couple at the shop of the Zhongzhou Guest House, Zhengzhou. The price of this exquisite piece of art was 50,000 yuan.

Progress in Promoting Tourism

Education and Research. Five new journals for tourists appeared in 1980: *Traveller* (China Youth Publishing House), *Tourism* (Beijing Publishing House), *Tourism* (Guangdong People's Publishing House), *Tourist World* (Shanghai Cultural Publishing House) and *Tourist Land* (Sichuan People's Publishing House). Beijing's *Tourism* had the largest circulation — in 1980, each issue was printed in 400,000 copies. The China Tourist Publishing House put out in the same year more than 40 books, brochures, maps and postcards in 3.3 million copies. Among them is the *Travel Guide*, co-published with a foreign firm. Distribution of its English and Japanese editions began last year. This was the first of its kind edited by Chinese staff. The China Tourist Publishing House is putting out a *China Tourism Series*. The first volume, *A Trip to West Lake*, came out in 1980. Many provincial publishing houses and tourist departments have put out publications introducing individual cities and scenic areas. The *Wonders of West Lake*, published by the Zhejiang People's Publishing House, has been received favourably.

Film and television studios produced a number of scenic films in 1980 which have helped in the expansion of tourism. Statistics show that 30 TV films and 11 films on tourist cities and areas were made during the year.

Education. Tourism education was enhanced in 1980. Tourism economics courses were begun at Hangzhou University. A Japanese tour guide department was established in Dalian Foreign Languages Institute. In addition to Shanghai and Jiangsu, tourism schools for training medium-level service personnel were set up in Sichuan and Hubei provinces. Other personnel will be trained in vocational schools and in short-term courses run in Beijing, Tianjin, Zhejiang, Guangdong, Shaanxi and Jiangxi. Establishment of a national tourist institute is under way.

Research. Research on tourism became active in 1980. The first national forum on tourist economics was held from December 4 to 10. The conference received 40 theses, reports and pieces of reference material. Some of them were read out to the participants. Articles on promotion of tourism were published in the newspaper. For instance, the

journal *Architect* has carried articles entitled "On the Layout of Scenic Cities and Protection of Scenic Spots," "On the Establishment of Scenic and Cultural Relic Preserves" and "On the Development of Construction in Scenic Areas of Famous Mountains." *On Tourism*, a book published by the China Tourist Publishing House, discusses methods for development of China's tourism.

Domestic Tourism

With the development of political unity and stability, the people's livelihood has been improving. This has brought about rapid progress in domestic tourism. According to incomplete statistics, Beidaihe's beaches received 780,000 tourists during the summer. The figure for the peak day was 45,000. Mt. Lushan received 1,310,000 visitors between May and August. Although Huangshan Mountain is far away from main communication lines, over 400,000 people climbed to its summit. The daily record was 6,000. This volume of visitors is unprecedented in history.

Trade and communication departments all over the country also played their part in tourism. A meeting convened by the Ministry of Commerce in Hangzhou urged that commercial departments in various places set up travel services for domestic tours. It is stated that service bureaus in over 40 cities are now engaged in domestic tourism.

Domestic tourism has been well developed in Shanghai, Beijing, Nanjing, Hangzhou, Chengdu and Kunming.

The Shanghai Travel Service runs some 30 tourist routes — short-distance, medium-distance and long-distance. Short-distance trips include Suzhou, Wuxi and Hangzhou. Medium-distance trips involve 3-7 days, with itineraries inclusive of Zhenjiang and Nanjing in Jiangsu Province; Tiantai Mountain, West Tianmu Mountain, Mogan Mountain and Shaoxing in Zhejiang Province; Wuyi Mountain in Fujian Province; and Huangshan Mountain in Anhui Province. Long-distance trips take 7-30 days. They are for special participants only, and take in destinations such as Qingdao, Mt. Lushan, Yandang Mountain, Guilin, Hainan Island, Xiamen, Beidaihe, Beijing, Kunming, Chengdu, Chongqing and Wuhan. Trips organized in Beijing by the Taxi Company and the Long-Distance Bus Company include scenic spots on the city's outskirts, as well as Chengde and Beidaihe. The service company affiliated with the Nanjing Second Bureau of Commerce runs six trips — three (of 1-day duration) within Jiangsu Province (Yixing, Zhenjiang and Yangzhou); the other three are to Huangshan Mountain (5 days), Hangzhou (4 days) and Mount Langya and Zuiweng Pavilion (1 day).

The company handled 16,000 tourists between May (when these trips began) and the end of the year.

Tourist itineraries operated by the Kunming Service Company, apart from visits to the nearby Stone Forest and West Hills, include Kunming-Suzhou-Hangzhou-Shanghai, Kunming-Guilin and Kunming-Emei Mountain-Chengdu.

Most domestic tourists in 1980 were teachers, staff members and students of colleges and middle schools. According to figures obtained from Beijing University and seven other institutes of higher learning, 20,000 students spent their summer vacations at Beidaihe, Chengde, Dalian, Qingdao, Mt. Taishan, the Summer Palace and the Miyun Reservoir. Many others were retired cadres, staff members and workers. Statistics show that in Hangzhou, half of the tourists received were retired workers; in Shanghai, 25% were pensioners, 35% workers and staff members, 16% teachers, 13% technical personnel and professors and 9% students. In some rural areas, owing to the realization of the party's policies, both output and personal income increased. Some peasants could make trips to visit scenic places. For example, the Xiaozhuang Brigade, Wulong Commune, Zibo, Shandong Province, pays two yuan for one work-day. With the cash available, the brigade was able to organize a trip for its members to Mt. Taishan.

The mode of travel for domestic tours varies. Some people travel by bike, some on foot. Some make sightseeing trips, some honeymoon trips. Honeymoon trips are encouraged since they enable the couple to see more of the country rather than spending a lot of money on giving feasts. This represents a change in social traditions. Special rooms are provided at a discount to newlyweds at Beidaihe and other places. More and more young people are now taking part in such trips.

Review of China's Tourism

The Beijing Overseas Chinese Travel Service was established in 1953 to receive overseas Chinese on home visits or on tours. Its head office was established in 1963. In 1973, it was renamed the Head Office of the China Overseas Chinese Travel Service. Another organization, China Travel Service, was set up in 1974 to take care of compatriots from Hong Kong, Macao and Taiwan and foreign nationals of Chinese origin coming on home visits or on tours.

International travel services in China began in 1954 when the China International Travel Service was established. Then, its main function was to receive tourists from the Soviet Union, Eastern Europe, Korea, Vietnam and some other countries.

Beginning in the early 1960's, tourists from Western countries were received. The Bureau of Travel and Tourism was officially set up in 1964. However, up to the outbreak of the "cultural revolution," tourist departments received only a limited number of guests. There were only 4,500 in 1966, providing an income of U.S.\$2 million. During the "cultural revolution," tourism came to a standstill owing to disruption wrought by Lin Biao and the Gang of Four.

China's tourism developed only after the downfall of the Gang of Four and by virtue of the concern of the party. In 1978, the bureau was renamed the General Administration of Travel and Tourism of China. Documents were issued by the central government calling on departments concerned to energetically develop tourism. The China International Travel Service received 124,000 foreign tourists in that year, greater than the total number of tourists received in the more than 20 years prior to the smashing of the Gang of Four.

To improve facilities, new hotels have been built and old ones expanded and renovated during the past three years. In addition, some luxurious guest houses have been turned over to tourist departments. For instance, some of the buildings in the State Guest House at Diaoyutai in Beijing are now used for tourists.

During the three years between 1978 and 1980, tourism progressed rapidly, as did the growth rate of revenues in foreign currency. Tourism income was U.S.\$260 million in 1978, U.S.\$440 million in 1979 and U.S.\$610 million in 1980.

Emphasis used to be placed on the political side, that is, to make new friends through tourism, so that China would be better understood by the world. The economic role of tourism was neglected. During the past few years, tourism was initially looked upon as an economic undertaking. It was, at the same time, considered an extension of foreign relations. Efforts have been made to ensure good results both economically and politically.

However, problems have come along with this rapid development. The main problem is the large number of people who wish to come to China. But owing to the limited facilities, it is impossible to receive all of them within two or three years. The slow increase in the capacity for receiving guests is holding back the capability of the whole country with regard to tourism.

Problems have remained despite improvements in service quality — bad manners on the part of some hotel attendants, poor service and poor environmental sanitation; and unqualified guides and interpreters who are unable to answer questions posed by tourists. Owing to bad manage-

ment, rooms were often not provided promptly upon arrival of tourists during the busy season; and schedules were often changed because of failure to obtain plane tickets. Unreasonable charges were made at some places. All this aroused discontent among tourists. Further improvements are needed in these areas.

More tourist areas have to be set up. During the busy season, some famous sites are much too overcrowded. Examples are Beijing's Great Wall at Badaling and the Underground Palace at the Ming Tombs; Suzhou's gardens; and Shanghai's Yuyuan Garden. People jostle each other, sometimes block-

ing the traffic. During the summer of 1980, rooms and food were hard to come by on the famous mountains — Taishan, Lushan, Huangshan and Emei. This state of affairs has to be changed. Otherwise, more tourists will feel disappointed and the landscape and cultural relics will be destroyed or polluted by poor planning. This will also have a bad effect on the development of international tourism. To cope with the rapid development of domestic tourism, the major cities should divert domestic tourists to new tourist spots. At the same time, effective measures should be taken to control the number of tourists visiting famous places.

46. THE SCIENCES IN CHINA

By the Policy Research Office,
Chinese Academy of Sciences

The victory of the Chinese Revolution in 1949 paved the way for the development of science in the country. In the early post-Liberation period, the Chinese Academy of Sciences was established as the country's highest scientific institution, embracing a number of research institutes. Afterwards, various academies of specialized sciences were set up, such as the Academy of Agricultural Sciences, the Academy of Medical Sciences, the Academy of Geological Research and the Academy of Railway Research.

The "Common Programme of the Chinese People's Political Consultative Conference," adopted on the eve of the founding of the People's Republic, stated explicitly: "Efforts shall be made to develop the natural sciences in the service of industrial, agricultural and national defence construction. Scientific discoveries and inventions shall be encouraged and rewarded and scientific knowledge shall be disseminated." This idea was developed in China's Constitution of 1954.

I. The History of Scientific Research in the Last 30 Years

In 1955 and 1956, at a time when the Central Committee of the Communist Party of China and the people's government issued a call to develop the sciences, the Chinese Academy of Sciences established awards for natural sciences, institutionalized a system of post-graduate studies with conferral of academic degrees, set up the Scientific Council of the Chinese Academy of Sciences and drafted the "Outline Programme of Scientific and Technological Development, 1956-1967." At the conference called by the Central Committee of the CPC to deal with the question of intellectuals, a correct policy was formulated and effective measures for improving the working conditions of intellectuals were put forward. The result was the mobilization and organization of scientific and technical personnel and the return to China of many Chinese scientists who had been residing abroad to take part in socialist construction. Within a fairly short time, a number of gaps in the sciences were closed and weak links were strengthened. The study of some newly emerging areas of technology was begun, opening up a new era in scientific research.

The development of science after 1957 met with twists and turns, but the general trend was

still one of progress. The temporary economic difficulties in the three-year period beginning in 1960, though they resulted in a reduction in the number of scientific undertakings, enhanced the determination of scientific and technical personnel to regenerate the country through self-reliance and hard struggle. During this period, China's scientific and technical personnel pressed forward, conducting research on atomic energy and man-made satellites, artificial synthesis of insulin and other highly specialized subjects.

Setbacks and Milestones. The "cultural revolution" which began in 1966 subjected to ruthless persecution large numbers of diligent and accomplished scientists who had made outstanding contributions. It nearly brought scientific research to a standstill and resulted in the loss of a generation of scientific talent. The gap in science and technology between China and the advanced, developed countries, which had been narrowing, widened greatly again. This state of affairs continued until the downfall of the Gang of Four, whereupon scientific undertakings were given a new lease on life and were gradually restored to their former conditions.

The National Science Congress convened by the Central Committee of the CPC in March 1978 marked a milestone in the annals of scientific development in China. At that congress, leaders of the central government adopted the "Draft National Outline Programme for Scientific and Technological Development, 1978-1985" and commended a large number of outstanding scientific and technical personnel. At the congress, science and technology were formally acknowledged as having played a crucial role in China's modernization and scientific and technical personnel were hailed as an important segment of China's working class. Thus began another "spring-time of science."

The year 1980 saw continued progress and good results in the restoration and consolidation of China's scientific undertakings. People from various walks of life paid greater attention to the role of science and technology in social and economic development; more and better results were obtained in scientific research; academic exchange grew considerably, as did the popularization of science; and cooperation and exchanges with scientific institutions in other countries continued to expand.

II. Involvement of Scientific and Technical Personnel in Various Levels of Decision-Making

Along with the development of the country's socialist construction, leaders at various levels became increasingly aware of the role of science and technology in social and economic development. On the eve of the 1980 Spring Festival, central government leaders invited a number of scientists to a discussion at which they encouraged scientists to put forward proposals and contribute to the country's modernization. At similar meetings in Jiangsu, Liaoning and other localities, party and government leaders discussed with local scientists ways to advance scientific and technological development.

Policies for Scientific Development. At the Second Congress of the China Association for Science and Technology, held in March 1980, Hu Yaobang, the Secretary-General of the party's Central Committee, made an important speech on behalf of the Central Committee. He pointed out that science was a tremendous motive force pushing history forward and that modernization would be impossible without advanced science and technology. He also put forward the following three measures for developing the sciences: (1) China should build up a contingent of cadres with specialized knowledge and abilities who are capable of adhering to the socialist road; (2) China should start a large-scale programme to build up a reserve force of trained scientific and technical personnel; and (3) the party should give full support to scientists by giving free scope to their talents.

The Secretariat of the party's Central Committee asked the Chinese Academy of Sciences to arrange for distinguished scientists to give lectures to leading members of the Central Committee and the State Council. Accordingly, on July 24, 1980, Professor Qian Sanqiang gave a lecture entitled, "A Brief Introduction to the Development of Science and Technology." Subsequent lectures were given by Professors Wu Zhonghua, Wang Ganchang, Guo Musun and Bao Hansen on the question of energy, and by Professors Tu Guangchi and Ye Lianjun on resources and their rational utilization. The specialized knowledge and proposals provided by these scientists will exert positive influence on party and state leaders in policy-making.

Apart from giving lectures, scientists and many other scientific workers acted as advisors to leaders at the national and local levels by putting forward proposals, offering their services as consultants, or organizing "brain trusts" or technical service companies. For example, the Chinese

Society of Agronomy and two other societies sponsored a symposium on agricultural mechanization in northwestern China, with participants coming from nine provinces and autonomous regions; and the Chinese societies of agronomy, forestry, water conservancy and ecology jointly sponsored a symposium on the development of ecological equilibrium in tropical and subtropical mountainous and hilly areas, with participants drawn from 11 other societies and 15 provinces. These symposia yielded many important proposals concerning the development of the loess highlands and of tropical and subtropical mountainous areas.

Water conservancy specialists in Shanxi Province made public the irrationality of a project which was designed to divert water from a river to Xiyang county, and the project was stopped after this appraisal caught the attention of the leadership. Botanist Hou Xueyu's "broader concept of agriculture" and his proposals have attracted attention and they are expected to have an important bearing on China's policies for agricultural production and developing food resources. Natural scientists and social scientists cooperated in forecasting the population growth trend, which will play an important role in the country's effort to formulate demographic and social policies.

Many scientific workers served as consultants to local leaders at various levels. For example, in 1980, scientific workers in Shanghai put forward a total of 42 major proposals, 25 of which have been adopted. The Scientific and Technological Commission of Liaoning Province set up 22 groups to serve as advisory bodies for the provincial leadership. The "brain trust" of Zhuzhou city in Hunan Province submitted to the city authorities more than 50 proposals which proved very useful. In Yichun County, Jiangxi Province, a scientific and technical service company was set up.

At the same time, scientific and technical personnel were recruited into leading bodies at various levels. In addition to Professor Wang Jinling, who was made vice-governor of Heilongjiang Province, and Professor Yang Jike, who became vice-governor of Anhui Province, many scientific and technical personnel were elected or appointed in 1980 to leading posts in the government and in various departments. One of them was Associate Professor Zheng Shouyi, who became vice-mayor of Qingdao. Many counties also sought scientific and technical personnel for their leading organizations. A case in point was Gaomi County in Shandong Province, which appointed a number of scientists to leading posts after overcoming the prejudice against intellectuals.

The participation of scientific and technical personnel in the policy-making process and the selection of such personnel for leading posts have

promoted scientific standards in policy-making and greatly improved the quality of leadership.

III. Results of Scientific Research

Scientific research, which has enjoyed stable conditions in the years following the downfall of the Gang of Four, made important advances in 1980. Some research results attained high standards. The government has adopted the policy of encouraging and rewarding excellence in research and of actively promoting the popularization and application of research results.

In May 1980, China successfully launched a carrier rocket over the Pacific Ocean. This achievement was significant for the further development of China's science and technology and the acceleration of its modernization programme.

Chinese scientists and technicians completed 2,600 major research projects in 1980. Of the 1,576 projects completed under the aegis of the Chinese Academy of Sciences, 329 were of great importance. Institutions of higher learning in China also made remarkable progress during the year.

Many research results were of vital importance to industrial and agricultural production. In research on large-scale integrated circuits, the successful development of a 4K MOS memory computer was followed by that of several other models. The 16K MOS memory computer, in particular, was as advanced and performed as well as similar models produced in other countries. This breakthrough paved the way for the development and production of large-scale integrated circuits in China.

The electric-spark seismic source which China developed for seismic prospecting of offshore oil had its own unique features and performed well. Progress was made, too, in the study of many scientific and technological problems related to the reclamation of marsh land through well-drainage and irrigation or to the construction of the hydroelectric power station at Ertan, as well as to the application of remote sensing techniques, to research on rare-earth permanent magnetic materials, and to the improvement of the properties of polypropylene fibres.

The research institutes for national defence undertook research projects for civilian purposes while fulfilling with flying colours the research tasks in their own specific fields.

Basic Research. The institutes under the Chinese Academy of Sciences and the various institutions of higher learning continued to press forward with basic research. In medical sciences,

basic research was started in areas such as molecular disease, cancer and immunological engineering with good initial results. A survey of 24 major research projects showed that 8 approached or had attained advanced international levels.

Awards. Various government departments, provinces, municipalities and autonomous regions became more aware of the need to give due recognition to research results. Beginning in 1980, the State Scientific and Technological Commission gave out awards for discoveries and inventions; it has approved three lists of inventions, or 107 in all.

A number of important research results won acclaim from various government departments. For example, the Ministry of Agriculture announced in January 1980 its second list of awards to 56 research projects in agricultural and animal husbandry sciences and technologies.

At a ceremony in February 1980, Beijing Municipality presented awards for 535 research projects, 13 of which won first prizes. In March, Shanghai Municipality awarded 10 first prizes to major research projects. Shaanxi, Sichuan, Heilongjiang, Guizhou, Inner Mongolia, Zhejiang, Henan and other provinces, municipalities and autonomous regions followed suit.

In accordance with the "Regulations of the People's Republic of China Concerning Awards for Natural Science," which was promulgated by the State Council on November 21, 1979, the State Scientific and Technological Commission formed the Awards Committee for Natural Sciences and adopted its "Provisional Constitution." The committee's appraisal of deserving research projects was going forward in 1980.

Research Applications. Various departments paid greater attention to the application and popularization of research results. The Ministry of Agriculture recommended the results of 19 agricultural research projects and demonstrated them at selected points thought the country in an effort to popularize them. The products of these research projects are technically sound, economical and rational; they require small investment and show rapid and good results, and are therefore widely welcomed. They included: two improved strains of rice, Zhongdan No. 1 and No. 2, and all-octoploid triticale; the technique of deep application of chemical fertilizers and pellet fertilizers; the method of selecting types of small-scale bio-gas digesters and sealing techniques; new cooking stoves with high heat efficiency; and new insecticides.

In 1980, hybrid rice was sown on over 5.3 million hectares in an effort to popularize this

improved strain throughout the country; the increase in yield was 3.5 million tons of rice, for an average increase of approximately 0.75 tons per hectare. Zhejiang Province popularized a Xian-type hybrid rice, which showed potential for increasing output by 0.75 to 1.125 tons per hectare. Lumian No. 1 cotton was grown on large tracts of land in Shandong Province in 1980 and showed a potential for increasing output by 25%. Hubei Province popularized the nitrogen-fixing blue-green algae on 47,000 to 53,000 hectares of farmland.

IV. Management of Scientific Institutions and of Scientific Research

By the end of 1979, China boasted 4,600 scientific institutions that operated independently at or above the prefectural level. Of this number, 116 were under the Chinese Academy of Sciences. The total number of such scientific institutions did not increase significantly in 1980. Attention was focused on consolidation, expansion and raising standards.

Industrial Research Institutes. There was considerable growth, however, in the number of research institutes attached to industrial and mining enterprises. In the past, such research institutes were rare, which was an important reason for the backwardness of production techniques and for the long interval between two generations of products. In recent years, especially in 1980, with the beginning of reforms in the economic system, enterprises were given greater powers and responsibilities. This gave them incentive to improve their products in order to be more competitive. Hence, factories and mines set up their own research institutions. For example, the number of research institutes and laboratories run by the factories and mines in Liaoning Province expanded to more than 800, with 13,000 full-time staff members, while the 15 specialized research institutes already existing in the industrial sector employed 7,000 professional research personnel.

Research institutes attached to factories and mines are geared closely to production and are capable of quickly training people with specialized knowledge. The growth of such institutes will have a far-reaching influence on scientific and technological development and on the country's social and economic development.

Experiments in Self-Management. In accordance with the party's policy of "readjustment, restructuring, consolidation and improvement," scientific institutions at various levels experimented in 1980 with restructuring the management of

scientific research. An important aspect of restructuring the system of management of scientific research is the expansion of the research institutes' authority to run their own affairs. Such experiments, which started in Sichuan, were inspired and influenced by those carried out in the economics field. The essence of the experiment was that scientific institutions were given more authority to plan their research projects and to undertake tasks assigned to them by units to which they were not affiliated or to transfer research results to such units — on condition that they first fulfilled assignments from the organizations directly above them. Scientific institutions were allowed to acquire and dispose of financial resources other than the funds allocated to them by the government and other higher bodies.

As a result of their expanded self-management powers, some institutions eagerly undertook new and promising projects through closer links with production units; in some localities, organizations combining scientific and production units were set up on a trial basis. This new system made it possible to undertake a number of projects aimed at application, shortened the time required before application of research results begins and allowed scientific and technical personnel greater scope for initiative.

In line with the reform in the management of scientific research, a number of localities introduced the practice of signing contracts between a scientific institution and a production unit. At present, there are contracts for undertakings commissioning scientific research projects (designing and testing), for transfers of research results, technical services, technological consultations, training of personnel on behalf of the production units and for the development of new products. Both research and production have benefited from this practice. Thus, the Combinational Machines Research Institute of Dalian, which had been operating below capacity, had the best record for research results in 1980 and increased its income by 600,000 yuan as a result of its cooperation with factories in Changzhou and Wuhan. And the enterprises in question are each expected to benefit from such cooperation by several million yuan in 1980 as well as in 1981. Shanghai Municipality tried out in 1980 the practice of having higher organizations sign contracts with the organizations under them, while the Ministry of Public Health experimented with inviting tenders for research projects.

The question of scientific research management received attention from leaders at various levels. The State Bureau of Scientific and Technological Personnel and the Chinese Academy of Sciences conducted courses for training adminis-

trators. A national symposium on the administration of science was also held in 1980.

V. Scientific Research Personnel

The ranks of scientific and technical personnel working in China's scientific institutions have grown considerably in recent years. At the end of 1979, independent scientific institutions at or above the prefectural level employed 751,000 people in all, of whom about 263,000 were scientific and technical personnel. Women accounted for 27.3% of all scientific and technical personnel.

Because of the interruption of scientific research and teaching during the "cultural revolution," the average age of China's scientific and technical personnel is relatively high. In the Chinese Academy of Sciences, for example, the average age of the personnel is approximately 40; only one-fourth of the personnel are under 35 years of age. This is a critical problem at present.

Improved Living and Working Conditions. Continued efforts were made to improve the living and working conditions of scientific and technical personnel, to raise the level of basic theoretical knowledge, experimental skills and foreign language ability, and to transfer those persons who could not put their specialized knowledge to use in their assigned jobs to more appropriate jobs. Great efforts were also made to build up reserves of scientific and technical personnel.

In 1980, over 50% of all scientific and technical personnel received pay raises. At the same time, a large number of scientific and technical personnel with outstanding achievements were given senior academic or technical titles appropriate to their level of expertise. Moreover, the government allocated special funds, totalling 100 million yuan, for housing projects for senior scientific, technical and educational personnel working under the Chinese Academy of Sciences, the Ministry of Education, the Ministry of Public Health, the Ministry of Culture and the State Commission of Physical Culture and Sports.

Various localities concentrated on the problem of scientific and technical personnel who had been assigned to the wrong kind of work. According to statistics for the first half of 1980, Zhejiang Province reassigned 6,000 people and Liaoning Province transferred more than 10,000 people. Attention was also given to bringing back into service those formerly trained scientific and technical personnel who had not been employed. In various localities efforts were made to give such personnel professional jobs again and, as a result, some people with useful experience and skills were rediscovered.

Education and Training. Scientific and technical administrative organs at various levels and scientific institutions throughout the country did much work in selecting and training promising personnel. At a special meeting called by the State Bureau of Scientific and Technological Personnel, it was stressed that the selection and training of scientific and technical personnel and the rational use of their talents were the pressing tasks at the present time.

Following the suggestion put forth by scientists themselves that scientific institutions be allowed to select and use promising people, a number of scientific institutions experimented with recruiting promising individuals for research work. The Xinjiang Branch of the Chinese Academy and several other organizations placed great emphasis on the training of scientific and technical personnel from among the minority peoples.

Within scientific institutions, young people who had showed proficiency and had served as the mainstay of research projects were promoted to leading posts. This greatly improved the quality of leadership and the organization and management of scientific research work.

Various scientific institutions and institutions of higher learning strengthened the training of post-graduate students. In 1980, the number of post-graduate students in the natural sciences and applied sciences totalled 21,600. On February 12, 1980, the Standing Committee of the Fifth National People's Congress promulgated the "Regulations of the People's Republic of China Concerning Academic Degrees." In December, the Committee on Academic Degrees held its first plenary meeting, at which the "Measures for Implementing the Regulations of the People's Republic of China Concerning Academic Degrees" was adopted. Those measures were later approved by the State Council.

VI. Funding for Scientific Research

The party and the government have attached great importance to the development of scientific research and have created conditions as favourable as possible for their rapid growth. Science and technology figured prominently at the Third Session of the Fifth National People's Congress, which took place in August 1980. The allocations for cultural, educational, public health and scientific undertakings in the national budget for 1980 totalled 14,830 million yuan, up 1,620 million yuan over 1979 — a huge increase considering the reduction of expenditures necessitated by the overall readjustment of the national economy.

Although funding for scientific research has

increased in recent years, the ratio between funds for scientific research and the gross national product has not yet been restored to the previous highest level because of the damage inflicted during the "cultural revolution."

VII. Activities of Academic Societies

National academic societies were extremely active in 1980. They sponsored a total of 760 symposia during the year, considerably more than in 1979.

At the second national congress of the China Association for Science and Technology held on March 15, 1980, representatives from various fields of science and technology gathered to discuss ways of developing scientific research and contributing to the country's modernization. Following the national congress, 15 provinces and autonomous regions held their own congresses. Of the country's 2,757 administrative units at the county level, 1,758 had science and technology associations, and over 1,000 communes, factories and units set up such associations on a trial basis.

In 1980, 10 new national academic societies were founded, bringing the total to 105. There are academic societies as well for a number of important specialized fields in science and technology. For instance, the nation's nuclear scientists and scientists engaged in radiation protection held their own first congresses in 1980, while societies for biophysics, space science and other important sciences were established.

Science and technology associations were active in disseminating scientific knowledge, training personnel and organizing technical exchanges. The China Association for Science and Technology organized an exhibition of fine art works for the popularization of science and sponsored a meeting at which artists working in this field could exchange experiences. At a meeting of the Association of Popular Science Writers, guidelines were formulated for the future work of its members. The association also put together a selection of "Popular Science Works for the New Long March" and called a meeting to discuss the promotion of scientific and technical activities among youngsters. Local science and technology associations also participated actively in the popularization of scientific knowledge.

VIII. Scientific Publications and Information Services

Remarkable progress was made in the publica-

tion of scientific and technical books and periodicals in 1980. Incomplete statistics show that 5,715 scientific and technical books were published in 1980, as against 4,199 in 1979, an increase of 36%. A total of 1,384 scientific periodicals were issued in 1980, an increase of 42% over the 978 published in 1979.

The readership of scientific books, periodicals and newspapers also expanded greatly. In 1980, China's 85 national and provincial popular science magazines had a total circulation exceeding 16 million. The magazines *Radio*, *Science Pictorial* and *Science and Life* each had a circulation of over one million. During the year, the Popular Science Publishing House issued 105 books. Various provinces, municipalities and autonomous regions published more than 30 scientific and technical newspapers; their total circulation was about 4.5 million. Also in 1980, 48 popular science books and 58 articles written between 1977 and 1979 were re-issued. The thriving situation of publication work mirrored the advances made in science and technology, as well as the public's growing interest in scientific knowledge.

Information Services. In July 1980, the State Scientific and Technological Commission called the Fifth National Conference on the Work of Scientific and Technical Information. At this conference, past activities were evaluated and the direction and tasks of current work were charted. Since the compilation of scientific and technical information was begun in 1956, various departments under the State Council and various provinces, municipalities and autonomous regions have set up a total of 72 institutes for scientific and technical information. Scientific and technical information services have contributed to the formulation of scientific and technological policies and plans, to the importation of technologies and to scientific research and designing work.

Library services also have made headway in recent years. Apart from the specialized libraries catering to science and technology, there are national and local general libraries that offer a wide range of scientific and technical services. In addition to performing their cultural and educational functions, general libraries have begun to play an important part in the scientific and technical information system.

Archives. In July 1980, the State Economic Commission, the State Capital Construction Commission, the State Scientific and Technological Commission and the State Archives Bureau jointly held a conference on scientific and technical archival work. The conference called on various economic departments and scientific research

institutions to restore order to the country's scientific and technical archives as quickly as possible and to expand, organize, store and use such archives effectively in the service of socialist modernization. A report submitted by the conference was subsequently circulated in a State Council document. The State Council approved the "Regulations Concerning the Work of Scientific and Technical Archives."

IX. International Scientific Cooperation and Exchanges

There was considerable growth in 1980 in the exchange of visits by scholars and scientists. The China Association for Science and Technology, for example, played host to 21 foreign delegations with 132 people and received over 300 scientists who came to China as tourists. The association also sent abroad 22 delegations with a total of 130 people. Also in 1980, the number of Chinese academic societies that had joined international academic organizations increased by 12, to reach a total of 60.

Various central ministries and commissions, institutions of higher learning and the Chinese Academy of Sciences also engaged in scientific exchanges. The Chinese Academy of Sciences sent 950 people abroad as members of delegations and study tours or as participants in international conferences, and it received 1,760 foreign scientists — almost a 50% increase over 1979. In addition, the Chinese Academy of Sciences sent 674 people abroad for post-graduate studies and advanced training or as visiting scholars.

Nine international conferences were held in China in 1980, including the International Conference on Particle Physics in Guangzhou, the Second International Symposium on the Role of RNA in Development and Reproduction, the Symposium on the Qinghai-Tibetan Plateau, the International Laser Conference and the International Symposium on Paddy Soil.

Honours for Scientists. A number of famous Chinese scientists received titles of honour from other countries. Among them were Guo Kexin, who was appointed a foreign member of the Swedish Royal Academy of Engineering Sciences, and Zhang Xiaotong, who received the Threshold Award.

Chinese academic bodies and scientific institutions conferred titles of honour on a number of foreign scientists or invited them to serve as part-time consultants or professors. For example, the Systems Science Institute under the Chinese Academy of Sciences invited professors Shing Shen

Chern and P.D. Lax, members of the National Academy of Sciences in the United States, to become honorary research professors and members of its academic committee; and the Mathematics Institute invited Professor Shing Tung Yan of Princeton University and Associate Professor S.Y. Cheng of the University of California at Los Angeles to serve as members of its academic committee.

International Cooperation. China's scientists cooperated with their foreign counterparts on a number of joint expeditions or research projects during 1980, such as the Sino-French joint expedition to study the geological structure of the Himalayas. Also in 1980, the Chinese-language editions of two U.S. publications, *Scientific American* and the *Encyclopaedia of Science and Technology*, were published in China.

X. Current Scientific Policies

Along with progress in scientific research, there was much lively discussion of scientific policies and many related issues that merit further study. The main issues brought up for discussion were:

(1) *The relationship between science and technology and social and economic development.* As science and technology penetrate daily into ever wider fields of the society and economy, they become increasingly important factors in the country's overall development. It is imperative that science and technology be taken into consideration when social and economic development planning is done. In turn, science and technology should make greater and more effective contributions to social and economic development. To place economic work more solidly on the basis of science and technology and to give full scope to the role of science and technology, scientific grounds for major decisions relating to economic and social development should be proven before such decisions are taken. At the same time, planning departments must draw up plans that unify and coordinate the development of science, technology, economy and society.

(2) *Guidelines concerning the development of science and technology.* In 1980, there was animated discussion about the guidelines China should adopt for developing science and technology in light of the successes and failures of other countries. It was agreed that science and technology should be developed in harmony with

the economy and the society, and that the primary task of their development should be the promotion of economic development. Other recommendations included: placing emphasis in research on production techniques; the correct selection of technologies within a national framework; strengthening technical exploitation and extension work at industrial and mining enterprises; ensuring the steady development of basic research; and making the study, digestion and assimilation of scientific and technological achievements from other countries an important part of China's scientific and technological development.

These and other views received careful attention from leading organizations. The Chinese Academy of Sciences, the country's leading research centre in the natural sciences, focused its discussions on how to use science and technology to better serve the country's modernization programme while upholding the principles of placing emphasis on basic sciences and of raising standards of research.

(3) *Readjustment of scientific and technological work.* The implementation of the

policy of "readjustment, restructuring, consolidation and improvement of the national economy" entails the readjustment of scientific and technological work. China aims to strengthen its scientific, educational, health and cultural undertakings while cutting capital investments and administrative expenses and readjusting production plans in certain sectors of heavy industry.

Scientific organizations themselves have called for the readjustment of their internal structure, notably to correct the imbalance between the various branches of science, between various kinds of research projects and between various kinds of personnel. Other problems that must be solved include the dispersion of efforts, overlapping of projects and some outdated projects. These problems must be resolved through readjustment, consolidation and restructuring.

In 1980, the initial exploration and discussion of these problems, as well as the carrying out of selective experiments and preliminary reforms were all underway. As the policy of "readjustment, restructuring, consolidation and improvement" is further implemented still greater progress is expected of scientific research in 1981.

47. STANDARDIZATION IN CHINA

By Huang Weijian

State Administration of Standards

The work of standardization in China began only after the founding of New China and has grown gradually with the development of the national economy. Since the Third Plenary Session of the 11th Party Central Committee, the work of standardization has grown rapidly and comprehensively. It has played a positive role in improving the quality of products, utilizing resources in a rational way, saving raw materials and energy, organizing specialized production, developing new varieties of products and raising the level of enterprise management.

I. The History of Standardization

Old China was a semi-feudal and semi-colonial country with a backward economy, and foreign capitalists controlled most of its industrial enterprises. There were a limited number of national industrial enterprises, but they operated at a low level of efficiency and depended on foreign capital economically and technically to a considerable extent. There were almost no independent standards in old China. Although the Kuomintang government had set up a bureau of standards and the China Standards and Specifications Committee, these agencies did not do any real work in standardization.

Enterprises entirely operated by foreigners adopted foreign standards, and most national industrial enterprises also adopted the standards of the countries with which they had economic or technical relations. For example, most enterprises in northeastern China adopted Japanese standards and most enterprises in Jiangsu, Zhejiang, Shanghai and other coastal cities relied on British or US standards, while a number of enterprises used German or French standards. An outstanding example of the semi-feudal and semi-colonial character of the economy of old China in respect to standardization was pre-Liberation Shanghai, where two voltage standards were in use — 220 v. and 110 v.

Establishing Standards. After the founding of New China, the party and the government turned to the work of establishing China's own standards. During the period of economic rehabilitation, the Financial and Economic Affairs Commission of the then Administrative Council created a special department to take charge of the work. Standardi-

zation was started in the railway, iron, steel, cement and textile industries in 1950.

Other industries and departments began to work out their own standards to keep pace with the development of economic construction during the First Five-Year Plan period. One after another, the industrial ministries set up departments to work out standards at the ministerial level. By the end of 1957, the metallurgical industry, for example, had issued 205 ministerial standards and produced standard product samples.

In 1953, the then Ministry of Fuels Industry called the first conference on standards in national petroleum products and set up a national committee to examine specifications for petroleum products. During the period of the First Five-Year Plan, standardization was started in the machine-building, chemical, electronics, shipbuilding, coal and other industries. In all, more than 100 standards were established between 1953 and 1957.

Control Measures. Before 1957, each industrial ministry conducted its own work in standardization. In 1957, however, a bureau of standards was attached to the former State Scientific and Technological Commission. Progress in standardization continued, but it was not as satisfactory as was expected owing to the influence of "Left" deviationist mistakes in our economic work. By 1960, only 33 national standards for industrial and agricultural products had been established and some of them presented problems when they were applied.

To overcome the consequences of "Left" deviationist mistakes in our economic work, the Party Central Committee put forward in 1961 the policy of readjustment, consolidation, development and improvement of standards. As a result, the work of standardization was considerably strengthened. In 1962 the State Council approved and promulgated the "Measures to Control the Technical Standards for Industrial and Agricultural Products and Construction Projects." The measures drew on our experience in standardization work since the founding of the People's Republic, formulated guiding principles for establishing standards and proposed concrete methods. Among the points made in the "Measures" were that scientific research departments, production units and users should work together, that investigations and experiments should be conducted before standards

are established and that the standards must be suitable to China's actual conditions and reflect the principles of economy and rationality.

In 1963 the First National Standardization Conference was called to draft a 10-year plan for the development of standardization. Following this conference, the ministries under the State Council held separate working meetings to prepare documents for the implementation of the "Measures," to establish or strengthen their own standardizing organs and to formulate plans for the development of their standardization work. In addition, a number of representative scientific research and designing units and industrial enterprises were appointed to revise existing national and ministerial standards and to establish new ones.

All these steps helped to accelerate the establishment and revision of national and ministerial standards for the country, as well as to raise the level of standards — some of which were already approaching the international standards of that time.

Obstacles. During the "cultural revolution," the work of standardization was criticized, standardizing organs were abolished and their personnel transferred to other jobs, records and files were damaged, regulations and systems were abrogated and the work of standardization was seriously undermined. In 1972, the State Bureau of Standardization and Metrology was set up with the approval of the State Council to ensure product quality. As a result, the work of standardization gradually resumed, but there were still many obstacles and progress was slow.

Only after the Gang of Four was smashed, and especially after the Third Plenary Session of the 11th Party Central Committee, was the work of standardization fully restored. It has made substantial progress since then. In May 1978, the State Council set up the State Bureau of Standards to supervise standardization work throughout the country. This provided strong leadership for our standardization work and solved the long-standing problem of organizational separation between standardization and production.

New Regulations. In March 1979, the State Administration of Standards called the Second National Work Conference to review both the positive and negative experiences in standardization work since the founding of the People's Republic. The conference defined the policy of "strengthening management, consolidating the work and laying a good foundation for positive development," drew up a series of specific guiding policies and set the targets to be achieved during the period of

economic readjustment.

In July 1979, the State Council promulgated the "Regulations to Control the Standards in the People's Republic of China" — an extension and improved version of the earlier "Measures to Control the Technical Standards for Industrial and Agricultural Products and Construction Projects" which had been issued by the State Council in 1962. The new regulations clearly defined the principles, policies, scope of work and functions of the standardizing departments. After the second conference, the ministries concerned and the provinces, municipalities and autonomous regions held further meetings, established or strengthened their standardizing organs, worked out the details for implementing the regulations and planned their own work. Comprehensive progress has been made in China's standardization work in the two years since the second national conference.

Practical experience in the past 30 years has shown that standardization is an important part of economic management. The development of the national economy requires the appropriate development of standardization work which, in turn, promotes the development of the national economy. Therefore, the healthy development of the national economy is the primary requisite for ensuring the development of standardization work. In accordance with the readjustment and development of the national economy since the Third Plenary Session of the 11th Party Central Committee, the party and the government have paid great attention to standardization work.

In 1979 and 1980, 986 national standards were worked out for industrial and agricultural products, accounting for more than 42% of all national standards established in the past 20 years. China is now eliminating the influences of "Left" deviationist mistakes in the national economy and standardization work is sure to grow in a comprehensive and sustained way.

II. Principles and Methods of Standardization

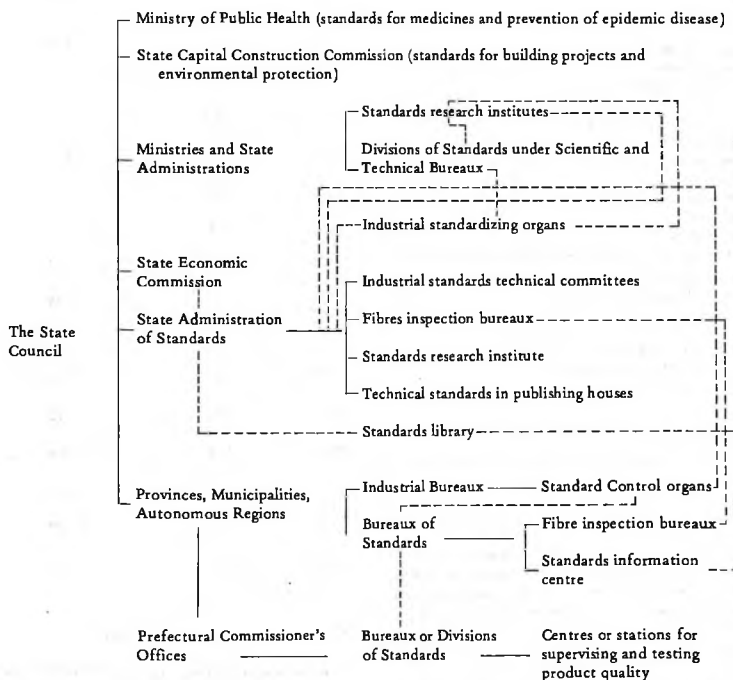

China is a socialist country and its standardization work is controlled by the government. The State Administration of Standards is the functional department under the State Council in charge of standardization work throughout the country. Its responsibilities include: defining principles and policies concerning standardization, drawing up and executing national standardization work programmes and plans, monitoring standards and supervising and inspecting the quality of products. The divisions of standards under the scientific and technical bureaux of various ministries are in

charge of standardization work in the respective ministries. At present, 23 provinces, municipalities and autonomous regions have set up bureaux of standards, while six others have set up standardizing organs. Some industrial cities, prefectures and a limited number of counties have also set up bureaux, divisions or sections.

The State Administration of Standards has a multi-branch research institute of standardization which is responsible for studying the principles and methods of standardization and for working out basic standards. Thirteen ministries have departments responsible for research in standardization and for the establishment and revision of

national standards and ministerial standards. The standards library under the Scientific and Technical Information Research Institute of China is the centre for information on standards in China. Reference centres on standards have been set up in 17 provinces. There are about 300 industrial standardizing organs responsible for creating or revising national standards and ministerial standards. With a view to improving the establishment and revision of standards, China has, in 1979 and 1980, set up 19 industrial standards technical committees composed of representatives from ministries, enterprises, scientific research institutes, colleges and users.

Note: — indicating relations of leadership
 - - - indicating relations of technical guidance

III. The Organizational Structure in Charge of Standardization in China

The standards in China are divided into three categories: national standards, ministerial standards and enterprise standards. National standards (coded GB) are those of vital importance to economic and technological development and must be followed by all enterprises in the country. They include standards for basic raw materials and semifinished materials; standards for important industrial and agricultural products which are essential to the people's livelihood, or are produced in large quantities or are made by two or more different enterprises; standards for interchangeable parts, accessories, components, appliances, structural parts, tools and measuring instruments; standards for interchangeable and common technical languages; standards for common testing and inspecting methods; standards for safety, health and environmental protection; and adopted international standards.

National Standards. The national standards for industrial and agricultural products are drafted by the ministries or by the industrial standards technical committees, and are approved and issued by the State Administration of Standards. The most important national standards must be submitted to the State Council for approval before they are issued. National standards for building projects and environmental protection are approved and issued by the State Capital Construction Commission. National standards for medicines and prevention of epidemic diseases are approved and issued by the Ministry of Public Health. By the end of 1980, China had established 2,331 national standards.

Ministerial Standards. Ministerial standards refer to the standards established by industrial ministries for use in the respective industries on a nationwide basis. Approved and issued by the ministries, these standards must be submitted to the State Administration of Standards for the record. There are altogether 15,000 ministerial standards. Ministerial standards must not contravene national standards. As the national economic system undergoes restructuring, some ministerial standards will gradually be turned into standards for respective industries and others will become national standards.

Enterprise Standards. Enterprise standards must be worked out for products for which no national standards or ministerial standards exist. They must not contravene national standards or ministerial standards. In order to improve the

quality of products, enterprises are encouraged to create standards more advanced than national or ministerial ones as well as those to be controlled by the enterprises themselves. Enterprise standards can be established by one enterprise for its own use or for use by other enterprises.

Table 1. Numbers of National Standards for Industrial and Agricultural Products Before and After 1966

Year	Number of New National Standards	Total Number
Before 1966	—	366
1966	8	374
1967	30	404
1968	23	427
1969	0	427
1970	62	489
1971	1	490
1972	13	503
1973	22	525
1974	24	549
1975	46	595
1976	250	845
1977	303	1,148
1978	197	1,345
1979	382	1,727
1980	604	2,331

IV. Enforcement of Standards

Chinese standards are compulsory. Once they are formally issued, they are put into force as technical decrees which all production, construction, scientific research, designing and management departments, as well as enterprises and undertakings must strictly follow. Proper actions

or even legal actions will be taken against those who violate the standards and cause great losses, depending on their severity. Those who have difficulties in following the standards must explain their reasons and submit their requests to higher authorities for consent and to the departments issuing the standards for approval. All industrial enterprises must follow the established standards in testing raw materials, semifinished products and finished products. To ensure that the standards are correctly followed, the departments in charge of standards shall examine the standards to be adopted before new products are designed and put into production.

Product Quality. The quality of products can be reliably guaranteed only when the standards are strictly followed in production or in the supervision and testing of products. Supervision and testing are the indispensable means to put the standards into effect and to organize production on modern lines, and they are an important part of standardization work. The State Administration of Standards and the local bureaux of standards are in charge of supervising and testing the quality of products at the national or local levels.

Local bureaux of standards and quality supervising organs have appointed a number of competent research institutes and large enterprises to serve as stations for testing the quality of products and, at the same time, to restore and set up product inspection stations so as to gradually build a local network of supervision and inspection centres. In addition, the Fourth Ministry of Machine-Building Industry and the ministries of Building Materials, Light Industry and Chemical Industry have set up their own inspection centres. There are now more than 50 industrial inspecting centres under various ministries, more than 40 quality supervision and inspection centres for local products and more than 500 testing stations.

International Standards. The China Association for Standardization (CAS) joined the International Organization for Standardization (ISO) in September 1978. As an active member of the ISO, China has participated in the organization's 51 technical committees, 127 subtechnical committees and two advisory committees. The CAS sent 273 representatives to 176 international standardization technical meetings in 1979 and 1980. China joined the International Electrotechnical Commission (IEC) in 1957 and sent 130 people to 69 International Electrotechnical Committee meetings in 1979 and 1980. China has signed agreements with Britain, France, the United States and West Germany for long-term cooperation in standardization and has established channels for

exchange of information and data on standards with 38 countries and standardizing groups.

IV. The Advantages of Standardization

China's practical experience in standardization over the past 30 years — since 1978, in particular — has fully demonstrated that standardization is an important means of promoting the development of the national economy and of achieving the best economic results.

(1) *Standardization helps to improve the quality of products.* During the "cultural revolution," the quality of products made in China became an outstanding problem. After 1977, however, the quality of products has been gradually restored or improved and the standardizing departments at various levels have done a great deal of work to improve the quality of products. Since September 1978, when the first nationwide "quality month" was launched, the standardizing departments of ministries and local governments have conducted a nationwide investigation of existing standards to find out where and why no standards have been adopted or existing standards have not been followed. They have mobilized all available forces to create enterprise standards and to follow existing standards so that no enterprise will produce goods without standards, lower existing standards or produce goods without following present standards.

Many enterprises have developed new enterprise standards after reaching existing national or ministerial standards, with a view to producing goods that are equal to or even better than the famous brands of their counterparts abroad. From 1979 on, many enterprises have adopted unpublished control standards for the quality of raw materials, semifinished products and finished products; for technological requirements, processes, means of testing and measuring; for production, technical and equipment management; and for the work of production workers doing different jobs. This has greatly improved the quality of their products. For example, the Ministry of Metallurgical Industry has adopted unpublished control standards for the entire processes of 67 quality products.

In the "Supplementary Rules for the Implementation of the 'Regulations on Awards to Quality Products in the People's Republic of China,'" the State Economic Commission listed the development and observance of unpublished control standards which are higher than existing technical standards as one of the qualifications for state quality product awards.

(2) *Standardization helps to make rational use of resources and to reduce consumption of raw materials.* Extensive research shows that correct determination of parameters for product standards can help to utilize resources in a rational way and to reduce consumption of raw materials. For example, the revised standards for cement allow the content of magnesium chloride to increase from 4.5% to 5%, which will greatly extend the period of limestone mining by cement plants. After standards were adopted for cement boats using steel mesh, Jiangsu Province reduced the consumption of steel by 37% for the five-ton cement boats it builds.

When the standards for China's No. 2 aviation oil were adopted, the freezing point for Chinese oils was tried out by temperature measurements at high altitudes and by actual test flights. This not only helps to make full use of China's oil resources, but also increases the production of fuels for jet planes.

The existing standards for Chinese matches were developed on the basis of extensive investigations and according to the principle of optimization, so that the size of matchsticks was reduced to the permissible extent in order to save 90,000 cubic meters of timber each year on the basis of present output.

(3) *Standardization is an important guarantee for energy saving.* Standardization for energy consumption is an important part of standardization work. By working out and following standards for energy consumption and for energy-saving products, the control of energy can be tightened, energy can be utilized scientifically and rationally, and energy consumption can be reduced. For example, the city of Dalian in 1980 worked out fuel consumption standards for all types of boilers; industrial furnaces, brick kilns and cement kilns;

standards for oil consumption by all types of motor vehicles; standards for power consumption by small fertilizer plants, electric arc furnaces, cement plants and chemical works; and standards for water consumption by boilers and industries. These standards cover 60% of the total energy consumption in Dalian. When all these standards are followed, about 15% of current energy requirements can be saved.

The adoption of standards for energy consumption by industrial boilers alone can save 130,000 tons of standard coal. The development of standards for energy-saving products has just begun in China. Standards are being developed in various parts of China for efficient engineering and electrical products, low-resistance electric conduction materials, well-insulated construction and heat-preserving materials and other materials that can conserve energy.

(4) *Standardization is the prerequisite for organizing specialized production.* To organize production along specialized lines, the variety of products must be simplified, regular parts and spare parts must be made interchangeable and goods must be produced in uniform quantities. Therefore, specialized production requires the standardization of products, regular parts and spare parts. The higher the degree of standardization, the better are the economic results in specialized production. For example, there were originally more than 700 specifications for fasteners produced by different factories, but after standards were adopted and revised, the number of specifications was reduced to 200. This has resulted in a higher degree of standardization, increased production of the same item, improved processes and better economic performance in specialized production.

Table 2. Comparisons of Economic Performance for Fasteners in Shanghai in Selected Years

Item	1956	1962	1974	Comparisons between 1974 and 1956
Employment (persons)	11,156	8,487	7,917	-29%
Output (pieces)	1,092 million	2,117 million	9,992 million	915%
Annual labour productivity (yuan/worker/year)	2,514	7,383	28,240	1,156%
Utilization rate of materials	40%	60%	80%	100%
Profits turned over to the state (in 1,000 yuan)	2,560	28,450	85,790	3,350%

(5) *Standardization is an effective measure for developing new varieties in a rational way.* The designing of products according to the principle of standardization and the development of product variations from base-model products are beneficial to the rational development of new varieties for different needs.

For example, when a radial drilling machine is designed according to the principle of standardization, it can easily be modified or adapted for different uses or types of drilling by adding or replacing some parts. When the standard mechanism for alarm clocks was developed, the variations in shapes and sizes of clocks increased from 20 to 100, making it possible to meet the different needs of different consumers at home and abroad. Thus, standardization helps to promote China's foreign

trade and the sales of Chinese products in other countries. Moreover, standardization is essential to the improvement of public health and safety and to environmental protection.

Standardization is an important means of achieving better results in the development of the national economy with less investment. If better economic results are to be achieved in the future development of the national economy, attention must be paid to improving product quality, reducing energy and raw material consumption, cutting production costs, producing more goods that are wanted by consumers and increasing exports. But these measures cannot be accomplished without standards. Therefore, we must further raise the level of our work of standardization during the period of economic readjustment.

48. EMPLOYMENT, WAGES, WORKERS' WELFARE AND LABOUR PROTECTION IN CHINA

By Zheng Ji

Policy Research Department, State Bureau of Labour

Before Liberation, China's economy was in very poor condition. Vast numbers of unemployed had long existed, and the people lived in destitution. Since the founding of New China, however, fundamental changes have taken place. With the development of the national economy, there has been an unprecedented increase in the number of workers and staff members in China. Their working conditions have been improved, and their wages, labour insurance and welfare benefits significantly increased.

Since the smashing of the Gang of Four in 1976, the Communist Party and the People's Government, with a view to making up for the losses suffered in the 10 years of turmoil, have made great efforts to increase employment. The authorities have emphasized the need to follow the principle "from each according to his ability, to each according to his work," gradually improved the living standards of workers and staff members on the basis of developing production, devoted much attention to safety in production and encouraged the initiative of workers and staff members. In this way, the national economy and other fields of work have been restored and developed at a fairly rapid pace.

I. Employment and Vocational Training

With the development of the national economy since the founding of New China, the increase in the number of workers and staff members has been unprecedented. In 1949 there were 8,090,000 workers and staff members throughout the country. In addition, there were 7,240,000 self-employed in cities and towns. By the end of 1980, the total work force was 104,440,000 with 80,190,000 working in state-owned enterprises and 24,250,000 in enterprises under collective ownership. In other words, the work force increased by nearly 11.9 times within 31 years.

There was not simply an increase in numbers, but a rise in ideological and political consciousness and cultural and technical levels as well. Many workers with a wide range of skills and millions of specialized people have emerged. The proportion of technical personnel in the total work force with degrees from secondary technical schools and

colleges rose from 2.7% in 1952 to 6.1% in 1979. The number of graduates from institutions of higher learning between 1949 and 1979 totalled 3,030,000 — more than 16 times the 185,000 who graduated between 1928 and 1947 prior to Liberation. And in the same 30-year period, graduates from secondary technical schools totalled 5,390,000, while those trained in the 16 years from 1931 to 1946 totalled only 546,700. These workers and staff members trained since the founding of New China constitute a mighty force in building socialism.

Reorganizing the Labour Force. In the early years after Liberation, the number of unemployed left over from the old society was more than four million. In an effort to solve the problem, the People's Government adopted a policy of "retaining" all workers and other employees in bureaucratic-capitalist enterprises and all personnel in Kuomintang military and administrative institutions. Government policy towards private industrial and commercial enterprises was to give them necessary support to prevent them from closing down and dismissing their workers and other employees.

While employing workers wherever they were needed in production, the government made considerable efforts to help the unemployed find work by means of "self-help through labour," "providing odd jobs instead of giving relief," "re-training in preparation for new jobs," etc. With cooperation from all sides, production developed rapidly and unemployment was wiped out by the end of 1958.

In the meantime, a system of unified recruitment and regulation of the labour force was gradually set up. Labour departments exercised unified control over recruitment and distribution when state or private industrial and commercial enterprises were short of manpower; and surplus labour was transferred or shifted to other enterprises by the competent authorities or labour departments. In this way, a system characterized by an overwhelming majority of regular workers gradually came into force.

Under that system, management was not permitted to dismiss regular workers, no matter what changes were effected in the operation of an enterprise. Only in the case of odd jobs and

seasonal work were temporary or seasonal workers employed by signing labour contracts. The system played a positive role in permitting enterprises to operate smoothly and in holding unemployment steady. However, the universal and indiscriminate application of this system was not conducive to simplifying the administrative structure and improving labour organization. Moreover, some workers could not fully utilize their skills or expertise because they were assigned unsuitable jobs, while other workers did not observe labour discipline since they were paid the same whether they worked well or not. Therefore, when the First Five-Year period was nearing completion, reform of the labour system was placed on the agenda. Under consideration were different schemes for regular workers, temporary workers and seasonal workers, so as to achieve a more flexible system of labour.

Vocational Training. During this period, vocational training was developed. The competent authorities in charge of our national economy, the labour departments and some large factories and mines systematically set up many vocational training schools. Between 1949 and 1980, 1,430,000 students were trained in these schools. At the same time, the state established a new apprenticeship system that absorbed the good points of the old system while dispensing with its outmoded conventions and customs. The majority of New China's skilled workers received their training under this new system.

Developments After 1976. After the fall of the Gang of Four in 1976, and especially since the Third Plenary Session of the 11th Central Committee of the Communist Party, China has adopted quite a number of measures in the administration of the labour force and vocational training. They include:

1. *Making great efforts to solve the problem of unemployment.* The 10 years of turmoil created by Lin Biao and the Gang of Four disrupted production and construction as well as education. As a result, large numbers of middle school graduates and other young people were unable to find jobs, creating a serious social problem.

Since the smashing of the Gang of Four, however, the party and the government have paid considerable attention to this problem. They have instructed the governments at all levels and various departments to provide more jobs by vigorously developing light and textile industries, handicrafts, repair services, commerce, service trades, catering, animal husbandry and other breeding industries, tourism, public utilities,

gardening, afforestation, etc., wherever necessary and whenever conditions permit.

In addition, the authorities have encouraged job-seekers to set up workshops and cooperatives themselves, i.e., develop individual and collective undertakings within a prescribed range. Meanwhile, the state has allocated funds to establish labour service companies in large and medium-size cities throughout the country to provide job-seekers with vocational training or casual work.

In August 1980, the Party Central Committee convened a national conference on employment to review the experience, both positive and negative, in New China. This conference officially adopted the policy that the problem of unemployment should be solved under the unified planning and guidance of the state through a combination of labour departments providing work for job-seekers, and job-seekers participating voluntarily in cooperative enterprises and self-employment. At the same time, the conference underlined the need for governments at all levels to support and establish all kinds of collective enterprises, to encourage young job-seekers to set up cooperatives, to develop agricultural, forestry and stockbreeding farms as well as agricultural-industrial-commercial enterprises that absorb mainly school graduates, to encourage self-employment and to establish and run labour service companies. In the four years from 1977 to 1980, more than 28,000,000 people were given jobs.

2. *Restoring and developing vocational training.* To raise the technical level of rank-and-file workers, the government has devoted great attention to the vocational training of the reserve skilled workers and on-the-job workers.

Vocational training schools are an important means of training reserve skilled workers in our country. After the smashing of the Gang of Four, these schools were restored and developed. In 1980, a total of 680,000 students were enrolled in such schools.

The fundamental task of vocational schools is to train and provide various sectors of the national economy with average skilled workers who have acquired socialist consciousness and have mastered modern production skills. The students spend half of their time in school workshops or in productive enterprises to receive on-the-job training and the other half in classes for general and technical education.

Apprenticeship is China's traditional way of training large numbers of reserve skilled workers. In recent years, more than one million apprentices have been enrolled each year in industrial enterprises owned by the state. The duration of ap-

apprenticeship varies from trade to trade and from profession to profession. In general, it lasts three years; at a minimum, no less than two years.

An apprentice is expected to acquire the skill and know-how of a second-grade skilled worker within two or three years; that is, he or she should reach the technical standard set by the relevant ministries, acquire sufficient basic and theoretical knowledge pertaining to his or her trade, and have a full grasp of basic skills and multi-purpose operational techniques. At the end of the apprenticeship, an apprentice is required to take an exam before becoming a qualified worker.

Vocational training of on-the-job workers is mainly provided by the enterprises, which will draw up plans and train workers systematically in accordance with their own production needs and with the workers' technical competence. Enterprises generally set up a special office to deal with this matter. On-the-job training is provided in various forms. Different forms are used for different trades and workers, and training may be full-time, part-time or spare-time. Workers are paid basic wages during the period of training, and receive rewards for exemplary results.

3. *Carrying out research and experiments in the reform of the system of labour.* Since 1979, various places have adopted a method of recruiting workers and staff members which takes account of the applicants' moral, intellectual and physical qualifications. Wherever this system has been applied, the workers and staff members have been qualified for the operational skills in the enterprises concerned, and their professional knowledge has been better utilized.

In the textile industry since 1980, a system of "four groups of workers rotating on three shifts" has been tried out in all cotton mills with more than 30,000 spindles and in half of the woollen and flax mills. This system not only provides a large number of jobs, but also allows workers a longer rest period. (According to the new system, each worker enjoys two days off after every six working days.) As a result, workers are better rested and more energetic on the job, the utilization rate of equipment is higher and production is enhanced. According to a Chinese saying, it is a case in which "the rider changes while the horse keeps on running." With a view to protecting workers' health, shorter working hours and job-rotation at regular intervals are also being tried out in some chemical plants and mines.

II. Wages, Labour Insurance and Workers' Welfare

Since the founding of the People's Republic,

we have reformed step by step, in accordance with the principle "to each according to his work," the irrational wage systems left over by the old society. With a view to protecting the health of workers and staff members, helping them overcome the difficulties in their livelihood, and providing the disabled and invalids with material assistance or social security, we have also established a system of labour insurance that covers their welfare benefits.

Wage Level and the Time-Rate Wage System. With the development of the national economy, the wage level of workers and staff members as a whole has been raised considerably. In 1980, the average annual wage in state-owned enterprises was 803 yuan, an increase of 80% over the 446 yuan in 1952 and of 32.7% over the 605 yuan in 1976. However, there were both increases and decreases throughout the years. The most significant rises in the wage level occurred during the period of the First Five-Year Plan and during the four years after the fall of the Gang of Four. In the last year (1957) of the plan, the average wage was 637 yuan, i.e., 42.8% higher than in 1952, for an average annual growth of 7.4%.

After the downfall of the Gang of Four, in spite of numerous difficulties, the government made strenuous efforts to raise the wage levels of the workers and staff members, while at the same time increasing the incomes of the peasants and production brigades and communes in the vast rural areas. On three occasions in the last four years, we readjusted the wages of the workers and staff members, 83% of whom received pay raises. The average annual increase was 7.3%, about the same as during the period of the First Five-Year Plan. From 1963 to 1965, China underwent a period of readjustment, but even then about 40% of the workers and staff members had their wages increased with an average annual growth of 3.3%. Declines in wage levels occurred during the following two periods: in the Second Five-Year Plan, when the annual decrease was 1.5%; and in the 10 years of the "cultural revolution," when the annual drop was 0.5%.

We have pursued a policy of "lower wages and more jobs," which is not only in the interest of expanding employment, but also enables families with more than one member at work to increase their income. Because of the continuous growth of the number of employed workers and the strict enforcement of family planning in recent years, the dependent members of workers' families have gradually decreased in number, thus reducing their economic burden.

The Time-Rate System. Quite diverse wage

systems existed in our country in the early years after Liberation. In some liberated areas the "supply system" prevailed, in others it was the "supply system" plus a partial wage system, and in still others a monetary wage system was in force with wages calculated on the basis of a number of commodities. In newly liberated areas, the old wage system was preserved in most cases, while in a few other places the "supply system" was applied. During the period of the First Five-Year Plan, we carried out reforms on the wage system several times. Our current wage system basically came into force following a total reform in 1956.

Since then, the majority of enterprise workers have been paid according to an eight-grade wage system, in which the highest grade receives approximately three times as much as the lowest.

For cadres, a hierarchical system based on their ranks or posts has been introduced. For government functionaries, there is a 24-grade salary system, with the highest grade receiving 12 times as much salary as the lower grade. For engineers and technical personnel, a 17-grade salary system has been implemented, the maximum rate being 9 times the minimum. The scientific, research, cultural, educational, health and physical culture sectors have their own pay scales.

Although the government has not laid down rules and regulations dealing with promotion, it nevertheless decided on different occasions to adjust wages upwards in accordance with the development of the national economy. In general, the wage or salary earner is moved to a higher grade in the wage system to which he or she belongs. On some occasions, we adopted the principle of ensuring a minimum amount of increase while at the same time limiting the maximum amount. Promotions are usually based on the attitude toward work, proficiency, contribution, seniority and, at times, political behaviour.

The Piece-Rate System and the System of Premiums. Generally speaking, the piece-rate system is a direct reflection of the principle of "more work, more pay and less work, less pay," whereas the system of premiums is a necessary supplement to this principle. In fact, when the principle of "to each according to his work" was observed, the two systems were implemented; otherwise they were not.

The percentage of production workers in state-owned enterprises covered by the piece-rate system changed quite often. It was 32.5% in 1952, 42% in 1957, (the peak year), below 5% in 1960 and 19.9% in 1963. After 1966, the piece-rate system almost ceased to exist.

The system of premiums followed a similar

pattern. In the period of the First Five-Year Plan, the various sectors of the national economy introduced a uniform system of premiums. In general, such premiums were linked to the results of production, e.g., over-fulfilling, effecting economies, achieving better quality and developing new products.

Management and technical personnel received premiums when state production plans were fulfilled or over-fulfilled. During the period of the Second Five-Year Plan, the premium for over-fulfilment of production and other premiums were combined and changed into a unified premium plus a "leap-forward" premium. During the "cultural revolution," the piece-rate system ceased to exist and the premiums were converted into an "additional wage" paid every month. It was only after the collapse of the Gang of Four that the piece-rate system and the system of premiums were gradually restored.

On April 1, 1980, the State Planning Commission, the State Economic Commission and the State Bureau of Labour promulgated the "Provisional Regulations Concerning the Piece-Rate Wages in State-owned Enterprises," which stipulated that piece-rates could be applied to all workers whenever conditions permit or wherever this system is more applicable. The ways of application may be divided into group-piece-rate and individual-piece-rate. On condition that rational and advanced production norms be maintained, there is no limit to the extra amount of wages a worker may receive under the piece-rate system.

On May 7, 1978, the State Council issued the "Circular on Introducing the Premium Payment and Piece-Rate Payment Systems." The premiums are generally drawn from the total payroll of all workers and staff members in the enterprises concerned and are included in the cost of production; they amount to 10%-20% of the total payroll of all workers covered under the system.

In 1979, with a view to restructuring the system of economic management, the government decided to start the experiment of extending the decision-making power of some state-owned enterprises. In these enterprises, the premiums were derived mainly from that part of profit retained by the enterprises. The first group of enterprises that started this experiment were allowed to retain part of the profit, at a percentage calculated on the basis of the full profit they made and, according to the percentages approved by the government, another part of the profit for expanding production, workers' welfare and payment of premiums. Since 1980, most of the enterprises have adopted a method of sharing the excess profits. Premiums in enterprises are usually paid every month in addition to a year-end bonus. The total

amount of premiums should not exceed 1.5 to 2 months' standard wages, but a small number of enterprises have overstepped this limit.

Allowances and Subsidies. In order to encourage workers and staff members to go and work in areas or at posts where the living and working conditions are harsh but where extra people are urgently needed, the central and local governments have decided to provide various kinds of allowances or subsidies. These are given to such workers as underground miners, construction workers, forestry workers, field workers, workers exposed to excessive heat, workers at certain meteorological stations, ship crews, truck drivers, train crews, postmen on outdoor duties, scientific researchers, school teachers giving extra lessons, head instructors in primary and middle schools, group leaders in workshops, outstanding athletes and sportsmen, etc. These allowances and subsidies are meant to encourage people to take up jobs which others are unwilling to do, or to encourage people to achieve outstanding results.

Labour Insurance. There are two basic systems of labour insurance. One is for workers and staff members in state-owned enterprises who are covered by the "Labour Insurance Regulations of the People's Republic of China" promulgated by the Government Administration Council in February 1951. A 1953 revision increased the benefits. For instance, work-injury benefits were increased from 5%-20% of the wages of the injured to 10%-30%; the old-age pension rose from 35%-60% of the wages of the insured to 50%-70%, the minimum up by 15% and the maximum by 10%; and sick benefits during the first six months were raised from 50%-100% of the wages to 60%-100%, the minimum up by 10%. Other benefits — such as funeral grants or allowances and pensions and preferential treatment to lineal dependents of the deceased for death sustained at work or not at work — were also increased in different degrees.

The main features of our labour insurance system are as follows: (1) the insurance fund is borne in full by the enterprises, and the workers and staff members do not make any contribution to it; (2) the payment of insurance benefits is based on a worker's remuneration (i.e., wages), and adequate consideration is given to his or her seniority of service; and (3) insurance benefits cover childbirth, old age, sickness, death, injury and disability. For example, women workers are granted a 56-day maternity leave with full pay; sick, injured or disabled workers enjoy free medical care, food allowances and invalid pensions during the period of hospitalization; retired workers and

staff members receive old-age pensions; funeral grants or funeral allowances and pensions may be given when a worker or his or her lineal dependent dies.

Labour insurance is jointly administered by the labour departments and trade unions, each having their own sphere of activity. Generally, the labour departments explain laws and decrees, while the unions supervise, control and implement the regulations at the grassroots level.

As for state organs, institutions and people's organizations, there is another system of labour insurance that is similar in some respects to the above system but different in others. Comparatively speaking, the benefits for sickness and death are higher than those in enterprises, but the lineal dependents do not enjoy free medical care.

In February 1958, the State Council promulgated the "Provisional Regulations Concerning the Retirement of Workers and Staff Members" and the "Provisional Regulations Concerning the Resignation of Workers and Staff Members." The two regulations are applicable to both state-owned enterprises and state organs, institutions and people's organizations, thus combining the two different systems into one.

Two improvements were made over the previous regulations. First, the qualifications for retirement benefits were relaxed, e.g., men at age 50 and women at age 45 may retire when in poor health or disabled if they have worked for 15 years, including 5 years of continuous service, and if they are confirmed by doctors or by the labour qualification committee to be disabled; or, regardless of his or her age, or he or she has worked for 25 years, including 5 years of continuous service, and if confirmed to be disabled; or if he or she has worked for the revolutionary cause for 20 years but is unable to continue service due to poor health. Second, terms and allowances are provided for those who want to resign before the age of retirement (maximum grant not exceeding 30 months' wages).

In May 1978, after approval by the Standing Committee of the National People's Congress, the State Council promulgated the "Provisional Regulations on Proper Treatment for the Aged, Weak, Sick and Disabled Cadres" and the "Provisional Regulations Concerning the Retirement and Resignation of Workers" for experimental application in enterprises and government institutions.

In comparison with the previous regulations, the main changes are as follows: First, new provisions are introduced to give veteran cadres honourable duties or retirement with full pay and all welfare benefits. Second, retirement benefits were improved. For example, those who joined the revolution during the War of Resistance against

Japanese aggression or during the War of Liberation may enjoy an old-age pension equivalent to 90% and 80% of their wages, respectively, if they are qualified for retirement. This is 10%-20% higher than the pension provided in the 1958 regulations that was equivalent to 70% of wages to those who had worked for the revolution for over 20 years.

Ordinary workers and staff members receive retirement pensions equivalent to 60%-75% of their wages, the minimum being up 10% and the maximum up 5% from 1958.

Third, a new rule provides retired workers with a guaranteed minimum pension of 25 yuan per month to ensure their livelihood. Fourth, a retired worker is entitled to have one of his or her children receive a job from the labour departments if the child meets the requirements for recruitment.

Workers' Welfare. Since the founding of the People's Republic, workers' welfare has been improved considerably, especially in new housing, welfare facilities and government subsidies. In 1952, new housing with a total of 7.5 million sq.m. of floor space was built for the workers. In the period of the First Five-Year Plan, another 94 million sq.m. were completed. In some regions and enterprises, many workers built their own houses with the help of the government. Since the downfall of the Gang of Four, the party and government have devoted much attention to housing construction and have made considerable achievements in this respect.

In 1952, there were 1,345 hospitals with 121,000 beds and 270 sanatoriums in urban areas. Many enterprises and institutions set up their own community canteens, kindergartens and day nurseries. During the period of the First Five-Year Plan, collective welfare facilities for workers and staff members rapidly increased. In 1957, there were 1,656 hospitals with 221,000 beds and 835 sanatoriums in urban areas. After the fall of the Gang of Four, workers' welfare facilities developed even faster. By 1978, the government had spent 6,691 million yuan on labour insurance and welfare benefits in the state-owned enterprises. Welfare benefits included allowances for home-heating and transportation, and travel subsidies for workers to visit their families. In addition, workers pay very low rent. In Beijing, for example, the rent per sq.m. of floor space is only about 0.20 yuan, which is not even enough to meet the cost of repairs. Thus the government must allocate large sums in the form of housing allowances.

In order to solve the problem of shortages of agricultural and sideline products, various enterprises, state organs, military units and schools far

from cities have engaged in agricultural and sideline production, carrying forward the revolutionary tradition of the Great Production Campaigns in time of war. The total land now under cultivation is 7 million *mu*, with an annual output of 1,000 million *jin* of grain and 3,000 million *jin* of vegetables, and a large quantity of oil, meat and fruits. All this has effectively improved the livelihood of the workers and staff members and has created favourable conditions for the employment of the workers' children.

III. Labour Protection

A major policy in China is to ensure the safety and health of the workers engaged in production. In the 31 years since the founding of the People's Republic, we have achieved significant results in labour protection.

Building a Foundation. The 17 years prior to the "cultural revolution" constituted a period of initiation and development of labour protection work in China. This period may be summarized by the following principal developments:

(1) The guiding principle for safety in production was defined in the light of Chairman Mao's directive: "While efforts are being made to increase production and practise economy, attention must also be paid to the safety, health and the indispensable welfare amenities of the workers and other employees; if attention is paid only to the one while the other is forgotten or neglected even to a small extent, this is a mistake."

(2) A whole series of laws, rules and regulations on labour protection were established. During the First Five-Year Plan period, the state promulgated 15 laws and regulations, such as "Regulations on Factory Safety and Sanitation," "Regulations Governing Safe Working Conditions for Construction and Installation Projects" and "Regulations on the Reporting of Accidents Resulting in Injury or Death of Workers and Other Employees." In addition, various ministries and bureaus at the national level and corresponding departments at local levels promulgated altogether more than 300 rules and regulations.

(3) Labour protection organs were set up and cadres trained. After the establishment of the People's Republic, labour departments, competent industrial authorities and the trade unions successively set up administrative organs for labour protection and trained a large number of cadres. According to 1953 statistics, 200,000 activists in

different enterprises were doing labour protection work after having received specialized training.

(4) Scientific research and teaching institutions were established. An Institute of Labour Protection, the preparation of which had started in 1955, came into being in 1957. Moreover, courses in safety measures were opened in the science and engineering departments of institutes of higher learning. For instance, a Labour Protection Department was formed in the Peking Labour College (now called the Beijing Institute of Economics).

(5) Working conditions were improved. Matters relating to working hours of the workers and staff members and protection of special interests of young workers and women workers are explicitly stipulated in our Constitution and other important laws. Funds earmarked by the government for labour protection increased year by year. According to the statistics of eight ministries — Metallurgy, Coal, the First Machine-Building, Railways, Communications, Textiles, Chemical Works and Forestry — the government had directly allocated by the end of 1957 a total of 490 million yuan for the purpose of improving working conditions. As a result, many important pieces of equipment to ensure safety and industrial sanitation were installed, such as installations for ventilation and drainage in mines, devices to protect workers against high temperature, devices to protect workers from toxic gases or silica dust, equipment to relieve workers of heavy manual labour and safety devices against electric shock.

According to incomplete statistics from 21 provinces and 3 municipalities, in the three years from 1954 to 1956 over 81,000 major pieces of equipment were systematically installed to ensure safety and sanitation. The enterprises and workers were mobilized on a large scale to carry out seasonal and specialized inspections on safety and sanitation; in other words, the enterprises, workers and staff members relied on themselves to improve their working conditions.

Furthermore, the Chinese government has since 1955 set up special organs to inspect boilers, pressure vessels and other special equipment in all stages of design, manufacture, installation, operation and repair. In the past two decades and more, achievements have been made in legislation, training of personnel, inspection, summarizing and popularizing experience. Statistics show that the accident rate fell from 39 per 10,000 boilers in the 1960's to 5.9 in the 1970's.

Recent Accomplishments. Since 1979, in order to rectify the erroneous tendency of "con-

centrating on increased output without regard to safety" and to implement the policy of safety in production, we have done work in the following areas to ensure labour protection.

1. *Additional legislative measures.* In 1979, we reaffirmed the implementation of the "Regulations on Factory Safety and Sanitation," "Regulations Governing Safe Working Conditions in Construction and Installation Projects," "Regulations on the Reporting of Accidents Resulting in Injuries or Death of Workers and Other Employees" and other regulations, and set out to draft new laws and regulations.

2. *Nationwide "Safety Month."* This was sponsored by the State Economic Commission and nine other ministries. With the approval of the State Council, a televised rally to observe "Safety Month" was held in April 1980 in Beijing.

All over the country, radio broadcasts, pictures, slides, films, art performances and exhibitions have been used to educate the people in safety. In the coal industry, widespread activities have been organized to study the regulations on safety in coal mines. Statistics from 84 bureaus and mines show that more than 700,000 workers and staff members have received training in safety, including about 57,000 cadres.

Through the "Safety Month" campaign, a considerable number of hidden dangers and possible accidents were avoided. According to statistics provided by Heilongjiang, Jiangsu, Shaanxi and 18 other provinces, municipalities and autonomous regions, during "Safety Month," more than 2,050,000 possible hazards were discovered, and measures have already been taken to eliminate 1,280,000 of them.

3. *Publicity, education and the training of cadres.* In the past year or more, the State Bureau of Labour has conducted five courses to train 500 cadres for labour protection work. Extensive teaching materials on labour protection (more than one million words) have been compiled, and a series of books and reference materials published. Special rooms for education in labour protection have been built in 40 enterprises, and eight films (both feature and documentary) on safe production have been shown.

4. *Funds for labour protection measures and development of scientific research.* According to statistics, good results have been achieved in more than 200 labour protection projects in more than 20 industries. The content of dust and toxic particles in the air in these factories and mines has, in the main, been reduced to the hygiene standard

set by the government. In 1980, the state and local authorities, as well as various ministries, allocated a total of more than 300 million yuan for labour protection measures to improve working conditions.

In the field of scientific research, another 11 institutes of labour protection are under preparation or being established.

5. *Dealing with major accidents.* Special personnel were sent to investigate and handle such recent major accidents as the gas explosion in a coal mine at Songshuzhen, Jilin Province, and the capsizing of the Bohai No. 2 oil rig. In particular, the decision of the State Council on August 25, 1980, on the Bohai No. 2 accident was widely supported by the broad masses of workers and staff members. Various local authorities and central ministries held a series of meetings to draw useful lessons from the Bohai No. 2 accident and to make a comprehensive check-up in their own fields. As they learned about the serious consequences of the accident, many departments and enterprises perfected their own rules and regulations and took measures to remove hidden dangers.

Some units, in line with the State Council's directive to strengthen education in legislation governing industrial and communications enterprises, and to deal with injuries and fatal accidents strictly by law, have enforced a system of "three not-let-slip-away's" (do not let accidents slip away before their causes are analysed and determined; do not let accidents slip away before those responsible and the working masses have learned their lessons; and do not let accidents slip away before preventive measures are worked out).

Gains in Safety and Health. Because of our efforts in recent years, and in 1980 in particular, the number of injuries and deaths resulting from accidents has begun to drop. According to incomplete statistics, the number of fatal accidents (including accidents to non-employees) fell by 11.2% in 1980 as compared with the previous year, and the number of serious injuries by 7.2%. The rate of deaths in state-owned enterprises dropped by 14.7% and the rate of serious injuries by 9.5%.

Owing to the attention paid by the party and the government and the efforts made by various enterprises in every industry and trade in the past 31 years, there are now numerous exemplary units with outstanding records in the implementation of the policy of safety in production and in the protection of the safety and health of workers and staff members. In the Xialong Tungsten Mine for example, the content of silicon dioxide in the ore is high as 58% to 97%. Since 1958, however,

X-rays have been given annually to workers and staff members in contact with silica dust, and for 22 years no worker has ever been found to be suffering from silicosis. The Zhangjialing Coal Mine in Shaodong County, Hunan Province, is not only a highly gaseous mine but also a commune-run enterprise with crude and simple equipment. Nevertheless, in the 20 years since 1960, there have been no serious injuries or deaths due to accidents, and the figure for minor injuries has dropped year after year.

The Beijing Refractory Materials Factory makes use of funds provided by the state for labour protection and raises funds itself to improve factory management, to rebuild equipment and to take measures to reduce dust. As a result, the dust content in 96.62% of the work places was brought within acceptable limits in 1979, while in none of them was it below permissible levels in 1973. In the Electrochemical Works in Wuxi County, Jiangsu Province, the leakage rate of pipes has decreased to within 5 per 10,000; the air there is fresh, and the plant is known as a "garden factory" full of beautiful flowers and green grass. The Water Pump Factory in Shijiazhuang, Hebei Province, has not had a single case of death due to accidents for 30 consecutive years and no serious injuries in the last five years.

IV. Remaining Problems

China has made outstanding achievements in the broad labour field since the founding of the People's Republic. However, because of the lack of a comprehensive appreciation of the importance of labour protection and mistakes in our work — and particularly the disruption caused by Lin Biao and the Gang of Four from 1966 to 1976 — many problems do exist, and some of them are quite serious.

Weaknesses in Education. For a long time, we have paid attention only to providing employment, but in one way or another neglected intellectual development. Both general and vocational education in China are lagging behind the advanced countries, and our vocational education is especially backward. At present, the levels of general and technical education of large numbers of workers and staff members are rather low, and are unable to meet the requirements for the realization of the four modernizations.

Difficulties Cited. In providing employment, we often do not pay attention to economic results and labour efficiency. This state of affairs is also due to poor management, which finds expression

in lack of discipline, disregard of rules and regulations, inefficiency, and overstaffing. Due to the slow economic growth and the existing economic structure and ownership system, which are unfavourable both to economic development and to expanding employment, the avenues for employment are becoming ever narrower.

With the government having to retain all workers and other employees on the job while young people wait for the government to assign them jobs — mainly in units owned by the state or in collective enterprises — the employment structure has become most irrational. As a result, productivity and efficiency in many units have declined, and many people have seen a drop in their standard of living. No significant change has been made in a situation in which "there are people without work, and there is work without proper people."

Housing Shortage. Because China is a populous yet poor country, and because in the course of economic construction we have placed undue emphasis on capital accumulation to the detriment of consumption, the standard of living of our workers and staff members is still low. Some workers' families find it difficult to make ends meet, particularly those who receive no premiums.

The most serious problem is the acute shortage of housing. Due to the vigorous efforts of the state, the construction of average floor space per capita increased from 3.61 sq.m. in 1978 to 3.74 sq.m. in 1979 and to 3.9 sq.m. in 1980, showing an average annual increase of 2.6% in the three years. Nevertheless, housing remains a serious problem.

Steps to be Taken. With regard to safety in production and the health of workers and staff members, apart from financial and material deficiencies, many problems have risen because of mismanagement or insufficient education. Some 70%-80% of the accidents are due to the neglect of existing rules and regulations by either the management or the workers.

In order to make our labour arrangements suit the needs of the four modernizations, greater efforts should be made to reform the employment structure, achieve better labour administration in enterprises, implement the principle "to each according to his work," and improve safety measures, the system of labour administration and existing legislation. Meanwhile, through the growth of production and the increase in labour productivity, we will endeavour to solve step by step the problems related to the standard of living of our workers and staff members.

49. CHINA'S TRADE UNIONS

By the Research Office,
All-China Federation of Trade Unions

I. Growth of the Trade Unions After Liberation

The Chinese trade unions are the mass organizations of the working class of China. The founding of the People's Republic in 1949 ushered in a new era in Chinese history and brought about a fundamental change in the status of the Chinese working class and trade unions. Since then, Chinese workers have been transformed from an oppressed, exploited and ruled class to the leading class of the country and masters of the new society.

After having won political power, the historical mission of the working class has shifted from one of destroying and overthrowing the old political power of the Kuomintang to one of strengthening and consolidating the new political power of the peoples' democratic dictatorship, led by the working class and based on the alliance of workers and peasants. The mission also includes rehabilitating and developing the national economy and building up the new life of socialism. As a pillar of the state's power, the trade unions have been unremitting in their efforts to mobilize and organize the masses of workers and staff members to strive for the accomplishment of their own historical mission.

Restoration of ACFTU. A year before the founding of the Peoples' Republic, the Sixth National Labour Congress was held in Harbin in August 1948. In this way, the All-China Federation of Trade Unions (ACFTU) was restored, and the unity of the working class of the whole country was achieved. In July 1949, ACFTU held a national conference on trade union work in Beijing. Soon afterwards, workers and staff members throughout the country were organized into trade union organizations at various levels. In June 1950, the national people's government promulgated the "Trade Union Law of the People's Republic of China" which laid down the rights and duties of the trade unions. Thereafter, the workers' movement developed rapidly on a nationwide scale.

Early Activities. During the period of rehabilitation of the national economy after the founding of New China, the people's government, with the assistance of the trade union organizations, took

over the bureaucratic-capitalist enterprises, turned them into socialist enterprises and restored production immediately. In privately owned enterprises, trade unions mobilized workers and staff to carry out the principle of "developing production, promoting economic prosperity, giving consideration to both public and private interests and benefiting both labour and capital." In this way, those enterprises beneficial to the national economy and people's livelihood were given a new life.

Meanwhile, trade unions educated workers and staff members in historical materialism, the Communist Party and communism, thus helping to raise their consciousness, foster a new attitude towards labour and bringing about an upsurge of enthusiasm in labour.

In July 1950, the National Conference of Labour Heroes of Workers, Peasants and Soldiers was held. In August 1950, the Government Administration Council of the central people's government (which was replaced in 1954 by the State Council) issued the "Decision on Rewarding Inventions, Technical Innovations and Rationalization Proposals with Regard to Production." The Government Administration Council also promulgated the Labour Insurance Regulations in 1951.

All these activities further aroused the enthusiasm and initiative of the workers and staff members of the whole country. After the masses of workers and staff in Northeast China launched the campaign to set new production records, workers and staff members in other parts of China followed suit. The campaign became a national movement for rationalization proposals.

Wartime Contributions. After the outbreak of the War to Resist U.S. Aggression and Aid Korea (1950-1953), Chinese trade unions educated the broad masses of workers and staff in patriotism and internationalism. Tens of thousands of workers and staff members volunteered to fight at the front and the others worked heroically and dauntlessly in the rear. The trade unions at various levels organized workers and staff in a patriotic emulation drive to increase production and practice economy, popularizing the experiences of the Ma Hen-chang Group in the machine-building industry and Hao Jianxiu's spinning method in the textile industry. All these greatly raised labour productivity, accelerated the rehabilitation of the national economy and effectively supported the front.

During the period of rehabilitation of the national economy and the War to Resist U.S. Aggression and Aid Korea, the Chinese trade unions mobilized the broad masses of workers and staff to participate actively in a series of major campaigns on a nationwide scale. These were aimed at suppressing revolutionaries and achieving democratic reforms in the enterprises (abolition of feudal "gangmaster" and "labour contractor" systems and establishment of a democratic management system). The San Fan and Wu Fan movements were launched to fight attacks by the bourgeoisie in order to consolidate the people's democratic dictatorship. The San Fan movement (1951-1952) was directed against the "three evils" (corruption, waste and bureaucracy within the party, government, army and mass organizations). The Wu Fan movement, begun in 1952, fought against the "five evils" (bribery, tax evasion, theft of state property, cheating on government contracts and the stealing of economic information, as practiced by owners of private industrial and commercial enterprises).

Manned Economic Growth. Beginning in 1953, our country entered a period of planned economic construction. In May of that year, the Seventh National Congress of Chinese Trade Unions was held. The fundamental tasks for trade union organizations as formulated by the Congress were: (1) to keep in close contact with and to educate the masses of workers, and (2) to raise the level of consciousness and organization of the working masses under the leadership of the Chinese Communist Party, so as to strive for the fulfilment of the plan of national industrial construction.

To fulfill and exceed the First Five-Year Plan for developing the national economy, the trade unions mobilized the masses of workers and staff to broaden and deepen socialist labour emulation. One of the prominent features of the emulation was the combining of labour emulation with technical innovation and mass proposals for rationalization. Wang Chinglun, a worker in the General Machinery Plant of the Anshan Iron and Steel Company, was an outstanding example. Using technical innovations, he fulfilled the production quota of four years in one single year of 1953.

In 1954 and 1955, socialist emulation drives to raise technical levels, improve skills and study and master new techniques were launched in various parts of China. This resulted in stimulating the work of evaluating and popularizing advanced experience, as well as organizing rationalization proposals. In 1956, the movement of advanced workers spread throughout the country. All these efforts stepped up the pace of socialist construction.

In private enterprises, the trade unions, in line with the Communist Party's policy of utilization, restriction and transformation of capitalist industry and commerce, mobilized workers and staff to exercise supervision over management. In the latter half of 1955 and the first half of 1956, along with the upsurge in the establishment of agricultural and handicraft cooperatives, the trade unions extensively mobilized workers and staff to assist the government in encouraging owners of private industry and commerce to accept the principle of joint state-private ownership of enterprises. This ensured smooth progress in the socialist transformation of capitalist industry and commerce, and the rapid development of production in enterprises of joint ownership.

We abolished the system of exploitation of man by man, transformed the system of ownership by small producers and established the comprehensive socialist public ownership of the means of production, thus making possible for the Chinese people, who account for more than one-fifth of the world population, to enter socialist society. This was the greatest and most profound change in the history of our country.

The Five-Year Plans. Until December 1957, when the Eighth National Congress of Chinese Trade Unions was held, the First Five-Year Plan had been fulfilled and overfulfilled. In the report of the Eighth Congress of Trade Unions, it was stated: "Proceeding from the present basis, our task is to strive to develop industry, actively support agriculture and concentrate all efforts on implementing the forthcoming Second Five-Year Plan." After the beginning of the Second Five-Year Plan for national economic construction in 1958, the trade unions mobilized and organized workers and staff to participate actively in the implementation of the plan and to contribute their wisdom and efforts to the building of socialist industry and agriculture.

During the three difficult years in the early 1960's, the trade unions mobilized and organized workers and staff to carry out labour emulation for increasing production and practicing economy, and to implement the party's policy of readjusting, consolidating, filling out and raising standards of the national economy, thus facilitating the rehabilitation of the economy. During this period, the trade unions paid special attention to the workers' livelihood and vigorously engaged in agricultural and sideline production in places where conditions permitted. These efforts played an important role in helping workers and staff to overcome the difficulties.

The Catastrophe. In the 17 years before the

"cultural revolution," the Chinese trade unions scored tremendous successes in their work. However, they also suffered some setbacks. They were wrongly charged with committing errors of "syndicalism" and "economism," and for a certain period there was a great deal of talk about the "withering away of trade unions." Even worse, during the period of the "cultural revolution," the trade unions suffered a catastrophe as a result of sabotage by the counter-revolutionary cliques of Lin Biao and Jiang Qing. Many trade union cadres, labour heroes and trade union activists were persecuted, and the All-China Federation of Trade Unions was forced to suspend its work for 11 long years.

II. Restoration and Development After 1976

In October 1976, under the leadership of the Party's Central Committee, the Chinese people smashed the Gang of Four in a great, historic victory. Since then, China's trade unions have been restored and developed as a result of efforts to consolidate them ideologically and organizationally.

The Ninth National Congress of Chinese Trade Unions, which was held in October 1978, set forth the basic principles and tasks for the workers' movement and trade union work in the new period, adopting the new "Constitution of the Trade Unions of the People's Republic of China" and electing the Ninth Executive Committee of the All-China Federation of Trade Unions. The national leading body of the Chinese trade unions, whose activities had been suspended for 11 years, resumed its function.

A New Beginning. The Ninth National Congress of Chinese Trade Unions marked a new starting point for the workers' movement in China. The congress laid down the following principle: Under the leadership of the Chinese Communist Party, the trade unions should unite, educate and encourage the workers and staff to raise continuously their level of political consciousness, master modern science and technology, take an active part in enterprise management, extensively promote socialist labour emulation, raise labour productivity and gradually improve the material and cultural life of the workers and staff on the basis of production growth. In this way, the trade unions will strive to fulfil the general task in the new period.

Historic Meeting. The Third Plenary Session of the 11th Party Central Committee, which was

convened in December 1978, proved to be of great historic significance. The decision was made to shift the focus of party work to socialist construction. It is the historical mission of the Chinese trade unions to mobilize and organize the working class to provide the main force in the building of a modern and powerful nation.

The Party's Central Committee has attached great importance to trade union activities, emphasizing time and again the importance of strengthening the work and issuing a number of important instructions. In his speech to the Ninth National Congress of Chinese Trade Unions, Comrade Deng Xiaoping expressed the hope that trade unions will indeed become the workers' own "organizations which are trustworthy, speak up on their behalf and work in their interests." In his speech at the celebration of the 30th anniversary of the founding of the People's Republic of China, Comrade Ye Jianying asked the trade unions to act as "an important representative of the masses"; in addition to "safeguarding the interests of the state and collective, the trade unions should resolutely safeguard the interests of the masses they represent."

In October 1979, Comrade Hu Yaobang pointed out in his speech at the national working conference of the educational workers' trade unions that the trade unions at present should resolutely protect the right of the working class to be masters of the state, show earnest concern for the masses' well-being, bring the socialist initiative of the working class into full play and continuously raise the communist consciousness of the masses of workers. These important instructions on trade union work, given by the leading comrades of the Party's Central Committee, reflect the great concern of our party for trade union work.

Committee Sessions. Trade unions at all levels have made unremitting efforts to implement the principles and policies formulated since the Third Plenary Session of the 11th Party Central Committee as well as the party's instructions concerning trade union work, bringing their role into full play and making certain that they really represent the workers and staff. In February 1979, the Second Enlarged Session of the Standing Committee of the Ninth Executive Committee of the ACFTU discussed how trade union work could effectively support the socialist modernization programme. It adopted a resolution on "Strengthening Stability and Unity and Launching a Campaign to Increase Production and Practice Economy in an Extensive and Thorough Way."

In October and November 1979, the Third Enlarged Session of the Ninth Executive Committee of the ACFTU was held. The participants

studied carefully Comrade Deng Xiaoping's speech at the Ninth National Congress of Chinese Trade Unions, as well as Comrade Ye Jianying's speech at the meeting in celebration of our National Day. They also corrected the mistake of the national trade union conference on the rectification movement held in 1958, and discussed and formulated specific tasks for the trade unions in achieving the readjustment of our national economy.

The Fourth Enlarged Session of the Standing Committee of the Ninth Executive Committee of ACFTU, convened in April 1980, adopted a resolution on "Mobilizing the Workers and Staff to Contribute to the Four Modernizations and Launching the Campaign to Increase Production and Practice Economy in a Thorough Way in Preparation for the 12th National Party Congress." Acting in accordance with the above-mentioned resolutions, the trade unions at all levels have taken many measures and have done a great deal of work, thus gradually resuming and stepping up their activities.

III. Major Accomplishments of the Trade Unions

Trade unions have played an active role in rapidly rehabilitating and developing the national economy after 10 years of chaos (1966-1976) by mobilizing and organizing the workers and staff to carry out socialist labour emulation, with emphasis on increasing production and practicing economy. The unions launched a campaign to make contributions to the Four Modernizations and encouraged the advanced collectives and persons on the economic fronts.

Emulation Drives. In recent years, groups, teams and individuals in a number of enterprises have participated in emulation drives to achieve higher scores in fulfilling the fixed norms based on their enterprises' economic indexes according to the state plan. Bonuses are worked out on the basis of how well these norms are fulfilled. These drives link the economic responsibility of an enterprise with its economic results and interests, on the one hand, and consider the interests of the state, the collective and the individuals, on the other, thus mobilizing the initiative of the workers and staff and boosting the growth of production.

For example, the power industry, which was the first to introduce such a drive in 1979, produced 3,900 million more kwh of electricity in excess of the state plan and saved 4.35 million tons of coal and 1,840 million kwh of electricity. In the first half of 1980, the output of electricity reached 50.7% of the annual plan. From January

to May, 1.5 million tons of coal were saved. Such emulation drives spur the enterprises to improve steadily their managerial work and encourage the workers and staff to study and adopt new techniques to improve their technological level.

Some industries launch labour emulation drives, such as the emulation of "weaving 10,000 metres of cloth without any fault" carried out in the textile industry; "safe operation without any accident in 100 days" among railway workers; and "all-excellent projects" for the building industry: An "all-excellent project" must meet these six criteria: (1) the project must be of high quality; (2) the project must be completed on time; (3) its labour efficiency must exceed state norms; (4) it must consume less raw material than the original plan; (5) it must be accomplished without major accidents causing serious injuries or deaths; and (6) it must have strict operation management, a tidy and clean construction site and the finished work must meet design requirements.

This particular emulation was initiated by No. 1 Division of Beijing No. 6 Building Company. By the end of 1978, the All-China Federation of Trade Unions, the State Capital Construction Commission and the State Bureau of Labour jointly called a meeting to popularize the experience. The emulation was quickly adopted by building enterprises in different places, and good results have been achieved. According to initial statistics from building enterprises in 18 provinces and municipalities, such as Beijing, Tianjin, Shanghai and Liaoning, 1,793 "all-excellent projects" with a total floor space of over 3,390,000 sq. m. were created in the first half of 1980, exceeding that of 1979.

Some industries are organizing inter-factory emulations, such as the emulation between bicycle factories in light industries and that between TV set manufacturing factories in the electronics industry. These emulations enable factories to support and learn from each other and to exchange techniques, thus helping the growth and technical improvement of the entire industry.

The TV set manufacturing industry suffered a loss of 10.62 million yuan for the first half of 1979. However, as a result of introducing inter-factory emulations in July 1979, it got out of the red. Taking 1979 as a whole, it gained a net profit of 960,000 yuan, and in 1980 its profits amounted to 80 million yuan. The output increased by 68% as compared with 1979, and the quality improved remarkably. In addition, trade unions at various places organized workers and staff in the same trade or doing the same type of work to emulate each other, and also organized contests between individuals and groups. All these activities also produced good economic results.

Four Modernizations. In 1980, a drive "to make contributions to the Four Modernizations" was launched in many provinces and municipalities. It closely integrated economic production and other activities of the various units with the effort to realize the Four Modernizations. The campaign gave great inspiration to the workers and staff members and won wide support. It has played a significant role in improving enterprise management, boosting production and mobilizing the initiative of the workers and staff.

In recent years, through extensive socialist labour emulations and the drive to make contributions to the Four Modernizations, the trade unions have achieved marked results in organizing the workers and staff to make rationalization proposals and carry out technical cooperation. According to statistics for the first half of 1980, 2.08 million workers and staff made more than 1,283,000 million proposals either individually or jointly, and more than 688,000 were adopted. Of those proposals adopted, 275,000 represented total annual savings of more than 1,900 million yuan.

According to incomplete statistics from 27 provinces, municipalities and autonomous regions for the first half of 1980, there were 2,000 organizations for technical cooperation and 186 technical exchange stations at the city and county levels and 22,000 organizations of technical cooperation at the grassroots enterprise level. In the first half of 1980 alone, 3,242 technical demonstrations were held and 7,947 lectures were organized by the technical exchange stations run by trade unions at or above the county level. More than 851,000 attended the activities of inspecting and learning from each other's work. A total of 3,329 new techniques were popularized through these activities. There were more than 15,000 activities designed to help agriculture. The technical exchange stations and teams for popularizing professional knowledge organized by trade unions at or above the county level helped solve more than 3,000 key technical problems.

Model and Advanced Workers. In the extensive socialist emulation drives and activities contributing to the Four Modernizations, a great number of model workers and advanced workers emerged. They are outstanding representatives of the advanced productive force. Award ceremonies were held by the State Council in September and December 1979 to commend the national advanced enterprises and national model workers in industry, transport and communications and capital construction, as well as the national advanced units and national model workers in agriculture, finance and trade, education, health and scientific research.

In 1980, 61 million workers and staff members in 264,000 basic units elected among themselves 1.23 million advanced collectives, including 920,000 advanced teams and groups, and 11.15 million advanced workers, which was 1.83 million more than in 1979, 7.95 million more than in 1963 and 10.95 million more than the total number between 1949, the year when New China was founded, and 1952.

Moreover, the trade unions at various levels rehabilitated veteran model workers who were persecuted during the "cultural revolution" and made certain that the policies of the party were well-implemented in their cases. The trade unions also publicized the advanced ideas and deeds of the model workers of all trades and professions and lauded their exemplary role. All these activities helped to promote the growth of the social productive forces.

The Workers' Congresses. Experience was gained and good results were achieved in the trade unions' unremitting efforts to restore and develop the system of workers' congresses and carry out experiments with the democratic election of leading cadres at the basic level. It has always been an important task for the trade unions to organize workers and staff to take part in the democratic management of enterprises and safeguard the democratic rights due them as masters of the enterprises.

As far back as 1948, it was decided at the Sixth National Congress of Labour to set up workers' conferences and factory management committees in industrial enterprises, these conferences and committees to be composed of factory directors, engineers, cadres in charge of production, trade union representatives and some of the delegates elected by the workers' general meeting. In May 1949, the Workers' Conference of North China adopted a resolution on the establishment of management committees and workers' conferences in factories and worked out regulations for its implementation. These regulations were promulgated and put into force by the People's Government of North China.

In an editorial in the *People's Daily* on February 7, 1950, entitled "Learn How to Manage An Enterprise," it was pointed out that "to learn to master managerial work and transform bureaucratic-capitalist enterprises into socialist ones should become a predominant slogan for the Chinese working class." A specific directive issued by the Party Central Committee called for taking this editorial as a guideline for running enterprises and boosting production at that time.

Subsequently, the Financial and Economic Commission of the Government Administration

Council issued a "Directive on the Establishment of Management Committees in the State-Owned and Public-Owned Factories." In the early years of the founding of the People's Republic, such a system was introduced in most of the state-owned and public-owned enterprises throughout the country. The Eighth National Party Congress held in 1956 declared that the system of workers' congresses under the leadership of the Party Central Committee should be adopted, while the system of factory directors bearing responsibility under the leadership of the Party Central Committee is enforced. In March 1957, the character, function and terms of reference of the workers' congresses were defined by the Party Central Committee, and thus the workers' conference, an advisory body, developed into the workers' congress, an organ of power.

In the "Draft Regulations Regarding Functions of State-Owned Industrial Enterprises" worked out in 1961, there is a chapter on workers' congresses. Trade unions have done a great deal to safeguard the democratic rights that are due workers and staff as masters of the enterprises and in supporting and helping them to take part in the management of the enterprises. In this they have gained considerable experience, even though there have been forward and backward steps.

After the downfall of the Gang of Four, the Party Central Committee and the State Council attached great importance to the rights of workers to be the masters of their enterprises. They reiterated that democratic management should be consolidated and the system of workers' congresses under the leadership of the Party Central Committee should be practiced by all enterprises without exception. Trade unions at all levels have made great efforts to restore and carry out this system.

Practice over a number of years shows that the system of workers' congresses under the leadership of the Party committee is fundamental to our socialist enterprise. The workers' congress is a basic form of democratic management of enterprise and an organ of power in which the workers and staff manage the enterprise and supervise the cadres. Under the guidance of the state plan and within the limits of the power of self-management of enterprise laid down by law, it has the right to make decisions on important issues concerning production, management and working conditions, wages, rewards and welfare. It has the right to elect and dismiss leading personnel of the enterprise and to recommend them to higher authorities for appointment or removal. It also has the right to examine and supervise the work of the leading personnel and ascertain that they carry out the resolutions adopted by the workers' congress.

As a working body of the workers' congress, the trade unions exercise the following main functions and powers: (1) to organize the election of the workers' representatives to the congress; (2) to solicit opinions from among the masses; (3) to prepare the convening of the congress; (4) to supervise and check up on the implementation of the resolutions adopted by the congress; (5) to organize and guide the regular activities of the workers' representatives; (6) to handle the complaints of the workers and staff members; and (7) to deal with other matters referred to by the congress.

Gratifying progress has been achieved in introducing the system of workers' congresses in China's enterprises over the last few years. By the end of June 1980, the system of workers' congresses was restored and established in more than 36,000 basic units, among which about 33,000 are industrial and mining enterprises and over 2,400 are cultural, health and educational institutions. A number of enterprises and undertakings carried out on a trial basis the democratic election of leading personnel at the grassroots level. This was a major development in the democratic management of enterprises.

Statistics show that in the first half of 1980, group and section chiefs of 33,225 basic units, workshop heads of 11,186 basic units and directors or managers of 965 enterprises were elected. In the country as a whole, however, the system of workers' congresses developed in an uneven way, with the large and medium-sized enterprises in industrial cities having always set up the congress.

The system of workers' congresses has yielded good results and played a remarkable role whenever it has been practiced properly. In bringing workers and staff together to discuss the important issues relating to production and management, the workers' congress has greatly enhanced their sense of responsibility and effectively boosted production. It has strengthened the ties between the cadres and the masses and consolidated unity and stability. It has also helped the leadership to solve the day-to-day problems of great concern to workers, which had remained unsolved for a long time, such as the allocation of housing, the employment of workers' grown-up children, etc. Some enterprises refer these problems to the workers' congress for discussion and a decision, and as a rule they are solved satisfactorily.

Labour Protection. The trade unions have improved their work in labour protection and the protection of women workers in order to reduce accidents, guarantee the health and safety of the workers and staff and promote safety in production. For years, the trade unions at all levels, under

the leadership of the party and in coordination with the departments concerned, have done much to implement the party's policies and the government's laws and decrees in regard to labour protection, and all this has played a positive role in urging the enterprises to ensure labour safety and safety in production. By 1957, the unsafe and unhealthy situation left over by the old society was fundamentally changed, and accidents causing injuries and death were reduced to the lowest level in the history of China. As a result, production made much headway.

Because labour protection was completely ignored during the "cultural revolution," safety in production suffered a great setback and accidents rose sharply year after year during that period. After the downfall of the Gang of Four, and in the course of restoration and development of production, the party and the government have time and again emphasized the importance of safety in production.

The Third National Trade Union Conference on Labour Protection, which was convened by the ACFTU in June 1980, decided to further implement the important directives of the Party Central Committee and the State Council on labour protection. The conference urged that trade union work in regard to labour protection of the masses be improved, and that the unions help and supervise the management of enterprises, in coordination with related departments, in taking effective measures to sharply reduce accidents and eliminate hazards caused by dust and toxic pollutants. These measures will ensure safety in production and further the smooth advance of the Four Modernizations.

After the Bohai No. 2 oil rig (operated by the Oceanic Petroleum Exploration Bureau of the Ministry of Petroleum Industry) capsized because of violations of safety rules, the ACFTU and other departments concerned formed a joint investigation group to study the case and report its conclusion to the Party Central Committee and the State Council. The State Council's findings on the accident were made public on August 25, 1980. Those directly responsible for the disaster were punished according to the criminal law and given administrative penalties. Since the decision of the State Council on the accident was implemented, serious accidents leading to injuries and deaths have been notably reduced, and safety in production and labour protection for the masses have made remarkable progress.

In 1980, the number of deaths and injuries due to industrial accidents dropped by 11% and 7.2%, respectively, compared with 1979. In the coal industry, the number of deaths dropped by 21.4% from 1979 and was the lowest since the

founding of the People's Republic. Encouraging results—ideological, organizational and professional—have been obtained in the labour protection work carried on by the trade unions. At present, trade union councils in 18 provinces, municipalities and autonomous regions and in 40 cities directly under the provincial governments have restored and established labour protection working committees; and some 500,000 labour protection inspectors are working in production groups. The restoration and development of labour protection for the masses has played a large role in reducing accidents and improving labour and working conditions.

Women Workers. The trade unions at all levels also have strengthened the protection of women workers. Departments of women workers of the trade unions throughout the country, in coordination with the departments concerned, made a study of the labour protection of women workers in 1980 and put forward positive suggestions to the governments at different levels. With the approval of the provincial and municipal governments, measures and regulations for the protection of women workers have been implemented in the basic units.

For the protection of women workers, some enterprises have adopted measures as shorter working hours, regular rotation on different jobs, transfer of pregnant or breast-feeding workers to other jobs and transfer of women workers from jobs that involve excessively heavy manual labour. Rapid progress has been made in the work of providing more facilities for protecting women workers at various localities. According to incomplete statistics from Hubei, Liaoning, Jilin, Beijing, Shanghai and Tianjin, 1,513 clinics for women workers were established or restored in 1980. With the help and support of the trade unions, the health protection departments conduct regular examinations for gynaecological diseases and provide prompt treatment. All these measures have improved the health of women workers and won their approbation.

Workers' Well-Being. The trade unions look after the well-being of the workers and staff so as to help them with their personal and family problems. After the fall of the Gang of Four, the party and government took a series of measures to improve the well-being of the workers and staff. Apart from wage increases for more than 75% of the workers and staff throughout the country, the bonus system has been introduced and more people have been employed. As a result, there has been a notable increase—of nearly 80 yuan in 1980 as compared with 1979—in the annual income of

the workers and staff in the state-owned enterprises.

Nine million people in cities and towns were given jobs in 1979, and another seven million were employed in 1980. Housing with a total floor space of more than 78 million sq. m. was completed in cities and towns in 1980, an increase of more than 25% over 1979. Trade union organizations also help the workers and staff build houses with their own money or with state subsidies. In 1979, 1,580 households of workers, staff and residents in Fuzhou, Fujian Province, built their own houses (totalling 87,870 sq. m. of floor space) with state subsidies.

While helping the workers and staff to understand the difficulties of the government and to realize that their livelihood can be improved only gradually on the basis of expanded production, the trade unions urged and helped management to improve the living conditions of the workers and staff. They opposed the bureaucrats' indifference to the well-being of the masses and their infringement upon the immediate interests of the workers and staff.

Trade union organizations at all levels have spared no effort to help improve the education of teenagers and children and to see that junior middle schools, primary schools, nurseries, breast-feeding rooms and other welfare facilities are well managed. In June 1980, there were 112,863 kindergartens, nurseries and breast-feeding rooms operated by industrial enterprises, with a total enrollment of 3,250,000 — an increase of 350,000 over 1979, 2,350,000 over 1964 and 3,200,000 over 1952. At present, in most parts of the country, more than 60% of babies are cared for in nurseries; in Shanghai, Jiangxi Province and Gansu Province the figure is no less than 70%.

The trade unions are in charge of labour insurance in the enterprises and the sanatoriums for the workers and staff, and they have paid great attention to administering this work well. The sanatoriums run by the trade unions have been gradually restored in recent years. In June 1980, the local trade unions operated a total of 157 sanatoriums and rest homes, with more than 24,000 beds. In addition, factories, mines and other basic units operated 634 sanatoriums and rest homes with 20,668 beds.

Mobilizing the masses and pooling their resources to solve some of their living problems has been a fine tradition and successful experience of our trade unions. By June 1980, no less than 255,000 units at the grassroots level had set up mutual-aid savings funds with a total membership of more than 35,132,000 workers and staff. Total deposits amounted to 960 million yuan, and more than 32,800,000 people received loans for them.

Labour mutual-aid activity has made much headway among the masses. Mutual aid among the workers and staff in many places has become a common practice in such activities as building and repairing houses, moving homes, helping with domestic chores, holding wedding parties, making funeral arrangements, nursing the sick, looking after orphans and mediating disputes.

Education. The trade unions have stepped up the ideological, political, cultural and technical education among the workers and staff for the purpose of raising their political consciousness and cultural and technical levels so that they can contribute to the Four Modernizations.

There were nearly 50 million workers and staff in 1965, and the number surpassed 100 million in 1980. The veteran workers who entered factories before Liberation or in the early years after Liberation are not many and few of them are in the vanguard of production. The majority of workers today started working in the 1970's. The advantage of this change in the composition of workers and staff is that today's contingent is young and has more education, but the disadvantage is that the younger workers lack strict training.

A survey of 20 million workers and staff at the end of 1979 showed that 80% of them had an educational level below that of a junior middle school graduate, and 7.8% of them were either illiterate or semi-literate. Half of the workers and staff in the country started to work after the "cultural revolution" began, and their educational level is generally below that required by formal schooling. Most of the workers are below Grade 3, and most of the managerial personnel are lacking in knowledge of modern enterprise management. It is highly important, therefore, that we strengthen the educational work among the workers and staff in general, and the young in particular.

The trade unions consider the ideological and political education of the workers and staff to be an important task. Workers are taught to realize that they are the masters of the state and the enterprises and to understand that the interests of the state, the enterprises and the individuals coincide, as do the long-term and immediate interests of the working class.

Ideological and political education consists of education on the current situation and tasks, on the fine tradition of the working class, on revolutionary ideals, on morality and on the communist outlook on life. Since the Third Plenary Session of the 11th Central Committee of the Communist Party, the trade unions have in various ways and through different channels propagated and publicized the principles and policies of the party, es-

pecially the significance of upholding socialism, the dictatorship of the proletariat, the leadership of the Communist Party and Marxism-Leninism-Mao Zedong Thought. This has raised the political consciousness of the workers and staff, strengthened their confidence in the socialist road and further stirred their enthusiasm to contribute to the Four Modernizations.

In carrying out the ideological and political work, many trade union organizations have commended good people and good deeds; fostered the spirit of uprightness and resisted unhealthy practices and noxious tendencies; and conducted thorough and painstaking ideological work among veteran, as well as young workers, women workers and intellectuals in light of their particular characteristics. The trade unions mobilized and organized their cadres and activists to make home visits and to have confidential talks with workers to help solve their personal problems. At present, emphasis is being placed on the ideological education among young workers — to help the advanced make further progress and the less advanced to become advanced.

Recreation and Sports. Trade unions at various levels make full use of all available facilities to draw the workers and staff into recreational and sports activities so as to enrich their leisure-time life and education. Trade unions at various levels have restored some of the workers' cultural palaces and clubs and constructed some new ones. In 1950, there were only 16 cultural palaces in the country. By the end of June 1980, 1,505 cultural palaces and clubs were restored and set up by county and municipal trade union councils and industrial unions, 179 more than in 1979. In 1950 there were only 773 cultural clubs. In 1980, there were more than 13,200 clubs run by industrial enterprises, an increase of about 2,000 over 1979.

In addition, county and municipal trade union councils and industrial unions have set up 2,898 libraries, 678 more than in 1963. Their collections total 13 million volumes. More than 105,000 libraries, with more than 211 million volumes, are run by the grassroots trade unions, representing an increase of 39,000 libraries over 1979 and 64,000 over 1963. In 1950, there were only 360 libraries run by the basic units and trade unions. A total of 1,446 film projection teams are run by county and municipal trade union councils and industrial unions below the provincial level, while another 18,500 are run by grassroots trade unions. At present, there are more than 15,700 workers' amateur troupes and groups, with 330,000 participants, and more than 8,800 workers' literary and artistic creation groups, with 53,300 members.

The basic units have more than 3,600 gymnasiums or stadiums and have established 8,800 sports associations and 208,000 sports teams with 2,196,000 workers taking part. In the first half of 1980, more than 70,000 basic units held 298,000 sports events, with 6,524,000 people participating. The county and municipal trade union councils and industrial unions below the provincial level set up 213 gymnasiums and stadiums and organized more than 10,000 spare-time sports teams with 107,000 athletes, and held over 20,000 competitions in which 1,100,000 people took part.

Spare-Time Education. In order to meet the needs of the Four Modernizations and the demands of the workers and staff, trade unions at all levels, in cooperation with the departments concerned, have made great efforts to restore and develop spare-time education. At the end of June 1980, more than 72,200 spare-time schools for workers and staff members had been organized throughout the country, an increase of 9,300 as compared with 1979. Of these, over 68,000 schools are run by basic units, an increase of 7,000 over 1979, and 1,887 are spare-time colleges including 310 run either by the municipal and county trade union councils or by the industrial trade unions below the provincial level.

More than 8,334,000 workers and staff members attended spare-time schools at different levels, and 4,954,000 attended short-term technical training classes of various kinds. Thus, total enrollment amounted to some 13,299,000 — 3,000,000 more than in 1979 and 9,000,000 more than in 1965. In 1949, the year of the founding of the People's Republic, only 276,000 workers and staff attended spare-time courses throughout the country. A large number of skilled workers and qualified technicians have since been trained by these schools.

Organizational Development. With the restoration and development of trade union activities, the reconstruction of trade union organizations is gradually being stepped up. By the end of 1980, there were 18 national industrial trade unions: the Metallurgical Workers' Trade Union, the Machine-Building Workers' Trade Union, the Chemical Workers' Trade Union, the Coal Miners' Trade Union, the Petroleum Workers' Trade Union, the Water Conservancy and Electricity Workers' Trade Union, the Textile Workers' Trade Union, the Light Industry Workers' Trade Union, the Railway Workers' Trade Union, the Road Transport Workers' Trade Union, the Seamen's Trade Union, the Postal and Telecommunications Workers' Trade Union, the Building Workers' Trade Union, the Geological Workers' Trade Union, the Agricultural

and Forestry Workers' Trade Union, the Financial and Commercial Workers' Trade Union, the Educational Workers' Trade Union and the National Defence Industry Workers' Trade Union. The banks and the ministries of machine-building have separate trade union organizations. All the trade union councils in 29 provinces (except Taiwan Province), autonomous regions and municipalities directly under the central government have been restored.

Both primary trade union organizations and union membership have increased. In June 1980, there were more than 376,000 primary trade union organizations across the country — an increase of over 46,000 as compared with that of a year earlier, 190,000 more than in 1964 and 169,000 more than in 1952. There were 449,000 trade union organizations at the workshop level, an increase of 8,000 over 1979; and more than 4,541,000 trade union groups, an increase of 701,000 over 1979.

In the basic units where trade union organizations are established there are in all 61,160,000 union members out of 74,480,000 workers and staff, i.e., 82.1% of the workers and staff members are organized. The membership rose by 9,690,000 over June 1979, an 18.8% increase and nearly three times the number in 1964. In 1949, union membership was only 2,374,000 in the whole country.

The number of trade union cadres has also increased. In June 1980, there were 243,000 full-time trade union cadres throughout the country, an increase of 22,000 over 1979 and nearly three times the number in 1964. They included 190,000 cadres of primary trade unions, 26,100 cadres in county trade union councils or in councils at higher levels, over 15,100 cadres in the industrial (bureau) trade unions and more than 11,700 cadres in trade unions at the company level.

The number of trade union activists has grown considerably. At the end of June 1980, the number of activists in primary trade union or-

ganizations throughout the country reached 7,700,000, an increase of 1,730,000 or 28.9% over the number a year earlier and 3,420,000 more than in 1964. In 1952, there were only 1,696,000 trade union activists.

The training of trade union cadres is also being improved. Throughout the country, 31 trade union cadres' schools have been restored or set up by provincial and municipal trade union councils, and more than 12,000 trade union cadres were trained in the first half of 1980. In addition, 27,000 trade union organizations all over the country held various kinds of short-term training classes on trade union work in which 1,234,000 trade union cadres and activists were trained.

Shortly before the Ninth National Congress of Chinese Trade Unions, the All-China Federation of Trade Unions resumed the publication of the *Workers' Daily*. Its circulation increased sharply: 977,000 copies in early 1979, 1,391,000 copies in early 1980 and 1,768,000 copies in early 1981, more than five times that on the eve of the "cultural revolution."

International Ties. Chinese trade unions have resumed and expanded friendly ties with trade union organizations in 86 countries on all continents. The international liaison work of trade unions serves the development and expansion of the international united front to help the fight against hegemonism and for the needs of the Four Modernizations.

The Task Ahead. Although trade union activities in our country have gradually resumed and have made progress in recent years, trade union work still falls behind the requirements of the party and the needs of the workers and staff members. We should sum up our experience, add to the achievements, overcome shortcomings and organize and mobilize the working class throughout the country to build China into a democratic and civilized modern socialist nation.

50. CHINA'S CULTURAL ACHIEVEMENTS IN 1980

By Cui Yongsheng

Policy Research Department, Ministry of Culture

In accordance with the requirements for the readjustment, restructuring, consolidation and improvement of the national economy, following the directive that literature and art should serve the people and socialism and in implementation of the principles of "let a hundred flowers blossom and a hundred schools of thought contend," "make the past serve the present and foreign things serve China," "weed out the old to bring forth the new," China has in 1980 achieved considerable success in promoting and developing literary and artistic production, in training professionals in culture and art and in reorganizing various cultural establishments. All this has been done with a view to meeting the needs of the people and modernizing the country.

To show the progress that has been made in cultural work in 1980, as compared with that of the past 30 years, it is necessary to review briefly the development of cultural establishments since the founding of New China.

I. Laying New Foundations for Cultural Development

China has an ancient civilisation and a rich cultural legacy. In modern times, however, especially in the semi-feudal and semi-colonial conditions of old China, cultural establishments were few and extremely backward. Before 1949, there were very few film studios, professional cultural and art organizations, colleges and schools of art, public libraries, theatres or cinemas. Traditional art was not supported by the government. Traditional opera, which had occupied a major place in the cultural life of the people, was in a state of decline. The artists of traditional opera had no secure means of livelihood and enjoyed a very low social status. The culture and art of the minority nationalities was in an even worse state, near to extinction. The cultural life of the masses, especially those living in the countryside and mountainous regions, and in the regions inhabited by the minority nationalities, was extremely poor.

In the years after the "May Fourth Movement," there was a surge of revolutionary and progressive literature and art under the leadership of the Communist Party of China, but it could not be sustained because of Kuomintang suppression. In the revolutionary bases and liberated areas,

cultural activities were hampered by wartime conditions; the only professional cultural activities that could be carried on took the form of song-and-dance ensembles or teams.

With the founding of New China in 1949, culture and the arts entered a new historical period of development under the leadership of the Communist Party of China and the People's Government and received the support of leading comrades in the Party Central Committee and State Council.

After the three years of rehabilitation and development of the national economy immediately after Liberation, China adopted its First Five-Year Plan. During the period from 1953 to 1957, a large number of cultural establishments were set up. By the end of 1957, there were a total of 11 film studios — 6 of them producing feature films and the rest producing science and educational films, animated cartoons and newsreels. Film projection units in 1957 numbered 9,965, more than four times the number in 1952. Most of the new units consisted of film clubs in factories and mines and mobile film projection teams in the countryside. Film clubs had increased from 426 in late 1952 to 2,243 in 1957, while mobile projection teams had increased from 1,113 to 6,692 in the same period. Newly organised professional troupes performing traditional operas, modern dramas and operas, folk songs and folk dances, acrobatics, shadow plays, puppet shows, ballets and symphonies totaled 2,884, about 800 more than in 1952. The number of theatres increased from 823 in 1952 to 2,372 in 1957. Art education developed rapidly with the establishment of 17 colleges of art.

With the development of popular culture, the country had 400 public libraries, 39 art galleries (engaged mainly in collecting and selectively introducing folk art and in directing the recreational activities of the masses), 2,748 cultural centres and 2,417 cultural stations which engaged mainly in popularizing culture, art and science in localities below the county level and in organizing spare-time cultural and artistic activities for the masses. At mines and factories throughout the country, spare-time clubs and reading rooms were opened. And in the minority nationality regions, professional organizations of art and culture, performing troupes and facilities were set up.

With the cooperation of the departments of machine-building, chemistry and electrical

engineering, production of art and film equipment became possible. In addition, factories for the manufacture of film and film machinery, dye-transforming factories, scenery equipment factories and factories for making stage settings were constructed.

Following the guidelines put forward by Comrade Mao Zedong in his speech at the Yan'an Forum on Literature and Art, and in accordance with the principles of "let a hundred flowers blossom and a hundred schools of thought contend" and "weed out the old to bring forth the new," literature and art flourished. Writers and artists produced many excellent works which attempted to depict the new era and the new life and struggle of the people. The traditional arts of the minority nationalities began to thrive as they had never done before. Performing troupes for all types of opera and drama were set up. Through rewriting and restructuring, thousands of operas and plays discarded the dross of feudalism and incorporated the essence of democracy. The folk-tales, folk art, folk songs and dances of the minority nationalities were collected and promoted. The social status and the standard of living of writers and artists were greatly improved and older writers, artists and artisans were accorded the respect due them.

The achievements made in the first eight years after Liberation, and especially during the period of the First Five-Year Plan, laid a solid foundation for the development of cultural work in our socialist country.

During the Second Five-Year Plan, which started in 1958, the mistakes of the "Great Leap Forward" followed by three years of natural disasters put a brake on this work. With the exception of art education and film projection units, there was relatively little development of cultural facilities.

However, the quality of various works of literature and art produced for the 10th anniversary of the founding of New China in 1959 showed vast improvement. In that year, 82 feature films were presented and traditional opera troupes put on many performances of operas dealing with modern social life as well as of newly written historical plays.

With the year-by-year improvement of the economic situation after 1962, there came a new growth of cultural establishments. By late 1965 there were 3,564 theatrical troupes of various kinds, 16 film studios, 20,263 film projection units, 22 colleges of art, 59 secondary art schools and over 1,000 art students. In the whole country there were 577 public libraries, 62 art galleries, 2,621 cultural centres, 2,087 cultural stations, 2,524 theatres and 2,528 cinemas. A network of

film studios, colleges and schools of art and professional theatrical troupes of all kinds was basically in place.

Unfortunately, just as these cultural establishments were ready to develop further, the "cultural revolution" began. From the summer of 1966 to the autumn of 1976, the country's cultural establishments were severely damaged by the counter-revolutionary cliques of Lin Biao and Jiang Qing. Fabricating charges of "a sinister line of literature and art" and "revisionism," they attempted to write off at one stroke all the cultural achievements of the 17 years after Liberation.

During these years, writers and artists were cruelly persecuted, all the fine works of ancient and modern and Chinese and foreign writers and artists were banned and most theatrical troupes were disbanded. Colleges and schools of art, public art galleries and research institutes in the arts were closed down. Many theatres throughout the country were deserted. Numerous local cultural organs, such as cultural centres, cultural stations and libraries, saw their work disrupted; some ceased to exist except in name. As a result, socialist culture and art in China suffered a severe setback.

The perverse acts of the Lin Biao and Jiang Qing counter-revolutionary cliques in the political, economic and cultural spheres ultimately led to their own downfall. In October 1976, the Central Committee of the Chinese Communist Party, acting on the wishes of the people, smashed the Jiang Qing counter-revolutionary clique. Correct party policies with respect to literature and art and artists were gradually restored and implemented.

Cultural establishments of various kinds soon reopened and resumed their work. In late 1978, the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party decided to shift the focus of the work of the party and the country to the building of a modern socialist country. Starting in 1979, China embarked on a new period of socialist modernization. The same was true of literature and art.

II. The Achievements of 1980

By 1980, cultural activity had not only resumed its pre-"cultural revolution" level but had also extended to new fields. In 1980 the country boasted 17 film studios (11 of which were producing feature films), 125,000 film projection units (over six times the 1965 figure or twice as many as in 1976); 3,533 theatrical troupes of all kinds (68 more than in 1965); over 2,500 indoor

theatres and clubs open to the public, 109 schools of art (of which 26 were colleges of art and 83 were secondary art schools, with a total enrollment of over 21,000), an increase of 28 over 1965. Art schools revised their teaching plans and programmes for various subjects and courses, compiled new teaching materials, established a stable teaching schedule, livened up the atmosphere of academic discussion and improved the quality of teaching. There were 1,732 public libraries in the whole country, three times as many as in 1965.

Culture for the Masses. There were also new developments in the cultural activities for the masses. To modernize agriculture in an all-around way it is very important and highly necessary to raise the level of cultural work in the countryside, to develop cultural establishments and to liven up the cultural life of China's 800 million peasants. In 1980, professional theatrical troupes of all kinds toured the countryside to give over 500,000 performances. Cultural organizations serving the countryside included 13 slide-producing centres, 218 public art galleries, 2,912 cultural centres and more than 25,000 commune-run cultural stations, 76,000 commune-run film projection teams and over 90,000 amateur theatrical troupes.

In 1980, in accordance with the instructions of the Party Central Committee to build up the small towns of the country into political, economic and cultural centres, a number of communes and towns strengthened their cultural offerings with the help of the collective economy. In these localities there were already some cultural organizations and facilities, such as cinemas, theatres, cultural centres, libraries and reading rooms. They served as multiple-purpose centres: educating peasants in socialist ideology and morality, popularizing knowledge of agricultural science and technology, organizing cultural and theatrical activities of all kinds and raising the general cultural level of the countryside. Cultural activities in the countryside became quite lively and were much appreciated by the peasants, especially by the young.

To encourage literary and artistic activities among the masses, many literary and art magazines were published; these publications promoted the exchange of ideas about the organization of cultural activities and made accessible to the masses a variety of short, vivid and popular writings on literature and art.

Professional Training. The training of professional writers, artists and artisans was improved and expanded. In 1980, there were in all 800,000 people working in various areas of culture and art. During the 10 catastrophic years of the "cultural

revolution," writers and artists were forced to abandon their professions and were deprived of the right to work. Some young people who were chosen from among the ranks of educated youth for cultural work never received formal training and lacked professional knowledge and fundamental skills. They must be given professional training if we are to improve artistic quality and raise levels of artistic creativity and performance.

Since the beginning of 1981, cultural organizations at all levels, federations of literature, art circles, art schools and theatrical troupes have begun to offer short training courses, classes and professional seminars in various forms of artistic creation, such as art collecting, conducting, performing, the construction of Chinese musical instruments, scenery design and so forth. In addition, some leading comrades in charge of cultural work were sent to study in party schools. Cultural departments in many provinces, municipalities and autonomous regions have reinstated schools for educating cadres in culture and art and have trained, by turns, a number of professional workers and cadres from theatrical troupes, art galleries, cultural centres and film projection teams and organized them for professional study. Some organizations, such as film studios and theatrical companies, sponsored seminars and research groups to broaden their members' knowledge and to encourage them to learn from each other for common progress. Some colleges and schools of art also held special classes to provide the minorities with professional training in the arts.

A Cultural Renaissance. Literary and artistic work in China is now thriving as it has never done before. The guidelines adopted by the Third Plenary Session of the 11th Central Committee of the Party and the discussions on "practice as the only criteria for examining truth" gave great impetus to ideological emancipation in the cultural field and to the implementation of the principle of "let a hundred flowers blossom and a hundred schools of thought contend." The result has been a renaissance of the arts.

In 1980, over 90 novels were published, three times the number published in 1959, which held the previous record for the number of novels produced. Incomplete statistics compiled by more than 40 leading publishing houses at central and provincial levels show that over 130 novelettes and 2,400 short stories were published in 1980, far more than in any previous year. The number of films produced in 1980 was 82, including feature films and stage art films. Both the quality and the quantity of animated cartoons, documentaries and newsreels were remarkably by comparison with other years.

The 30th anniversary of the founding of the People's Republic in 1979 was marked by unparalleled achievements in the creation and performance of modern operas, traditional operas, dramas, songs and dances. A number of new modern operas added excitement to the field of drama, while traditional opera was infused with new vitality. Some excellent modern plays were created and staged following the restoration of the principle "develop the three dramas simultaneously" — the three being traditional drama, newly compiled historical drama and modern drama.

In 1980, the leading magazines on literature and art published by central and local governments carried selections from 43 new, revised or rearranged scripts; of these, 19 were modern dramas, 8 were newly compiled historical dramas and 16 were revised traditional dramas. More than 20 of these plays were widely staged by local theatrical troupes. Some provinces, municipalities and autonomous regions jointly organized performances of modern dramas.

In music, the number of compositions increased and the quality improved. There was also progress in the field of dance. At the First National Dance Competition held in Dalian in 1980, 46 works (including solo dances and dances for two and for three people) received prizes for choreography and performance, 26 won prizes for music composition and 72 dancers were awarded prizes for artistry.

Painting and drawing also flourished. Since the beginning of 1980, 32 major exhibitions — not including exhibitions of works by artists who are no longer alive — have been sponsored by the National Art Gallery. The works on exhibit totalled over 10,000.

Problems and Shortcomings. There were some shortcomings in the new works of literature and art. For example, the range of subjects treated was narrow; writers tended to descend "like a swarm of bees" on the same few subjects. The forms of artistic expression were nearly all the same and the themes of some dramas were not satisfactory.

On the whole, however, the new works tried to restore and continue the realistic tradition of socialist literature, to widen the scope and improve the content of dramatic works, to express the aspirations, concerns and wishes of the masses, to raise and answer timely questions about actual life and to explore new forms of artistic expression.

Arts of the Minority Nationalities. The year 1980 also saw important progress in the literature and art of China's minorities. In 1979, the State

Council had approved the establishment of a number of film studios in the autonomous regions of Inner Mongolia, Xinjiang and Guangxi. These began to produce films in 1980. In the regions inhabited by minority nationalities, there were 18,556 film projection units (of which 17,872 were mobile teams) and 603 professional theatrical troupes of various kinds. Some excellent operas by the minority nationalities, which had not been seen for years, were presented. These included traditional operas of the Tibetan, Bai, Dai and Uyghur nationalities. A number of minority nationalities, such as the Mongolians, the Hui, the Tibetans and the Tu, staged new dance dramas and song-and-dance dramas based on their own traditions. The wealth of new dramas produced in 1980 demonstrated that the artistic creativity of our minority nationalities is expanding and that the level of professional skill has risen markedly.

The highlight of the celebration of the 31st anniversary of the founding of the People's Republic in 1980 was a national drama festival which was hailed as one of the most significant cultural events since the Jiang Qing counter-revolutionary clique was smashed. A total of 1,196 professional and amateur artists from 55 minority nationalities took part in this month-long festival, which included 21 programmes comprising 473 song-and-dance numbers, popular entertainment acts and folk operas. The entire festival was recorded and videotaped and some of the programmes were filmed. The largest festival organized since 1949, it demonstrated vividly the recent achievements made in restoring and developing the cultural traditions of the minority nationalities.

Research in the Arts. The research institutes specializing in the theory of literature and art have been restored; there are now more than 30 such bodies in the whole country. The China National Research Academy of Art (under the Ministry of Culture) completed a number of works and theses dealing with the history of Chinese literature and art and art documentation. The Research Institute of Traditional Opera recorded and videotaped 238 operas, representing 45 different types of local operas. Local research organizations also produced dozens of special works and theses on the history of literature; some have been published and others will soon be published.

For the National Conference on Science and Technology, cultural workers made some contributions to the research on scientific and technological subjects. Among the 39 projects that received awards were the "Direct Current Outdoor Scenery Lamp with Dysprosium-Holmium Filament," "New Technique of Dye Transfer Process

— Sound Track Produced with Silverless Dye-stuff," and "HF — A Silver-Extracting Technique." These inventions and techniques helped to preserve traditional musical instruments and to reduce health hazards for actors. Progress was also made in simplifying stage scenery, lighting and props so as to make it easier for travelling theatrical troupes to give performances in the countryside and mountainous regions. Some of these modifications have already been introduced with gratifying artistic and economic results.

III. Current Policies and Problems

The cultural achievements of 1980 were made possible by many factors. The major factors were:

1. *The Party Central Committee improved and strengthened its leadership role in literature and the arts and gave more effective ideological guidance in these areas.* Deng Xiaoping's congratulatory speech at the Fourth National Congress of Literature and Art, held in early 1980, was followed by a long and important speech by Hu Yaobang, then a member of the Political Bureau of the Party Central Committee and Head of the Central Committee's Propaganda Department. Comrade Hu's speech dealt with the creation of dramatic works. He gave a lengthy exposition on the current state of literature and the arts and the fundamental problems concerning literary and artistic creation. The congress not only provided ideological guidance but also improved and strengthened the party's leadership in literature and the arts. It was followed by a meeting of the heads of the provincial cultural departments at which the guidelines of the Third Plenary Session of the 11th Central Committee of the CPC and the congratulatory speech of Comrade Deng Xiaoping, as well as the main points of Comrade Hu Yaobang's speech, were studied and arrangements were made to implement the principles of readjustment, restructuring, consolidation and improvement in cultural institutions.

Later, other meetings were held: the National Working Conference of Compilers of Literary Magazines, the Forum on Music Work, the Working Conference on Repertoires of Traditional Operas, the Forum on Literary Creation for Minority Nationalities and on Music and Dance. These conferences and forums were actually con-

tinuations of the 1980 forum on literature and art.

2. *The system governing examination and approval of film and play scripts was reformed.* The power to examine and approve artistic productions was handed over to those who produce art. This aroused the enthusiasm, creativity and initiative of writers and artists and further emancipated the productive forces of art.

Unresolved Problems. To develop into a modern, powerful, socialist country, we must not only attain a high level of material well-being, but also high socialist, intellectual standards. At present there is still a large gap between the quality and scope of our cultural achievements and the requirements of the era and of the people. Many problems remain to be solved.

The quality and quantity of artistic creation still fails to meet the growing need of the people for a richer cultural life. The range of subjects of theatrical works is narrow and there are not enough works reflecting the construction of a modern socialist country and describing the experience of workers, peasants, soldiers and children. Cultural facilities in general fall short of what the people need for a rich cultural life; they are even less adequate in vast areas of the countryside, in the border regions and the regions inhabited by minority peoples.

Because we failed to follow standard practices for art production and cultural activities, many problems appeared in the operation and management of cultural organizations. Some of the problems are: (1) inadequate rules and regulations in management; (2) overlapping units of artistic production; (3) irrational staff size, with some organizations overstaffed. Because of these problems, the enthusiasm and creativity of the workers in literature and art cannot be brought into full play. These problems must be solved through further readjustment.

At present, the magnificent cause of building a modern socialist country is attracting and inspiring a large number of writers and artists. Guided by the correct ideological, political and organizational line adopted at the Third Plenary Session of the 11th Central Committee of the party and by the party's principles and policies on literature and art, China's new culture and art will surely develop more fully in the course of building a modern socialist country.

51. PUBLISHING IN CHINA

By the Editorial Department,
Chinese Publications Yearbook

China is the country where paper-making and the art of printing were invented. Thanks to the early start of printing and publishing, our splendid ancient culture has been preserved, making a great contribution to human civilization. However, the development of publishing in China was very slow, due to the long centuries of feudal rule. Later, during the semi-feudal and semi-colonial period, China's publishing activities still lagged behind those of some developed capitalist countries. It was only the great victory of the new democratic revolution and the founding of New China that opened up broad prospects for the development of our publishing industry.

I. Development of Publishing Since 1949

After the establishment of the People's Republic of China in 1949, the Central People's Government set up a state organ to direct and manage the work of publication and began to establish a network of publishing enterprises of a new socialist nature throughout the country.

In the past 31 years — except for the disastrous 10-year period during which the country as a whole suffered a historical retrogression — but particularly in the four years since the smashing of the Gang of Four, the publishing industry has advanced steadily in the direction of serving the people and serving socialism. For the purpose of reviewing the development of publishing in New China, we may divide the 31 years into the following stages:

1949-1952. In this period, publishing developed rapidly and achieved significant successes. In the early days after Liberation, the party and the government took a series of important measures for the development of publishing: (1) the lawful confiscation of the publishing industry of the reactionary Kuomintang government and bureaucrat-capitalists; (2) the unification of the Xinhua Bookstores, until then under decentralized management, into a national state-run publishing enterprise; (3) the establishment of the Central People's Publishing House and various provincial and municipal people's publishing houses, with all publishing work under the management of Xinhua Bookstores; (4) the setting up of Xinhua Printing Houses in various locales, with all printing work

under the management of Xinhua Bookstores; and (5) the creation of a number of specialized publishing organizations.

When the task of rehabilitation of the national economy was completed at the end of 1952, there had already been considerable development in the publishing industry. In 1952, we published 13,692 titles, a 45% increase over the books published in 1936, the pre-Liberation year in which the largest number of books were published. The total number of copies published in 1952 was 785.66 million, an increase of 341% over 1936.

1953-1957. After the First Five-Year Plan was adopted in 1953, the following tasks were carried out: (1) the state-run publishing enterprises were developed and a great number of scientific and technical publishing houses were set up to meet the need of national economic construction; (2) the socialist transformation of the private publishing industry was in the main completed; (3) planning of publications was improved; (4) a series of unified rules and regulations were worked out for the publishing industry; (5) a network of book distribution centres in cities and rural areas was formed; and (6) the printing of books and periodicals was improved. The First Five-Year Plan called for a 54.2% increase in the number of books published as compared with 1952. This target was exceeded by a large margin in 1956. In fact, 28,773 books with a total of 1,784.37 million copies were published, representing an increase of 110% in numbers of books and a 127% increase in numbers of copies over the figures in 1952. Sales of books in 1956 came to 301.89 million yuan, 126.23% over sales in 1952. At the end of the First Five-Year Plan in 1957, the amount of paper used for printing books came to 4.13 million reams, as against 67,000 reams in 1950.

During 1953-57, the growth of publishing was demonstrated not only in the large number of books printed, but also in the increasing variety of titles and the improved quality of book production. In that period, 241 titles by Marx, Engels, Lenin and Stalin were published. The publication of the *Collected Works of Lenin* and the *Collected Works of Marx and Engels* was started in 1955 and 1956, respectively. Also published were the *Selected Works of Mao Zedong*, in three volumes. The large numbers of scholarly works and books on literature and art that were published reflected

the lively academic activity and flourishing literary and artistic creativity which characterized this period. Other publications included the annotated *Collected Works of Lu Xun*, multi-volume editions of writings by Guo Moruo and Mao Dun and a good many new works all well-received by readers. In 1956, books on philosophy and the social sciences numbered 3,727; on literature and the arts, 9,372 — increases of 171% and 87%, respectively, over 1952.

Also published in 1956 were 8,698 scientific and technical books and 2,391 popular books, increases of 181% and 30.8%, respectively, over the books published in 1952. The publication of some Chinese classics and the translation and publication of foreign works saw remarkable success in those years, as did the publication of books for young people and children and books in minority nationality languages or foreign languages. In 1956, 484 different periodicals were printed, a increase of 36.7% over 1952.

1957-1965. During this period, the publication of works by Marx and Lenin was extensive. By 1959, all 39 volumes of the *Selected Works of Lenin* and the 19 volumes of the *Collected Works of Marx and Engels* had been published. In 1960 a new edition of the *Selected Works of Lenin* in four volumes was published, and in 1965 the four volumes of the *Selected Works of Marx and Engels* were printed. After publishing the fourth volume of the *Selected Works of Mao Zedong*, we published editions A and B of selections from his works. In 1958, the publication of the 10-volume annotated edition of the *Collected Works of Lu Xun* was completed.

This period also saw the publication of many good novels such as *Song of Youth*, *Red Cliff*, *Keep the Flag Flying* and *Builders of a New Life*. Before 1960, large numbers of academic writings were also published. For example, we published many selections, specialized articles and reference books on such subjects as the research methodology in the history of Chinese philosophy, problems of aesthetics and problems of formal logic. All of these works were widely discussed in academic circles at that time. We also published many teaching materials for liberal arts colleges and reading materials on common knowledge. In this period, the publication of periodicals also developed very rapidly. In 1964 alone, 856 different periodicals were printed, an increase of 76.86% over 1956.

During this period, publishing suffered severe setbacks as a result of the growing "Left" ideological trend. In the 1957 anti-rightist campaign, a large number of comrades who had offered well-meaning criticisms and positive proposals in regard

to our work in publishing were, without any justification, labelled rightists. This campaign seriously dampened the enthusiasm of writers and workers in publishing. The attempt to effect a premature transition to communism during the period of the Great Leap Forward also carried over into publishing. We published a great number of pamphlets to publicize the "Three Red Banners," but these pamphlets were discarded as useless soon afterwards. Moreover, some effective regulations and procedures in the publishing industry were disrupted. As a result, the quality of books published then was far inferior to that of earlier books. In the campaign against "Right Opportunism" in 1959 and 1960, a number of worthy literary and artistic works and academic works were unjustly criticized, as were many writers and editors.

Because of the disturbances produced by the "Left" ideological trend, the policy of "let a hundred flowers blossom and a hundred schools of thought contend" (also known as the "Double Hundred" policy) could not be implemented. Academic works decreased and the trend toward "formulaism" and generalization in works of literature and art became ever more serious. The decline was reflected in the smaller number of new books printed. In 1965, we published only 20,143 new titles, 30% less than in 1965.

1966-1976. During the 10 years of turmoil of the "cultural revolution," Lin Biao and the Gang of Four attacked the work achieved in publishing during the first 17 years after Liberation. The industry was accused of being "the dictatorship of counter-revolutionaries" and the people working in publishing were labelled "basically bourgeois elements." Many publishing houses were disbanded and large numbers of splendid books were reviled as "feudalist, capitalist and revisionist poisonous weeds."

The decline in publishing may be seen in the following statistics: the number of new books dropped from 20,143 in 1965 to 11,055 at the beginning of the "cultural revolution" in 1966 and dropped further to 2,925 in 1967 (a mere 10% of the new books published in 1956). In subsequent years, a total of about 4,000 new books were published. It was only as a result of Comrade Zhou Enlai's exhortation in 1971 to publish more good books that the number of new books began to rise again. However, the pace was very slow because of sabotage by the Gang of Four. Between 1966 and 1976, the average number of new books published each year was 6,340, about 44% of the number published between 1950 and 1965.

Besides, a great number of the books published in the years 1966-1976 were really "poisonous weeds"; they served as vehicles for the

Gang of Four to manipulate public opinion and to usurp supreme party leadership and state power. Moreover, some books were shoddy, published only "to suit the needs of the struggle" at that time. The publication of conspiratorial writings on literature and art and books with historical allusions ran rampant while worthy academic works and cultural and artistic creations were rarely seen. Books dealing with advanced science and technology and trends in contemporary academic thinking and the schools of thought in literature were almost non-existent.

Many books published in the 10 years of catastrophe not only exerted a pernicious political influence, but also confused right and wrong theories, thereby bringing about heavy economic losses. After the smashing of the Gang of Four in 1976, the sale of these books was stopped because of their erroneous content; they represented more than 200 million yuan worth of books, about one-third of the total sales of the "Xinhua Bookstore" in 1976.

II. A New Era in Publishing

In the period from 1977 to 1980, our publication work entered a new stage with the guideline of serving the people and serving socialism.

Reformulation of Guidelines and Policies. The national forum on publishing held at the end of 1977 repudiated the two counter-revolutionary evaluations of workers in publishing imposed by the Gang of Four, and removed their spiritual shackles. After the Third Plenary Session of the Party's 11th Central Committee, the workers continued to emancipate their thinking and criticize the pernicious influence of the ultra-"Left" line.

A national forum on publication work, held in Changsha at the end of 1979, further defined the fundamental tasks of publishing in the new stage. These tasks include: 1) to mobilize and organize writers and translators to create, edit and translate more works; 2) to publish books needed by the country and the people; 3) to propagate Marxism-Leninism and Mao Zedong Thought; 4) to disseminate and compile scientific and technical knowledge and achievements; 5) to enrich the people's cultural life and contribute to raising the scientific and cultural levels of the entire Chinese nation and to the realization for the Four Socialist Modernizations.

The 1980 national forum on publishing reviewed the publication work in the past few years and reaffirmed the necessity of upholding the principles and tasks defined of adhering to the guideline of "serving the people and serving socia-

lism" and the "Double Hundred" policy as well as to the principle of "quality first." These forums held under the direct leadership of the Propaganda Department of the Party's Central Committee summed up ideological achievements and the lessons, both positive and negative, drawn from our work in the past 30 years and were tremendously important to the development of socialist publication work.

III. Publishing Activities in 1980

Expanded Facilities. The number of publishing, printing and distribution organizations has grown as a result of our efforts. By the end of 1980, there were 193 publishing houses (101 at the central level and 92 at the local level) with a total of 15,000 workers and staff members; 179 printing houses (for books exclusively) with a total of 120,000 workers and staff members. The annual capacity for printing books and periodicals has increased by 30 times as compared with that in the early years of Liberation. According to incomplete statistics, these printing houses increased their productivity over 1979 by the following measures: typesetting, 115.78%; stereotype printing, 111.45%; offset printing, 116.62%; bookbinding, 116.01%.

Distribution and Sales. By the end of 1980, there were 7,884 state-run bookstores throughout the country, employing a total of 58,945 workers and staff members. In addition, there were nearly 60,000 bookselling agents commissioned by the state-run commercial enterprises or by supply and marketing cooperatives; of this figure, 25,000 were located in the countryside. Total book sales in 1980 exceeded 1,500 million yuan, an increase of 22% over 1979 and of 96.33% over 1977 — the year following the end of the "cultural revolution."

From Table 1, we can see that the number of titles published in 1980 increased by 67.9% over 1977, and by 178.23% over 1971. The number of copies printed in 1980 hit an all-time high in our history of publishing, increasing by over 138.84% over the 1977 figure and 189.7% over the 1971 figure. It shows that publishing was restored and developed very rapidly after the smashing of the Gang of Four.

Major Categories. Of the 21,621 titles published in 1980, 15,669 were general works (an increase of 112.5% over 1977 and 318% over 1971); 3,440 were textbooks (an increase of 11.6% over 1977 and 79.5% over 1971); and 2,512 were illustrated books (an increase of 3.37% over 1977 and 19.76% over 1971).

Table 1. Volume of Books Published, 1971-80

Year	Titles	Copies (in millions)
1971	7,771	2,421.08
1977	12,886	3,308.04
1980	21,621	4,592.98

From Table 2 it would appear that the rate of increase of books on philosophy and the social sciences was not very high — new titles published in this category in 1980 were up only 13.2% as compared with 1971. However, the rate of increase registered for 1980 would certainly have been much higher if we had not had to publish those pamphlets to serve the political movements during the "cultural revolution."

The number of new books on literature and the arts in 1980 was 165.1% more than the number published in 1977 and 8.2 times that in 1971. This shows that after the smashing of the Gang of Four, literary and artistic creation flourished under the guidance of the party's "Double Hundred" policy. In 1980 we published 109 new novels or novelettes — a new record since the founding of the People's Republic. The rate of increase in books on literature and the arts showed that our readers eagerly welcomed the publication of Chinese and foreign literary masterpieces.

Books on the natural sciences and technology published in 1980 increased by 100% compared with 1977 and by 6.3 times compared with 1971. In the same year, books on culture and education increased by 360.4% over 1977 and by 17 times over 1971. These figures show that as the party shifted the emphasis of its work to the Four Modernizations after the smashing of the Gang of Four, we needed large numbers of books on science and technology and on culture and education to meet the demand for progress in those fields. They also show that our writers, translators

and employees in publishing have worked extremely hard to produce so many books.

In 1980, we published 2,446 new children's books with a total of 554.96 million copies. The number was 40.82% greater than in 1979 and the number of copies constituted 29% of the total number of copies of general books printed in that year.

Also in 1980, we published 1,921 new books in various minority nationality languages, with a total number of 34.27 million copies. The increases in titles and copies were 24.4% and 26.6%, respectively, over 1979.

Of the 3,440 textbooks published in 1980, 1,599 were for universities, colleges and technical secondary schools, 1,207 were for primary and middle schools and 634 were for spare-time education and other teaching purposes. The total number of copies was 1,895 million, an increase of 63.84% over 1977 and of 160% over 1971. Now, the primary and middle schools in most parts of the country can get enough textbooks before the opening of the new school year. This has contributed to the development of primary and middle school education.

Supplying books for China's 800 million peasants is a primary task of publishing. In the past few years, employees in publishing and distribution have made great efforts in this respect. About 900 million out of the 1,500 million yuan of total sales in 1980 came from the county towns and the countryside (460 million of the 900 million came from the countryside, representing an increase of 31.5% over 1979). With the growth of economic prosperity in the countryside, cultural needs have grown. However, sales of books in the countryside, while they have gone up rapidly, are still lagging behind demand. Thus, we urgently need to step up the publication and distribution of books for the countryside.

The nature of publishing has changed remarkably in the past few years in that it no longer serves as a tool for political movements. With the shift of emphasis in the party's work and the restoration of political stability and unity, the

Table 2. Categories of Books Published, 1971-80

Year	Philosophy and Social Sciences	Literature and the Arts	Natural Science and Technology	Culture and Education
1971	1,847	404	911	121
1977	2,057	1,253	2,857	455
1980	2,091	3,322	5,715	2,095

publishing industry has been able to pay attention to the working out of a long-term plan and especially to the publication of major books which require many years to complete.

Reference Books. Preparations for the publication of the first large encyclopaedia of New China began in 1978 and the first volume, "Astronomy," was published in 1980. Also published in 1980 was the *Chinese Medical Encyclopaedia, Otolaryngology*. The compilation of the *Chinese Agricultural Encyclopaedia* has begun. The new edition of the annotated *Collected Works of Lu Xun* is being set and will come off the press on the centenary of his birth in 1981. A new one-volume edition of *Ci Hai* (Lexicology) and the first two volumes of *Ci Yuan* (Etymology) have been published. The revision of these texts had been going on for many years. A comprehensive dictionary of Chinese phrases and a comprehensive dictionary of Chinese characters are being compiled. The bound volume of *Jiaquwen* in 13 fascicles, mainly compiled by Guo Moruo during his lifetime, is coming off the press. ("Jiaquwen" are Shang Dynasty inscriptions on bone or tortoise shell). In 1980, we also published the *Chinese History Yearbook*, the *Yearbook of World Economy* and the *Chinese Publications Yearbook* as well as other large reference books.

Academic and scientific works by prominent Chinese scholars have also been published. These works include Xue Muqiao's *China's Socialist Economy and Current Problems of China's Economy*; Xu Dixin's *On Socialist Production, Circulation and Distribution*; Zhu Guangqian's *A History of Western Aesthetics*; Li Siguang's *An Introduction to Geomechanics*; Qian Xuesen's *Engineering Cybernetics*; and Qian Weichang's *Calculus of Variations and Finite Elements*. In the past few years, we have translated and published many foreign classics and literary works, including *The Complete Works of Shakespeare*, *Gesprache mit Goethe*, Kant's *Prolegomena Zu Einer Jeden Künftigen Metaphysik die Als Wissenschaft Wird Auftreten Konnen* and Hegel's *Aesthetics*.

Periodicals. The publication of periodicals has flourished in recent years. In 1980, 2,191 different periodicals were registered with the publishing administrative organizations, representing an increase of 156% over the 856 periodicals published in 1964. Among the 2,191 periodicals, 1,384 (63% of the total) dealt with the natural sciences and technology; 265 dealt with literature and art; 210 were devoted to the social sciences; and the remaining 332 covered a variety of other subjects. The publication of so many periodicals reflects the desire for further development in the sciences and technology, as well as the growing enthusiasm of the writers. A good number of these periodicals, however, are of poor quality and should be improved.

IV. Future Tasks of Publishing

Since the smashing of the Gang of Four, our publication work has achieved great success. However, to achieve the Four Modernizations and to meet the people's increasing need for books, we still have a long way to go. Although the number of titles published in 1980 (21,621) greatly exceeded that in the period of the "cultural revolution," it was only 75% of that in 1965. And the total number of all titles published in 1980 was only 61.6% of the total in 1965.

The gap is particularly large in books on literature and art. This showed how seriously the influence of "Left" thought over a long period, and especially the denial of the "Double Hundred Policy" during the 10 years of turmoil, had damaged our scientific research, literature and the arts. In order to make our publications rich and varied, it is necessary for writers, translators and employees in publishing to do a lot of hard work. In the past we have published books of poor quality and too many copies of unnecessary books. In addition, some units that had nothing to do with publishing, published many books at random. At present, our printing facilities are inadequate

Table 3. Decline in Publishing Between 1956 and 1980

Year	Philosophy and Social Sciences	Literature and the Arts	Natural Science and Technology	Culture and Education
1956	3,727	9,375	8,698	2,391
1980	2,091	3,322	5,715	2,095
1980:1956	56.1%	35.4%	65.7%	87.6%

— typesetting and bookbinding are particularly weak. Both in the quality of printing and in the techniques of printing, our standards are far below those of the advanced countries.

As regards the distribution of books, we are currently short of sales agents in the cities as well as in the countryside, and the management of bookstores at the basic level needs much improvement. The number of editors and other staff

members in the publishing, printing and distribution units should be increased and their professional levels raised. The organization of the publishing industry also needs restructuring. The workers in publishing, under the leadership of the party and the government, are studying ways of gradually overcoming these shortcomings and difficulties so as to develop the publishing industry and make it prosper.

52. CHINA'S JOURNALISM IN 1980

By the Press Research Institute,
Chinese Academy of Social Sciences

China is now undergoing a great historical period of transition. As a link between the Chinese Communist Party and the masses, journalism is also experiencing development and rapid change. Guided by the spirit of the Third, Fourth and Fifth Plenary Sessions of the 11th Central Committee of the Chinese Communist Party, journalism in China was marked by reform and healthy development in 1980.

Press reform has improved all areas of journalistic work — from theory to practice, from content to form, from style of writing to coverage, from quality to quantity. Meanwhile, lively academic activities in the field of journalism have started. These changes have forged closer links between the party and the masses, restored and promoted the fine traditions of the press and raised the prestige of journalism.

I. The Development and Restoration of China's Journalism

In the early years after the founding of the People's Republic, journalism took on a completely new image in the eyes of the public. But its scale was far from adequate to satisfy the needs of the 400 million people in China.

By 1952, through the attentive care of the party and the people's government, radio stations had been established at the national, provincial, municipal and autonomous regional levels. There were 129 newspapers published by organs above the provincial level, with a total circulation of 1,384 million copies. In 1958, broadcasting stations were established in districts, towns and counties throughout the country, and 220 newspapers were published with a total circulation of 2,893 million copies. By 1965, prior to the "cultural revolution," the national broadcasting network had been extended to every people's commune, production brigade and production team, and everyone could listen to central and local broadcasting programmes.

A Time of Havoc. During the 10 years of turmoil, Lin Biao and the Gang of Four kept a tight control over the mass media in the country. They made special efforts to control the national newspapers and magazines, creating havoc in the entire field of journalism. Large numbers of journalists were persecuted and many publications

were closed down. They wantonly revised the nature and tasks of the press, using newspapers, radio and television as their tools to usurp the leadership of the party and state power. In news reporting, idealism spread unchecked, metaphysics ran wild, and there was an endless assortment of lies, empty talk, boasting, extreme expressions and clichés — all of which served to confuse the people, sabotage national economic construction and undermine the party's fine tradition.

Lin Biao and the Gang of Four also fostered fascist cultural despotism on a massive scale, forbidding the publication and presentation of outstanding works of literature and art — ancient and modern, Chinese and foreign — in the press, radio and television. Their perverse acts gravely impaired the prestige of journalism among the masses, causing a great retrogression in the history of journalism. From 1966 to 1970, the number of newspapers in the country went down to 49.

Emancipation. After the Gang of Four was smashed and conditions were set aright, a large number of veteran journalists were rehabilitated and the people regained control of people's journalism. By repudiating the reactionary Lin Biao and Jiang Qing cliques, by acting in accordance with the guidelines of the Third, Fourth and Fifth Plenary Sessions of the Party's 11th Central Committee and by carrying out discussions on the principle "practice is the only criterion for testing truth," journalists further emancipated their minds, the press underwent significant changes and journalism was gradually restored. By 1979, there were 69 newspapers above the provincial level with a total circulation of 13,082 million copies.

II. Rapid Advances in Journalism in 1980

Journalism in China continued to enjoy rapid growth in 1980. In that year there were 188 newspapers above the provincial level with a total circulation of 14,042 million copies. During 1980, *Chinese Peasants* and *China's Legal System*, as well as the English-language *China Daily*, began trial publication. Professional papers, regional, town and county papers, as well as evening papers such as the *Guangzhou Evening News* and *Beijing Evening News* also resumed or started publication.

Radio and Television. The country now has 106 radio stations, 484 transmitting and relay

stations, 2,560 radio diffusion centres and more than 100 million loudspeakers. The Central People's Broadcasting Station beams two comprehensive radio programmes to the whole nation, one programme to the minority nationalities, one programme to Taiwan and one special frequency modulation musical programme. Broadcasting stations in various provinces, municipalities and autonomous regions produce 130 radio programmes.

Radio broadcasting to foreign countries began in 1950. At present, the international broadcasting station is offering 38 language programmes, as well as programmes in standard Chinese and four dialects for overseas Chinese and foreign nationals of Chinese origin.

Television broadcasting was initiated in 1958, and television stations now have been set up in 29 provinces, municipalities and autonomous regions (one is under construction in Tibet). The Central TV Station and more and more local TV stations are showing colour programmes. The nation has 38 TV stations, 246 transmitting and relay stations, each with a power of 1,000 watts, and 2,000 TV translator stations with a power of less than 50 watts. In order to train more people for national construction in the shortest possible time, TV stations and the Ministry of Education have jointly initiated a TV broadcasting university, which has an enrollment of 324,000 students and represents the first stage in the development of a TV university education network.

News Agencies. The Xinhua News Agency has 29 local branch offices in China, with 700 reporters, and 85 branch offices in foreign countries, with 150 resident correspondents. Every day the domestic branch offices send news stories from their reporters to the head office in Beijing via telex, telegram or telephone to be handled by the Home News Department of the head office.

The Xinhua branch offices abroad send news dispatches home in English, French, Spanish and other languages, sometimes in the Chinese phonetic alphabet or in Chinese code. The dispatches are sent by telex or telegram to transmitting centres set up by Xinhua in foreign countries, which relay them back to the head office in Beijing.

In addition to providing home service, Xinhua News Agency also operates foreign services in five languages — English, French, Spanish, Arabic and Russian. The foreign services include an English service to the whole world and special line services to different regions of the world in English, French, Spanish, Arabic or Russian, broadcasting a total of 150,000 words in five languages daily.

The Xinhua News Agency publishes news bulletins in six languages — Chinese, English, French,

Spanish, Arabic and Russian, and "News from Foreign Agencies and Press" in three languages — Chinese, English and French.

The China News Agency, established in 1952, has resumed operations and has expanded. Its head office is in Beijing, and it has branch offices in Guangdong, Shanghai and Fujian and correspondent centres in Guangxi and Yunnan. It also has an office in Hong Kong, which sends dispatches, general news, feature stories and pictures to Chinese-language newspapers abroad and newspapers in Hong Kong and Macao. It also releases films abroad introducing China's beautiful scenery, cultural relics, construction projects and local dramas.

Research and Training. Twelve universities in the country provide special training in journalism, including five departments of journalism and two specialized courses in journalism, with a total enrollment of 1,106 students. In 1980, institutes for research in journalism were also set up in Beijing and elsewhere.

The All-China Journalists Association has resumed its activities. Branch associations were restored or set up in Yunnan, Anhui, Hubei, Hebei, Liaoning, Jilin, Heilongjiang, Fujian and Tianjin.

The Beijing Journalists' Society, composed mainly of journalist units in the capital, was founded on February 6, 1980, with Hu Qiaomu as honorary president, Hu Jiwei as president and a number of veteran journalists as advisers. Journalists' societies were also set up in Hebei, Anhui, Jiangsu, Hubei and Tianjin.

After the founding of the Press Research Institute of the Chinese Academy of Social Sciences in 1978, journalism research institutes were set up in Heilongjiang, Jilin and Shanxi. Journalism research departments or offices have also been established by the Xinhua News Agency, the *Liberation Army Daily*, the Beijing Social Sciences Research Institute, Fudan University in Shanghai and the Beijing Broadcasting Institute, as well as by some provincial newspapers, such as the *Dazhong Daily*, *Sichuan Daily*, *Chongqing Daily*, *Fujian Daily*, *Hunan Daily*, *Ningxia Daily*, *Hubei Daily*, *Guangxi Daily* and *Tianjin Daily*.

The *People's Daily* established a spare-time self-study journalism school to train journalists on the job. It stresses research in journalism theory and press reform. The All-China Journalists' Association and the Chinese People's University jointly set up an evening school for training journalists who work in Beijing.

In 1980, academic activities in the field of journalism were many and varied; a number of publications dealing with basic theoretical problems in the areas of legislation governing the

press, news writing, news reform and photo journalism came off the press.

Competition. Sponsored by the monthly *News Front* and the Beijing Journalists' Society, a nationwide campaign to honour good news writing — the first since the founding of the People's Republic — was launched in 1979. Included for consideration were all news articles published in newspapers or news stories broadcast over the radio in that year. The aim of the campaign was to stimulate press reform and encourage journalists to write more, better and more concise stories to serve the Four Modernizations. A total of 31 news items and stories were selected, 6 for first prize and 25 for second prize. The campaign was conducted again in 1981 on a large scale. The book *Good News* was published by the Beijing Journalists' Society and the editorial department of *News Front*.

Press Publications. A number of publications for the profession specialize in the dissemination of research on journalistic theory and experiences of journalists. These publications are on sale to the public. The monthly, *News Front*, founded by the *People's Daily*, resumed publication in 1979. New publications in 1980 included: *Data on Journalistic Research*, a quarterly published by the Press Research Institute of the Chinese Academy of Social Sciences; the quarterly *Press Research*, published by the *Shanxi Daily*; the monthly *Press Study*, published by the *Hubei Daily*; *Journalistic Theory and Practice*, put out by the *Gansu Daily*; *International Press Circles*, a publication of the Journalism Department of the Chinese People's University; and *Broadcasting Journal*, by the Beijing Broadcasting Institute.

Forums and Meetings. The Press Research Institute of the Chinese Academy of Social Sciences, in April, September and December of 1980, invited specialists, scholars and leading members of the press to separate forums to discuss such topics as compiling the history of journalism and the basic problems of journalistic theory.

The Beijing Journalists' Society sponsored a dozen academic reports and forums on press reform, the basic problems of journalistic theory, including legislation governing the press, the value of news and news writing, economic reporting and the use of media to air criticisms.

The five dailies in North China (in Beijing, Tianjin, Hebei, Shanxi and Inner Mongolia) held meetings in April and August of 1980 in Shijiazhuang and Beidaihe, respectively, at which participants exchanged experiences on how to make the newspapers ideological centres of stability and

unity and how to make economic reports lively.

In May 1980, representatives of more than 40 press units from 18 provinces and cities held a symposium sponsored by the five dailies in Northwest China (in Shaanxi, Gansu, Qinghai, Ningxia and Xinjiang). This symposium, held in Lanzhou, discussed the nature, task and role of newspapers, as well as the objective laws of journalism and other issues affecting the press.

Newspapers in the three provinces of Northeast China held a meeting in Shenyang in June 1980 to deliberate on the questions of how to continue to emancipate the mind and how to criticise the influence of the "Left" line in reporting industrial news.

Six provinces in East China and Shanghai Municipality jointly held a forum in Shanghai in August, attended by leading members of eight dailies (Dazhong, Anhui, Xinhua, Zhejiang, Jiangxi, Fujian, the *Wenhui Daily* and the *Liberation Daily*). They exchanged experiences on publicizing economic work in the new situation and reviewed the problem of how to make economic reporting lively.

A national meeting of all city newspapers was held in Hangzhou in November to exchange experiences on how to run city papers and how to expand the role of the press. Ways and means for improvement were also discussed.

Reform and Improvement. Journalistic research in 1980 promoted press reform; improved news content, writing style and newspaper layout; and gave further play to the guiding role and militancy of proletarian journalism.

At the beginning of 1980, the *People's Daily* revised its layout, expanding the paper from six to eight pages, giving more space to economic news and encouraging shorter, more substantial and informative reports. Articles criticizing certain people and events have won the approval of the paper's readers.

With timely reporting on the profound changes in every area of national life, the Xinhua News Agency, in accordance with objective reality, improved its work in all respects. It placed emphasis on the readjustment of the organizational structure in the head office, on the training and education of the staff and on the renewal and improvement of press equipment.

The Central People's Broadcasting Station greatly reformed and expanded its news programming. At present, there are 22 newscasts a day, with a total of 30,000 words, accounting for 335 minutes or 15% of the total broadcasting time.

Both national and local newspapers undertook reforms and achieved tangible results.

In 1980, after a series of studies and reforms,

the press in China gradually regained its fine tradition of seeking truth from the facts, gave prominence to major developments, stressed truthfulness in reporting, broke away from conventional ideas and practices and extended news coverage.

Economics Reporting. Many newspapers gave priority to reports on the economy. The *Wenhui Daily* in Shanghai, for example, increased the proportion of economic news on the front page month by month in 1980 — 13% in August, 20% in September, 42% in October and 47% in November. Besides giving priority to economic news, the *People's Daily* and other newspapers, as well as radio stations, also initiated special columns on economic news: "Men of Action" in the *People's Daily*, "Trades" in the *Workers' Daily*, "Economy and Management" in the *Guangming Daily*, "Contributions to the Four Modernizations" in the *Beijing Daily* and "Market Information" in the *Wenhui Daily*. All these special columns reflecting economic life were warmly welcomed by the readers.

Criticism Restored. Critical reporting regained its proper place in the newspapers, ending the former practice of reporting only the good. It has restored and brought into full play the Chinese Communist Party's three important styles of work — integrating theory with practice, forging close links with the masses and practicing self-criticism — and reflects the spirit of socialist democracy in China.

An example of such open critical reporting was seen at the time of the Bohai No. 2 drilling rig accident. The articles, which drew praise from readers at home and abroad, not only broke away from the past restrictions that "major accidents are not allowed to appear in newspapers," but also resulted in a demerit for one vice-premier, the

removal of the minister of the petroleum industry from office, and the sentencing of some leading members of the Oceanic Oil Exploration Bureau.

Other examples included reporting that exposed an ill-advised project to divert a river from west to east and uncovered the false reports by Xiyang County on its grain yields. All these reports had a tremendous influence on the readers.

Other Advances. Coverage of important meetings also changed for the better. When the Third Plenary Session of the Fifth National People's Congress was going on, the *People's Daily* published excerpts of the delegates' speeches. The Xinhua News Agency divided the session's working reports into subject areas and reported on them separately. These changes produced timely and lively reporting.

The contents of literature supplements and art and literature columns became more varied — to the delight of readers who were eager to have an opportunity to study the excellent Chinese and foreign literary works that had been banned for a long time.

At present, newspapers in China display the following common characteristics: original layout, numerous special columns, illustrated feature articles and lively and interesting subjects. Newspapers in Beijing alone have added about 50 special columns. News stories contain interesting sidelights, articles carry subheads and feature stories are accompanied by photos. All these improvements have been welcomed by the masses.

The transformation and development of journalism is continuing unabated. Further reform will require arduous efforts by the profession to sum up the experience and the lessons of the past and to improve news coverage in all branches of the media.

53. CHINA'S FILM INDUSTRY

By Ji Hong

Film Bureau, Ministry of Culture

Since the founding of New China 30 years ago, enormous progress has been made in China's film industry. In the 17 years prior to the "cultural revolution," the industry reached a high level of production and proficiency. By 1965 there were seven feature film studios, one animated film studio, one newsreel and documentary film studio and three studios specializing in scientific and educational films. Between 1949 and 1965, they produced a total of 603 feature, stage art and opera films, 279 reels of animated films, 8,342 newsreels and documentaries and 1,980 reels of scientific and educational films.

During the 10 years of calamity caused by Lin Biao and the Gang of Four, the Chinese film industry — like other industries — was disrupted and seriously damaged. The vast majority of film workers were attacked and persecuted. In the period from 1966 to 1975, only 69 feature films, 36 reels of animated films, 1,473 newsreels and documentaries and 731 reels of scientific and educational films were produced. In the years 1967 to 1969, with the exception of a few documentaries, all film studios suspended production. All films made prior to the "cultural revolution" were regarded as "poisonous weeds" and banned. China's film industry was on the verge of being destroyed.

I. Recovery of the Film Industry

After the smashing of the Gang of Four, however, the film industry began to revive. Films banned during the "cultural revolution" were again shown to the public, and the warm welcome they received greatly inspired the film workers. New productions were gradually resumed. It was at this time that the Hunan Film Studio was founded. Three feature film studios also were established in the Xinjiang, Guangxi and Inner Mongolia autonomous regions in order to strengthen the cultural development of minority nationality regions. By the end of 1980, China had 11 feature film studios. The animated film studio, newsreel and documentary film studios and scientific and educational film studios also were revived and strengthened.

Following restoration and consolidation, and

adhering to the political and ideological line laid down by the Third Plenary Session of the 11th Party Central Committee, the workers in the film industry have upheld the principle that literature and art should serve the workers, peasants and soldiers, as well as socialism. In this way, they have implemented the policy of "letting a hundred flowers blossom and a hundred schools of thought contend," thus bringing about the prosperity of the film industry.

In 1979, the release of films presented in honour of New China's 30th anniversary marked the beginning of a favourable turn in the film industry. Produced during the year were 65 feature and stage art films, 25 reels of animated films, 375 newsreels and documentaries and 349 reels of scientific and educational films. Especially heartening was the emergence of a number of films that were of high intellectual and artistic quality and were well-received by the audiences. Among them were 22 feature films, including *From Slave to General*, *Ji Hongchang*, *Xiao Hua*, *Anxious to Return*, *The Cradle*, *Twins Come in Pairs* and *What a Family*; 8 stage art films, including *Romance of an Iron Bow*; 8 documentaries, including *The Premier of the People* and *Counterattack in Self-Defence*; 7 newsreels, including *China's New Look* (No. 1) and *China Today* (No. 1); and 15 scientific and educational films, including *Biological Evolution*, *The Movement of the Earth's Crust*, *Lace Wing* and *Grotto Art in Dunhuang*. All of these films received awards from the Ministry of Culture in 1979.

II. Continued Progress in 1980

In 1980, further progress was made by building on the foundations laid in the previous year. A total of 82 feature films were produced — 75 by the 11 feature film studios and the remaining by the Central Newsreel and Documentary Film Studio and other studios. In addition, 32 reels of animated films, 365 newsreels and documentary films and 337 reels of scientific and educational films were produced. Some of the films showed marked improvement in both content and form. Among the films honoured by the Ministry of Culture in 1980 were the feature films

Evening Rain, Legend of Tianyun Mountain, In and Out of Court, A Young Hero, The Tenth Bullet Scar, Unmelted Snow, The Young Teacher and The Man Who Deals with Devils; the stage art film *The White Snake*; the animated films *Three Monks and Snow Boy*; six newsreel and documentary films, including *Eternal Glory to Comrade Liu Shaoqi and Huangshan Mountain*; and seven scientific and educational films, including *Life and Protein — Synthetic Crystalline Insulin and Remote Sensing*.

The important achievements of China's film industry in 1979 and 1980 also included the broadening of the ranks of creative workers. Among the 65 feature and stage art films produced by the feature film studios in 1979, 15 were directed by young artists. Among the feature and stage art films produced in 1980, over 30 were directed by young artists. Middle-aged and young artists also directed various films in other departments and units. Many of these films were of good quality. The talent of these young directors added a freshness and sparkle to China's screen. The Beijing Film Institute, one of the major centres for training film workers, was revived after the smashing of the Gang of Four.

Audiences Broadened. When the People's Republic was established, there were only 596 cinemas in the whole country. The vast majority of these cinemas were concentrated in a few major cities. People in the countryside and in the smaller towns had very little opportunity to see films. In order that the masses might have access to movies, the party and government made great efforts to develop film projection facilities outside the large cities while expanding film production. By the end of 1980, there were 125,000 film projection units, one-third of them in the cities and two-thirds in the countryside. Because of the large population and the backwardness of the economy, however, the number of film projection units remains inadequate and their quality is mediocre.

Only a few of the film projection units in the large cities are in actual cinemas; most operate in theatres, in auditoriums of societies, factories and mines and in clubs; or else they travel from place to place. About half of the projection units located in the countryside are equipped to show 16 mm. films, the other half to show 8.75 mm. films. Most units in the countryside are mobile projection teams which show films in the open air.

In recent years, following the implementation of the party's policy on agricultural economy, the development of agricultural production and the reactivation of the rural economy, many towns in the rural areas have established regular showing facilities. According to incomplete statistics, there

are about 2,000 of these crude cinemas in small towns, thus expanding the viewing opportunities for the peasant audiences. The establishment of more crude cinemas will make an important contribution to the cultural development of China's small towns.

Organization and Training. The China Film Distribution and Exhibition Corporation is responsible for the distribution of all films in the country. It also handles film import and export. In addition to the central office, there are more than 3,300 branch organizations reaching to every province, municipality, autonomous region, prefecture and even county. In the communes, there are film administrative stations. All films shown in the cinemas and clubs and by projection teams are handled by these corporations and stations.

The China Film Equipment Corporation was established to organize the production and supply of film equipment and parts. It handles the import and export of film equipment. The central office, together with its 180 branches, is responsible for supplying and maintaining equipment in each province, municipality and autonomous region.

Personnel for film distribution and projection are trained in 14 film technical schools and training organizations throughout the country. In addition, some film corporations hold classes for their employees from time to time. At present, about 400,000 people are working in the areas of distribution, projection, equipment supply and maintenance.

III. Contributions to Culture and Education

The film industry in China is considered an important component of culture and education. For this reason, admission and film rental fees are kept low; rural projection teams receive support for their 16-mm. and 8.75-mm. film showings by sharing part of the income earned by 35-mm. film showings in the cities; and film screenings in the national minority areas are subsidized or even free of charge. These measures are aimed at speeding up the development of film showing capabilities and at making films more available to the countryside, mountainous areas, remote inland and national minority areas.

International Exchanges. With the development of political, economic and cultural contacts between China and other countries, film exchanges have increased rapidly. At present, China's film industry has relations with 180 film companies in 63 different countries and regions. Between 1976

and 1980, we sold a total of 1,848 "film rights" (one film can be sold a number of times) for both long and short films, and imported 158 films. In 1979 and 1980, we held film festivals featuring productions from Korea, Romania, Yugoslavia, Japan, France, Egypt, Australia and many other countries. Some of these countries, in turn, held festivals of Chinese films.

The China Film Co-Production Corporation, established in 1979, facilitates co-production with foreign countries and provides assistance to companies interested in making films in China. It was founded on the principle of mutual benefit and friendship. Since its establishment, it has held talks with companies from more than 30 countries and regions. A number of agreements were reached, leading to 18 completed films at the end of 1980. These included the feature films *Beyond Forbearance* and *Roof of Tile*; the documentary *Film and Television in China*; and the scientific-educational film *Medicine and the Japanese*. A number of other films are under production. These exchanges have promoted mutual understanding and friendship between the Chinese people and the people and film workers of other countries.

Self-Reliance. In order to develop our film industry on the basis of independence and self-reliance, we started to build up our film equipment and film stock industries shortly after Liberation. Previously we had relied completely on imported equipment and film stock. The necessary material conditions for the development of the Chinese film industry have gradually been attained. Large-scale film equipment factories have been established in Nanjing, Shanghai, Harbin, Beijing and Gansu Province. In addition, there are more than 50 equipment factories of various sizes in other localities and numerous repair and spare-parts centres. Some equipment still has to be imported, but basically we are self-sufficient. Besides the large No. 1 and No. 2 Film Stock factories, there are also some smaller film stock

factories. At present we can manufacture black-and-white positive, colour positive and black-and-white negative stock — all of which are used in large quantities. However, we still have to rely on imported colour negative and inter-negative film, in which there remain quality-control problems. There are two major film-processing laboratories, in Shanghai and Beijing; in addition, every film studio and some film stock factories have their own processing facilities. Altogether there are more than 40 laboratories to handle the needs of more than 100,000 exhibition units.

Remaining Tasks. We have been greatly encouraged by the revival and development of the film industry since the downfall of the Gang of Four. At the same time we are very aware of the many remaining problems. First of all, films are not always compatible with the demands of the new historical period. The range of subjects is not broad enough; especially lacking are films about the lives and struggles of China's 800 million peasants and films about children. There are few works depicting the psychological aspects of the current great historical period. The ideological and artistic quality of our films also needs to be raised.

Shortcomings also exist in the industry itself. Manpower and equipment are not being developed and used to their full potential. We have more than enough equipment, film stock and processing laboratories but our technical skill and forces are scattered. Also, the quality of the equipment manufactured is not high enough, obliging us to import colour negative and inter-negative film, as well as some equipment. We have a large number of film exhibition units, but many are of low quality and do not meet the needs of the masses. All these problems must be solved through adjustment, correction and improvement. We believe that under the correct leadership of the party and the government, our film industry will be raised to new heights.

Appendix:

CATALOGUE OF FEATURE AND STAGE-ART FILMS OF 1980

Studio	Title of Film	Colour	Reels	Screenplay	Director	Photography	Principal Players
Peking Film Studio	<i>Marriage of Li Tianbao</i>	Colour	12	Min Bin, Feng Po	Chen Fang-qian, Duan Jishun	Wen Zhixian	He Quanzhi, Ma Lan, Chen Jing, Li Jinying, Li Qi

Studio	Title of Film	Colour	Reels	Screenplay	Director	Photography	Principal Players

54. EDUCATION IN CHINA

By Ji Hua

Ministry of Education

Owing to the long rule of feudalism and, in particular, to aggression at the hands of imperialist powers, old China was a semi-feudal and semi-colonial country with corrupt politics, a depressed economy and an extremely backward cultural and educational system. The broad masses of the working people were deprived of the right to education. On the eve of the founding of New China, over 80% of the population were illiterate or semi-literate and only about 20% of school-age children attended school. The total enrollment in institutions of higher learning was only 155,000, while that in middle schools was 1,879,000.

The distribution of schools was extremely uneven. Universities and colleges were concentrated in a few large cities and coastal provinces. Middle schools and primary schools were concentrated in cities and towns, with a very small number scattered in the countryside. In border regions and national minority regions, schools were virtually non-existent.

I. Development of Education Since 1949

After the founding of New China, under the leadership of the Chinese Communist Party and the people's government, and with the efforts of China's own teaching and administrative staff, as well as those of people of all nationalities, the party's correct line was carried out most of the time on the educational front. Educational institutions left over from old China were systematically transformed and remarkable successes in education were achieved along with the successful development of the national economy.

School Enrollment. In 1979, the nationwide enrollment of students in institutes of higher learning, middle schools and primary schools was 207,940,000, or an eight-fold increase over that of the early post-Liberation years. In 30 years, college enrollment had increased 8.7-fold; middle school enrollment, 47.5-fold; and primary school enrollment, 6-fold.

Spare-time education at all levels, including preschool education and education for the blind and other handicapped, also increased. The education of women received much attention from the party and the government, with the result that girls now make up 45% of all primary school

pupils, 41% of middle school students and about 24% of college students. The situation in the national minority regions also changed drastically. In 1979, the enrolment of national minority students in schools at all levels throughout the country reached 9,546,000, for a rate of increase well above the national average rate of increase over the past 30 years.

The past 30 years also saw a steady growth in the number of teachers and school administrators. In 1979, the total number of teachers and administrators in all types of schools reached 11,120,000, or an increase of 10.8 times over 1949. The teaching and administrative staff in state-run schools numbered 6,100,000, or a seven-fold increase over 1949.

During the past 30 years, a total of 3,030,000 competent people with professional training graduated from institutes of higher learning and 5,390,000 people received training in technical secondary schools. These people — particularly those who were trained and graduated in the 1950's and 1960's — constitute an important segment of China's intellectuals. With 10 to 20 years of working experience behind them, the graduates of the 1950's and 1960's represent the main force for carrying out the country's Four Modernizations.

Over the past 30 years, 46,000,000 have graduated from senior middle schools; 147,000,000 from junior middle schools; and 305,000,000 from primary schools. In addition, agricultural middle schools, vocational middle schools and regular primary and middle schools together have trained several million people to provide reserve forces of labour, and thereby have assured the development of various undertakings in our country.

Organizational Changes. The development of New China's education has been marked by socialist construction, profound reforms and constant improvements. In the early years after Liberation, we took over all public and private schools from the Kuomintang and transformed and merged them with missionary schools that had been financed by foreign subsidies, abolished the reactionary educational system of old China and established party leadership over all schools. Party and Youth League organizations were formed in schools, the system of ideological and political

work was established and courses on Marxism-Leninism were conducted. An ideological remoulding movement was started among teachers so as to unite all patriotic intellectuals to serve the people in education.

After 1952, the institutes of higher learning and their departments were reorganized, teaching reforms were introduced and the unified college enrollment system and system of assigning college graduates were adopted. In this way, higher education was brought under the control of state planning. On the basis of the experience gained in educational work in the former liberated areas and of the experiences of other countries in the sphere of education, Chinese schools at all levels formulated for each subject matter a set of teaching plans, a syllabus and textbooks — all of them geared basically to actual conditions in China.

Policies and Rules. After 1957, all schools made an effort to carry out the policy put forward by Chairman Mao, namely: education must serve proletarian politics and must be combined with productive labour, and everyone who receives an education should be enabled to develop morally, intellectually and physically and should become a worker with socialist consciousness and culture. All schools actively experimented with teaching reforms in the effort to establish a socialist educational system with Chinese characteristics and further developed the experience of running various types of schools according to the principle of "walking on two legs." In so doing, however, some "Left" errors were made.

In 1961, on the basis of our experience in educational work during the 12 years after the founding of New China, we worked out three sets of basic rules for schools: the "Draft Provisional Regulations Concerning the Work in Institutes of Higher Learning Directly under the Ministry of Education" (which became the "Sixty Regulations for Institutes of Higher Learning"); the "Draft Provisional Regulations Concerning the Work in Full-time Middle Schools" (which became the "Fifty Regulations for Middle Schools"); and the "Draft Provisional Regulations Concerning the work in Full-time Primary Schools" (which became the "Fifty Regulations for Primary Schools"). These regulations put our educational work on the road of healthy development, and led to the establishment of a stable teaching order, a rise in the professional level of teachers and striking improvements in teaching quality and scientific research.

Advances and Achievements. In the 17 years prior to the 10 years of turmoil, the number of educational institutions of various types and at all

levels increased rapidly. During those years, regular colleges and universities turned out 1,550,000 graduates — approximately 9.4 times the number of college graduates in the 20 years prior to Liberation, and 16,000 persons received post-graduate training.

During the same period, 200,000 people graduated from spare-time colleges and correspondence colleges and 2,960,000 people graduated from professional secondary schools. Today, most of these graduates serve as key members in various fields.

In 1965, the total enrollment in institutes of higher learning throughout the country was 674,000, or 5.8 times as many as in 1949. Students in middle schools totalled 14,320,000, or 11.3 times as many as in 1949; and pupils in primary schools totalled 116,210,000, or 4.8 times the number in 1949. The number of teachers and administrative staff members in all types of schools at all levels reached 5,6743,000, or 5.5 times the number in 1949, and the political consciousness and professional level of those working in education rose steadily.

Schools at all levels possessed buildings and basic teaching facilities. This was especially true of institutes of higher learning and technical secondary schools; they undertook extensive construction, acquired large quantities of books, reference materials and instruments and, thus, met the material requirements for both teaching and scientific research. Institutes of higher learning conducted scientific research on a large scale and produced a number of significant results, thus narrowing the gap between China and the advanced developed countries. Party leadership in schools at all levels was constantly strengthened during the period in question and basic experience in how to exercise party leadership in education was gained. In the 17 years before the 10 years of turmoil, we carried out on the whole a Marxist line. In spite of our lack of experience, which led to some errors and shortcomings, our achievements were outstanding.

Setbacks and Problems. Education in China was seriously undermined by Lin Biao and the Gang of Four during the 10 years of turmoil. The quality of teaching dropped drastically, affecting an entire generation of China's youth. The result has been a temporary, yet severe, shortage of competent people to succeed the older generation on every front of endeavour. Although vast numbers of those who were engaged in educational work laboured diligently at their posts under the most difficult circumstances and waged a protracted struggle against the fascist cultural despotism of the Gang of Four, they were unable

to turn the tide because of certain conditions at the time.

In the four years since the smashing of the Gang of Four, order has returned to education, thanks to thorough reform, restoration and consolidation carried out under the leadership of the party. The prospects for education have definitely improved. Nevertheless, old wounds have not completely healed, vigour has not been fully regained and a number of problems have yet to be solved.

II. Lessons Learned from Our Experiences in Education

The facts show that we have followed a correct line in education for most of the past 30 years, that our achievements have been substantial and that, having learned both positive and negative lessons, we have laid a solid foundation for further development. The principal lessons learned from our experiences in the past 30 years are:

1. *Socialist education must be well co-ordinated with economic construction; that is, it must be developed in a planned and proportionate manner.* To maintain a proper and relatively stable balance between education and economic construction, education must be suited to the development of the national economy. At the same time, the material prerequisites for expanding educational facilities must be guaranteed and given priority in overall planning. The view that educational institutions are purely units of consumption and therefore nonessential must be thoroughly refuted. It is equally important to refute the view that quantity can be obtained without consideration of the existing conditions and quality.

2. *Socialist schools must stick to the principle of training students to be red and expert by stressing their all-around development.* Everyone who receives an education should be enabled to develop morally, intellectually and physically and should become a worker with socialist consciousness and culture for the purpose of attaining socialist modernization. Schools at all levels must concentrate on teaching and must steadily improve the quality of education.

3. *It is imperative to carry out correctly the party's policy toward intellectuals.* Intellectuals are a part of the working class and also a force that the party can rely on. Party organizations at all levels must trust them, care about them and help them. Their working and living conditions should

be gradually improved. While encouraging intellectuals to bring their role into full play, party organizations should help them to acquire a communist world outlook and to advance in the direction of being both red and expert.

4. *It is essential to strengthen the party's leadership in education and to adhere to the four fundamental principles.* Any statements and actions that weaken the party's leadership are harmful and must be corrected.

III. The Current Situation in Education

As in all other areas of endeavour, the current situation in China's education is excellent. Since the smashing of the Gang of Four and particularly since the Third Plenary Session of the 11th Party Central Committee, fundamental changes have taken place and remarkable achievements have been obtained in education.

1. *The Party Central Committee has attached great importance to education.* The Fifth Plenary Session of the 11th Party Central Committee decided that no time should be lost in establishing an educational programme and system that are suited to the development of our national economy. The Party Central Committee and the State Council have discussed the educational work several times and have made decisions and issued instructions on important questions calling for urgent settlement. Under the leadership of party organizations at various levels, the teaching and administrative staff and students have gradually liquidated, through the "exposure-criticism-investigation" movement, the pernicious influence in ideology and theory of the "ultra-Left" line pursued by Lin Biao and the Gang of Four.

The Central Committee has annulled the "Summary of the National Conference on Educational Work in 1971" as well as other erroneous documents. It has thoroughly repudiated the Gang of Four's reactionary "two appraisals" and has broken the mental shackles that had been fastened on educational workers. Cases of people being unjustly, falsely and wrongly charged or sentenced have been redressed. The party's policies towards intellectuals and cadres have been further implemented. The leading groups of various types and at all levels have been reestablished through readjustment and consolidation. All students have been taught to adhere to the four fundamental principles: the socialist road, the dictatorship of the proletariat, the leadership of the party and Marxism-Leninism-Mao Zedong Thought.

The students also have been taught to love their motherland, the people, labour and science and to take good care of public property. They have been guided to acquire lofty revolutionary ideals and a communist outlook on life, to uphold patriotism and the spirit of plain living and hard struggle, to observe discipline and public morality and to follow the orientation of being both red and expert. The tendency to neglect politics — which had appeared among some students — has been put right. Erroneous ideas concerning the four fundamental principles have been criticised.

2. Institutes of higher learning have revived and developed. In 1977, institutes of higher learning resumed the practice of holding entrance examinations. This has aroused the enthusiasm of students, improved the quality of entering students and brought study back into vogue. In recent years, both the number of institutes of higher learning and the enrollment of college students have grown. In 1980, there were 675 colleges and universities in China. Of that number, 316 admitted 2,964 post-graduate students, thereby increasing the total number of post-graduates in school to 17,728, or 14.1% more than in 1979. In 1980, institutes of higher learning admitted 281,200 undergraduates in regular programmes and special programmes and turned out 146,600 graduates. Thus, the number of students in school totalled 1,143,700, or a 12.1% increase over 1979. In accordance with the state plan, 273,800 students were enrolled, 143,500 graduates matriculated, and the total number of students in school was 1,030,900, up 13.4% over 1979. According to each local plan, 7,400 students were admitted and 3,100 were graduated. Thus, the total number of students in school was 112,800, or an increase of 1.4% over 1979.

In 1980, the number of teachers and administrative staff members in colleges and universities totalled 631,900, of which 246,900 were full-time teachers. There were altogether 4,212 professors, 13,788 associate professors and 119,102 lecturers.

In order to meet the needs of national construction, more students have been channelled into those fields and specialties which need strengthening — e.g., finance and economics, political science and law. As a result, the distribution of students among the various fields and specialties in institutes of higher learning has changed. The percentage of students in finance and economics increased from 1.2% in 1976 to 3.2% in 1980. In the same period, the percentage of students in political science and law went from 0.1% to 0.5% and that of students trained as teachers, from 19.4% to 29.6%.

Institutions for scientific research at colleges and universities have all been restored and a number of new scientific research institutes have been established. Progress has been made in scientific research and a number of achievements with relatively high scientific standards and important economic consequences have been registered. All these measures have helped to develop China's science and technology and have contributed to the fulfilment of the Four Modernizations.

3. Training of competent people in secondary professional skills has been strengthened. Socialist modernization in China needs not only a large number of competent people with advanced professional skills, but also a large number of competent people with secondary professional skills. To suit the needs of socialist construction in the 1980's and to promote such construction, the National Conference on Secondary Professional Education was held in 1980. The participants affirmed that secondary technical schools, characterized by less investment, rapid construction and a shorter training period, are an important means for training more competent people in secondary professional skills in a faster, better and more economical way. The conference also decided policies and requirements for running these schools in the future.

Appropriate adjustments were made in the length of schooling in secondary technical schools. For schools enrolling junior middle school graduates, the length of schooling is generally four years, varying to five years for a few schools and to three years for some specialties. The length of schooling in schools which enrol senior middle school graduates is generally two years, extending to two-and-a-half or three years for some specialties.

Approved by the State Council, academic titles for teachers in secondary technical schools are: associate professor, lecturer, assistant and probationary teacher. The "Provisional Rules Concerning the Designation of Academic Titles and Promotion for Teachers in Secondary Professional Schools" will first be tried out in a few schools and then implemented in all such schools by stages and in groups.

In 1980, there were 3,069 secondary technical schools; they admitted 467,000 students, graduated 410,300 students and had a total enrollment of 1,243,000 students — a 3.7% increase over 1979. Among these schools were 2,052 secondary worker-training schools, which took in 252,900 students, turned out 201,200 graduates and had an enrollment of 761,300 students, for an increase of 6.6% over 1979. There were 1,017 secondary

teachers' schools, which admitted 214,700 students, graduated 209,100 students and had 482,100 students enrolled — representing a 0.5% drop from 1979. The number of teachers and administrative staff members in all secondary technical schools was 298,400, of which 128,600 were full-time teachers. Compared with 1979, the total number of teachers and administrative staff members increased by 35,900, and that of full-time teachers, by 15,800.

4. *The overall arrangement of middle schools has been readjusted and technical education has developed in a positive way.* During the ten years of difficulties, the concept of "two educational systems" was wrongly criticized and all technical schools and agricultural middle schools were closed. On the other hand, unscrupulous actions were taken to develop senior middle schools. First-year senior middle school classes were attached to junior middle schools and first-year middle school classes were attached to primary schools. Key teachers at each level were transferred to higher-level schools. All this had an adverse impact on primary schools and lowered the quality of middle schools as well. In the past two years, the overall arrangement of middle schools began to be readjusted in every region and the enrolment for senior middle schools was brought under control. Middle schools that were unable to remain open in the absence of necessary conditions were either closed down or merged with or turned into primary schools.

In 1980, China had 118,400 regular middle schools with a total enrollment of 55,081,000 students. Compared with 1979, the number of schools declined by 23,700 and the number of students in school dropped by 3,734,000. The total number of teachers and administrative staff members in the general middle schools was 3,897,100, of whom 3,019,700 were full-time teachers.

Based on the "Report on the Reform of Structure of Secondary Education" issued by the Ministry of Education and the State Bureau of Labour, and approved by the State Council, local authorities at all levels, after first conducting experiments, have set up vocational schools, agricultural middle schools and vocational training classes, and have been opened vocational courses in some middle schools. In 1980, there were 3,314 vocational schools and agricultural middle schools throughout the country. These schools took in 307,200 students, bringing the number of students in school to 453,600 — an increase of 93.1% over 1979. The number of vocational schools increased from 31 in 1979 to 390 in 1980. Enrolling 121,800 students in 1980, these schools had a

total number of 133,600 students, or 15.9 times that of 1979. There were 2,924 agricultural middle schools, which admitted 185,400 students and enrolled 320,000 for an increase of 41% over 1979. The number of teachers and administrative staff members of vocational schools and agricultural middle schools in China totalled 40,800, of whom 23,200 were full-time teachers.

5. *Achievements in the popularization of primary education were consolidated.* At present, 93% of China's school-age children attend school, although only about 60% will finish the five-year courses. In order to solve problems in the popularization of primary education, the Party Central Committee and the State Council issued in 1980 the "Decision on Some Problems Concerning the Popularization of Primary Education," which called on the whole party to give close attention to primary education and to work for its popularization. The popularization of primary education throughout the country in the 1980's has been designated as an historical task. Programmes for universal primary education are being mapped out in every locality, based on local economic, cultural and other conditions, so that primary education will be made universal by stages and in groups.

In recent years, in order to help universalize primary education, the overall distribution of primary schools in the countryside has been readjusted on the principles of letting children attend nearby schools and of sparing manpower and material resources. While efforts are made to operate efficiently full-time primary schools, other types of primary schools have been set up, e.g., part-time primary schools, primary schools which are open every other day and mobile primary classes or groups. All these efforts have produced more opportunities for school-age children.

The local authorities of provinces, cities and autonomous regions have given close attention to rural primary education and some have taken earnest measures to increase the pay of primary school teachers in the countryside and to solve their living problems. In some places, part of the local revenues has been used for school building maintenance. In 1980, there were 917,300 primary schools; 29,423,400 pupils were admitted, 20,532,700 pupils finished the five-year schooling, and the number of pupils in school totalled 146,270,000, which was 359,800 less than that in 1979. The number of teachers and administrative staff members of all primary schools was 6,054,100, representing an increase of 179,400 over 1979, and 5,499,400 of them were full-time teachers, which was an increase of 117,600 over 1979.

6. *Preschool education, education for the blind and deaf-mute, and education on a work-study basis have received attention from people in all walks of life.* "The Regulations Concerning the Work of Kindergartens in Cities," drawn up in 1979, redefined the task and training purpose of kindergartens. At present, preschool educational institutions are run on a large scale by all departments of education, government organizations and mass organizations, army units, industrial enterprises and communes and production teams all over the country.

In 1980, there were 170,000 kindergartens throughout the country. The number of children in kindergartens totalled 11,507,700, which was an increase of 30.9% over 1979. In 1980, there were 292 schools for the blind and deaf-mute. These schools took in 5,900 students, turned out 3,700 graduates and thus had a total enrollment of 33,100 students. In 1979 and 1980, 112 work-study schools were set up in 23 provinces, municipalities and autonomous regions, with a total enrollment of 7,200 students.

With support from people in all walks of life and thanks to the hard work of both cadres and teachers in these schools, remarkable results have been achieved in educating and rehabilitating youngsters who have taken a wrong step in life. In October 1980, a national forum on work-study schools was held, at which experiences in running these schools were exchanged and a document on how to run work-study schools was prepared.

7. *Great importance was attached to education for national minorities.* Education for the national minorities in China has gradually revived and developed in the last four years as a result of the implementation of the party's policy toward national minorities. The provinces and autonomous regions concerned have adopted a series of concrete measures. In planning secondary and primary education for national minorities, first consideration has been given to the actual conditions of each nationality, with emphasis on quality and actual results.

Efforts have been concentrated on operating efficiently a group of state-run middle and primary schools and on restoring or setting up a number of middle and primary boarding schools. Expenses are guaranteed for these schools, more competent teachers are provided and priority is given to building or renovating school premises and purchasing facilities. It has been stressed that the content of courses and teaching methods should suit the characteristics of the national minorities. For national minorities that have written languages of their own, those languages should be used in teaching. Students are required

to learn the language of their own nationality while learning Chinese.

In order to accelerate the training of competent people for construction in the minority nationality areas, courses on minority nationalities were offered in four key universities and colleges in 1980. Some institutes of higher learning in areas where national minorities live also offered such courses. The decision has been taken to operate colleges and schools for national minorities in every autonomous region or province where national minorities are relatively numerous in order to train more qualified teachers for minority nationalities.

In 1980, national minority students in schools at all levels numbered 9,656,000, of which 42,900 were college students, 84,000 secondary technical school students, 2,007,500 middle school students and 7,522,200 primary school pupils.

8. *Education for adults has developed considerably.* Both in 1979 and in 1980, the Ministry of Education convened national conferences on education for ministry staff members and workers, education for peasants, correspondence universities and evening universities run by institutes of higher learning and other forums. At these conferences and forums, past experience was summed up and tasks for future work were clearly defined. All this has given great impetus to education for adults. In 1980, television colleges had an enrollment of 324,400 students. Preparations are now being made to offer liberal arts courses.

Beginning in 1979, all universities for staff members and workers and for peasants who meet the standard for higher education were given formal recognition by local authorities of provinces, municipalities and autonomous regions, or by the ministries, commissions and general bureaus under the State Council. This was carried out according to the document of the Ministry of Education approved by the State Council — "Temporary Regulations for Procedures of Approval Concerning the Running of Institutes of Higher Learning for Staff and Workers and Peasants."

In the "Proposals Concerning Large-scale Development of Correspondence Education and Evening Universities," approved by the State Council, it was affirmed that correspondence education and evening universities, both sponsored by colleges and universities, play an important part in developing higher education in our country. The "Proposals" stipulate that those who enroll in undergraduate courses or special college courses given by correspondence or in evening universities should be given college diplomas by the colleges or universities they attend upon their completion of

the required courses and their passing formal examinations. And the best students should also be granted degrees in accordance with the set requirements. In 1980, worker-peasant students receiving higher education of this type numbered 1,554,100; those receiving secondary education, 8,044,700; and those receiving primary education, 16,461,000. In 1980, 5,388,000 illiterates in the country learned to read and write.

9. *Chinese students were sent to study abroad, foreign students came to study in China and international academic exchanges were organized.* Since 1978, China has sent a total of 5,609 students to 46 countries to pursue further studies and has accepted 1,276 foreign students from 79 countries in exchange. China has also invited a large number of foreign experts and scholars to give lectures at Chinese institutions. Many delegations of Chinese educators and researchers have been sent abroad to study, or to attend important international academic conferences.

Since it joined UNESCO, China has done some work to promote mutual understanding with other countries and to strengthen international unity and friendship. In 1980, China sent abroad 2,124 students, thereby increasing the number of Chinese students in foreign countries to 4,654. In 1980, foreign students studying in China numbered 1,382; of these, 569 were accepted in 1980.

10. *Trial implementation of temporary work regulations for colleges and universities, middle schools and primary schools has resumed.* Regulations for middle school students and primary school pupils have been reformulated. After being revised and implemented, these regulations have helped all schools to restore teaching order. In the future these regulations should be further revised and perfected. Our country's first regulations concerning academic degrees have been ratified by the Standing Committee of the National People's Congress for trial implementation. These regulations are bound to exert a far-reaching influence on the development of education and the sciences in China. The Central Research Institute of Education has been restored and research work in education has begun. Societies of education have been set up in all localities and problems in the theory of education have been discussed.

11. *Much work has been done to compile teaching materials and to construct school buildings and laboratories.* Trial editions of standardized teaching materials for the 10 years of basic schooling in all primary and middle schools have been published (with a few exceptions). The

results obtained in using these teaching materials is being summed up in preparation for the publication of official textbooks. A large quantity of new teaching materials for liberal arts, science and engineering, agriculture and medicine in institutes of higher learning have been published. Among them, 523 kinds of new teaching materials for basic courses in science and engineering and in technology were compiled under the direct supervision of the Ministry of Education; these were published by the end of 1980. Teaching materials for most courses in secondary technical schools have already been compiled; teaching materials for the rest of the courses are being compiled.

The state budget allocates a guaranteed amount each year for construction and maintenance of educational institutions. In addition, some provinces, municipalities and autonomous regions have taken sums out of local financial reserves, various extra charges, city maintenance expenditures and funds for aiding underdeveloped areas, or they have raised funds specifically to subsidize educational institutions. With the help of the departments in charge of capital construction and units doing actual construction, investment in capital construction for educational institutions was increased in 1980.

Special consideration was also given to construction of school buildings and supply of building materials. In 1980, capital construction completed for institutes of higher learning totalled 3,250,000 sq. m. of floor space — an amount unprecedented in the past 30 years. As a result, rooms for college students enrolled in 1980 were ensured and housing conditions for some teaching and administrative staff were improved. There has been a significant increase in the quantities of instruments and other equipment and of books and reference materials in schools at all levels. Quite a number of laboratories for basic science and technology courses in colleges and universities have been put into operation. Some key universities and colleges have begun to use audio-visual teaching aids, while some middle and primary schools have begun to use lantern slides in their teaching.

12. *The teaching faculties in schools of various types and at all levels have been strengthened.* In addition to reopening previously existing advanced and secondary teachers' schools and setting up new ones, provincial, prefectural and county authorities have set up in-service teachers' schools and colleges for advanced studies. Self-study, off-the-job training and research activities have been organized for the in-service teachers, helping to raise the level of their political culture and professional knowledge. In 1980,

774,400 in-service teachers of middle schools attended teachers' colleges (or schools) for advanced studies and comprised 25.6% of the total number of middle-school teachers. In-service teachers of primary schools who attended teachers' schools for advanced studies numbered 1,531,200 and accounted for 27.8% of the total number of primary school teachers.

In June 1980, the Fourth National Conference on the Work Concerning Normal Education was convened. At the conference, it was reaffirmed that normal education performs the work of a "machine tool" in the system of education as a whole. It was stressed that the basic task for teachers' schools at all levels is to turn out qualified teachers for the people. New requirements for all teachers were proposed at the conference. Teachers are required to work hard at acquiring a relatively broad and profound store of knowledge, to study earnestly in order to master the science of education so as to grasp the rules of education, and to have a high moral character and noble ideals. In short, teachers are required to be worthy of the name of teacher.

To guarantee the quality of candidates in teachers' training schools, it was decided that, beginning in 1980, one key normal university or teachers' college in each province, municipality and autonomous region would be given the same privilege as the nation's key colleges and universities in selecting entering students. In 1980, the number of teaching and administrative staff members of normal schools of various types and at all levels throughout the country totalled 11,540,000, of whom 9,333,300 were full-time teachers. In state-run normal schools, the total number of teaching and administrative staff members was 6,619,700, of whom 4,718,900 were full-time teachers. In normal schools not financed by the government, the total number of teaching and administrative staff members was 4,920,300, of whom 4,614,000 were full-time teachers.

Current Problems. The above-mentioned facts show that immense changes have taken place in China's education and that our work on the educational front has gradually moved onto the right path, thus creating favourable conditions for the future development of education. Nevertheless, the current state of affairs in education falls far short of satisfying the needs of the country's Four Modernizations. The main problems are as follows:

(1) Higher education and secondary technical education have developed slowly. There is a severe shortage of competent, professionally trained people, especially at advanced levels. Our

ability to train competent people is limited and the quality of training provided is not high. What is more, most of the people trained so far are in a limited number of fields, while there are none in other fields.

(2) In secondary education, efforts have been concentrated on the development of general education. Vocational education has just recently been revived. The gap between secondary education and economic construction has not yet been closed. Primary education has not been made universal and the number of young illiterate people is growing.

(3) Education for workers and peasants has not been carried out satisfactorily. The educational and technical level of workers is very low. According to incomplete statistics in 1979, the level of education of 80% of workers and administrative personnel is below that of junior middle school. In the case of workers and administrative personnel who began working during and immediately after the 10 years of turmoil the actual level of education is generally below the level indicated by their record of schooling.

The operating conditions of schools at all levels are still far from satisfactory. Expenditures for education and capital investment for educational institutions are far from sufficient. School facilities are overcrowded. Teaching equipment and scientific research are inadequate and outdated. There is a shortage of teachers and the quality of existing teachers is substandard. The social status of teachers and teachers' living conditions are unduly low. During the 10 years of turmoil, the quality of education declined significantly. First-year classes at higher levels were attached to schools at lower levels, while key members at lower-level schools were transferred to jobs at higher-level institutions. This looked impressive, but had no real benefit because the quality of education offered by schools at all levels was lowered. The consequences of those years are still being felt.

IV. Education and Our Readjustment Policy

At present, all economic departments are continuing to carry out the policy of readjustment, restructuring, consolidation and improvement, with readjustment as the key. The work in education should be carried out in line with this policy, even though education has its specific problems. It is essential to eliminate the "Left" ideological influence and to adhere to the correct guiding ideology in educational work. Many ex-

pressions of the "Left" ideological influence are still to be found in education. For instance, the inherent link between economic construction and cultural construction was ignored for many years and education was not given due consideration in the overall state economic plan, with the result that education failed to develop in step with economic construction.

In the past, class struggle was stressed as the key link and successive political movements were launched. People who studied diligently were criticised for "following the road to becoming specialists without socialist consciousness." This kind of thinking adversely affected teacher training in all schools and discouraged competent people from becoming both red and expert in order to serve socialist construction. There was an ultra-"Left" deviation in carrying out the policy against intellectuals which downplayed the important role of intellectuals in socialist construction.

Teachers had low social status and received unreasonably low pay. There was little understanding of the need and the importance for cadres to acquire both general and scientific knowledge. Consequently, a good number of cadres were content to stay with what they knew and a whole generation of cadres were hindered from developing in all-around manner. In developing educational institutions, high targets were set without due consideration for the country's capability, thus causing many ups and downs in educational work. As a result, student enrollment dropped and, more importantly, the quality of education declined.

Strengthening the Weak Link. Education is currently a weak link in our national construction and it urgently needs to be strengthened. During the readjustment of the national economy, education should be regarded as an important aspect of overall readjustment. It is just as essential to strike the proper balance between education and the economy as it is to strike the right balance between different sectors of the economy. More attention must be given to the development of "manpower resources." In both the long-term programme and the annual economic plan, priority should be given to investment in education, so as to ensure the necessary conditions for operating schools. Unless these conditions are improved and outstanding problems are solved, it is impossible to increase the number of people receiving an education or to improve the quality of education. Another important task in the readjustment of education is to correct the disproportion between various types of educational institutions at different levels, to enable us to achieve systematically the planned and balanced development of socialist education.

The nature and purpose of education should be further clarified, so that it can better meet the various needs of society and better serve the construction of a modern, powerful socialist country. In the course of readjustment, necessary reforms must include a reform of the structure of education and of its rules and regulations. The system of education should be gradually combined with the organization of labour and of cadres. Records of formal schooling and actual educational ability should be required in recruiting workers and selecting cadres, so that trained personnel can apply what they have learned and fully utilize their skills.

In the past, the readjustment policy was not fully understood and the serious consequences of the actions of Lin Biao and the Gang of Four were underestimated. For this reason, the readjustment policy was not accompanied by effective measures. Now, however, it is imperative to carry out the policy thoroughly and resolutely and to work harder for the success of readjustment in education. The whole party should be engaged in educational work. Party committees and people's governments at all levels must put educational work on their agenda and tackle the important problems in education while there is still time. In the course of readjustment, particular emphasis should be placed on improving the quality of education at all levels. We must avoid the temptation to make worthless things appear impressive. Weak educational institutions must be truly strengthened, as must be leadership at all levels. Ideological and political work must be undertaken in earnest and the position of Marxism in schools must be consolidated to enable us to carry out better the policy of enabling everyone who receives an education to develop morally, intellectually and physically. Primary education must be made universal as soon as is feasible. Effective measures will be taken to ensure that primary school pupils will complete the five-year programme and will reach the proper educational level by the time they finish school.

Reform Measures. We will work vigorously for the restructuring of secondary education. Various types of secondary technical education will be offered according to plan. In the course of operating and developing higher and secondary professional education, close attention will be paid to the training of competent people in such fields as economics and law, science, engineering, agriculture and medicine. Education for national minorities will be taken seriously and strengthened. Continued efforts will be made to develop adult education, preschool education and education for the blind and other handicapped. We

will also redouble our efforts to train more competent teachers, compile more and better teaching materials and supply schools with more instruments and other equipment. We will carry out the correct policy toward intellectuals and, while consolidating the nation's contingent of teachers, we will further raise their social status, their living standards and their political and professional expertise.

Effective measures will be adopted to improve the operating conditions of schools at all levels, with emphasis on the major colleges and universities, major middle and primary schools and major schools of other types. Construction of laboratories and the acquisition of books and reference materials will be strengthened in a systematic fashion, and the use of audio-visual teaching aids will be popularized gradually. In the course of readjustment, the leading organs and

administrative systems will undergo readjustment, as will the system of schooling, educational rules and regulations and teaching. However, these reforms must be accomplished on the basis of our past experience and in accordance with actual conditions. They must be tested first before being popularized, systematically and in a planned way.

Furthermore, it is imperative to draw on the relevant experience of foreign countries and to continue our scientific, cultural and educational exchange with friendly countries all over the world.

In short, in accordance with the requirements of the Four Modernizations, we must constantly review our experience, adhere to our correct guiding ideology, analyze the new conditions and tackle new problems in order to make our educational system a success. We will strive to make education flourish and turn China into a powerful, modern, socialist country.

55. CHINA'S HEALTH SERVICES

By Wei Zhi

Ministry of Public Health

In the 31 years since the founding of New China, under the leadership of the Chinese Communist Party and the people's government, the health services have undergone fundamental changes and made remarkable achievements.

Before Liberation, the masses lived in extreme poverty, epidemic diseases were rampant and health facilities were scarce. The people's health standard were very low. Since Liberation, the working people have been freed from exploitation and oppression. Their material and cultural life has greatly improved.

Owing to the efforts made by the government in developing mass health service, the health standards of the people have been raised considerably. The mortality rate, which was about 25% before Liberation, has fallen to 6.2%. Incomplete statistics show that in 31 years the average life span has increased from 35 years to 68 years.

I. The Fight Against Disease

As a result of the nationwide, patriotic movement for health and for preventive and curative measures, such infectious diseases as plague, smallpox, venereal diseases, kala-azar, recurrent fever, typhus, etc., have been successively eradicated or basically controlled. Schistosomiasis once was prevalent in 347 counties of 12 provinces and one autonomous region in the southern part of China; more than 10 million people suffered from this disease in an area of 13,000 square miles infested with snails. In the past 31 years, however, snails have been wiped out in two-thirds of the affected area and two-thirds of the sufferers have been cured. Schistosomiasis has been wiped out completely in Guangdong, Guangxi, Fujian, and Jiangsu provinces and in Shanghai Municipality. In more than 200 counties the disease has been basically eliminated.

Before Liberation there were more than 30 million people afflicted with malaria. Now, through intensive control, the number of malaria patients has dropped to some 3.3 million and the mortality rate of malaria in 862 counties has dropped to below 0.5%. Also, nearly 10 million patients with endemic goiter have been cured, and new cases of goiter have been controlled in more than 100 counties.

Keshan disease, Kaschin-Beck disease, and

endemic fluorosis have been controlled to a certain extent. The incidence of acute infectious diseases, such as poliomyelitis, measles, diphtheria, pertussis and tetanus in new-born infants, has decreased considerably. Statistics on the causes of death among inhabitants in some localities show that mortality caused by respiratory diseases, digestive diseases and acute infectious diseases has dropped, and that heart disease, cerebrovascular disease and malignant tumours have emerged as the main causes of death for the population.

Preventive Measures. Much has been done with regard to environmental, industrial, food, and school hygiene, as well as health protection from radiation. Since 1971, systematic tests and surveys have been carried out on the water quality of five big water systems, including 177 rivers, five lakes and six bays, and on the air quality in 75 cities, producing 730,000 items of scientific data. We have organized several nationwide campaigns for screening and treating occupational diseases. In the three years from 1974 to 1976, more than 2,900,000 workers doing jobs in dusty air were examined; at the same time those with detected silicosis were hospitalized for treatment and then transferred to other jobs. For the prevention of food contamination, data from nearly 100 million tests were collected, analysed and scientifically tested preparatory to the establishment of 54 national hygiene standards that were implemented on a trial basis for 14 items, including food grains, oil, meat, eggs and aquatic products.

Medical and Health Facilities. Before Liberation, China had very few medical institutions or workers' health facilities, and those few were concentrated in cities and coastal regions, leaving the vast countryside and remote regions without medical care and drugs. After Liberation, we trained a large number of medical workers, built many medical and health institutions and established an urban-rural medical care network composed of various kinds of institutions staffed with professional medical and health workers.

In the past 31 years, 406,000 students have graduated from higher medical colleges throughout the country, or 42.7 times as many as in the 20 years prior to Liberation, and 354,000 students have graduated from middle medical schools, or 20.6 times the pre-Liberation figure. From 1949

to 1980, the number of medical and health institutions rose from 3,600 to 181,000, an increase of 49.2 times; hospital beds from 80,000 to 1,982,000, an increase of 24.8 times; and professional medical and health workers from 541,000 to 3,535,000, an increase of 6.5 times. Among the latter, health technicians increased from 505,000 to 2,798,000, an increase of 5.5 times; and physicians from 360,000 to 1,153,000, an increase of 3.2 times. From 1949 to 1980, based on the average number for every thousand persons, hospital beds increased from 0.15 to 2.02, health technicians from 0.93 to 2.85, and physicians from 0.67 to 1.17.

Rural Health Services. Since 80% of China's population lives in the countryside, priority in medical and health care is given to rural areas. In the past 31 years, the developments in rural health services have been especially remarkable. In 1980, there were 2,337 general hospitals at the county level, 2,093 anti-epidemic stations, 1,885 maternal and child health stations and 1,165 postgraduate health schools throughout the country. In some counties, hospitals of traditional Chinese medicine, institutes for drug control and specialized institutions for preventive and curative services have been established.

There were 55,413 public health centres in 50,000 and more communes, and cooperative medical care stations or health stations generally in every one of the 600,000 and more production brigades throughout the country, with the cooperative medical care system operating in 68.8% of the production brigades. China has a total of 1,214,000 hospital beds, 1,485,000 professional medical and health workers, 1,463,000 "barefoot" doctors, and 2,992,000 rural health workers and midwives. The growing number of "barefoot" doctors and the development of the cooperative medical care system have played important roles in putting an end to the scarcity of medical care in rural areas.

Medical Research. Before Liberation, research work in medical science had been very backward, with only four research institutes and no more than 300 researchers. At present, a comprehensive medical research system has been established on a preliminary basis. There are 282 independent research institutes and 18,000 professional research workers, and more than 300 research institutes affiliated with higher medical colleges which employ several thousand research workers.

In the past 31 years, 4,576 medical and health research achievements at the provincial and national levels have been obtained, among which

353 items were given state awards. 802 items were awarded prizes by the Ministry of Public Health and seven inventions were recognized. Some items such as the treatment of deep burns over a large area, reattachment of severed limbs, acupuncture, anaesthesia, and the treatment of acute abdominal and bone joint damage, anal/rectal disorders, etc., combined with Chinese traditional and Western medicines, have attained or nearly reached international standards. The advances in completing a series of research projects on basic, preventive, clinical and traditional medicines have given an impetus to the development of medical and health sciences in China.

II. Medical Advances and Achievements in 1980

In 1980, the policy of readjustment, restructuring, consolidation and improvement was implemented in health services in accordance with actual conditions under the guidelines put forward by the Third Plenary Session of the 11th Party Central Committee. At the National Conference of Health Bureau Directors held early in 1980, eight health tasks were proposed and arrangements were made for carrying them out in the course of the year. After the conference, health authorities at various levels succeeded in overcoming "Left" influences and began to readjust some policies, as well as establish, supplement and renovate certain systems, thereby strengthening the preventive and curative health services. Among the achievements of 1980 were:

1. *Development in the construction of rural health services.* Based on past experience and lessons learned from the actual conditions of the country, a portion of the available manpower and resources was concentrated on the consolidation and improvement of the medical and health establishments at the county level. These establishments were gradually to become direction and education centres for medical, health and family planning services in the counties, and would thus contribute to the constant improvement of the medical techniques of the rural medical network as a whole. Health services should be improved, and within a given period of time—beginning in one-third of the counties. This plan was integrated into the local agriculture production development programme in different localities and carried out according to local conditions.

The Ministry of Public Health issued the "Opinions on the Improvement of Reconstruction of Health Services in One-Third of the Prefectures" and "Opinions on the Enhancement of

Country Hospital Work" and obtained information and experience in the pilot counties. In the first one-third of pilot counties, problems chiefly concerning the improvement of administrative ability and technical knowledge of leading authorities were solved during the year. Attention was paid to the establishment of leading groups, of ranks of technical personnel and of rules and regulations. In some counties, attention was also given to the reconstruction of medical and health centres of several major communes. Training courses for hospital directors, station leaders and institute chiefs, as well as special courses in medicine, surgery, genetics, pediatrics, nursing and laboratory work, were successively conducted in one-third of the counties. Effective results were obtained in training the staff and raising their professional techniques to a higher level.

Persistence in the improvement of the cooperative medical service and the consolidation and improvement of the work of "barefoot" doctors were instrumental in strengthening the construction of rural health services. In 1980, different methods of operating cooperative medical services and of collecting funds and reimbursing medical expenditures were used, depending on the economic conditions of different places. In the better-off brigades which had relatively more funds, the scope and proportion of reimbursement were greater, while in the poorer brigades they were smaller. For those not in a position to reimburse expenses for the time being, drugs were sold at cost. In those brigades where conditions are not appropriate for the formation of cooperative medical services, health centres that collect charges or medical units which operate in other ways can be organized. The methods to be used depend on the opinions of the masses and the brigade has the right to make decisions. The training and re-education of "barefoot" doctors will continue. About one-third of them have attained the technical level of middle health school graduates.

2. *Health authorities at various levels continued to implement the policy of stressing preventive medicine, to launch anti-epidemic and patriotic health movements and to strengthen the preventive and curative services.* In 1980, emphasis was placed on the prevention and treatment of parasitic, endemic and communicable diseases such as schistosomiasis, malaria, filariasis, endemic goiter, hepatitis, pulmonary tuberculosis, etc. and on planned immunization. The "practice of vaccination" was adopted. Teams of investigators were dispatched to several provinces in northeastern China and to the south to obtain information on the development of planned immunization. The investigation and examination of malaria were

carried out in focal malaria districts, and five provinces (Jiangsu, Shandong, Henan, Hubei and Anhui) held a joint conference on malaria prevention in Shandong in 1980 to exchange experiences. To promote anti-malaria work, 328 anti-malaria training courses with 14,093 persons attending were conducted in the same five provinces. Some 995 microscopic examination stations and 69 monitoring stations for malaria were established. Eradication of mosquito breeding grounds and drug treatments during the quiescent stage were carried out in combination with the urban and rural patriotic health movement, improvement of city surroundings and farmland construction. Epidemics in large areas were fundamentally controlled during the year.

Quarantine at seaports and airports was intensified and arrangements for "monitoring infectious diseases at border ports" were promulgated; quarantine stations were set up at Kunming, Nanning, Hangzhou, Urumqi, Shenyang, and five ports on the Changjiang River. The "Provisional Regulations Governing Port Service" were issued jointly by the Ministry of Communications, Ministry of Foreign Trade and the Customs General Administration.

The Ministry of Health issued "Opinions on the Strengthening of the County Anti-epidemic Stations" and gave attention to the establishment of training bases for anti-epidemic health workers in Heilongjiang, Jiangsu, and Hubei provinces. It formulated "Food Hygiene Criteria" (draft), convened a conference on food hygiene criteria and issued "Rules for Health Control on Imported Food" jointly with the Ministry of Foreign Trade and the Ministry of Food.

After the issuance of the "Provisional Regulations on Middle and Primary School Health Service," the "Provisional Regulations on Health Service in Institutes of Higher Learning" was issued together with the Ministry of Education. Twenty-two provinces, cities and autonomous regions were organized to carry out eye examinations of 250,000 students in 500 schools.

With a view to popularizing medical and pharmaceutical knowledge among the masses, much has been done by the national and local newspapers, radio and television broadcasting stations, publishing houses and the health propagation and education centres of some provinces, cities and districts. The Health Publishing House of the Ministry of Health is publishing 340,000 copies of *Health* per issue.

3. *To implement the party's policy on traditional Chinese medicine and to promote the integration of Chinese traditional and Western medicine, a national conference was held in March at*

Beijing. The conference proposed the policy of simultaneous development and long-term coexistence of three forces — traditional Chinese medicine, Western medicine and combined traditional-Western medicine. Colleges or schools of traditional Chinese medicine and drugs should be improved for the training of traditional doctors and druggists; training of apprentices by masters should be advocated; on-the-job training and education for traditional doctors and druggists, as well as postgraduate training, should be actively enforced; Western-trained doctors should be encouraged to learn traditional Chinese medicine so that there will be a corps of senior physicians with both Western and traditional medical knowledge; Tibetan, Mongolian and Uygur medicines should be developed; therapeutic, educational and scientific research institutions of traditional Chinese medicine should be established and improved; and the theory of traditional Chinese medicine and the means of modern medicine should be thoroughly studied.

Experts on Chinese or Western medicine or drugs who have made outstanding contributions to the research of traditional Chinese medicine or to the integration of Chinese traditional and Western medicines will be promoted and honoured, according to the conditions specified. This will give impetus to the development of Chinese traditional medical service. With the approval of the State Council, the "Report on the Work of Combining Traditional Chinese Medicine and Western Medicines" was issued; and on the basis of investigation some new regulations and arrangements were provided.

The Chinese Traditional Medical Association conducted nationwide scientific activities and conferences, such as the National Conference of the General Secretaries of the Chinese Traditional Medical Associations, held at Shanghai; the Symposium on Anal-Rectal Disorders in the Theory of Traditional Chinese Medicine, held at Fuzhou; the Symposium on the Scientific Research on "Qigong" (energy), held at Hangzhou; the Symposium on the Treatment of "Three Deficiencies," held at Harbin; and the Symposium on the Theoretical Research on Traditional Chinese Medicine, held at Kunming.

With the approval of the State Council, provisions allowing doctors to practise individually was issued. This enables the traditional and Western-trained doctors who are not working for the state or for collective medical units to utilize their professional knowledge and provides them with the opportunity to serve the masses in preventing and treating diseases.

4. New achievements in medical research. In

1980, medical research gave priority to tumors, cardiovascular diseases, paracholera, malaria, hepatitis, epidemics, schistosomiasis, the prevention and treatment of occupational diseases, basic medicine, microsurgery, biomedical engineering, molecular biology, immunology and such new techniques and new disciplines as organ transplantation.

In order to improve the management of scientific research, measures such as the monitoring of specifications, graded responsibilities, assessment by colleagues and signing of contracts have been adopted systematically. After adoption of the contract system, the sense of responsibility on the part of research units and researchers has grown stronger and has accelerated their research. Most projects were carried out according to the contracts and some have completed the research in advance or have obtained promising results. With a view to utilizing the limited investment to do as much work as possible, encouraging the enthusiasm and creativity of scientific and technical personnel, accelerating the process of scientific research, activating scientific thought and protecting academic competition, the "competitive contract" in the form of a "bid" has been introduced.

Assessment of major scientific achievements and inventions in 1978-1979 was carried out. Of the 1,145 items, 104 were selected as achievements attaining the ministerial level and among these, 40 were selected as first-class and 64 as second-class achievements. Among the first-class achievements was the research on the law and principle of acupuncture analgesia by the Shanghai No. 1 Medical College, which demonstrated through human and animal experimentation that acupuncture analgesia was different from "stress analgesia," thus solving an important problem in the laws of acupuncture analgesia and providing an experimental basis for its clinical use. A certificate of honour and 2,500 yuan were awarded for each first-class achievement.

At the request of the National Scientific Council, the Ministry of Public Health and the National Medicine and Drug Administration jointly set up the Committee to Assess Medical and Pharmaceutical Inventions. The Committee assessed 78 inventions and reported to the National Scientific and Technical Commission that seven of the inventions had been approved. The "sexual reproduction of *Gastrodia elata*," successfully developed by the Institute of Materia Medica and others of the Chinese Academy of Medical Sciences, and the "Artemisinin" developed by the Academy of Traditional Chinese Medicine and others, have played important roles in practical use. The success of sexual reproduction of

Gastrodia elata has shortened its maturation period, solved the problem of regression, increased the output and expanded the area for plantation. Other major achievements were: the "sterilization by injection into *vasa deferens*" by the Chongqing No. 1 Workers' Hospital; the "omentum roller skin flap" by the Beijing Jisuitan Hospital; the new anti-leptospirosis drug — Imidazole-4(5)-carboxylic acid ethyl ester — developed by the Institute of Epidemiology and others of the Chinese Academy of Medical Sciences; the "hemostatic powder No. 10" developed by the Institute of Blood under the Chinese Academy of Medical Sciences; and the "screening test for serum and blood glutamic pyruvic transaminase activity" developed by the Beijing Medical College.

5. *Further enhancement of high- and middle-level medical education and staff training.* In 1980, on the basis of the rectification and restoration of medical education in 1978 and 1979, emphasis was placed on the improvement of teaching quality. National conferences on higher and middle medical education were successively convened. These conferences summed up both the positive and negative experiences and lessons of the past 30 years. In the implementation of the policy of enabling the student to develop morally, intellectually and physically, the conference on student's ideological work was held to analyse the thinking of students, to exchange experiences in developing ideological work and to discuss concrete methods of strengthening such work. The health conditions of students in colleges and schools were inspected and experiences were exchanged.

In 1980, many measures were taken to improve teaching quality. Various colleges were encouraged to take full advantage of their special features. Colleges were given more independence in teaching and were allowed a certain flexibility in matters of curriculum, teaching schedules and the selection of teaching materials. Some colleges offered special subjects and lectures. In about a dozen colleges, medical courses taught in foreign languages were organized to help students improve their foreign language proficiency. In these courses, foreign language textbooks were used and most of the lectures were given in a foreign language. After two years, the preliminary results have been good. All medical schools took practical measures to upgrade training in foreign languages, the fundamentals and self-teaching. Emphasis was placed on practical training and experimentation and on the use of audiovisual aids in teaching.

In regard to the development of staff education, the authorities in medical education at various levels investigated the conditions of health

service personnel. A national conference on the education of health workers was held to exchange experiences and to define the direction, tasks and methods of staff education over the long term. One result was the formulation of a 10-year training programme. It is estimated that more than 110,000 professional and technical personnel have already participated in the training programme on a full-time or a part-time basis.

Training courses for directors of health bureaus and medical colleges of provinces, cities and autonomous regions were also conducted. A number of provinces, cities and autonomous regions conducted training courses for health service administrators at various levels. Furthermore, the Ministry of Public Health charged health bureaus and medical colleges of certain provinces and cities to conduct national training courses for the key personnel in various branches of medicine. In 1980, 270 such courses were conducted, with 4,400 persons participating — more than double the number in 1979. Also in 1980, provinces, prefectures and counties drew on existing teaching bases to conduct local training programmes for large numbers of non-professional health workers, thus making a head start in the improvement of the technical level and management of medical and health units and services.

In 1980, selected post-graduate students were sent abroad for further training under the auspices of the World Health Organization or through bilateral arrangements, and foreign medical experts were invited to lecture in China. About 1,200 persons have been trained in this way and some advanced techniques suitable for China's current conditions have been introduced.

6. *Technical direction of family planning and health care for mothers and children.* Development of family planning has always been an important routine task of the Ministry of Public Health. The medical and pharmaceutical units at various levels have made great contributions in this effort and achieved excellent results in the improvement of sterilizing procedures and the development of more effective and more easily practicable contraceptive methods, drugs and devices.

In the field of maternal and child care, more than 860,000 patients with uterine prolapse and urine fistula have been cured. In 1980, the Ministry of Public Health issued the "Regulations for Maternal and Child Health Service" (draft for trial implementation), the "Regulations for City Nurseries" (draft) and the "Regulations for City Nursery and Kindergarten Health Service Systems" (draft). A symposium on nursery service was held to discuss the problems of early education before three years of age and it led to the formulation of

a "Programme for the Cultivation and Education of Children Below Three Years of Age" (draft). Discussions were held on teaching projects for nursery directors, health workers, child-care workers and cooks, and on the standards for model and experimental nurseries.

7. *Improvements carried out in drug factories and on drugs in 24 provinces, municipalities and autonomous regions led to better quality drugs and instruments, a large number of category specifications and more effective methods of production.* This development enabled the production and supply of drugs and instruments to better serve the prevention and treatment of disease and the protection of people's health. Drug standards were tightened through the enforced ratification of drug categories, the development of effective drugs, the absolute elimination of ineffective drugs and a strict ban on the manufacture and sale of false and substandard drugs. The State Council approved and promulgated the "Report on the Tightening of Drug Control and Ban on the Manufacture and Sale of False and Substandard Drugs" in 1980. It also issued the "Rules for Drug Standard Control" and the "Regulations for the Drug Code Committee."

8. *The scientific control and financial control of health services were strengthened.* Various medical and health service units made certain changes in technical and financial control and revised or established more than 50 kinds of medical and health regulations, systems and control measures. The results were improved hospital order and a better attitude toward patients, stricter ward control and an increase in number of outpatients and inpatients.

The tightening of financial control in observance of economic laws was a major change in the administration of health services. Beginning in 1979, we have been popularizing the reforms in drug control and the ways of increasing revenue and reducing expenditures. At the same time, we have tried to implement in some of the hospitals at or above the county level a new financial system. The system would allow hospitals to exercise some independence in their financial arrangements, yet integrate the interests of the state, the collectives and individuals by making hospital cadres and staff conscious of the need to maximise revenues and reduce expenditures — i.e., do things more economically.

The financial control of commune health centres was organized according to each commune's particular conditions, and was introduced first in selected centres. The "comprehensive budget" arrangement, introduced by

the Ministry of Finance, and the "contract system" for scientific research projects were adopted on a trial basis at anti-epidemic stations, maternal and child care stations, institutes for drug control and scientific research and education units. By the end of June 1980, about 50% of the hospitals at or above the county level and about 20% of the commune health centres throughout the country were on this system of financial control.

In implementing stricter financial controls, many provinces and cities investigated hospital costs and suggested ways of reducing the deficits in hospital operating costs. To carry financial control even further, some units practised "fixed-amount" control, undertook to raise funds for schools, made warehouse inventories and audits. Attention was given to the coordination of financial and technical control and of administrative and ideological work, with serious implementation of the related government principles, policies, decrees and provisions for more effective operation of the socialist welfare service and for better quality medical care for the masses. It was prohibited, however, to seek more income by lowering the quality of medical care or by imposing unreasonable costs on the patients.

III. Principal Tasks of the Health Service

At present we are readjusting the national economy. The health service is an important component of our socialist system; it is vital to the people's health, the country's growth and the continuation of the nation. Hence, the government has decided that the development of the health service must be pushed forward as much as possible during the period of readjustment. Emphasis will be placed on the readjustment, restructuring, consolidation and improvement of existing establishments, on the full utilization of existing medical and health units. In this way, we will raise the standards of medical science and techniques, administrative capability, the quality and efficiency of our work, as well as arouse the enthusiasm of the masses of health workers for the prevention and treatment of disease, thereby serving the people's needs and the needs of modernization.

The realization of modernization in China's medicine and medical service is in keeping with the World Health Organization's target of "Health for All by the Year 2000." We are striving for more rapid development of our medical sciences and techniques, for the popularization of knowledge about health, for a marked improvement in urban and rural hygiene and in the general health of the people.

With a view to attaining this ambitious target, the current guidelines and main tasks of our medical and health service are as follows:

1. *Give priority to the improvement of medical service in the countryside, in factories, mines and cities.* Over 80% of China's population live in the countryside, where numerous endemic infections and parasitic diseases proliferate and where medical and health services are still relatively scarce. Therefore, the principal challenge remains the prevention and treatment of disease among the country's 800 million peasants. However, the relationship between the countryside and the cities should be correctly handled; we cannot provide more and better services to the countryside until health services in urban areas have been improved. The organization of basic health services for both urban and rural areas will be strengthened and the health centres in rural communes and the health stations in urban communities should be consolidated and improved.

The training and advancement of "barefoot" doctors will continue. Those "barefoot" doctors who have attained the level of middle medical school graduates and have passed a qualifying examination will be certified as "rural physicians." To increase the ranks of "barefoot" doctors, we will grant them reasonable living stipends. The current cooperative medical service in the countryside is an ideal system for providing medical care to peasants, so it should be consolidated and developed. However, other ways of organizing medical and health services that would entail payment for treatment will be allowed.

Preventive and curative services for the masses can only be secured after the basic health establishments in urban and rural areas have been well organized. In the meantime, county medical and health institutions will be grouped, by stages, into technical direction centres and training bases for primary medical and health workers in the areas of epidemic prevention, maternal and child care and family planning.

2. *Continue the policy of stressing preventive medicine.* Because China's population is large and there are many diseases, the fundamental goals of health services must be to mobilize the masses to take care of their health, to prevent diseases, to advocate clean living, to transform certain social habits and to improve the environment. We must strengthen anti-epidemic work, launch patriotic health movements, actively prevent and treat debilitating diseases and enhance the general health of the people.

3. *Adhere to the policy of developing and*

integrating the three forces — traditional Chinese medicine, Western medicine and the combination of traditional and Western medicine. The integration of Chinese traditional medicine and Western medicine should be strengthened in order that we may evolve a medical science with distinctive Chinese characteristics. Priority in medical research will be given to the study of major technical problems and to the basic theories of those diseases that are severely debilitating.

4. *Adopt various forms and methods of operating medical services.* The urban and rural medical and health institutions are run by the state, the enterprises, the collectives and a small number of individuals who have acceptable medical skills and are qualified to practise medicine in our country. The forms and methods of operating medical systems should vary with the conditions in their location.

5. *Support for family planning and strong technical guidance should be a major responsibility of the health service.* In the effort to limit China's population to under 1,200 million, the party and the government have called upon the people to have only one child per couple. This is an important measure which will affect the progress and future of China's modernization, the health and welfare of our descendants and the long-term and immediate interests of the nation. The health service should provide technical guidance for family planning, stress the policy of contraception, strengthen the training of technical personnel and improve contraceptive techniques, while advocating eugenics, strengthening maternal and child care service, improving pre-natal health care, protecting the health and safety of children and improving nursery organizations in cooperation with other departments involved.

6. *Coordinate steps in medicine and pharmacy and combine medicine with pharmacy more closely.* Active support should be given to the readjustment of medical and pharmaceutical services and the improvement of pharmaceutical plans and products. Drug administration and control should be strengthened so that the production, supply, quality, quantity, categories and standards of drugs, biological products, medical instruments and contraceptive devices may more adequately meet the needs of preventive and curative health services and of family planning.

7. *Improve the training of technical and managerial personnel in the health service.* This affects not only the immediate needs of the health service, but also its modernization in the long run.

The higher and middle medical schools should be run well and the quality of teaching should be raised. Special attention should be paid to developing various forms and methods of staff training with a view to forming a pool of skilled personnel who possess modern scientific and technical knowledge, as well as scientific management ability.

8. *Strengthen the financial, scientific and administrative control of the health service.* In improving the medical service, consideration should be given to economic returns, that is, raising quality while cutting expenses. Medical service is closely linked to economic construction. The

improvement of medical service depends on existing economic conditions and, in turn, promotes the development of economic construction. Therefore, the readjustment of the medical service in a systematic fashion is crucial to the normal development of the national health service. If we carry out our task by following closely the correct policies and principles laid down by the Party Central Committee, we will surely overcome difficulties and achieve with success the central task of adjustment, improve the people's health and contribute to the modernization of our country.

56. FAMILY PLANNING IN CHINA

By the Policy Research Section,
Family Planning Office of the State Council

Family planning in China has been a lengthy process. Initially, we did not grasp the importance of this work and lacked practical experience. Now, family planning work has been brought within the scope of the national economic plan and is proceeding smoothly in coordination with the growth of the national economy.

I. Thirty Years of Stops and Starts

Human reproduction is decided by a social mechanism. There is a close relationship between material production and human reproduction. China's experience has proved that family planning has a direct bearing on the speed of a country's economic development, on the improvement of the people's livelihood and on the welfare of the nation as a whole. It took China as long as 30 years to understand this issue clearly and to give it serious attention.

Early Efforts. Family planning in China has been consistently advocated and implemented under the leadership of the people's government. The issue was publicized as early as the 1950's, soon after the founding of New China. In August 1953, the Government Administration Council directed the Ministry of Health to help the people carry out family planning. In 1956, Comrade Mao Zedong presided over the drafting of the "National Programme for Agricultural Development," in which is stipulated: "Other than in areas inhabited by national minorities, birth control should be publicized and popularized in all densely populated areas and family planning advocated, so that the family can avoid being overburdened and the children can have better education and chances of full employment."

In September 1956, Comrade Zhou Enlai, in his report on the "Proposals on the Second Five-Year Plan for the Development of the National Economy," advocated an appropriate birth control policy in the interest of protecting women and children, of educating our descendants and of ensuring the health and prosperity of the nation. He called on the health departments to take effective measures for this purpose.

In 1957, Comrade Mao Zedong indicated at the 11th Supreme State Conference and at the Third Plenary Session of the Eighth Party Central

Committee that mankind should exercise control over nature and grow in a planned way. He said there should be a 10-year plan for family planning with some years allowed for testing, publicizing and popularizing the measure. Some Chinese economists likewise advised controlled population growth in China.

However, these views and proposals were never given effect due to the "Left" influence on the country's guiding ideology. In 1958, a scholar doing research in population theory who was an advocate of family planning was unjustly criticized. After that, population theory became almost a forbidden subject, and the work in family planning was greatly hampered.

During the three years of great economic difficulties due to natural disasters (1959-61), the natural growth rate of the Chinese population declined. In 1962, following the recovery of the national economy, there was a tendency towards rapid increase in population growth. In view of this trend, the Party Central Committee and the State Council issued the timely directive to carry out family planning work conscientiously so as not to jeopardize the nation's economic growth. This became an established policy for China's socialist construction.

On numerous occasions, Comrade Zhou Enlai had dealt with the importance of late marriage and birth control and had proposed certain concrete measures. In 1964, the Office of Family Planning was established under the State Council and made a good beginning in population control. When the "cultural revolution" began in 1966, this good beginning was frustrated by Lin Biao and the Gang of Four. Family planning organizations were suspended, the personnel in this field were attacked and the work once again fell into a state of neglect.

In 1971, Comrade Zhou Enlai again took a personal initiative in establishing family planning work. A leading group for family planning was set up under the State Council in August 1973. Family planning was brought into the Fourth and Fifth Five-Year plans for the development of the national economy.

In spite of many explicit directives and correct proposals from the party and the government for work in family planning, the majority of the people did not understand sufficiently for a long period of time that population growth should be

coordinated with the growth of the national economy; instead most of us clung to the notion that the more people, the better. Although we advocated family planning work, we did not devise specific measures to implement it. For a time, therefore, population growth went unchecked, and the resulting high birth rate coupled with a low mortality rate added up to an extraordinarily high rate of natural population growth. In the 30 years from 1949 to 1979, China's population grew by more than 430 million — from 540 million in 1949 to 970 million in 1979.

Population Growth. The last 30 years have been characterized by the imbalance between population growth and economic growth. China's grain output in 1979 was over 660,000 million catties (330,000 million kg.), nearly treble the 1949 output, but the average amount of grain per capita in 1979 had risen only 135 kg. over the amount of 1949. The imbalance has greatly hampered the improvement of the people's livelihood, both materially and culturally.

During the first 20 years after Liberation, poor family planning led to an annual 2% increase in population. From the early 1970's on, after the government included family planning in the plans for national economic development and attached importance to this work, the population growth rate dropped. In 1970, the birth rate was 33.6 per thousand population; in 1979 it dropped to 17.9 per thousand. The natural population growth rate of 26 per thousand population in 1970 dropped to 11.7 in 1979.

Because human reproduction takes place in relatively long cycles, the current birth rate is influenced by what happened 20 years ago; just as the birth rate today will influence the future 20 years hence. The experience of the past 30 years has taught us that population growth should be conducted in a planned way, in keeping with material production. The national economy must be developed while population growth must be reduced to achieve a better balance.

Since 1978, with the return of political stability and unity and the readjustment of the national economic plan, the guidelines and policies of the party and the government relating to family planning have become more explicit and work in this field has proceeded with satisfactory results.

II. Family Planning Developments in 1980

The heartening achievements in family planning obtained in 1980 can hardly be separated from the basic work done in the previous years. Since

the Third Plenary Session of the 11th Party Central Committee, a correct ideological line has been established together with correct political and organizational lines and a series of correct policies have been promulgated. In 1979, stability and unity returned and the national economy developed according to the guidelines of readjustment, restructuring, consolidation and improvement.

Flexible economic policies in rural areas brought about improvements in the people's livelihood. To coordinate population growth with economic development in China, the government strengthened its guidance over family planning work. Leaders at all levels attached importance to this work and all the departments concerned coordinated their tasks. Much attention was given to propaganda and educational work, as well as to research in population theory. Posts in family planning units and departments were filled and arrangements were made to assign to every people's commune, town and neighbourhood one person specifically in charge of this work. Provinces, municipalities and autonomous regions promulgated provisional rules and regulations on family planning that came with awards and penalties. All these measures contributed to the advance of family planning work in 1980.

The "One Couple, One Child" Policy. In light of China's actual conditions, the central government has called for even stricter controls on population growth with the slogan "one couple, one child." The report on the work of the government at the Second Session of the Fifth National People's Congress called for practical measures to reward couples who agree to have only one child. This is a new development in China's family planning policy — and a well-founded one.

Thanks to years of effort in this field, the Chinese people are beginning to realize the importance of family planning and more and more couples have decided to have only one child. The planned birth rate has risen but the rate of second and third births has dropped. A number of units have distinguished themselves in family planning work. Sichuan, for example, is China's most densely populated province. Its natural growth rate was as high as 29 per thousand population in 1971, but in 1979 it dropped to 6.7. A number of advanced counties achieved outstanding results, reducing their natural growth rate by a big margin.

All this clearly demonstrates that effective family planning depends on propaganda and practical measures. If the work is done well, the plan for one-child families will be carried out smoothly. It is most important for the masses and cadres to realize that population growth must be made com-

patible with economic development and that the success of the current policy is in the interest of the individual, the collective and the whole nation from both the long-term and the immediate point of view.

The Importance of Family Planning. In 1980, family planning was placed on the agenda for discussion by the party and the people's government at all levels. In June 1980, the Secretariat of the CPC Central Committee called a meeting specifically to discuss control of population growth and family planning. At the meeting, it was pointed out that family planning is a strategic issue for the nation, and that the proper handling of this issue is a long-term task with major policy implications. The meeting also called on party committees at all levels to strengthen the leadership over this work and to make efforts to grasp the importance of family planning for the development of material production and to place it on the long-term programme for national economic development.

On September 25, 1980, the Central Committee of the CPC issued an open letter calling on Communist Party and Youth League members to take the lead in limiting population growth to one child per couple. This letter spelled out the general target and the policies of population control in China. Each province, municipality, autonomous region, prefecture, county and commune appointed one leading comrade — sometimes even the top leader — to take responsibility for family planning work. The work was to be put often on the agenda for discussion and review, so that problems in connection with the implementation of family planning could be solved promptly.

The idea of raising the national economic growth rate and reducing the birth rate has been accepted by more and more people. The planning, review and supervision of population growth and national economic growth have been coordinated in practice with the cooperation of all departments concerned.

The effective control of the birth rate in 1980 was ensured by the following measures:

(1) *We launched a popular educational campaign via mass media to provide information about family planning and to encourage couples of child-bearing age to volunteer to practice birth control.* Activities in making comparisons between unplanned and planned population growth were widely carried out in 1980 in provinces, municipalities, prefectures, counties and towns, and down to the communes, production brigades, production teams and individual households. Everyone participated in calculating population growth rates during the past 30 years, changes in farmland

and grain consumption per capita. People came to realize that if population growth continued unchecked, per capita acreage would decrease because the total farmland area remained a constant. Although grain output had doubled since the early years after Liberation, grain consumption per capita had not increased much. Given the reality of the present, people were asked to think about the future and future generations.

Great advances were made in the study of population theory. Twenty-nine research institutes and research departments have been set up in the provinces, municipalities and autonomous regions. Subjects included: study of the population theory under the guideline of Marxism; ideological approaches to both material production and population growth; China's current population policies; population forecasting; control of urban and rural population growth; and family planning for national minorities.

(2) *We practised family planning by implementing economic measures.* In 1980, economic rewards and penalties were introduced. Rewards were given to those units and individuals who had done good work on family planning. Those couples who volunteered to have only one child received regular child care allowances. Economic penalties were levied on the few who, after patient ideological education, still paid no attention to family planning and the very few individuals who undermined this work were punished. Rules and regulations regarding rewards and penalties have been formulated in various localities and good results have been achieved in promoting family planning work and population control.

(3) *We used models in family planning.* Cadres at all levels and the broad masses of party and Youth League members conscientiously took the lead in having only one child. Parents who had passed child-bearing age persuaded their married children to have only one child. This had a good effect on popularizing family planning and got the broad masses of people to follow their lead. The open letter of the CPC Central Committee calling on party and Youth League members to take the lead in having one-child families in the interest of the whole nation strengthened the people's confidence in the work. By the end of 1980, statistics from 25 provinces, municipalities and autonomous regions showed that there were 19.51 million couples with only one child and that 11 million couples received certificates for pledging to have only one child.

(4) *We stressed knowledge about eugenics.* The basic guideline for family planning is to con-

control the population and improve the health of the offspring by encouraging fewer but healthier births. In 1980, publicity on eugenics was emphasized. Investigation and study on hereditary diseases were started and consultant clinics on eugenics were set up in some medical and health units where conditions permitted. Forecasting the health of the foetus was begun.

It is stipulated in China's marriage law (Chapter II, Article 6) that marriage is not permitted in circumstances where the man and woman are lineal blood relatives or collateral blood relatives up to the third degree of relationship. Neither is marriage permitted where one party is suffering from any disease which is regarded by medical science as rendering a person unfit for marriage.

(5) *We paid attention to the study of new trends and to the solution of new problems.* The restructuring of China's economic system, the relaxation of agricultural economic policies and the implementation of various forms of payment in the countryside brought about an unprecedented affluence in the rural economy and new challenges in family planning work. Accordingly, certain effective new measures had to be formulated for population control. These included contracts for late marriage and one birth and other measures which are under review for trial implementation.

(6) *We have intensified our cooperation with other countries in family planning work.* Following the development of family planning work in China, we have cooperated and exchanged experience with world organizations on population and family planning and with family planning departments of other countries. We have cooperated in the programmes organized by the United Nations Fund for Population Activities and have sent abroad various study groups and individuals to conduct scientific research on family planning. In June 1980, China set up the Family Planning Society, which has collaborated on projects with a Japanese nongovernmental organization — the Japanese International Cooperative Financial Group of Family Planning. In our work with foreign countries, we have learned advanced scientific technology and gained broad experience in family planning work and have made use of foreign funds and equipment to advance family planning work in China in light of the country's actual conditions.

In summary, family planning work achieved good results in 1980, mainly through renewed ideological education supplemented by appropriate and necessary economic measures. However, there are still problems to be tackled, such as: the uneven development of the work; relatively more

multiple births in remote and mountainous regions; the shortage of technical personnel; bad management and primitive, coercive working methods; the shortage of contraceptives and their poor quality; and inadequate implementation of the "one couple, one child" policy.

III. Excellent Prospects for the Future

We are conducting the work of family planning in a developing country with nearly 1,000 million people, of whom about 800 million are peasants. The country is not rich and its science, culture, education and public health are comparatively backward. What is more, vestiges of feudalism remain and influence the people's thinking. All these factors make population control difficult. However, in family planning work, as in the work being done in other fields, difficulties are being surmounted and progress is being made. We have every reason to expect that our progress in the future will be excellent.

(1) *We have legal guarantees.* The Constitution adopted at the Fifth National People's Congress in 1978 stipulates in Article 53: "The State advocates and encourages family planning." Article 12 of the marriage law adopted at the Third Session of the Fifth National People's Congress in 1980 stipulates: "Husband and wife are duty bound to practice family planning." Is it the legal obligation of every Chinese citizen to abide by the law and practice family planning, including the practice of late marriage and birth control.

(2) *Family planning organizations have been set up from the topmost level down to the grass-roots, with responsible party and government members taking a leading role.* Even at the level of the commune and the street neighbourhood, there are people specially assigned to take charge of family planning work. They receive support from a strong network of activists in family planning. Authorities at the national and the local level have drawn up plans for population control on the basis of local conditions and the opinions of the masses.

(3) *The principle in family planning is to persuade people to practice birth control voluntarily under the guidance of the state and to use comprehensive methods of contraception.* In cities as well as in rural areas, contraceptives are distributed free of charge by women cadres, medical workers, women production team leaders, family planning counsellors and pharmacy shop-assistants. Sterilization procedures are performed free of charge and recuperation leave is granted with full

pay. Where conditions permit, some factories and communes also give food allowances and other subsidies to couples who practice family planning.

(4) *Health services for mothers and children are being improved.* A network of health services for women and children is gradually being set up in China. There are health clinics for mothers and children, hospitals of gynaecology, obstetrics and pediatrics in the provinces, municipalities and autonomous regions. There are health centres in prefectures and counties, county doctors and midwives at the commune and production brigade levels and all kinds of nurseries and kindergartens in cities and in the countryside. There are also clinics for periodic check-ups and outpatient services especially for one-child families. Vaccinations and injections are given free of charge to prevent the spread of infectious diseases and to ensure the healthy growth of children.

In urban areas, workers and staff members, upon retirement, receive pensions which ensure their living expenses. In the countryside, each village has its own arrangements for the care of old people without children to support them.

(5) *A sizeable detachment of scientific and technical personnel for family planning is gradually taking shape.* Researchers in population theory

and workers in the natural sciences, as well as in the social sciences, are concerned with the work of controlling population growth. All departments are working together and mapping out plans according to the Party Central Committee directive to implement the policy of the one-child family. Fundamental to this work and favouring its success is the leadership given by the Chinese Communist Party and the superiority of the socialist system, which can bring all the advantages into full play and create new ones. Now that family planning has been brought within the scope of the national economic programme, administrative measures can be used to promote this work. The Chinese people are highly intelligent and have a strong sense of discipline, so they will understand the importance of practicing family planning in the interest of the health and prosperity of the whole nation and that of the welfare of future generations.

We have now recognized the objective law governing the control of population growth. We have found the solution to the issue which was raised over 20 years ago. Proceeding from China's present-day reality, in keeping with the objective law governing the control of population growth and through the concerted efforts of the people, we are confident that we can maintain our population growth at an ideal level.

57. ENVIRONMENTAL PROTECTION IN CHINA

By the Research Section,
Office of the Environmental Protection Leading Group
of the State Council

China's environmental protection work began in the early 1970's. At the first National Conference on Environmental Protection, held in 1973, the "Regulations Concerning Protection and Improvement of the Environment" (draft for trial implementation) were adopted. In 1974, the State Council set up a leading group with an office under it to direct environmental protection work and issued or authorized the circulation of the following rules and reports: the "Provisional Regulations for Preventing Contamination of the Sea," the "Report on Preventing Food Contamination," the "Sanitary Standards for Designing of Industrial Enterprises" and the "Provisional Emission Control Standards for Industrial Waste Gas, Water and Residues."

Since that time, various areas and departments have done a great deal of work to prevent and treat pollution and have achieved quite a few successes. However, because of the turmoil during the years 1966-76, and the influence of erroneous "Left" ideas on our economic work, the principles, policies and measures concerning environmental protection have not been fully implemented. Pollution of the environment, destruction of natural resources and disturbance of the ecological balance have not been effectively controlled.

In the winter of 1978, the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party took a decision of historic significance, namely, to shift the focus of the party's work to modernization. At the end of that year, the Central Committee authorized the circulation of the "Main Points of the Report on Environmental Protection" prepared by the environmental protection leading group of the State Council, and issued important instructions for stepping up the work in this area. The report of the leading group explicitly pointed out that environmental protection is essential to economic construction and the realization of the Four Modernizations, and that environmental pollution problems must be tackled while construction is going on.

The leading group convened a national conference on environmental protection in March 1979 in Chengdu. The participants conscientiously studied the Central Committee's instructions, reviewed the work that had been done in the interim and called for improved management of the en-

vironment. In September 1979, the Standing Committee of the National People's Congress adopted and promulgated the "Environmental Protection Law of the People's Republic of China" (for trial implementation), thus initiating a new stage in China's environmental protection work.

I. Principal Achievements in Environmental Protection in 1979-80

In the past two years, in accordance with the principles and policies adopted since the Third Plenary Session of the 11th Party Central Committee, various areas and departments have carried out the Environmental Protection Law and the Central Committee's relevant instructions, introduced and exercised better management of the environment and accelerated the progress in this work.

Environmental Protection in Urban Areas

China's 216 large and medium-sized cities all suffer to varying degrees from air, water and noise pollution. Over the past few years, the cities have vigorously tackled the most urgent local environmental pollution problems. Thanks to the efforts made by various departments in Beijing, Shanghai, Tianjin, Shenyang, Lanzhou, Guilin, Hangzhou and Suzhou — cities designated by the state as major targets for environmental protection — pollution in these cities has been more or less reduced or controlled.

Beijing. In the past two years, and particularly in 1980, environmental protection in the capital has been stepped up. Some achievements were made after the Secretariat of the Party Central Committee put forward four suggestions concerning guidelines for construction in Beijing. These suggestions included: "Transform the environment of Beijing, improve afforestation and sanitation and, by taking advantage of the hills, waters, cultural and historic sites, turn the capital into a first-rate, beautiful, clean and modern city."

Beijing's water supply comes from the Guanting, Miyun and Huairou reservoirs. With improved environmental protection, the water from these

reservoirs now meets drinking water standards laid down by the state. The Changhe, Tonghui, Lianhua and four other rivers used to be contaminated by effluents from 401 major sources of pollution. Over the past few years, and especially during the past two years, treatment of 324 of the sources has significantly reduced the discharge of toxic substances into these rivers. Comparing the figures for 1980 with those for 1974, it can be seen that discharges of phenol have been reduced by 88%, cyanogen by 80%, cadmium by 85%, arsenic by 87% and chlorine by 45%.

To control smoke and soot pollution, 86% of the 5,095 furnaces in Beijing proper have been renovated, resulting in a reduction of such discharges. At the same time, emissions of sulphur dioxide have been reduced by using less coal. As a result, except during the central heating season, the air quality in Beijing basically meets the standards that the state has set for the city.

To reduce noise pollution in residential areas of Beijing, 31 factories that were considered serious sources of noise pollution were either merged with other factories or relocated, and 53 machines for making honeycomb coal briquettes were renovated in 1980. In some areas of the city, trees were planted to upgrade the environment.

Shanghai. Since 1977, the Shanghai Municipal People's Government has invested nearly 200 million yuan for treatment of pollution and has constructed a number of facilities for the treatment of waste water and gas. In 1980 alone, the government invested 78,480,000 yuan and completed 2,290 treatment facilities with the capacity for treating 155,000 tons of waste water a day, 321 cu. m. of waste gas per hour and 576,000 tons of residues per year. The dust level in the city proper has been reduced and the discharge of major pollutants such as mercury, cyanogen and cadmium has by and large been brought under control.

To check the spread of industrial pollution, the departments in charge of protecting Shanghai's environment have exercised strict supervision over capital construction. Since 1978, more than 92% of the construction projects achieved in the city have been carried out with close attention to the regulations concerning environmental management. Environmental protection measures were also adopted during the process of factory construction.

The Municipal People's Government has also set up a special organization to bring together experts to draw up plans for the treatment of the serious pollution of the Huangpu River.

Tianjin. The Haihe River is the chief source of

Tianjin's water supply. During the dry season each year, backwash from the sea brings in saline water. Between April and July 1977, there were 80 days when the chloride content of the water was over 500 mg./litre, and sometimes as high as 1,855 mg./litre, resulting in an increase of sulphates and general mineral content. Hence, protection of the Haihe River's water quality became an urgent matter. In recent years, to block the backwash from the sea a dam was built across the lower reaches of the river, an air curtain was used to operate the lock gate and all sewage outlets along the river were sealed. In 1980, the chloride content was maintained at below 200 mg./litre and oxygen consumption below 5 mg./litre, while other major pollutants such as phenol, cyanogen, mercury, chlorine and arsenic were all kept within the limits set by the state. The water quality was 90-95% up to standard. To improve the management of the Haihe River, the Standing Committee of the Tianjin Municipal People's Government recently adopted the "Provisional Regulations for Protecting the Section of the Haihe River System Inside Tianjin."

A good deal of work has been done to eliminate smoke and soot discharged from industrial and other furnaces. More than half of the 5,800 or more furnaces in the city have been remodelled. However, control of industrial waste gas is inefficient and the amounts of sulphur dioxide and nitrogen oxides in the air still exceed the limits set by the state.

Shenyang. In 1979, the Shenyang Municipal People's Government drew up a "Programme for Environmental Protection, 1980-1985," which made control of air pollution its chief target, and began city-wide all-around prevention and treatment of pollution. In accordance with the requirements of the programme, construction of a gasification station and a heat-supply unit in the Tiexi Power Plant was stepped up to supply the city with gas and heat. In 1980, the city invested over 50 million yuan in pollution control projects, of which 300 have been completed. Furnaces and kilns were remodelled to eliminate smoke and soot, and waste gas was conducted to adjacent areas for heating use. Consequently, air pollution has been brought under initial control; dust levels and the content of sulphur dioxide in the air have dropped.

The Hunhe River, an important source of Shenyang's ground water supply, is contaminated by phenol and other toxic substances. The city is simultaneously trying to save water and to treat waste water. In 1980, the supply of water to 131 factories whose daily consumption of water exceeded 10,000 tons was regulated, with the result

that water consumption was 6.7% less than in 1979. The use of recycled water in industrial plants reached 44.3%, an increase of 13.4% over 1979, while waste water treatment capacity increased by 21 million tons a year. These measures led to a 5,532-ton reduction of such pollutants as phenol and arsenic, thereby lessening the pollution of the Hunhe River.

The greening of Shenyang is part of the environmental protection programme. In 1980, 210,000 trees were planted, 2,000 *mu* of land were afforested and an area of 288,000 sq. m. was covered with new lawns.

Lanzhou. Owing to its location in a river valley, Lanzhou was subject to temperature inversions in winter and heavy smog throughout the year. The air pollution problem used to be very serious. Over the past three years, however, 71% of the boilers in the city, 43% of the industrial furnaces and kilns and 67% of the boilers for drinking water have been remodelled to eliminate smoke and soot. Industrial waste heat was circulated to heat homes in densely populated residential areas covering 650,000 sq. m., and more than 200,000 tons of anthracite of low sulphur content and volatility were brought in from other provinces for home heating. At the same time, emission of industrial waste gas was kept within certain bounds and a time limit set for its treatment.

In 1980, 235 pollution treatment projects went into operation, considerably improving the air quality in Lanzhou. In the winter of 1980, the sulphur dioxide content in the air was 0.152 mg./cu. m., 75% less than in 1977, bringing it almost into compliance with state standards. The floating dust content was 1.41 mg./cu. m., 42% lower than in 1977, but still higher than state standards. Heavy smog has basically been eliminated.

Guilin. For some time, Guilin's beautiful Lijiang River had been contaminated by industrial pollutants. To protect the scenery of Guilin and the Lijiang River, the State Council issued special instructions and allocated funds for the treatment of the river. The Guangxi Zhuang Autonomous Region and the Guilin Municipal People's Government restored and reconstructed scenic spots and achieved initial success in putting a stop to the destruction of the area's famous karst landscape. To control industrial pollution, 13 of the city's factories were ordered to suspend production or close down, and a number of factories that polluted the environment with waste water and gas were instructed to install pollution control devices. Today, the water quality of the Lijiang River has improved and the scenic beauty of Guilin has basically been restored.

Suzhou. Suzhou is a beautiful city of gardens and trees. But, because no attention was paid in the past to protecting the landscape, more than 400 factories were allowed to be built in the city, and the rivers and air became seriously polluted. In recent years, the Suzhou Municipal People's Government has adopted certain guidelines with regard to the expansion of the city and has ordered the construction of facilities for the treatment of industrial waste water. This has reduced the emission of toxic substances. In 1979, it was found that 68% of the water from the Grand Canal was contaminated with phenol, cyanogen, arsenic, chromium and mercury; the levels of these pollutants exceeded by 31% the permissible limits. In 1980, only 41% of the water was contaminated and the level of toxic substances had dropped to 14% above the permissible limit. The famous Hanshan Temple in Suzhou was once subject to contamination by waste water and residue discharged by the Huasheng Paper Mill. After the mill was renovated, the discharge of waste water was reduced by 42% and that of residue by 72%.

In line with industrial readjustment, certain factories that had high noise and vibration levels, were serious polluters, or produced combustibles or explosives have been moved out of the city.

Hangzhou. The Hangzhou Municipal People's Government has all along attached importance to the protection of the environment of West Lake. In recent years, the Yuewang Temple and other well-known sites have been repaired and the areas surrounding the lake have been cleaned up. Repairs were made over 20 km. of the embankment and a revetment built. To prevent offices and institutions located along the banks and local residents from discharging sewage into the lake, a sewage conduit, 9.4 km. in length, was laid around the lake and eight sewage pumping stations built. Fifty-six diesel engine boats working on the lake were converted into storage battery boats to prevent contamination from oil leaks. In 1980, the lake was dredged and 60,000 cu. m. of sludge removed.

To control the noise level in Hangzhou, trucks were not permitted in the vicinity of the lake and 280 diesel engine vehicles were banned from entering the city limits. To keep the air in the scenic area clean, 55 furnaces belonging to offices and to other buildings located along the banks were renovated to eliminate smoke and soot, and most of the furnaces belonging to tea-houses in the area switched to using liquified petroleum gas. Four factories that spoiled the view were moved out of the vicinity of the lake.

In 1980, the Hangzhou Society for the Study of Environmental Science was established to

evaluate the environmental quality of the lake and to study anti-pollution measures.

Prevention and Treatment of Water Pollution

In China, the average annual surface water runoff amounts to 2,600,000 million cu. m. and that of groundwater runoff to 700,000 million cu. m. The country ranks third in the world in terms of total storage of water. But the average annual surface water per capita is no more than 2,700 cu. m., about one-fourth of the per capita average in the world. China is not rich in water resources. Moreover, 15 of its 37 large rivers are seriously contaminated. The Party Central Committee and the State Council have attached great importance to the prevention and treatment of water pollution, and have obtained initial successes in this respect.

The Bohai and Huanghai Seas. Two of China's important bodies of water, the Bohai and the Huanghai seas, border on the provinces of Liaoning, Shandong, Hebei and Jiangsu and on the city of Tianjin. Large quantities of untreated effluent from factories, harbours and oil fields along the coast, as well as from ships and vessels that sail on the two seas, contaminate the waters with petroleum and heavy metals. The pollution in the Bohai Sea is particularly serious because the Bohai is a semi-closed inland sea.

In 1977, the State Council called a conference and set up a leading group with an office under it to take charge of planning 195 treatment projects. By the end of 1980, 142 of the projects were completed. The Petroleum Administration of the Dagang, Shengli and Liaohe oil fields and the Off-shore Petroleum Bureau built eight sewage treatment stations which have the capacity to treat 92% of the oil effluent in the Bohai. At the same time, a number of chemical factories and metallurgical plants along the coast changed their production techniques and began to treat pollutants, thereby reducing the emission of heavy metals. Oil pollution in the Bohai and Huanghai seas is now basically under control. The waters of Bohai Bay and Laizhou Bay have met the quality standard set for surface water and are approaching the standard set for fisheries. Except in a few areas near the coast, where the pollution from heavy metals slightly exceeds the acceptable standard for fisheries, the levels of toxic substances such as cadmium, lead, chromium and copper are within the acceptable limits set by the state.

To further combat pollution of the seas, 16 environmental protection stations have been set up

along the coast, with 145 monitoring posts under them. A monitoring network has been set up under the National Research Centre for Maritime Environmental Studies to conduct day-to-day monitoring.

Songhua River. The Songhua River and its tributaries supply Jilin and Heilongjiang with most of their water. However, these rivers are heavily polluted. In 1978, a leading group was set up to study the problem and initiate the construction of water treatment projects. By the end of 1980, 68 of 141 planned projects, representing a total investment of 85 million yuan, were completed on schedule. Construction of the country's largest pollution treatment project was begun in 1979 to deal with the pollution from the Jilin Chemical Industrial Complex — once the principal sources of pollution of the Songhua River. The project includes a 65-km.-long sewage pipe, a monitoring station, a neutralization station, a residential sewage treatment station, sludge incinerators and three other components. When it is completed, the project will have a treatment capacity of 8,000 tons per hour. At the end of 1980, only the first stage of the project had been completed. The state's investment in this project is 40 million yuan.

The Changchun No. 1 Motor Vehicle Plant, the Changchun Pharmaceutical Factory, the Northeast Low Alloy Processing Plant, the Harbin Oil Refinery, the Mudanjiang Paper Mill and some other enterprises located along the Songhua River have basically completed their treatment projects on schedule, so that the amounts of organic substances and heavy metals discharged into the river system have been reduced.

Ya'er Lake. Situated in eastern Hubei Province, between the middle and lower reaches of the Changjiang River, Ya'er Lake is a shallow body of water rich in organic substances. The lake is replenished chiefly by surface water, runoff which is abundant and of excellent quality, and is ideal for breeding fish. In the 1950's, the lake's annual output of fish was over 500,000 kg. After the Wuhan Gedian Chemical Factory went into production, the lake became contaminated by large amounts of toxic industrial effluent; agriculture and fishing in the area were adversely affected and the people's health was endangered. The State Council thereupon gave special attention to the treatment of pollution in Ya'er Lake. In 1973, construction began on a treatment project with 6,530,000 yuan of state investment. Completed in August 1976, the project includes a tertiary lagoon with an area of 6,200 mu, a 5,500-m. embankment, a 38-km. flood discharge, a 5,600-m. pipeline, 12 bridges, 16 culvert sluice-gates and an

electric drainage station. The project has played a significant role in reducing the contamination of the lake. The annual output of fish that meets the state's food standards is 250,000 kg. With pollution under control, the areas surrounding the lake have once again become suitable for agriculture.

Key Water Areas. While paying close attention to treating water contamination, the state has strengthened management of key water areas, conducted monitoring, assessment and scientific surveys of these areas, studied the changes in water quality and mapped out comprehensive plans and programmes for pollution control.

The Changjiang River is extremely long and its water, in its natural condition, is of excellent quality and of such abundance that it has a tremendous diluting and self-purification capability against pollutants. By the end of 1980, 172 monitoring stations had been set up, forming a preliminary network for protecting the water quality of the Changjiang. In the same year, a "Report on the Investigation of the Pollution Load in the Main Stream of the Changjiang River" was prepared, and research was conducted on the laws governing the dilution of pollutants and self-purification in typical sections of the main stream, as well as on the river's carrying capacity. The investigation showed that its absolute pollution load is remarkable; it also showed that the river was contaminated in sections where it passed big cities and industrial areas. But in terms of amount of water in the river as averaged over a number of years, the ratio between natural water and contaminated effluent discharged into the main stream is estimated at 200:1; so the average amount of pollutants in the river itself is not high and water quality as a whole is good.

The Huanghe (Yellow River) is the second longest river in China. In recent years, industrial waste water discharged into the river every day reached three million tons. To protect the river, 18 monitoring projects, constituting part of a larger network, monitored 127 sections of the river. By the end of 1980, one had a clear idea of the state of contamination of the river as a whole. In addition, investigations and research on protection of the Lanzhou section of the Huanghe River, the biological assessment of water contamination in the middle and upper reaches of the river and the study of the self-purification capability against BOD in the Xianyang-Xi'an section of the Weihe River and of the impact of the Sanmenxia Reservoir on ecology have provided a scientific basis for comprehensive prevention of pollution.

The average annual amount of flow in the Zhujiang River (Pearl River) is 341,000 million cu. m., second only to the Changjiang River and also

second in the whole country. Analyses made on the basis of research and monitoring data collected between 1971 and 1981 showed that water contamination of the river system was either minute or slight. In recent years, contamination in the lower reaches of the Xijiang River and the Dongjiang River has been reduced from slight to minute, whereas in 15% of the Beijiang River's sections, contamination has increased from slight to moderate. Guangzhou was found to be the biggest source of contamination of the Zhujiang River. Contamination in the Guangzhou section had reached serious proportions in 1975. However, owing to pollution treatment over the past few years, contamination in this section has been significantly reduced.

Treatment of Industrial Pollution

Pollution and destruction of the environment in China are caused mainly by the discharge of industrial wastes. In the past two years, various areas and departments have integrated the work of eliminating pollution with that of tapping the potential of industry, renovating industry, promoting comprehensive utilization and strengthening production management.

Petroleum Industry. The departments and units concerned with petroleum production have vigorously popularized the new technology of "sewage recycling reinjection," thus reducing the emission of waste material. By the end of 1980, 78 sewage disposal stations had been built in oil fields throughout the country. These stations dispose of over 290,000 tons of sewage every day. The rate of comprehensive treatment reaches 92% and that of sewage recycling reinjection, 76.4%. The Daqing Oil Field is able basically to dispose of its own sewage water and use it in place of clear water for recycling. This has prevented environmental pollution, controlled the tendency of the water table to drop each year, and helped increase production. The oil refining industry has treated environmental protection as part of production management. It has actively devised means for recovering and utilizing waste gas and sewage water.

Every year, several hundred thousand tons of crude oil are recovered. In 1980, the amount of water consumed in refining one ton of oil was reduced to 6.7 tons, 50% less than in 1979. The Changling Oil Refinery in Hunan Province was once a source of serious pollution. After many years of effort, it now sets an excellent example in environmental protection to the entire oil refining industry. The refinery built its own advanced waste water treatment equipment which can

handle 600 tons of effluent per hour. It was the first such unit designed by our own country. The treated water is basically of the same quality as surface water. In the past, the No. 5 Oil Refinery in Jinzhou, Liaoning Province caused several fires when it discharged industrial pollutants into the river. In recent years, it has paid close attention to the treatment of contaminated water. In 1980, 97.3% of contaminated water was so treated, reducing the emission of oil into the water to 660 tons and thus cutting down on the pollution of rivers and bays. In the process of treatment, 25,041 tons of oil were recovered from the effluent.

Metallurgical Industry. The departments and units of the metallurgical industry are placing emphasis on the multi-purpose utilization of resources and energy. According to statistics, the output value of products recovered through multi-purpose utilization in 1980 was over 800 million yuan, double that of 1976. Many wastes that pollute the environment have been turned into raw materials. In the case of non-ferrous, precious and rare metals, over 50,000 tons are recovered every year. The non-ferrous metal smelteries now recover and utilize highly concentrated sulphur dioxide gas to produce more than 800,000 tons of sulphuric acid annually, an increase of 300,000 tons over 1972. In the steelworks, 71% of the blast furnace slag is re-used. Over half of the cement enterprises in the whole country make use of water sediment as cementite.

In the field of waste heat utilization, certain successes have also been achieved. The utilization rate of combustible gases in the key steel works increases yearly. In 1980, the utilization rate of blast furnace coal gas reached 90% and that of coke oven coal gas, 96%. These two items alone amounted to a saving of more than 10 million tons of standard coal. The Shenyang Smelting Plant was once an exceptionally serious polluter. Over the past three years, the enterprise has made the elimination of pollution a major target of its technical transformation and has introduced technical innovations and comprehensive utilization for this purpose. In 1980, it produced 113,000 tons of sulphuric acid from waste gas, and its re-utilization rate of water reached 75%, thus saving over 25,000 tons of water every day. It also achieved a notable reduction in the emission of heavy metals. The Shenyang Smelting Plant invested 18,550,000 yuan in environmental protection. However, just by increasing the output of sulphuric acid, recovering all kinds of metals and saving water, it has saved the equivalent of 17,290,000 yuan.

Chemical Industry. In 1980, nine big chemical

enterprises, including those in Jilin and Lanzhou, completed a total of 105 pollution control projects. With the environmental protection installations that were built in the past, there are now altogether 307 installation units. This has served not only to conserve resources and reduce pollution, but also to create savings of 9,430,000 yuan each year.

The Lanzhou Chemical Company has completed an installation for the disposal of nitric acid tail gas and a project for the recovery of flare gas. The amount of nitrogen oxide emitted in nitric acid tail gas decreased from 970 kg. to 160 kg. per hour, meeting state emission control standards. Most of the 500 kg. of flare gas emitted per hour is recovered and used as fuel for boilers. This has led to a significant reduction of flare gas emissions and basically solved the pollution problem caused by the "yellow smoke dragon" and the "red smoke dragon" — a particularly severe problem in the Xigu district of Lanzhou.

Of the 121 chemical plants under the Shanghai Municipal Chemical Bureau which emit chlorine, hydrogen chloride, nitrogen oxide and sulphur dioxide, 80 have now brought pollution under initial control.

Building Materials Industry. The cement industry is focusing on dust elimination in its environmental protection work. By the end of 1980, 137 kilns in 49 large and medium-sized cement works all over the country were equipped with 121 electrostatic precipitators and large numbers of bag collectors. These devices enabled the cement works to recover altogether one million tons of powdered dust, which converts into a value of about 20 million yuan and constitutes 9.2% of their profits. In the past, the Dukou Cement Plant was almost hidden in clouds of cement dust. After several years of treatment, the dust emission level has dropped from 10% of the cement output per year in the past to 0.4% of the present output. The environment of the plant has undergone marked improvement.

Light Industry. In recent years, the paper-making industry has vigorously engaged in the recovery of alkali and the popularization of the ammonium sulphite process, the ammonia process and the use of semi-chemical pulp. The leather industry has introduced a new process of tanning by dehairing hides with enzymes. The synthetic fatty acid and detergent industries have begun the recovery of mirabilite and the comprehensive utilization of waste hydrochloric acid. The battery producing industry is popularizing non-mercuric cells, while the food industry, including the industries engaged in sugar and wine production, is

making efforts to make full use of raw materials. Successes have been achieved in all these areas.

In 1980, 190,000 tons of caustic soda were recovered by paper mills, 60,000 tons more than in 1973. The Jilin Paper Mill recovers 30,000 tons of caustic soda annually and uses waste pulp to manufacture over ten kinds of products, totalling more than 1,000 tons. Its annual output value from comprehensive utilization is over 13 million yuan. The output value of the Hefei Leather Mill as a result of comprehensive utilization is over 1 million yuan, with a profit of over 200,000 yuan every year. About 20% of the factories under the Shanghai Bureau of Handicraft Industries have brought waste water under control and over 60% of the boilers and industrial kilns have been equipped with smoke-eliminating and dust-reducing devices. Some of the factories have also brought noise, vibration and dust under control and recovered many resources at the same time.

Power Industry. The power industry has increased the use of fine coal ash. According to statistics, the country's coal-burning thermal power plants discharge a total of about 26 million tons of ash every year. About 9% of this ash residue is used for various purposes. In recent years, many departments have extended the uses of fine coal ash beyond that of manufacturing building materials such as bricks and tiles. The Zhuzhou Power Plant in Hunan Province uses fine coal ash to manufacture No. 400 cement, a type of cement with little chamotte. Shanghai uses fine coal ash to pave the load-bearing layer of road surfaces. Power plants in Yantai, Qingdao and Chongqing separate dressed iron ore from fine coal ash, thus reducing the harmfulness of pollution from coal ash.

Coal Industry. The coal industry is making multiple uses of gangue. According to incomplete statistics, 60 or 70 million tons of gangue are discharged throughout the country every year. Now, over 10 million tons, or about 20%, may be reutilized. Shandong Province has made use of over 2,700,000 tons of gangue, about one-third of the amount discharged, thus saving more than 300,000 tons of coal. In recent years, many coal-washing plants have built installations with a closed system for the treatment of coal sludge, thus reducing pollution caused by coal sludge.

Communications Departments. The communications departments have strengthened harbour environment management. Sewage treatment installations and installations for recycling garbage have been constructed in Dalian, Qinhuangdao, Qingdao and Zhanjiang. In 1980, these installa-

tions handled 5,880,000 tons of sewage containing oil discharge from ships and boats and recovered over 33,400 tons of waste oil. This has brought them an income of 8,290,000 yuan. Harbour pollution has been controlled to some extent.

Cultural Departments. Over the past three years, the 10 film-processing factories under the Ministry of Culture have recovered more than 20,000 kg. of silver from waste water discharged in the course of film processing.

In accordance with the policy of industrial readjustment, reorganization and integration, many areas and departments have dealt with serious polluters and irrationally-distributed factories so as to reduce damage from pollution. The Jinan Municipal Chemical Bureau of Shandong Province has called upon seven chemical plants, located on the windward side of the urban district and upstream from water sources, to shift to other types of production, and thus solve the pollution problem caused by these chemical enterprises. The Jinan Municipal Light Industrial Bureau has integrated factories which can make mutual use of their industrial wastes to turn the wastes into useful materials. For example, a printing and dyeing mill supplies a nearby paper mill with waste alkali effluent as a substitute for caustic soda. This not only reduces the pollution caused by waste water containing alkali discharged from the printing and dyeing mill, but also saves coal and electricity valued at 150,000 yuan a year.

The steel casting and forging, heat treatment, electroplating and printing plate industries have factories scattered far and wide, where most of the work is done by hand. The noise and dust pollution and the emission of toxic or other harmful substances is considerable. It is costly for a factory to engage single-handedly in the treatment of pollution and some factories do not have the facilities to do so. In accordance with the policy of industrial readjustment, cities such as Tianjin, Jinzhou, Lanzhou, Jinan and Qingdao have amalgamated these factories to carry out specialized production, thus raising labour productivity and facilitating the treatment of pollution.

Protection of the Natural Environment

The protection of the natural environment — land, water, forests, grasslands, wild animals and plants — is of far greater strategic significance than the sole prevention and control of pollution. Since the Third Plenary Session of the 11th Central Committee of the Party, the Central Committee and the State Council have issued the "Decision on Some Questions Concerning the Acceleration of

Agricultural Development" and the "Directive on the Vigorous Development of Afforestation," both of which have played important roles in protecting and improving the natural environment of our country.

National Investigation of Natural Resources and Regionalization of Agriculture. In 1979, the State Council set up the Committee for the National Investigation of Natural Resources and Regionalization of Agriculture. The committee, in turn, set up nine specialized groups to study land resources, water resources, rural energy resources, agricultural mechanization, extensive use of chemical fertilizers and other farm chemicals, natural reserves, rural housing, rural economy and comprehensive regionalization of agriculture. Investigation of natural resources and regionalization of agriculture are strategic measures of overall importance for the reasonable exploitation, use and protection of natural resources, the planning and guiding of agricultural production in line with local conditions, and the achievement of socialist modernization of agriculture in our country.

In the past two years, 28 provinces, municipalities and autonomous regions have carried out regionalization of agriculture at the provincial level and 243 counties have proposed regionalization at the county level — regionalization is now being carried out in 695 counties. Many areas have readjusted the structure and distribution of agricultural production on the basis of investigation and regionalization, gradually restoring and improving the ecological balance where it has been disturbed.

Construction of Shelter Belts. The Huanghe River basin is the cradle of our civilization. The areas along its middle and upper reaches were once covered with dense forests and luxuriant grass. Over hundreds and thousands of years, the natural environment has been destroyed and the areas of forest vegetation have dwindled, causing severe ecological imbalance, with some areas becoming barren desert land. Since Liberation, the party and the government have done a great deal to improve the natural environment and great successes have been won. However, the problem remains quite serious.

The shelter belt system affects 324 counties and banners in the 11 provinces and autonomous regions of Xinjiang, Qinghai, Ningxia, Gansu, Shaanxi, Inner Mongolia, Shanxi, Hebei, Liaoning, Jilin and Heilongjiang. The area covered has a rural population of 44 million people, 290 million *mu* of cultivated land, over 800 million *mu* of pastureland and 81 million *mu* of forest. Only 2.1% of the area is forested. According to the plan, the goal of the first phase of the project is to afforest 80

million *mu*, while carefully protecting the existing forest vegetation. This will expand the current 4% of forest-covered agricultural and pastoral land in the windy and sandy regions (not including the Gobi Desert) to 10%. It will also increase the current 5% of forest-covered of land in the heavily eroded areas around the middle reaches of the Huanghe River to 18%. And, it will mean an initial improvement in the natural environment and the life of the people in this area.

The State Council has set up a leading group to guide the construction of shelter belts and has also established, within the Ministry of Forestry, a bureau for the construction of shelter belts in the north, northwest and northeast. Since 1979, a contingent of over 8,100 professionals has been organized to carry out surveying and planning work. The 11 provinces and regions have drawn up a general plan, taking the county and banner as the basic unit, and are collecting seeds and raising seedlings. By 1980, more than 39.20 million *mu* of trees had already been planted in these areas.

Afforestation of the Plains. Afforestation of the plains is a significant measure for the improvement of the natural environment and agricultural ecology of our country. Because the State Council has attached importance to this project, the work has developed fairly fast. Over the past three years, a network of 100 million *mu* of farmland and forest shelters has been created. 15 million *mu* of cultivated land were planted with farm crops, sectioned off by belts of paulownia and planted with 3,200 million trees. The area of afforested land is approaching the sum total for the previous 27 years. Since the Party Central Committee and the State Council issued the directive on the vigorous development of afforestation in 1980, over 100 counties out of 400 on the North China Plain have built networks of tree-sheltered farmland. In addition, a number of advanced counties in south China have carried out afforestation work.

Nature Reserves. The creation of nature reserves is another important measure for the protection of the natural environment. In 1979, while regionalization of agriculture was underway, scientific surveys and designations of nationwide nature reserves were also being carried out. The tentative plan is to create over 300 nature reserves of various ecological types in different parts of the country, comprising 1% of the total territory. In 1980, another 17 new nature reserves were designated while the existing ones were consolidated and their administration strengthened.

The nature reserves that have been approved

by the State Council include: the Laotieshan Mountain and Snake Island areas located in Liaoning Province, where the emphasis is placed on the protection of snakes and migratory birds; the Sacsaul area in the Inner Mongolia Autonomous Region, where the target of protection is the area's sandy vegetation; the Nangunhe River area in Yunnan Province, where the principal targets of protection are the tropical rain forests, rare animals and elephants; and the Xinjiang Poplar Conservation Zone, where the targets of protection are the diverse-leaved poplars of desert areas.

By August 1980, 75 nature reserves had been established with a total area of 2,100,000 hectares, constituting 0.22% of the entire country.

II. Environmental Management in 1979-80

Legislation and Standards. In 1979, the Standing Committee of the Fifth National People's Congress approved and promulgated China's Environmental Protection Law (for trial implementation) and China's Forestry Law (for trial implementation). Later, the state also promulgated the Regulations for the Protection of Aquatic Resources of the People's Republic of China, the Standards of Water Quality for Farmland Irrigation, the Standards of Water Quality for Fisheries and the Standards for Safety in the Use of Insecticides. The enforcement of these laws and standards is an important indication that China has made new headway in environmental protection.

The Environmental Protection Law, being the basic law of environmental protection, proceeds from the actual conditions of the country. The purpose of the law is to enforce the rational use of the natural environment, the control of environmental pollution and the prevention of damage to ecosystems in the course of building a socialist modernized country. The law aims to create a clean, healthy and pleasant environment in which the people can live, work and carry out economic development.

The scope of the environment to be protected is specified in the Environmental Protection Law: the air, water, land, mineral resources, forests, grassland, wildlife, wild plants, aquatic plants and animals, historic sites, scenic spots for tourists, hot springs, nature reserves, residential districts and so forth. The chapter on the natural environment deals with soil, water and aquatic flora and fauna, mineral resources, forests, grassland and the resources of wild life and wild plants. The chapter on the prevention and elimination of pollution and other hazards to the public specifies nine kinds of pollutants to be dealt with: waste gas, waste water, residues, dust, garbage, radioactive material, noise, vibration and bad odours.

In 1980, the people's congresses and people's governments of the provinces, municipalities and autonomous regions adopted a number of regulations for the enforcement of the Environmental Protection Law.

Economic Measures. In the last few years, China has begun to use economic measures in environmental management. The principal measures adopted are:

(1) *The inclusion of investments for environmental protection purposes in the state's capital construction plan.* Such investments ensure that enterprises under construction adhere to specifications for environmental protection and supplement efforts to control pollution in existing enterprises. In 1980, supplementary investments amounted to 107,680,000 yuan, accounting for 0.2% of the total investments in capital construction.

In order to control pollution, a number of important industrial departments have set aside funds for environmental protection in their capital construction plans and plans for technical innovation. According to incomplete statistics of eight departments — including those of the metallurgical, chemical and petroleum industries — a total of 489,710,000 yuan was spent on technological transformation and on the construction or installation of devices to reduce the discharge of pollutants and to dispose safely of industrial wastes.

(2) *The adoption of economic penalties.* The Environmental Protection Law stipulates: "In cases where release of pollutants goes beyond the limits of the specified national standards, a fee shall be charged according to the quantities and concentrations of the pollutants, as specified."

In 1980, the Standing Committees of the people's congresses of Shanxi, Heilongjiang, Liaoning, Shandong, Jiangsu, Yunnan and Guizhou provinces, and the people's governments of Hebei, Zhejiang, Anhui, Hubei, Sichuan, Gansu, Xinjiang and Shanghai formulated relevant regulations and measures and charged fees to 8,700 enterprises for the discharge of pollutants. The fees thus charged are generally a little higher than the expenses needed for the proper disposal of pollutants, and the fees were included in the enterprises' production costs and paid out of the profits at their disposal. Out of consideration of their own economic benefits, the enterprises have shown interest in protecting the environment, thereby facilitating the control of pollution.

(3) *The adoption of economic incentives.*

The production of pollutants by industrial enterprises is tantamount to a waste of resources and energy. Therefore, the state encourages the multi-purpose utilization of resources and energy. It is stipulated in the Environmental Protection Law that "the state will grant tax reductions or exemptions on, and apply a preferential pricing policy to products manufactured by using waste gas, waste water and waste residues as main material, and the profits thus derived need not be turned over to the state but will be used by the manufacturers concerned to control pollution and improve the environment." To implement this stipulation, the Ministry of Finance and the Environmental Protection Leading Group of the State Council have worked out specific measures. In 1979, enterprises were allowed a total of 81,000,000 yuan out of their profits for use in developing their capacity for utilizing waste water, gas and residues and the elimination of pollution. In 1980, multi-purpose utilization and utilization through recovery of waste materials registered considerable success. The various light industrial enterprises in Shanghai alone recovered 17.5 kg. of platinum, 280 kg. of gold, 34,450 kg. of silver and 28.89 kg. of palladium from waste water and residues.

Administrative Measures. The principal administrative measures that China has adopted for environmental management are as follows:

(1) *Urban planning.* In 1979, Shenyang and Suzhou worked out urban environmental plans. Their example was followed in 1980 by such large cities as Beijing, Tianjin, Shanghai, Guilin, Guangzhou, Lanzhou, Wuhan, Baotou, Changchun, Luoyang and Qingdao.

The principal measures taken by Shenyang in designing its urban environment were:

- The building of a plant with a gas-producing capacity of 540,000 cu. m. to increase the percentage of gas-using homes from 44% to 92%. Construction of the plant began in 1980.

- The expansion of facilities to supply central heating. Work has started on enlarging the heat-supplying equipment of the Tiexi Power Plant, to replace the large number of small boilers in the city's industrial section, and also supply heat for the central heating system of a number of the workers' homes.

- The use of waste hot water from power plants for domestic heating purposes. In 1980, waste heat was used for central heating in houses with a total floor space of 800,000 sq. m.

(2) *Strengthening environmental management of capital construction projects.* With regard to new construction, reconstruction and extension

projects, the state requires that measures for environmental protection shall be designed, built and put into operation at the same time as the main project, so as to control new sources of pollution. In 1980, the State Planning Commission, the State Capital Construction Commission, the State Economic Commission and the Environmental Protection Leading Group of the State Council jointly issued a circular requiring that all enterprises contemplating a large or medium-sized capital construction project compile a report on the potential environmental effects. In 1980, 53% of all capital construction projects fulfilled the above requirement, whereas only 39% did so in 1979.

(3) *Setting a time limit for enterprises with serious pollution problems to control the pollution.* In October 1978, the State Planning Commission, the State Economic Commission and the Environmental Protection Leading Group of the State Council ruled that 261 sources of pollution in 167 industrial and mining enterprises would have to be completely controlled before 1982. Later the number of pollution sources was changed to 267 and the number of enterprises affected to 164. By the end of 1980, 143 or 53.5% of the pollution sources had been put under control.

Environmental Science Research

There are about 6,000 people engaged in environmental science research in China. Specialized research organizations at the provincial or ministerial level include: The Chinese Research Academy of Environmental Sciences, the Institute of Environmental Chemistry of the Chinese Academy of Sciences, the institutes of environmental protection of 27 provinces, municipalities and autonomous regions, and 7 institutes of environmental protection of the ministries of chemical, metallurgical and light industries. In 1979 the Chinese Society of Environmental Science was set up.

China has made great headway in environmental science research.

In the study of environmental social science research has begun on the level of fees to be charged when the discharge of pollutants exceeds the limits specified by the government, and on the basic theory and policies of the environmental management system, environmental economics, environmental law and the science of environmental management.

In the study of environmental quality, pollution surveys and environmental quality assessments have been made for many bodies of water such as the Guanting River system, certain sections

of the Huanghe River and of the Changjiang River, the Second Songhua River, the Jiyun, Xiangjiang and Lijiang Rivers, Taihu Lake, the Yellow and Bohai seas, Hangzhou Bay and the mouth of the Zhujiang River. Surveys and assessments have also been made for cities such as Beijing (western and southeastern suburbs), Shenyang, Lanzhou, Nanjing, Panzhuhua, Xi'an and Maoming. In some cases, charts of environmental quality have been drawn. Investigations and studies have been made of the pollution sources of over 3,000 large and medium-sized enterprises as well as of nearly 10,000 small ones. In some areas, files of pollution sources have been established. Research has been conducted on samples of ice, snow, soil and on animals and plants of the Changbai Mountains and Mount Qomolangma, and on the soil background values of certain cities and districts. Progress has been made in the study of the index system of environmental quality assessment, and of the modes of transformation and transport of pollutants.

In addition, Chinese environmentalists have advanced new concepts, such as "pollution degree," "pollution fields" and "ecological factors" — which have helped them formulate theories and methods of conducting environmental quality assessment under the conditions particular to China.

In the study of pollution control techniques, a tremendous amount of research on the treatment of various kinds of sewage has been carried out in combination with research on production technology. Achievements have been made in the treatment and purification of waste water containing alkali-chlorine and heavy metals; of waste water from electroplating, petroleum-refining, leather-processing, charring and film developing; and on the disposal of organic sewage and sewage with high acid content.

In the field of air pollution control, dust-collecting equipment such as scrubbers with Venturi high-voltage wide-spaced electrostatic precipitators and scrubbers with water film inclined pipes have been successfully produced, and research has been made on the recovery of high-density sulphur dioxide. Progress has also been made in the multi-purpose utilization of industrial waste residues, such as pulverized coal ash, red mud from aluminium plants, gangue and steel slag.

In the fields of environmental chemistry, environmental biology, environmental medicine and environmental acoustics, studies have been conducted on the laws of degradation and transformation of such pollutants as heavy metals, pesticides, phenol and cyanogen in soil and bodies of water; on the ecological effects of such pollutants on farmland and on water; and on the laws of their

accumulation and metabolism in plants and animals. Attempts have been made to study the harmful mechanism of trichloro-acetaldehyde on wheat and the degradation mechanism of pesticides by symbiotic algal bacteria, as well as the effects of microbial activity on the speed at which sediment in bodies of water release methyl mercury. All these studies have provided useful data for the elimination of pesticide contamination and the control of mercury contamination in water. Through experiments, a number of plants that are resistant or sensitive to SO_2 , HF or Cl_2 have been screened. Colour plates of symptoms of affected plants have been compiled.

In the study of the effects of environmental pollution on people's health, epidemiological surveys of and research on the rapid screening of carcinogenic contaminants have been made. Investigations have been conducted in 22 cities and in Xuanwei Prefecture, Yunnan Province, into the interrelationship between air pollution and lung cancer. Research on the effects of heavy metal pollution of the Bohai and Yellow seas on human health, the effects of mercury pollution of the Songhua River on the health of fishermen, and the effects of minute quantities of organo-chlorine in drinking water on human health. The double-region theory of carcinogenic activity of polycyclic aromatic hydrocarbons has been advanced.

In the study of the elements of life and health, research has been conducted with positive results into the causes of Keshan and Kaschin-Beck diseases.

In the field of noise control, surveys of transport noise have been made in Beijing and Tianjin and other large cities. China has set environmental noise standards and testing norms, and industrial noise standards. Research has also begun into sound absorption, sound insulation, sound resistance and vibration absorption, as well as into the control of air flow noise.

Environmental Monitoring

Environmental monitoring is the basis of environmental management and research and provides important data for the formulation of policies, laws and regulations on environmental protection.

Since the founding of the People's Republic, we have steadily carried out monitoring work with regard to public health, weather, surface water and ground water. After the First National Environmental Protection Conference was held in 1973, work on environmental monitoring began; it has developed considerably in the last two years. By the end of 1980, there were 312 environmental

monitoring stations throughout the country, with a total staff of 5,200. If the environmental science research institutes and their staff were included, the total would come to 354 units and 6,800 persons. Specialized monitoring units have also been set up in departments of industry, communications, public health, agriculture and forestry, water conservation, foreign trade, commerce, fishing, oceanography and meteorology, as well as in many large and medium-sized enterprises. In some areas, environmental monitoring networks are taking shape.

In accordance with the provision laid down in the Environmental Protection Law that environmental protection organizations at all levels should "organize environmental monitoring in a unified way," the Office of the Environmental Protection Leading Group of the State Council saw to it that standard monitoring methods were used by the various monitoring organizations, and that the organizations were supplied with standard monitoring instruments, equipment, reference materials and reagents. This office also supervised the drafting of the "Method of Analysis of Environmental Monitoring Standards." In addition, it made preparations for the establishment of a general environmental monitoring station for the nation, while equipping 64 provincial stations and stations of provincial capitals and other key cities.

Up-to-date technology, such as remote sensing and telemetering, laser techniques and electron-activated techniques, has been applied, though on a limited scale. Automatic atmospheric pollution monitoring vehicles and water quality pollution monitoring boats have been manufactured and put to use on a trial basis. The monitoring of air and water quality, noise and the discharge of industrial waste water, waste gas and waste residues has been strengthened to varying degrees.

To further improve environmental monitoring work, a national conference was held in December 1980. At the conference, the orientation, tasks and aims of monitoring work were clarified. The regulations on environmental monitoring work throughout the country and detailed rules for their implementation were revised. The conference decided that the system of filing environmental quality reports would begin in 1981, first in 38 provinces and cities — with Liaoning Province and Chongqing as the pioneers who would set the example for the whole country.

Education and Publicity Concerning the Environment

Education on environmental issues is of strategic importance for environmental protection. At

present, such education takes the form of school education, social education and the training of in-office cadres.

The aim of education on environmental issues in schools is to train specialists and popularize environmental knowledge among children and young people. Experiments were conducted in 1980 in some kindergartens and primary schools. Teaching materials on environmental issues have been compiled for middle schools, to be tried out in the key cities. In the whole country, 21 institutes of higher learning have started 25 departments and selective sections in environmental studies to train personnel for environmental management, research and monitoring. In Changsha and Guangzhou, two secondary technical schools specializing in environmental protection have been set up. The state has also sent a number of scientific and technical personnel abroad for advanced study in the field.

The purpose of educating the society at large about environmental issues is to help the Chinese people realize the importance of environmental protection, to popularize knowledge and techniques of environmental protection, so as to cultivate an awareness among the citizens of their responsibility to protect the environment.

Of crucial importance is the training of the personnel of environmental protection departments and the large number of cadres transferred only recently from other posts to become administrative personnel in environment protection. At the present time, this is the focus of our efforts in education about environmental issues. In 1979 and 1980, the Office of the Environmental Protection Leading Group conducted four study courses to train 635 environmental protection cadres for local people's governments, ministries under the State Council and key enterprises. It also conducted three courses on prediction assessment of air quality and other subjects attended by 294 people. In addition, 21 provinces, municipalities and autonomous regions, 11 ministries under the State Council and the Office of Environmental Protection of the People's Liberation Army have in recent years run a total of 202 training courses for 9,067 technical personnel on water quality analysis, air monitoring, urban noise monitoring, environmental statistics, assessment of environmental quality, sewage disposal, new technology electroplating, and smoke prevention and dust control for industrial furnaces. At present, the Office of Environmental Protection Leading Group of the State Council is preparing to establish an environmental protection cadre school in Qinhuangdao, Hebei Province.

Since environmental protection is a new undertaking, it is essential to publicize its impor-

tance and popularize general knowledge about environmental science. In March 1980, a month-long campaign to publicize environmental protection was launched throughout the country. Remarkable results were obtained as a result of the concerted efforts of the propaganda department, the press, the departments of industry, transport and communications, public health and environmental protection, the Chinese Science and Technology Association, the trade unions, the Communist Youth League and the women's association. Incomplete statistics show that over 2,000 editorials, commentaries, news reports and articles were published during the month. A dozen or so films, including *Protection of Water Sources*, were shown in various places. Tens of thousands of pamphlets were printed and distributed, and forums on environmental protection were broadcast over the radio. Everywhere, lectures, workshops and forums were held. Shanghai alone reported 3,400 such gatherings, with 890,000 participants. In most provinces, cities and autonomous regions, the leading officials spoke to the masses about the importance of environmental protection. The chairmen of the standing committees of the people's congresses in Shandong and Hubei provinces went to grassroots units to investigate the environmental problems and to explain to the people the importance of pollution control.

Environmental Management Organizations

The Environmental Protection Leading Group of the State Council was set up in 1974. Composed of officials of the relevant ministries and commissions of the State Council, the group is now headed by Gu Mu, who is concurrently Vice-Premier of the State Council. The functions of the group are: (1) to implement and supervise the carrying out of national guidelines, policies, laws and decrees relating to environmental protection; (2) to draft regulations, rules, standards, economic and technical policies relating to environmental protection in conjunction with relevant departments; (3) to draw up long-term programmes and annual plans for the protection of the environment in conjunction with relevant departments, and to supervise their implementation; (4) to make unified plans for organizing the monitoring of the environment, investigate and keep under review the environmental conditions and trends of development throughout the country and recommend improvement measures; (5) to organize and co-ordinate environmental science research and environmental education in conjunction with relevant departments, and actively promote advanced experience and techniques — foreign as well as

domestic — in the field of environmental protection; (6) to direct the environmental protection work of all the departments under the State Council, and of the provinces, autonomous regions and municipalities directly under the central authorities, and; (7) to organize and coordinate international cooperation and exchanges in the field of environmental protection.

The Office of the Environmental Protection Leading Group of the State Council attends to the day-to-day work of the leading group. Directly subordinate to it are the Chinese Academy of Environmental Science, the General Environmental Monitoring Station of China, the China Environmental Science Publishing House, and the Environmental Protection Cadre School. Environmental protection bureaux, offices and subsidiary units have been set up in other relevant departments of the State Council which are in charge of the chemical, metallurgical, petroleum, power, textile and other industries, as well as those in charge of the communications, railways, agriculture, forestry, public health, education, oceanography and national defence industries.

Environmental protection bureaux have been set up under the people's governments of 22 provinces, municipalities and autonomous regions. Environmental protection offices have been set up in the rest of the provinces and autonomous regions. All large and medium-sized cities, most of the prefectures and small cities, and some counties now have environmental protection institutions. The local government departments in charge of enterprises, and the large and medium-sized industrial enterprises generally have offices or personnel in charge of environmental protection.

In the drainage basins of the Changjiang (Yangtze), Huanghe (Yellow), Songhua, Huaihe and Zhujiang rivers, and in the areas of Bohai and Yellow seas, Taihu Lake and Guanting Reservoir there are organizations in charge of the protection of water sources. The local environmental protection organizations are under the direct leadership of the people's governments at the corresponding level, and in professional affairs they accept the guidance of the environmental protection organizations at the higher level. Their main tasks are: (1) to supervise and monitor the implementation of the state's guidelines, policies, laws and decrees relating to environmental protection by the departments and other units in their respective areas; (2) to draft specific environmental protection standards and norms for their areas; (3) to organize environmental monitoring and review the environmental situation and trends of development in their respective areas; (4) to draw up, in conjunction with relevant departments, long-term programmes and annual plans for the protection of

the environment in their areas and to supervise their implementation; (5) to organize, in conjunction with relevant departments, research and educational programmes in environmental science in their areas; and (6) to actively promote advanced experiences and techniques, foreign as well as domestic, in the field of environmental protection.

Environmental Protection and International Cooperation and Exchanges

In the past two years, China has further expanded its international cooperation and exchanges in environmental protection. In 1979, 40 people were sent abroad to attend international environmental protection meetings, engage in academic exchanges or investigate environmental protection practices; and 152 foreigners were invited to China for academic exchanges. China attended a workshop in Stockholm sponsored by the United Nations to discuss resources, environment and population and their interrelationships. It ran a methane training course on behalf of the U.N. Environment Programme and discussed with this body the possibility of cooperating in building a methane training centre and a desert control training centre. Discussions were also held in Beijing between China and the Intercontinental Engineering Company of Canada concerning the techniques of controlling atmospheric pollution.

In 1980, 57 persons were sent abroad and 111 foreigners visited China in connection with environmental protection. China also took part in numerous conferences, such as the conference of specialists on soil protection, called by the U.N. Environment Programme; a conference to discuss the relationship between the wider use of coal and the environment; a conference to compare and assess the effects of different kinds of energy on the environment; an conference on environmental statistics of the Pacific region; the second conference to discuss an agreement concerning the use of motor vehicles; a conference on air quality and water quality techniques; and a conference on the recovery and disposal of waste materials. The Workshop on Environmental Management, jointly sponsored by China and the East-West Centre's Environment and Policy Institute, was held in Beijing. Through these technical exchanges, we acquired a new understanding of the situation of environmental protection in other parts of the world and foreign achievements in this field.

China also became a signatory to the International Union for the Conservation of Nature and Natural Resources, the Convention on International Trade in Endangered Species of Wild Fauna and Flora, the International Convention for the Re-

gulation of Whaling, and the International Whaling Commission. The Protocol for Scientific and Technical Cooperation in the Field of Environmental Protection was signed by the United States' Environmental Protection Agency and China's Office of the Environmental Protection Leading Group of the State Council. China also signed with the World Wildlife Fund the Protocol for the Establishment of a Research and Conservation Centre for the Giant Panda and an "Action Plan."

III. The Outlook for 1981

In the last two years China has had varying degrees of success in different fields of environmental protection. There are however, quite a few problems. Generally speaking, we have not been able to control the pollution of the environment and the destruction of natural resources. In fact, environmental quality in many places is deteriorating. This is a problem which can only be solved gradually as our national economy develops.

The future of environmental protection in China is bright. Both the party and the government attach great importance to this problem. On February 24, 1981, the State Council issued the "Decision on Strengthening the Work of Environmental Protection During the Period of Readjustment of the National Economy." This is another historic document which will serve as a guide to our future work in environmental protection. This decision attaches new significance to environmental protection, regarding it as a matter of principle and referring to it as a fundamental task in the modernization of the country. It specifies the guiding principles and tasks for environmental protection in the period of the readjustment of the national economy and puts forward a series of policies and measures to that end. This document has provided us with guidance in our work on environmental protection in the forthcoming period.

Readjustment and Environmental Protection. The ongoing readjustment of the national economy has also created many favourable conditions for environmental protection. For example, the various policies and measures adopted in accordance with the economic readjustment (reduction of the scale of capital construction; inclusion of all capital construction projects in the state plan; strict observance of the procedures for capital construction; consolidation, reorganization and amalgamation of industrial enterprises; conservation of energy resources; tapping the potential of productive resources; reforms and renovations in older enterprises; improvement of city planning,

and filling in the gaps in municipal construction) have all benefited to no small degree the work of environmental protection. If environmental protection is carried out in coordination with the various tasks of economic readjustment, both the economy and the environment stand to benefit.

Indeed, the State Council has pointed out explicitly in the above-mentioned decision: "The state shall give better planned guidance to environmental protection" and gradually "work out plans for improving, developing and utilizing the land of the country." Leading comrades of the State Council in charge of such work have repeatedly stressed that land use, planning and city planning are actually environmental planning. China has a total area of 9,600,000 sq. km. Such a huge area cannot be managed well without a unified plan and unified control. A fundamental plan for environmental protection is also needed in the cities. We must stop the indiscriminate development of cities, undertake city planning, study population control and urban development policies, rationalize the distribution of industries and enforce pollution control. In order to do good job of protecting the general environment, we must consider the orientation and tasks of environmental protection in a socialist country from a macroscopic point of view. This will help to define more clearly the future prospects of our work.

We expect that in 1981 environmental control

in China will see further progress. We shall promulgate a whole series of laws and regulations concerning environmental control for nationwide and local application. We shall work out the necessary technical and economic policies that will benefit socialist construction as well as environmental protection. We shall try to solve a number of outstanding environmental problems in a planned and systematic fashion and in accordance with the resources at our disposal during the period of readjustment, so that the environmental quality of key cities and regions will be further improved. We shall attach even greater importance to the work of recycling waste water, waste gas and waste residues into useful resources, improve production techniques, carry out multi-purpose utilization of materials, and recover harmful substances and turn them into useful materials.

From a macroscopic point of view, we shall continue to study ways of improving the lands and land use throughout the country, the relationship between the consumption of natural resources and the renewal and supply of such resources and the relationship between exploitation of resources and ecological balance. We shall improve overall planning and work hard to create a decent environment for living and for the development of our industry, agriculture, forestry, animal husbandry, fishing and other occupations.

and filling in the gaps in municipal construction) have all benefited to no small degree the work of environmental protection. If environmental protection is carried out in coordination with the various tasks of economic readjustment, both the economy and the environment stand to benefit.

Indeed, the State Council has pointed out explicitly in the above-mentioned decision: "The state shall give better planned guidance to environmental protection" and gradually "work out plans for improving, developing and utilizing the land of the country." Leading comrades of the State Council in charge of such work have repeatedly stressed that land use, planning and city planning are actually environmental planning. China has a total area of 9,600,000 sq. km. Such a huge area cannot be managed well without a unified plan and unified control. A fundamental plan for environmental protection is also needed in the cities. We must stop the indiscriminate development of cities, undertake city planning, study population control and urban development policies, rationalize the distribution of industries and enforce pollution control. In order to do good job of protecting the general environment, we must consider the orientation and tasks of environmental protection in a socialist country from a macroscopic point of view. This will help to define more clearly the future prospects of our work.

We expect that in 1981 environmental control

in China will see further progress. We shall promulgate a whole series of laws and regulations concerning environmental control for nationwide and local application. We shall work out the necessary technical and economic policies that will benefit socialist construction as well as environmental protection. We shall try to solve a number of outstanding environmental problems in a planned and systematic fashion and in accordance with the resources at our disposal during the period of readjustment, so that the environmental quality of key cities and regions will be further improved. We shall attach even greater importance to the work of recycling waste water, waste gas and waste residues into useful resources, improve production techniques, carry out multi-purpose utilization of materials, and recover harmful substances and turn them into useful materials.

From a macroscopic point of view, we shall continue to study ways of improving the lands and land use throughout the country, the relationship between the consumption of natural resources and the renewal and supply of such resources and the relationship between exploitation of resources and ecological balance. We shall improve overall planning and work hard to create a decent environment for living and for the development of our industry, agriculture, forestry, animal husbandry, fishing and other occupations.

58. ECONOMIC DEVELOPMENT IN ANHUI PROVINCE

By the Economic Research Institute,
Anhui Provincial Planning Commission

Geography and Population

Anhui Province lies in the southeastern part of China, extending across the middle and lower reaches of the Changjiang and Huaihe rivers. It covers an area of 139,000 sq. km. and has a population of 48,920,000 (urban inhabitants, 6,631,000; peasantry, 42,290,000). The province has 66,690,000 *mu* of cultivated land; 18,000,000 *mu* of water surface and 53,660,000 *mu* of forest land. It is rich in mineral resources. Over 40 types of mineral deposits have been verified, including coal, iron, copper, manganese, molybdenum, lead, zinc, pyrite, iron, phosphorus, alunite, gypsum, limestone and halite. Reserves of coal, iron, copper, alunite and pyrite have national significance. Anhui's climate and abundant rainfall are suitable for a variety of crops. Rice and wheat are chief among the grain crops, followed by beans, corn, sorghum and sweet potatoes. Principal industrial crops are cotton, tobacco, peanuts, rapeseed, tea, jute, ambary and silkworm cocoons.

Pre-Liberation Economy

Before Liberation, owing to the exploitation of the labouring people by the reactionary ruling class and to plunder by the imperialists, the economy in Anhui had long been stagnant. Irrigation and water conservancy facilities were in long disrepair, resulting in frequent floods and droughts. There was a folk saying along the banks of Huaihe: "We have famines nine out of ten years." In times of famine, people fled their villages and went begging, leaving farm lands unattended. The level of agriculture was very low. In 1949, the total value of agricultural output was only 1,728 million yuan; grain output was 12,784 million catties; cotton, 34,700,000 catties; and oil-bearing crops, 2,986,000 catties. Anhui's industrial foundation was also extremely backward. No heavy industry existed except for the Huainan Coal Mine run by the comprador-bourgeoisie. There were only about 60 small fragmentary mines and mills and a few industrial handicrafts shops. The total value of industrial output in 1949 was only 340 million yuan. Transport and communications were undeveloped, with only 719 km. of railway lines and 2,088 km. of highways. Science, education, culture and

public health were also in a backward state. In 1949, the ratio of university undergraduates per 10,000 population was 0.4; middle school students, 11; and primary school pupils, 238. The ratio of medical workers was even less, averaging only 0.1 per each 10,000.

After Liberation, under the leadership of the Communist Party of China and the government, the people of Anhui, having finished the task left over by democratic revolution, embarked on socialist economic construction in a planned and systematic way. Because of the hard work and arduous struggle of people throughout the province, great achievements have been made in socialist construction. Since the Third Plenary Session of the 11th Central Committee of the Party, all fields of work have been moving forward along the right track as a result of following the correct line, general and specific policies, and the policy of readjusting, restructuring, consolidating and improving the national economy.

Agriculture

Agriculture in Anhui Province occupies an important position in China. Both the party and the government attach great importance to agriculture. Since Liberation, the state has invested 4,430 million yuan in farmland improvement and water conservation work in Anhui.

Some 390 rivers, extending over a total of 8,200 km., have been harnessed; 4,089 reservoirs have been built with a combined storage capacity of 22,500 million cu.m. Among these are ten large reservoirs with a storage capacity of over 100 million cu.m. each, including Fuziling, Meishan, Xianghongdian, Mozitan, Chencun, and Hualiangting. The large Pishihang Irrigation Project has been completed, and some new man-made rivers excavated, such as Ci Huai, and Xin Bian. Within the province, effectively irrigated area amounts to 36,570,000 *mu*, of which 22,750,000 *mu* can ensure stable yields despite drought or waterlogging, an increase of 3 and 14.8 times, respectively, over post-Liberation conditions. Agricultural machinery has increased gradually. By 1980, there were over 17,000 tractors, 116,000 walking tractors and 4,287 trucks. Power-driven irrigation and drainage machinery total 4,980,000 aggregate hp. Mechanized farm machinery aggre-

gates 9,038,000 hp. while the areas now ploughed by tractor amounts to 29.4% of all cultivated land. The amount of chemical fertilizer applied averages 73.66 catties per *mu*. Power consumption in agriculture totals 1,060 million kwh. The adoption of a series of correct policies for agriculture by the party and the government and the gradual improvement of production conditions have boosted agricultural production. Over the 31 years since Liberation, the total value of agricultural output has increased 2.43 times at comparable prices, or at an average annual rate of 2.9%; grain output has increased by 2.3 times; cotton 7 times; and oil-bearing crops, 3.3 times. The number of hogs and the output of other industrial crops have all multiplied substantially.

Agricultural Output in 1980. In 1980, further implementation of the party's economic policies for agriculture along with the strengthening and perfecting of all kinds of systems of responsibility in production have mobilized the enthusiasm of cadres and commune members for increasing production. As a result, good harvests were achieved despite severe flooding. Industrial crops, forestry, animal husbandry, sideline production and fisheries all registered increases, with grain the only exception. The output of grain was 29,078 million catties, down 9.7% from the previous year; cotton output was 244 million catties, an increase of 25.4%; oil-bearing crops, 996 million catties, an increase of 11.53%; tobacco, 48.3 million catties, an increase of 13%; silkworm cocoons, 8.98 million catties, an increase of 22.3%; jute and ambar, 326.2 million catties, an increase of 5.4%; and tea, 64 million catties, an increase of 6.8%.

The total output value of forestry, animal husbandry, sideline production and fisheries increased by 8.3%, and their combined percentage in the total output value of agriculture increased from 23.4% in 1979 to 25.2% in 1980. Afforested area totalled 1,560,000 *mu*, an increase of 34%. By the end of 1980, draught animals numbered 2,915,100 head, having increased by 10.2%; the total output of pork, beef and mutton was up to 518,000 tons, an increase of 1.76%. Aquatic products amounted to 72,800 tons, increasing by 30.5%.

In Chuxian Prefecture, where the system of responsibility in agricultural production had earlier been put into effect, output of grain and oil-bearing crops registered greater increases than in other prefectures. Chuxian's grain output increased by 13.6% over 1979, averaging more than 1,000 catties per person. The output of oil-bearing crops increased by 52.9% over 1979. A good example is offered by Fengyang County, one of the poorest counties in China. In 1980, 10.5% of

the peasant households in this county produced 10,000 catties of grain each.

Industry

Since the founding of the People's Republic, great changes have taken place in industry in Anhui Province. Today, sizeable industries have been set up, including coal mining, electricity, metallurgy, chemicals, machine-building, electronics, building materials, forestry, food, textiles and paper-making. There are 140,000 industrial enterprises with a total work force of 1,418,000. Among these units, 2,795 were owned by the whole people with fixed assets of 9,140 million yuan and 959,000 workers and staff. Over 12,000 were enterprises under collective ownership, having 459,000 workers and staff. The province has 97 large and medium-sized industrial enterprises. Their output value accounted for 35.2% of the province's total growth rate. Over the past 31 years, the total value of industrial output in Anhui increased 35.9 times, with an average growth of 12.2% per year.

Readjustment in 1980. In line with the policy of readjusting, restructuring, consolidating and improving the economy, some essential measures were adopted for the development of industry in Anhui in 1980: 1. Priority was given to light industry and textiles for the supply of fuel, power, local materials, funds and imported raw materials. The sum of capital construction investment, technical development funds and other loans spent on these industries increased by 40% over the year before. 2. Work began to reform the economic system, and the regulatory rule of the market was brought into play under the guidance of national planning. The number of enterprises given greater decision-making power on an experimental basis increased from 87 to 174. 3. Resolute support was given to the development of the collective economy, and new avenues of production were tapped. 4. Some beneficial attempts were made to give free rein to superiority, protection of competition, and promotion of integration. As a result, in spite of critically inadequate investments in the machinery industry, total industrial output value still reached 12,170 million yuan, increasing by 6.9% over 1979. Of this total, light industry grew by 16.6%, exceeding the rate of heavy industry. The proportion of light industry within the entire industrial sector rose from 47.9% in 1979 to 52.2%. Plans for the production of over 40 main industrial products such as steel, rolled steel, pig iron, coal, timber, cement, plate glass, synthetic ammonia, chemical fertilizers, chemical

fibres, cotton yarn and cotton cloth, were fulfilled or overfulfilled. Products such as watches, bicycles, radios, TV sets and sewing machines all increased greatly, by 2.1, 3.3, 3, 2.5 times and 66.4% over the previous year, respectively. Textiles and light industries also strove to improve quality and increase their variety of patterns and designs. According to incomplete statistics, 2,300 new patterns and designs were brought out, and 110 products were designated as "High-Quality Product" either by the province or the ministry.

Transport, Posts and Telecommunications

Progress was also made in transport, posts and telecommunications. Railway lines were completed, linking Wuhu and Tongling, Qinglongshan and Fuyang; and the lines between Wuhu and Jingdezhen in Jiangxi, Fuyang and Huainan were under construction. Anhui's rail lines open to traffic totalled 1,501.2 km. (including 320.4 km. of double track), 110% the length during the early post-Liberation period. In 1980, the volume of passenger traffic reached 4 million passenger-km; freight volume was 18,145.3 million ton-km., increases of 16% and 2%, respectively, over the previous year. Highway mileage reached 24,262 km., an increase of 11.6 times over that during the years immediately after Liberation. Civilian vehicles numbered 50,000 in 1980, of which 7,030 were in the possession of the transport departments, an increase of 17.8 times over the early post-Liberation period. In 1980, the volume of passenger traffic and highway freight reached 3,850 million passenger-km. and 1,090 million ton-km., respectively, increasing by 19.2% and 5.5% over the preceding year. Transportation capacity of inland rivers such as the Changjiang River also increased. Civil aviation has grown up from nothing. Airports have been built in Hefei, Anqing, Tunxi and Fuyang. Regular air services connecting Hefei to Beijing, Shanghai, Jinan and Wuhan have been opened.

Postal and telecommunication services have made considerable progress, and the total length of postal routes has increased by 5.3 times; long-distance telephone calls, by 9.5 times; telegraphic services, 3.2 times; and the capacity of telephone exchanges within cities, by 32.7 times. The output value of postal and telecommunication services amounted to 38,498,000 yuan in 1980, an increase of 14.7 times over 1950 and 5.1% over 1979; in 1980, mail service output increased by 8.07% and telegraphic services by 5.6%.

Capital Construction

Large-scale capital construction has been

undertaken throughout the province with the aim of putting an end to the backwardness of Anhui's economy, scientific endeavours, education, culture and public health services. From 1952 to 1980, cumulative funds in this sector amounted to 18,789 million yuan, of which productive construction accounted for 84.6% and non-productive construction for 15.4%. Newly increased fixed assets amounted to 12,419 million yuan; the rate of utilization was 66%. In 1980, Anhui's total investments were 1,456 million yuan, a 5.5% increase over 1979. Of this, investment within the state budget was 840 million yuan, dropping by 27.1% compared with the previous year. Funds raised by the province reached 290 million yuan, increasing by 34.9%. Domestic loans for investment purposes exceeded 100 million yuan. In 1980, newly increased fixed assets amounted to 870 million yuan.

Great gains have been made in readjusting investments in capital construction and in accelerating the construction of major projects. Compared with 1979, the amount of investment fulfilled in heavy industry increased by 1% in 1980; light industry, 62%; coal industry, 13%; power industry, 22.5%; building-materials industry, 27.9%; and housing, culture, public health and urban construction, 10.7% (of which the investment in housing increased by 17%, with 1,820,000 sq.m. of floor space completed; and the investment in the construction of college buildings grew by more than 100%, with 152,000 sq.m. completed. More than 20 major projects were basically completed). Conversely, 41 projects were halted or postponed, saving investments of more than 250 million yuan. By the end of 1980, 594 individual engineering projects had been halted or postponed, cutting investments by 86 million yuan.

Domestic and Foreign Commerce and Tourism

With the growth achieved in industry and agriculture, the purchase and sales of commodities have increased steadily and the ranks of workers in commercial departments have been expanded. By 1980, the total volume of retail sales had increased by 16.2 times over 1949. Purchases of domestic commodities increased by 16 times over 1952, and sales by 19.1 times. During the 30-year period from 1949 to 1979, the profits of state-owned commerce turned over to the state amounted to 3,450 million yuan, and taxes from these sources totalled 1,470 million yuan. In 1980, as a result of initial reforms in the management system, along with the institution of multiple channels of distri-

bution and multiple forms of operation, the combined volume of commodity buying and selling registered remarkable increases. Net purchases of domestic merchandise amounted to 6,990 million yuan, increasing by 8.9%. Of this total, industrial products came to 3,770 million yuan, increasing by 8.9%; and agricultural products to 3,180 million yuan, increasing by 9%. Retail sales amounted to 7,530 million yuan, an increase of 15.2%. Net sales volume of major consumer items all increased to varying degrees: pigs and pork, 0.6%; sugar, 19.3%; synthetic and polyester/cotton cloth, by 38.7% and 34.8%, respectively; knitted underwear, 30%; bicycles, 9%; sewing machines, 17.7%; watches, 35.7%; and TV sets, 65.2%. By the end of 1980, the total value of goods in stock amounted to 4,560 million yuan, a 2.4% increase over one year before. In 1980, the index of retail prices went up by 3.4% over 1979. The index of list prices in state-run commerce rose by 3.6%, that of negotiated prices in state-run commerce by 12.4%, and that of prices in country markets by 0.2%.

Foreign Trade Activity. In recent years, foreign trade in Anhui Province has increased greatly. In 1978, the total foreign-trade purchases had increased by 16.4% over 1977; and in 1979, by 32.1% over 1978. In 1980, these purchases amounted to 710 million yuan, an all-time high and representing an increase of 96 times over 1950 and 12.1% over 1979. Direct exports and imports both grew considerably. In 1980, the volume of direct exports was U.S.\$39 million, an increase of 42.4% over 1979. The categories of such exports increased to 57 and included items such as frozen pork, fresh eggs, aquatic products, pears, candied dates, cans, rabbit hair, feathers and feather products, goat skins, fur pelts, tung slabs, calcium, citric acid, coal, cement, towels, writing paper, thermoses and chinaware for everyday use. Good sales were made to Hong Kong, Macao, Japan, the Soviet Union, the United States, Federal Republic of Germany, Italy, France and Spain. At the same time, direct imports were tried and contracts signed with 74 firms in 16 countries or regions. Anhui imported 65 categories of goods, chiefly raw materials to supply chemical, textiles and other light industries. In 1980, a commercial port was opened at Wuhu, thus creating favourable conditions for the further development of foreign trade.

The tourist trade underwent even greater development: Three cities — Hefei, Wuhu and Ma'anshan, and two scenic spots — Huangshan Mountain and Jiuhuashan Mountain, were opened to foreign visitors. In 1980, Chinese compatriots from Hong Kong and Macao, overseas Chinese, and foreign guests coming to Anhui on tour or on

business together totalled more than 15,000, an increase of 56.3% over 1979. Income from the tourist trade increased by 267% over 1979. Overseas Chinese and compatriots from Hong Kong and Macao also made contributions to the construction of their home towns.

Science, Education, Culture and Public Health

Since the founding of the People's Republic, great achievements have been made in science, education, culture and health services. At present, there are 91 independent research organizations in natural science with a staff of 5,839, of which 2,578 are professional researchers. There are 79 non-independent research institutes in the natural sciences with a staff of 1,456, of which 770 are professionals. The number of universities and colleges has increased from 2 to 21; technical secondary schools, from 24 to 105; middle schools, from 143 to 4,420; primary schools, from 12,000 to 45,000. Compared with 1949, the number of students attending these four categories of schools increased by 35.8, 8.5, 81 and 12 times, respectively. Anhui now has more than 20 opera companies, 137 performing arts troupes and ensembles, 123 cinemas, 108 theatres and over 1,800 cultural centres. In 1980, 110 million books in 399 titles were published.

Health services in both Anhui's cities and rural areas have improved, with hospitals and health centres now totalling more than 6,600. The total number of hospital beds is 86,000, 457 times that in 1949. Medical personnel number 105,000, 338 times more than in 1949. A network of medical services has taken shape. In line with developments in education, health services and cultural establishments, both the physical and cultural level of the people has improved.

Living Standards

Since Liberation, the national and cultural life of the people both in town and country has improved gradually on the basis of increased production. In the first place, employment has increased rapidly. The total number of workers and staff in state-owned units increased by 7.4 times at the end of 1980 over that at the end of 1952. The workforce in units under collective ownership nearly doubled between 1964 and 1980. Due to the opening of new avenues for employment since 1978, 460,000 people have been added to the workforce. Of these, 217,000 received jobs in 1980 alone. As a result of increasing employment

and pay raises, the total wage bill has increased greatly. For the 29 years since 1952, the total wage outlay for workers and staff in state-owned units has increased by 19 times. The wage bill for 1980 reached 2,267 million yuan, increasing by 21% over 1979. The annual wage per worker increased from 598 yuan in 1979 to 684 yuan in 1980, a rise of 14.38%. The average wage per year of a worker in state-owned units was 739 yuan, an increase of 15.4%; and that of workers in urban collective units was 541 yuan, an increase of 11.7%. All this resulted from increased payments for 40% of workers and staff, raises in wage scales, the institution of rewards in factories and mines, and subsidies for urban workers and staff due to increases in food prices. In order to improve living conditions in the cities and towns, an average annual increase of over 700,000 sq.m. of floor space has been added over the 31 years since the founding of New China. Even greater improvements were achieved during the last three years, with the addition of 1,600,000 sq.m.

Living Standards in Rural Areas. Peasants' lives have improved significantly thanks to the abolition of exploitation. In 1980, due to the development of agricultural production and increases in purchasing prices by the state for portions of farm and sideline produce, the income of the overwhelming majority of the peasants increased to varying degrees. According to incomplete statistics, 15 production brigades and 212 production teams had average incomes from their collectives that reached 300 yuan or more per person; there were 8 brigades and over 40 teams whose per capita income, including earnings from domestic sideline production, averaged around 400 yuan.

Problems and Prospects for Future Growth

To sum up, since the founding of New China, economic construction in Anhui Province has been a demonstrated success. However, Anhui has suffered from a poor foundation left over from old China and from the failure to bring into full play the superiority of the socialist system. This was due to the long prevailing influence of "Left" guiding thought in economic construction, and especially to the serious interference and sabotage by Lin Biao and the Gang of Four. As a result, average income per capita in Anhui is below that of the whole country. The main problem is that the national economy continues to be out of balance, a situation that has as yet to be completely rectified. Thus, the overall economic situation remains relatively poor. To be specific, as

over-extended capital construction goes beyond the availability of financial and material resources, the effectiveness of investment declines. With poor management in many enterprises, their production capacity has not yet been put to full use and their economical and technical targets have not attained optimum levels. Losses have been incurred to varying degrees in 17.6% of state-owned enterprises engaged in independent accounting.

In farming, Anhui's ability to offset disasters is still weak and per-unit yields are low. Even more serious has been a continuing inadequacy in adapting methods to local conditions, in developing a diversified economy and in taking full advantage of economic assets. These approaches had long been ignored in the past, and this situation has not totally changed today. Historically, Anhui Province has been a major producer of "Qi Hong" (a variety of black tea) and "Tun Lu" (a variety of green tea), both highly regarded at home and abroad. However, slow development has failed to meet the requirements of domestic and overseas markets. Freshwater fish-breeding has not developed fully despite the fact that Anhui's inland water surface ranks first in China. The output of some industrial crops cannot meet the requirements of local textile and light industries.

An irrational internal structure in industry and blind development in the machine-building industry have led to overproduction of general-purpose machine tools with the result that quite a few enterprises are operating below capacity. On the other hand, the development of textile and light industries has lagged behind the needs of the people. Anhui is self-sufficient in only 70% of the industrial products needed for daily use. Demand greatly exceeds supply. The proportion between the "bone" and the "flesh" is not coordinated. A lot has to be done to improve the people's livelihood and great difficulties have to be overcome to achieve full employment. Therefore, in the future, the principle of readjusting the national economy should be further carried out, and the influence of "Left" ideology completely eliminated. The reform of various management systems to benefit economic readjustment should be continuously implemented so as to tap the potential of existing enterprises. Economic results will be further improved by gradually readjusting the structure of industrial product mix and the organizational structure within enterprises.

At present, the general need is to cut capital construction, increase production, reduce expenses, achieve a balance between revenues and expenditures, stabilize prices and stimulate the market. This means that capital construction should be resolutely curtailed to suit the province's financial, material and energy resources.

Those enterprises which produce in an unplanned way with poor economic results should be shut down, combined with others or shifted to other lines of production. Expenditures should be trimmed to balance the budget, while production output should be increased. Agriculture, textiles and light industries should speed up production so that increases in agricultural and sideline production can gradually catch up to the needs of light industry and so that the development of light

industry can meet increasing demands for consumer goods. Energy, transport, building materials, education, science and technology, culture, hygiene, public health, urban construction, environmental protection and tourism should continuously develop, and the work of family planning must be carried out successfully. All of these steps are certain to raise the living standards of the people both in urban and rural areas.

59. ECONOMIC DEVELOPMENT IN BEIJING

By the Research Office,
Beijing Municipal People's Government

Survey of Economic Development Since 1949

Beijing has made rapid progress in economic construction in the 31 years since the founding of the People's Republic. Remarkable changes are evident in the city's industry, agriculture, domestic and foreign trade, housing construction and public utilities. Today, Beijing is more than the political and cultural centre of China — the city also plays an essential role in China's economy.

The capital of several feudal dynasties, Beijing has always had a strong political and cultural tradition, but its economy has long been relatively backward. In 1949, the city's total industrial output was valued at 170 million yuan; its agricultural output, 130 million yuan; and its volume of retail sales, 280 million yuan. The total value of its export commodities in 1950 was US\$2,420,000. By 1980, however, the total value of industrial output had grown to 23,200 million yuan, a 210-fold increase over 1949; that of agricultural output, 1,390 million yuan, an 8.75-fold increase; that of retail sales, 6,100 million yuan, a 21.7-fold increase; and that of exports, US\$590 million, a 245-fold increase. The volume of construction — including buildings, roads and public utilities such as water supply, sewers, gas, heating, public transport and telecommunications — has increased 10 to 20 times in the past 31 years. Specific examples of the principal aspects of Beijing's economic construction are given below.

Industry. In 1949, only a handful of factories in Beijing employed more than 100 people. At that time, the city's annual production was meagre: approximately 20,000 tons of pig iron, 1,000,000 tons of coal, 30,000 tons of cement, 12 million metres of cotton cloth, 7,000 metres of woollen fabric, 2,000 tons of paper and 150 million kwh. of electricity. Neither steel nor machine tools were made, and consumer articles such as toothpaste, scented soaps and even iron nails had to be brought in from other cities. The industrial work force of Beijing then numbered only 83,000 and the city's total fixed assets were worth just 80 million yuan.

Industry grew rapidly after Liberation. During the First Five-Year Plan period (1953-57), 41 new factories were built and 329 plants were renovated or extended. By 1957, the city's total industrial

output value had increased to 2,140 million yuan.

Industry saw even greater expansion in 1958-60, and by 1960 the total value of industrial output had soared to 9,330 million yuan. The output value dropped to 4,360 million yuan in 1963 as a result of the economic readjustment between 1961 and 1963. But in 1964-65, sound progress was made and the total value of industrial output in 1965 was up to 5,910 million yuan.

By 1970, after the Yanshan Petrochemical Complex went into production and after the expansion of the motor vehicle and internal combustion engine plants, the city's industrial output value totaled 12,920 million yuan. By 1976, it had reached 15,500 million yuan, and at the end of 1979 it was 21,150 million yuan. In the past 31 years, Beijing's industrial output value had grown at an annual rate of 18.8%.

Of the 3,725 industrial enterprises located in Beijing today, 1,098 are state-owned while the other 2,627 (not including those run by production brigades in the suburbs) are collectively owned by those who work in the producing units. Beijing now boasts an industrial work force of 1.35 million people, constituting 43% of the city's working population. The city's fixed assets are now valued at 14,300 million yuan (at their original value).

Production figures for the city's major industrial products in 1980 were as follows: 290 million metres of cotton cloth, 11 million metres of woollen piece goods, 1.52 million watches, 450,000 sewing machines, 58,000 washing machines, 25,000 refrigerators, 50 million garments, 7 million pairs of leather shoes, 55,000 tons of beer, 31,500 tons of candy and confectionery, 280,000 television sets, 1,910,000 transistor radios, 7,000 metal-cutting machines, 28,000 jeeps and light trucks, internal-combustion engines with a total capacity of 3.9 million hp., electric motors with a total capacity of 1.4 million kw., 2.17 million tons of cement, 2,900 million bricks, 240,000 tons of ethylene, 160,000 tons of high-pressure polyethylene, 150,000 tons of synthetic ammonia, 3 million tons of pig iron, 2 million tons of steel, 1.52 million tons of rolled steel, 7.8 million tons of coal, and 10,650 million kwh. of electricity.

Among China's major cities, Beijing ranks second only to Shanghai in industrial output value. Of the products made in Beijing, 37 have won the

state's gold or silver medals for good quality and another 137 have come first in national quality competitions.

Agriculture. At present, there are 6,380,000 *mu* of cultivated land and a rural population of 3,750,000 around Beijing. Beijing's agricultural production, like its industry, was fairly backward in 1949. In that year, the total grain output was 830 million catties, averaging 128 catties per *mu*; the output of vegetables was 210 million catties, averaging 3,000 catties per *mu*. This meant an annual agricultural output value of 58 yuan per capita for the city's rural population.

Since Liberation, enormous efforts have been made by the government to develop agriculture. There has been significant progress in mechanized farming and in the construction of irrigation and drainage facilities. Chemical fertilizers are now applied in quantity, and electricity is available in almost all villages.

Since Liberation, Beijing has constructed 82 water reservoirs of varying size, sunk 37,000 motor-pumped wells for irrigation and built over 6,000 pumping stations. This has increased the area under irrigation from 373,000 *mu* in 1952 to 5,100,000 *mu* in 1980, which constitutes 80% of the total area under cultivation.

In 1952, the farms near Beijing had only seven tractors. By 1957, the number was a mere 299; and existing agricultural machinery had a combined total of 30,000 hp. By 1980, however, there were 7,665 large and medium-sized tractors, 24,912 walking tractors, 4,581 trucks and 535 combines. Together, these machines totalled 3,190,000 hp., representing a 106-fold increase over 1957.

In 1952, a total of 432 tons of chemical fertilizers and 510,000 kwh. of electricity were used for agriculture in Beijing. By 1980, the figures had jumped to 588,000 tons for chemical fertilizers, averaging 184 catties per *mu*, and 76,753 million kwh. for electricity, averaging 120 kwh. per *mu*.

In addition, great headway has been made in soil amelioration, the popularization of better seed strains and improvement of cropping programmes and plant protection. Although the area of cultivated land was reduced in 1980 by 2.5 million *mu* (representing 35% of the total), grain output in that year still reached 3,720 million catties, a 4.5-fold increase over the output of 1949. The average per-*mu* yield in 1980 was 747 catties, or 5.8 times the 1949 figure of 128 catties.

Progress has also been made in vegetable production, forestry, animal husbandry, sideline occupations and fishing. In 1980, the output of vegetables reached 3,519 million catties, almost 17

times that of 1949; output of dried and fresh fruits reached 310 million catties, a 3.5-fold increase over that of 1949; the number of pigs sold to the state was 2.28 million, a 19-fold increase over the 1949 figure; production of milk was 136 million catties, or 18 times the output of 1952; and production of aquatic products totalled 8,074,000 catties, 14 times the figure for 1957. Earnings from commune-run industries and sideline production reached 1,210 million yuan, 3.5 times more than in 1975.

These developments brought the per capita output value for Beijing's rural population in 1980 to 372 yuan, which was 5.4 times that of 1949. Each person received 182 yuan from the collective in 1980, or 3.3 times more than the sum for 1958.

Commerce and Service Trades. There has been a tremendous increase in Beijing's commercial transactions since 1949. The total value of goods purchased by commercial departments in 1949 was 280 million yuan. By 1980, this figure had risen to 12,220 million yuan, representing a 43.6-fold increase. Whereas 85,000 people employed in the retail business in 1949 and the volume of retail sales in that year came to just 280 million yuan, by 1980 the number of people employed in the retail business had increased to 79,000 and the retail sales volume had risen to 6,100 million yuan.

There were similar developments in the catering and repair trades. In 1980, 97,000 persons were working in these trades in the city proper and in the suburbs, whereas in 1949 there were only 28,000.

Foreign trade and tourism have also expanded over the last few years. The amount of foreign currency earned by exporting goods in 1980 was 9.1 times that of 1970. Beijing accommodated 286,000 foreign tourists in 1980.

Architecture and Urban Construction. At the time of Liberation, there were few modern buildings in Beijing. Old and shabby houses could be seen everywhere in the city and suburbs. However, large-scale capital construction has been going on non-stop since then and an average of 2.6 million sq. m. of floor space has been added every year. Floor space in Beijing has expanded four-fold since 1949.

Of the 80 million sq. m. of floor space added since 1949, 37.56 million sq. m. have been used for factories and office buildings, nearly an 8-fold increase over the 1949 figure of 4.77 million sq. m., while 44.35 million sq. m. have been used for residences and service facilities, a three-fold increase over the 1949 figure of 15.78 million sq. m. Large buildings now surround Tian An Men Square and line East and West Chang'an boulevards. Clus-

ters of factories, apartments and embassies have risen in the eastern suburbs, while the western suburbs house many government offices. Universities and colleges are clustered in the northern suburbs. All this construction has changed the appearance of the capital city.

Public utilities in Beijing were extremely scarce and of poor quality in the early years after Liberation. In 1949, there were only 215 km. of paved roads and 86,000 tons of running water available daily. There were only 221 km. of sewage pipes. The city had 14,000 telephones and 164 trams and buses. Gas was unavailable. Only 772 hectares of land were planted with trees and grass.

Great improvements have been made in extending public utilities over the years. By 1980, 1,185 km. of roads had been paved, or 10 times the pre-Liberation mileage, and the daily running water supply had risen to 1.34 million tons, or 15.6 times the amount in 1959. The sewage system had been extended to 1,423 km., 6.4 times the 1949 figure. The city had installed 210,000 telephones, a 14.3-fold increase over 1949. Buses and trolley buses serving the city numbered 3,000, an 18.3-fold increase. A total of 2,693 hectares of land had been planted with trees and grass, 3.5 times the area in 1949. There were 802,000 households using gas for cooking, representing 62.5% of all households in urban Beijing. New apartments had central heating. A 24-km. subway was constructed in 1969, and a ring road with nine flyovers was completed in 1980.

Current Problems and Goals for Future Development

The last 31 years have seen great progress in Beijing's economic construction. However, owing to "Left" mistakes in our economic work, a number of serious problems remain to be solved.

(1) *Imbalance between heavy and light industries.* The tendency over the years has been to build an all-inclusive, self-contained industrial system in Beijing, making it one of the industrial centres of the country. The one-sided emphasis on the development of heavy industry has resulted in a steady decrease in the proportion of light industry. In 1957, the proportion of light industry in Beijing was 58%, but by 1971, it had been reduced to 28%. The result was that heavy industrial products piled up and machines lay idle while the rising demand for consumer goods — food, clothing and other daily necessities — was left unsatisfied.

The water and mineral resources in Beijing are limited. There is no big river nearby and the sea is

far from the city, thus the city lacks the means of water transportation. Large-scale expansion of industry in Beijing has not only aggravated the shortage of water and power supplies and the availability of transportation, but has also adversely affected the environment.

(2) *Uneven development in city construction.* While a great many factories and office buildings have been erected in the past 31 years, construction of housing, public utilities and service establishments has been limited. Living quarters for the residents of Beijing are becoming increasingly crowded. In 1949, the per capita housing space in the city proper was 4.75 sq. m.; in 1972, it was 4.29 sq. m. In the past 31 years, the city's urban population has grown 3.1 times, the number of motor vehicles, 44 times and the number of bicycles, 21 times. However, the total road mileage has increased only 10-fold and the total road surface area only 12-fold. The volume of sewage has increased 29 times, but there has been only a 5.9-fold increase in the total mileage of sewage pipes. The peak demand for tap water on any day is 1.4 million tons, but the actual supply cannot exceed 1.34 million tons. The volume of passenger traffic has increased 81 times, but the number of buses and trolley buses in service has increased only 18 times. All this causes considerable strain on traffic control, public transportation, and water supply and sewage disposal systems. The construction of public facilities such as hospitals, nurseries, sports grounds and parks has also failed to match the growth of the urban population, causing great inconvenience to the residents of the city.

(3) *The inadequate development of agriculture, forestry, animal husbandry, fishing and sideline occupations in the city's rural sectors.* For many years, efforts have been limited to growing grains and vegetables, and there has been insufficient emphasis on other fields of production to ensure an all-round development. Premature transformation of the relations of production in the city's outer suburbs prevented the full exploitation of the production potential. Although mountains account for 62% of the total area of greater Beijing, commercial forests developed very slowly over the years. The output of dried fruits and nuts, including chestnuts and walnuts, was 9,225 tons in 1952. In 1961, the output dropped to 4,435 tons. In 1976 it climbed back, but only to 9,490 tons. The number of draught animals for the years between 1952 and 1979 fluctuated around 300,000, and that of goats and sheep was approximately 500,000 between 1960 and 1979. Peasants in the rural districts have not prospered as rapidly as they should have over the past 31 years.

(4) *Imbalance between sales and service trades and other trades.* In contrast to the enormous expansion of the urban area and the rapid growth of population, the number of stores and service units has decreased. At the time of Liberation, there were 72,000 shops and service units in the city and suburbs for a population of 1.76 million — which means that, on average, each shop catered to 24 customers. In 1957, when the city's population stood at 3.42 million, the number of shops and service units had been reduced to 31,000 — as a result of placing commercial and service units under joint state-private management, many shops and service units became integrated into larger units while others closed down. The ratio of service outlets to customers changed to 1:107. After 1958, quite a number of stores were reorganized into factories. During the "cultural revolution," which began in 1966, a great number of collectively owned and privately owned commercial establishments and service units went out of existence. In 1979, when Beijing's population reached 8,706,000, with 4.41 million living in the city proper, there were only 9,400 stores and service units left, each catering to an average of 469 persons. This inevitably meant poor service for the consumers. At present, food stores, tailor shops, restaurants, hairdressers and repair shops are all badly overburdened.

Recent Improvements. Following the removal of the Gang of Four from power in 1976 and especially after the convening of the Third Plenary Session of the 11th Party Central Committee in 1978, China gradually freed herself from the influence of the "Left" guidelines that had previously controlled her economic construction. Measures were taken to restore order and to right wrongs so that the country could be set on the right track. As the nation's capital, Beijing is China's political, scientific and educational centre as well as the centre of international exchanges. To give full play to these roles, the Secretariat of the Party Central Committee put forward in 1980 a four-point proposal to tackle the problems in city construction. Gratifying changes have taken place in the last two years:

(1) *Priority has been given to the food, textile, household electronic and electrical appliances, printing and other light industries.* Branches of heavy industry which used to manufacture products mainly for their own use are now beginning to serve the textile and light industries. The output value of light industry in 1979 showed a 13.1%

increase over 1978, and another 22.2% increase was registered in 1980. The output value of heavy industry in 1970 increased by a mere 9% and in 1980 by only 4%. In 1980, light industry accounted for 39.5% of the city's overall industrial capacity. Progress has also been made in solving environmental pollution and problems caused by industrial development.

(2) *Priority has been given to construction of housing projects and public facilities.* In 1979 and 1980, the city completed 7.02 million sq. m. of floor space for housing, an amount surpassing the total floor space constructed during the entire 10-year period between 1966 and 1976. In these last two years, 796 million yuan has been spent on the construction of roads, water supply, sewage, gas and thermal power supply systems, and on tree-planting and landscaping projects. This amount was 2.3 times that spent during the period 1966-76.

(3) *Emphasis has been laid on developing forestry, animal husbandry, fishing and sideline production, while grain and vegetable production is still encouraged.* In the last two years, trees have been planted on 600,000 mu of land in the suburbs of Beijing, three times the annual rate of afforestation during the period 1966-76. Today, not only state farms raise pigs and chickens, but peasant families and production teams are also encouraged to do so. In 1980, the supply of pork increased by 15% over 1979 and that of eggs by 8.4%. Sideline production undertaken by rural collectives and individuals has also made great progress in the past two years.

(4) *Commerce and service trades have been emphasized.* New stores and service units have been established and some old ones have been reopened. By giving more support to the collectively owned and individually owned stores and services, organizing village fairs and opening farm-produce markets in the city, the inconveniences formerly experienced by the population have been mitigated to some extent. The number of stores and service units in 1980 increased by 3,600 over 1979 and that of service staff by 32,000. Foreign trade and tourism have also increased substantially.

Continued efforts will be made to implement the party's four-point proposal and the policy of economic readjustment. It is expected that Beijing will undergo great changes in the next 10 to 15 years and become a clean, beautiful and prosperous city.

60. ECONOMIC DEVELOPMENT IN FUJIAN PROVINCE

By the General Office,
Fujian Provincial People's Government

Geography and Population

Location. Fujian Province is located on the southeast coast of China to the north of the island of Taiwan. It is bordered by the province of Zhejiang to the north, Jiangxi to the west, Guangdong to the southeast, the South China Sea to the south and the Taiwan Straits to the east.

Population and Administrative Divisions. The province has a population of 25.18 million. The Han ethnic group makes up 99% of the population, while She, Hui, Miao, Manchu and other ethnic groups account for only 1%. In addition, there are several million Fujianese residing in more than 90 different countries and regions of the world. The province is subdivided into seven prefectures (or secondary administrative units) and two municipalities. These subprovincial areas are again subdivided into 62 counties (including Jinmen to be returned to the embrace of the motherland) and four county-level municipalities. Fuzhou, the capital of the province, is also the centre of politics, economy and culture.

Geographic Characteristics. The province has an area of more than 120,000 sq.km. About 95% of Fujian is mountainous, with one half of it at elevations between 200 and 500 metres. The province is characterised by mountain ridges of steep gradients with a chain of low hills undulating between river valleys and basins. The main mountain ranges are Wuyi, Shanlin, Boping and Daiyun. The major rivers are the Minjiang, Jiulongjiang and Tingjiang.

Climate. The province, facing the sea and with mountains behind, lies just the north of the Tropic of Cancer in the subtropical zone. The climate is temperate and humid. The mean temperature in Fujian is between 17.8 and 21.5°C. The frost-free period within the year lasts from 240 to 330 days. Rainfall averages between 900 and 2,000 mm.

Natural Resources and Agriculture. The province is abundant in natural resources. The most prevalent resource is timber. Forests cover about 39.46% of Fujian. The main species of timber are: Masson pine, cedar, cypress, *cryptomeria fortunei*, camphor, phoebe nanmu, sassafras, castanopsis, evergreen chinquapin, banyan, oil tea

camellia, tung tree (*Paulownia*), bamboo and other rare timber like *Metasequoia*, *Taxus chinensis*, *Pseudolarix amabilis* and ginkgo.

The shoreline is extremely irregular, with a total length of 3,324 km., providing many excellent natural harbours and extensive fishing areas. Some 600 different species of fish are caught in Fujian waters.

The six major fruits of Fujian are orange, longan, lichee, banana, loquat and pineapples.

The province is also rich in tea, dry bamboo shoots, mushrooms, fungus, resin and medicinal herbs. In addition, Fujian has considerable mineral wealth, including estimated coal deposits of over 800 million tons, 500 million tons of iron ore and various amounts of tungsten, copper, molybdenum, lead and zinc.

Survey of Economic Development Since 1949

Fujian's economic development stagnated prior to Liberation. The total area of cultivated land was about 21,750,000 mu which provided for an output of 284,000 tons of grain. At that time, Fujian's industry consisted only of some small printing presses, food processing and match factories, thermal power stations, machine maintenance workshops and handicraft workshops. The total number of workers employed was less than 3,000. Even a nail had to be imported from other provinces. The problems posed by Fujian's difficult terrain to the development of internal communication and transport had not been tackled, which left the province very isolated. There were no railways in the province at all; roads existed only in 44 counties, and in 28 of them the roads were not serviceable. In addition, the impervious terrain of the inland rivers meant that navigable waterways were limited in number.

Capital Construction. After Liberation, the party and the government instituted land reform and organized the peasants to take the road of socialist collectivization and to undertake land-leveling, water conservancy and soil improvement projects. Over 600 large, medium-sized and small reservoirs and 100,000 small water conservancy works have been built, and electric irrigation equipment of 100,000 hp. has been installed. A

number of breakwater and tidal protection dykes, with a total length of 5,000 km., have been constructed. Shelter belts have also been put up along the uncultivated coastal areas. Scientific farming has been widely adopted.

These developments have improved immensely the economic situation in Fujian. The total area of cropped land is now approximately 19,000,000 *mu*. In 1980, it yielded about 802,000 tons of grain, 3.8 times the amount in 1949, or an average annual growth rate of 3.3%. Agriculture has also been further diversified and developed.

Industry. Fujian now has a relatively adequate industrial foundation with many branches of industry, including: metallurgy, power, coal, chemical, machinery, building-materials, forestry, light industry, electronics, drugs and pharmaceuticals. A defence industry has also been established. To date, there are more than 16,000 factories and enterprises, of which more than 2,600 are state-owned, having a work force of 1,670,000; and more than 7,900 are collectively owned factories, employing 630,000 workers.

The total value of industrial output in 1980 was 7,550 million yuan. The average annual growth rate of industrial output has been 12.4% since Liberation. The output of steel in 1980 was 240,000 tons; pig iron, 320,000 tons; rolled steel 200,000 tons; coal, 4,630,000 tons; chemical fertilizer, 240,000 tons; and electricity, 5,000 million kwh. "Narcissus" Brand canned food and some other handicraft products are exported to more than 50 countries and regions. Shaushan stone carvings, Fuzhou lacquerware, cork carvings and Dehua porcelain are products equally well-known both at home and abroad.

Transportation. The province is now served by two major railway lines — one connecting Yintan with Xiamen, the other running from Waiyang to Fuzhou. Both play a very important role in the economic development and the distribution of commodities in the province. In addition to these two trunk lines there is the Zhanglung Line, the Zhangfu Line, the Fuma Line — altogether totalling over 1,000 km. Road construction has been intense. A total of 30,000 km. of road now link all the counties, with Fuzhou, Xiamen, Quanzhou, Nanping, and Yong'an as major junctions. The Xiamen Causeway was constructed in 1956 to connect the island with the mainland. The Wulungjiang Highway Bridge was completed and put to use in 1971, greatly facilitating south-north highway transportation. Navigation on inland waterways has greatly improved after dredging operations were performed in over 100 locations. Xiamen, Mawei in Fuzhou, Quanzhou, and

Sanduo in Ningde are Fujian's major ports. At present, there are regular civil air services between the provincial capital, Fuzhou, and Beijing, Tianjin, Shanghai, Hangzhou, Nanchang and Guangzhou.

Education. Fujian has 114 research institutes, 2,994 professional and technical people, 16 universities and colleges attended by more than 38,000 students, 1 television university, 82 secondary technical schools with 38,000 students, 1,148 middle schools with 1,090,000 students and 28,000 primary schools with 3,760,000 pupils.

Review of 1980

Fujian's economy has continued to move ahead during the implementation of national economic readjustment policies. The total value of industrial and agricultural output was 11,681 million yuan, 10.49% higher than the previous year. Industrial output rose 11.9% to reach 7,550 million yuan while agricultural output was 4,130 million yuan, an increase of 5.7%. The total volume of retail sales was 5,180 million yuan, an increase of 15.8%. The total export value was U.S.\$360 million, an increase of 47.5%. The total revenue of the provincial budget was 1,530 million yuan. With total expenditures of 1,508 million yuan, the province was able to reach almost a balanced budget with a small surplus.

Agriculture. In 1980, Fujian Province suffered a number of natural disasters including low temperatures, drought and typhoons. The afflicted area amounted to 11,560,000 *mu*, representing 37% of the total area under crops. However, the implementation of the agricultural policies of the party and the State Council, the further development and improvement of the system of responsibility, and the restructuring of the internal composition of agriculture in a planned way helped to make full use of local advantages, emphasised scientific farming mobilised financial aid and material supplies, fired the enthusiasm of the commune members and thus overcame the natural disasters.

In the wake of the third bumper harvest year came a fourth. Grain output increased to 130,000 tons, a 1.7% increase over the previous year. The major cash crops — apart from peanuts, tobacco and hemp, which experienced a small decline in output — all registered increased yields. The policy of providing grain subsidies as incentives for sugarcane production resulted in a bumper sugarcane crop despite two typhoons. The total yield of sugarcane was 3,512,000 tons, an increase of 7.9%

over the previous year. The total yield of rapeseeds was 20,000 tons, an increase of 30.5%. The output of fruit was 126,600 tons, a 2.2% increase over the previous year, registering an all-time high since 1958. The orange crop reached 33,500 tons while the output of dry longan was the highest in the country. Narcissus was cultivated over 940 *mu*. Fujian is one of the major tea producers in China and its total output of tea in 1980 reached 25,850 tons, an increase of 13.5% over the previous year. Wuyi tea is one of the well-known species of China tea, combining the light flavour of green tea and the sweet fragrance of black tea. The yield of Wuyi tea was about 125 tons in 1980. The output of jasmine tea and Iron Buddha tea — varieties well known at home and abroad — came to 7,500 tons and 200 tons, respectively.

The province is one of the six major forest regions in China. The total forest land is 98,710,000 *mu*. The total area of replanting was 2,627,000 *mu* in 1980; of seedling 37,000 *mu*; of nursing sapling 5,880,000 *mu*. Output of roundwood was 3,407,000 cu.m. in 1980, that of sawn timber 541,000 cu.m. and artificial board 38,000 cu.m. The total output value of forestry industry was 316 million yuan in 1980.

Industry. The industrial output value increased by 16.99% in 1980, a relatively big increase for the fourth year in succession. Some of the major products like sugar, chemical fibre, chemical fertiliser, cement, paper, steel etc. all overfulfilled their plan targets. Some daily necessities of good marketability like woollen yarn, TV sets, plate glass, sewing machines, bicycles and photofilms also had considerable increases.

The "Xin-lo-quan" Brand red wine manufactured by Longyan Brewery was awarded a gold medal for the national best quality products. "Xiamen" Brand photo paper by Xiamen Photochemical Factory, "Heron" Brand Six-flavour Glutinous Rehmannia Pills by the Xiamen Medicinal Herb Factory, and the "Sailing Boat" Brand resin by the Wuping Forestry Chemical Factory received silver medals of a similar nature. The consumption of raw material and energy was further reduced, so that the cost came down and the profit went up in most factories and enterprises. Some 300,000 tons of coal, 130 million kwh. of electricity and 20,000 tons of petroleum were saved. The state-owned enterprises, at the county level and above, netted 20.8% more profit than in the previous year — bringing about increases both in production and profit.

Light industry achieved a quicker development. There were over 227 improvements conducive to tapping the potential of existing equipment while some 110,000,000 yuan was

newly invested. Consequently, production capacities of sugar, paper, textile and food-processing factories have been enhanced. The output of paper and cardboard was 224,000 tons in 1980, an increase of 1.6% over the previous year; sugar 371,000 tons, an increase of 14.3%; chemical fibres 13,500 tons, increasing by 19.1%; cotton yarn 24,000 tons, increasing by 20.7%; cotton cloth 130,000,000 m., up 6.8%; bicycles 27,000, up 71.1%; sewing machines 130,000, up 73.7%. The total output value of light industry registered an increase of 14.3% over the previous year, surpassing that of heavy industry, at 6.3%. The output value of light industry, which accounted for 59.6% of the total output of industry in 1979, increased to 61.3% in 1980. The textile industry alone increased by 22% over the previous year in output value.

Transportation. The weak links in transportation were also strengthened. The modification of the Ying-Xia and Waifu railway lines has already started, involving a cost of 24,000,000 yuan. The total volume of freight transported will be enhanced by 30%, when the modification is completed in 1982. The Zhang-Quan Railway Line has a designed length of 252 km. of which 57 km. of rails had already been laid down. The Fude-Jiandou section, the most difficult part of the line, has been finished. After inspection, it was put into operation on May 1, 1981. In line with the demand for the development of foreign trade, the ports of Hondu in Quanzhou, Gongko in Shaonan County, Zhuyukou in Pingtan, Dongao and Xiazhai in Zhangpu county have all been opened for shipping export commodities. The freighter *Gushan* made her maiden voyage to Singapore in November 1979, which marked the first step to the opening up of an ocean shipping line. In addition, the Fujian and Guangdong transportation companies jointly run coach lines between Fuzhou and Guangzhou, Quanzhou and Shenzhen, greatly facilitating the travel between Hong Kong, Macao and Fujian.

Foreign Trade. In 1980, Fujian continued to carry out the special policies of the central government coupled with flexible measures and energetically developed its external economic activities. Accordingly it established new economic units and restructured existing ones. The Fujian Investment and Enterprise Corporation (called "Hua Fu" for short) officially sanctioned by the State Council, was set up in January 1979 for the purpose of channelling, absorbing and utilizing foreign funds, advanced technology and equipment into Fujian. It subsequently established branch offices in some of the major cities and key

areas. In addition, the General Corporation of Foreign Trade, the Industry Trading Company, the Agricultural Trading Company and Hua Min Company (H.K.) Ltd. — the general agent for all the Fujian units involving external economic activities, were opened. Many districts within the province have assumed a positive attitude to initial two-way trade following the changes in foreign trade apparatus.

The province has granted local governments some autonomy. The Fujian Investment and Enterprises Corporation, in cooperation with relevant departments, has received over 1,300 foreign businessmen from 31 countries and regions and held talks and discussions on trading, economic activities and technical exchanges. Extensively applying international practices, we have actively conducted business in the form of processing with raw materials supplied, assembling products from premanufactured parts, or participating in joint ventures, to bring in advanced technology and equipment. So far, more than 700 contracts in light industry — chemicals, forestry, metallurgical, construction materials, electronics, transportation, food-processing, livestock- and marine products-processing, farm cultivation and fish cultivation — have been signed. The finalization of these contracts will contribute to the economic development of the province. The value of purchasing export goods in 1980 scored an increase of 43.1% over the previous year; the total export value for the same period scored an increase of 47.4% over the previous year; while that of imports was 95.3%. The total foreign exchange earnings for the same year recorded an increase of 37%.

In October 1980, the State Council approved the setting up of a Special Economic Zone in Xiamen. An area of about 2.5 sq. km. has been delineated in Huli for this purpose. The Administration Committee of the Special Economic Zone has already started to function. The first phase of its construction is underway. In the zone, top priority will be given to such branches of industry as electronics, light industry, textiles, instruments and meters, arts and crafts, precision instruments and, at the same time, to further develop resident construction and tourism. The authorities have invited compatriots in Hong Kong and Macao, overseas Chinese and foreign businessmen to invest or set up their own enterprises in that area. Due to the favourable conditions of the zone, much keen interest and response has been expressed from overseas.

In March 1980, Fuzhou, Xiamen, Quanzhou and Zhangzhou were opened to foreigners. Leaders of many countries such as the Democratic People's Republic of Korea, Romania, Japan, Australia,

New Zealand and Singapore as well as delegations from other foreign countries have visited Fujian since then. In April 1980, Premier Doug Lowe of Tasmania, Australia, visited Fujian, initiating the establishment of friendly state and province relations between Tasmania and Fujian to assist the development of economic and cultural exchanges. The trip was crowned with success. In November the same year, Fuzhou and Nagasaki in Japan became sister cities. The tourist industry also showed a marked development. The influx of tourists reached more than 130,000 (including repeats) and hard currency earnings registered an increase of 37% over the previous year.

Current Problems and Goals for Future Development

The major problem in the economic development of Fujian Province is disproportionate growth. We overreached ourselves in the field of capital construction, overtaxing the province's financial and material resources, as a consequence of which some of the weaker links such as transportation, communications and energy development have not been able to be duly strengthened.

Transportation. The transportation system is strained as the handling capacity has practically reached its peak. As for shipping transportation, the silting of river mouths poses some problems; some harbours and wharves are outdated; the delays in loading and unloading are serious. The civil air service is also not able to cope with the demands of economic development of the province.

Agriculture. Agricultural produce falls short of the demands of economic development and the needs of the people. Grain consumption per capita is still less than that of the best record of the past. Some other cash crops like peanut, hemp, cured tobacco, lichee and longan are still well under the all time high record reached in the past. The income of commune members is rather low. The development of animal husbandry and fishing is stagnant. In forestry, more trees are being felled than replanted, not only overtaxing the timber resources but also eroding the balance in the ecological environment, thus representing a direct threat to agricultural production.

Industry. Many industrial enterprises need to upgrade their business management because of poor economic efficiency. Some factories are simply pursuing a high quantity of output, but do not attach much importance to quality or diversity. Sometimes they even manufacture blindly.

The result is a substantial surplus of inventories, a waste of energy and ineffective utilization of funds. The overlapping of building factories of a similar nature is quite outstanding. As a consequence, although industrial output registered quite a big margin of increase, it failed to represent the actual growth of effective social wealth. In addition, the gap between the amount of social purchasing power and supplies of commodities is widening year after year. Within enterprises, business management has failed to catch up with the new status following the release of market forces and the resumption of multi-channel marketing, causing instability of the market and commodity prices. The development of science and technology, education and culture and medical and public health services are far from adequate to keep pace with economic development.

With the above-mentioned problems in view, the basic requirement in the economic development of the province is that Fujian will continue, in the present period of national economic readjustment, to pursue the decision of the central government to implement special policies and flexible measures. The province will strive to balance the ratio between consumption and accumulation, enhancing this ratio to better the standard of living; proportioning the development of agriculture, light industry and heavy industry in overall economic development by giving top priority to agriculture and light industry; readjusting the relation between production and capital construction, between the tapping of the potential of existing enterprises and the setting up of new ones, proceeding from the present groundwork and assuring ongoing production; readjusting the inter-relationship among different branches of industry; strengthening the weak links in communications, transport and energy development; resolving the relationship between production, construction, science, technology, education and culture; arranging appropriately for the market to stabilize commodity prices; and expanding foreign trade. We must lay the foundation for a co-ordinated, well-balanced development of the economy. At the same time, we will fully take advantage of the power granted by the central government to implement special policies and flexible measures, bring the strong points and favourable conditions of the province into full play, actively utilize the funds provided by overseas Chinese and foreign entrepreneurs to import advanced technology to expedite the development of economy and technology as well as bring up more people with knowledge and skill to alter the economic backwardness of the province and improve the life of the people.

The ten key points in the economic development plan are as follows:

1. *Develop agriculture significantly.* While stressing grain production, efforts should be made to establish base areas of forestry, animal husbandry, fishing and cash crops (mainly oil-bearing crops, sugarcane, tea and fruit).

2. *Protect forest resources.* Conduct comprehensive utilization and stabilize the production of timber in the next few years, identify the ownership of the forest areas and the forests themselves; implement the policy of forestry in a down-to-earth way; intensify reforestation and the comprehensive utility of timber; enhance the production of forestry by-products.

3. *Develop the farming and cultivation of marine products.* Combining with the development of oceanic fishing, fully make use of the shallow coasts and inland waterways to develop sea water and freshwater fish farms.

4. *Bring about a breakthrough in the area of light industry.* Bigger strides are to be expected in the production of some major products including sugar, paper, canned food, electronics products, lacquer ware and arts and crafts, to greatly enhance the production of consumer goods and expand processing agreements with materials supplied and compensation trade, so as to expand production, increase income and provide more jobs.

5. *Modify the industrial structure.* Make better use of the existing production force to manufacture all kinds of daily commodities and durables and provide the advanced machinery and equipment for the technical renovation of every branch of industry.

6. *Explore and mine mineral deposits with particular emphasis on non-metallic deposits.* Intensify the exploration of metallic reserves. Build up the Qinlin Tungsten Mine. Extensively develop the exploration and mining of river sand, kaolin, granite, limestone, barite and raw salt and other non-metallic deposits.

7. *Do a good job of electricity generation.* Build hydro- and thermal power stations, but particularly hydroelectric stations. A circular power grid will be formed in 1985.

8. *Change the backward status of transport and communications.* Emphasis should be laid on the completion and modification of Dongdu Port

in Xiamen; the dredging and modification of Mawei Port in Fuzhou; the first phase of modification of the Yingxia and Waifu railway lines; the modification and extension of the Fuzhou and Xiamen air terminals; and the installation of the 10,000-line telephone switcher in Fuzhou and Xiamen.

9. *Develop tourism.* Emphasis is to be placed on setting up tourism centres in Fuzhou, Xiamen, Wuyi Mountain and other scenic spots in anticipation of increased foreign currency earnings from tourism.

10. *Develop science and technology, culture and education, and public health.* In the following years more funds are to be squeezed out to maintain a greater share of investment in this aspect of the economy. Stress must be placed on popularizing primary education, restructuring secondary education and running the key high schools and tertiary education units better, so as to nurture and educate more people with better knowledge and skills.

61. ECONOMIC DEVELOPMENT IN GANSU PROVINCE

By the General Office,
People's Government of Gansu Province

Geography and Population

Location, Geographic Characteristics and Climate. The province of Gansu, situated in the northwestern part of China, covers an area of 45,000 sq. km. Its distance from southeast to northwest is 1,655 km.; the longest distance from north to south is 530 km. and the shortest is only 25 km. The land area of the province averages 1,000-3,000 m. above sea level and gradually descends southeastward. Mountain ranges crisscross the province in a complex pattern. Its water system includes the Huanghe, Changjiang and Inland rivers. Gansu has a dry climate which varies greatly in temperature; it enjoys adequate sunshine but has little rainfall. Natural disasters — drought being the worst of all — frequent the area during most parts of the year.

Population and Administrative Divisions. Gansu has under its jurisdiction 13 prefectures, cities and *zhou* (including 2 autonomous *zhou* and 3 provincial cities); 81 counties, towns and districts (including 7 autonomous counties, two county-level towns and 6 county-level districts). The land is inhabited by 19.18 million people distributed among 14 nationalities, including Han, Hui, Mongolians, Tibetans, Uyghurs, Tu and Dongxiang. Minorities total 1.44 million people and comprise 7.6% of the population of the province.

Natural Resources and Agriculture. Total cropland in 1979 was 53.32 million *mu*. More than 20 grain crops are grown, including wheat, corn, millet and highland barley. Cash crops include cotton, rapeseed, fruit, melons and medicinal herbs. The province's grassland totals 200 million *mu*. The major livestock are pigs, cattle, horses, donkeys and camels. More than 50 million *mu* of land is covered with forests which contain timber trees such as dragon spruces, Chinese pines and poplars.

Gansu is relatively rich in mineral and hydraulic resources. It has a potential capacity of 14.24 million kw. of hydroelectric power. The combined flow volume of all rivers is 52,900 million cu.m. per year. There are 61 verified minerals, including nickel, copper, lead and zinc. Gansu is among the major producers of these

minerals in China. Apart from the large quantities of fuel provided by two oil fields, Yumen and Changqing, there are 5,950 million tons of coal reserves.

Survey of Economic Development Since 1949

In the past 30 years or so since the founding of New China, Gansu has made great achievements in socialist construction. Compared with pre-Liberation days, the economy of Gansu has gone through tremendous changes. The industrial and agricultural output value of 1979 was 10,458 million yuan, 10.9 times that of 1949, and has risen at an average rate of 8.3% a year.

Agriculture. In the period immediately following Liberation, farming conditions were extremely backward: farm machinery and chemical fertilizers had never been introduced or applied; and irrigated land never exceeded 2.3 million *mu*. Annual grain output was only 4,000 million catties in 1979. Total farmland was 53.32 million *mu*, of which 12.69 million *mu* was effectively irrigated, while 9.67 million *mu* had ready access to irrigation. The former made up 23.8% of total farmland and the latter, 18.6% — or 5.2 times the area of the early post-Liberation period. There were in the rural areas 16,000 large or medium-sized tractors and 52,000 walking tractors. As a result, machine-ploughed fields reached 12.6 million *mu*, 24% of total farmland. In 1979, there were 2,375 agricultural trucks, 670,000 tons of chemical fertilizers applied and 700 million kwh. of electricity consumed in the countryside. The total output of grain in 1979 was 9,230 million catties and total agricultural output value was 2,180 million yuan; both figures were 2.2 times the totals of 1949.

Industry. Shortly after Liberation, industry in Gansu was almost nil. What we did have were 1,100 small factories, mines and handicrafts workshops, which together employed 7,000 workers. Industrial output value was 120 million yuan. The total amount of electricity generated each year was 5.3 million kwh. The Yumen Oil Field, then already well-known throughout the country, produced merely 69,000 tons of oil a year.

In 1979, the number of industrial enterprises

reached 4,710; total industrial output value was 8,279 million yuan, 65 times that of 1949, of which 7,782 million yuan, or 94%, was derived from state-owned enterprises. Industrial production capacity in 1979 was: 9.35 million tons of iron, 195,000 tons of steel, 4.2 million tons of oil, 48,000 tons of electrolyzed copper, 320,000 tons of chemical fertilizers, 2.82 million kw. of electricity, 5.95 million tons of coal, 80,000 tons of synthetic fibres and 28,000 wool spindles. The output of major industrial products in 1979 was: 54,000 tons of pig iron, 17,000 tons of steel, 68,000 tons of rolled steel, 1.1 million tons of crude oil, 2.91 million tons of processed oil, 158,000 tons of chemical fertilizers, 57,000 tons of methanol, 41,000 tons of rubber, 49,000 tons of oil equipment and 4.36 million m. of woollen fabrics, Gansu had already become one of China's important bases for nonferrous metals, hydroelectric power, petroleum chemicals and oil equipment.

Transport. In 1949, Gansu's railways were only 50 m. long, while in 1979 they amounted to 2,245 km. Lanzhou, the capital of the province, has become an important railway hub. The province in 1979 had 31,188 km. of highways, while in 1949 it had only 3,700 km. An extensive network of bus services links more than 97% of the communes and 70% of the production brigades. Air services linked Lanzhou with Beijing, Shanghai, Guangzhou, Shenyang and Urumqi. There were two air routes operating in the province: one between Lanzhou and Qinyang, the other between Lanzhou and Jiuquang.

Review of 1980

In 1980, economic readjustment began to yield marked results owing to the further implementation of the policy of readjustment, restructuring, consolidation and improvement.

Agriculture Development. In agricultural production, 1980 was the best in recent years. The rural economy clearly changed for the better. Efforts had been made to further implement flexible rural policies. Varying forms of the system of responsibility were adopted; the system of fixing output quotas or assigning work to each household was practiced by 71.8% of all production teams. Thanks to the implementation of the policy of taking agriculture as the key factor; of developing agriculture and animal husbandry simultaneously; of promoting agriculture, forestry, animal husbandry, sideline production and fishing in an all-around way; of suiting measures to local conditions and placing different emphasis on them; and also owing to

financial and material aid provided by the state, the majority of cadres and peasants were highly enthusiastic in running agriculture. The total output value in 1980 was 2,380 million yuan, a 9.3% increase over the previous year. Output of the major agricultural products included grain, 9,850 million catties, an increase of 6.8% over 1979; oil-bearing crops, 27,900 million catties, an increase of 64.9%; cotton, 5,360,000 catties, an increase of 32.3%; and beets, 12,600 million catties, an increase of 42.8%.

In 1980, the total area of afforestation reached 855,600 *mu*, an increase of 6.6% and an all-time record. The year also saw great progress in animal husbandry. The number of large livestock at the end of 1980 amounted to 3,923,000 head, an increase of 5.3% over 1979 and reaching an all-time high. The number of sheep and goats in stock was 11,800,000 head, showing an increase of 6.7% over 1979. The numbers of pigs, cattle and sheep slaughtered or sold all showed increases over the year before.

Industrial Development. Industrial production yielded good economic results and the structure of industry was gradually being rationalized. In accordance with the eight-point formula for economic readjustment, we set about restructuring the production of industrial products, reducing products in over-supply and promoting those in short supply. Based on the principle of economic rationalization, some enterprises which had incurred losses were shut down, suspended, combined or shifted to production of other items. Experiments were conducted in 51 enterprises to enlarge their decision-making authority. The method of sharing out profits from over-fulfilment of production plans or increases was adopted in enterprises affiliated with provincial industrial bureaus. These changes had the effect of arousing the enthusiasm of the enterprises and their workers and staff and improving their management. Meanwhile, efforts were made to restructure industry in the province. A proportionate relationship developed among various industries that was advantageous to the development of the provincial economy and to the improvement of the people's livelihood. Heavy industrial output value was reduced to 6,476 million yuan, a decrease of 4.8%, caused by poor markets, the untimely supply or drying up of mineral resources, the lack of raw materials, great demands on railway transport and general shortcomings in our work. Although light industrial output value reached 1,610 million yuan, an increase of 8.9% over 1979, the increase in light industry could not make up for the decrease in heavy industry. As a result, total

industrial output value amounted to only 8,086 million yuan, representing a 2.3% decrease from the year before. Economic results improved, however, as can be seen from the following: budgeted profits turned over to the state reached 720 million yuan, overfulfilling the plan by 17.5%; losses incurred by enterprises were 33.68 million yuan less than 1979, or a decrease of 29.5%; the share of light industry in total industrial output value increased to 19.9%, as against 17.9% in 1979; there was an increase in the designs and variety of products, and an improvement in their quality. A total of 338 new products were manufactured or trial manufactured. Of 140 major products assessed, 122, or 87.1%, met required quality standards; 97, or 77.6%, were improved or retained their 1979 land. Forty-five products from Gansu ranked first, second or third in nationwide contests.

Marketing and Sales. Markets were brisk in 1980; there was a marked increase in purchases, sales, allocations and storage of products. Along with progress in industry and agriculture, the transformation of management and methods in running industry also improved. The value of purchases totalled 2,440 million yuan, up by 9.12%. Of this total, 1,560 million yuan was used to purchase industrial goods from outside the province, a decrease of 1.5%; 680 million yuan went for agricultural and sideline products, an increase of 21.4%. Owing to the growing purchasing power and to relatively ample supplies of goods, the total volume of retail sales reached 2,960 million yuan, rising by 8.9%. Of this total, 2,560 million yuan was accounted for by consumer goods, up 15.5%; 394 million yuan was for agricultural means of production, a decrease of 20.6%. The total volume of retail sales of industrial products jumped to 196.75 million yuan, or 86% above 1979; their proportion in the total volume of retail sales of the province rose from 3.8% in 1979 to 6.6% in 1980. The trade volume of urban and rural fairs amounted to 258 million yuan, an increase of 23.8%. The total value of commodities in stock rose by 4.2%. Moreover, the year witnessed new developments in foreign trade. Thanks to harmonious cooperation among various departments in manufacturing, supply, marketing and foreign trade, the variety of export goods grew from dozens of items to over 170. Total purchases of export commodities reached 194 million yuan, rising by 26.5% over 1979 and including a 2.2% increase in the value of local and animal by-products, cereals, oils and foodstuffs; a 31.4% increase in the value of textiles and light industrial products; and a 43.7% increase in the value of chemical fibres

and machinery. The total volume of direct exports amounted to U.S.\$37.89 million.

Capital Construction and Investment. The scope of capital construction was reduced in 1980. The total amount of investments in capital construction was 840.86 million yuan, a decrease of 55.69 million yuan from 1979. Of this total, budgeted capital was reduced to 512.71 million yuan, a decrease of 207.3 million yuan from the previous year, while non-budgeted capital reached 328.15 million yuan, an increase of 151.16 million yuan. The increase was the result of more funds collected by various departments after they had enlarged their decision-making powers. Invested capital was mainly used for projects in science, culture, education, public health and people's livelihood. Compared with the amount of work done the year before, a 42.97% increase was registered in science; a 12.45% increase in culture, education and public health; and a 39.55% increase in housing. The total floor space of housing under construction was 263 million sq.m. Of this, 1,432 million sq.m. were completed in 1980, representing an increase of 335,000 sq.m. over 1979. Thus, 1980 was the peak year in housing construction. The quality of construction also improved gradually. The number of projects rated as good quality increased from 872 in 1979 to 997 in 1980, showing a 14% increase. The ratio of highly rated projects reached 56%. In construction planning, stress was placed on guaranteeing the completion of 39 major projects. These were required to be wholly or partly completed within the same year. By the end of 1980, 12 projects, including the Lanzhou Vinlon Plant and the Dunhuang Hotel, had been put into use; 17 projects, including expanded school buildings at Lanzhou Normal University, had been partly completed. Invested capital produced better results than in 1979.

Finance and Commerce. In finance, revenues and expenditures were balanced and there was a small surplus. Local revenues of the province in 1980 totalled 1,489.12 million yuan, or 5.7% more than budgeted revenues. Local expenditures were 1,250.83 million yuan, or 89.68% of budgeted expenditures; this was a decrease of 6.5% from the year before, resulting in a net surplus of 143.92 million yuan. Bank savings by the end of the year amounted to 3,128 million yuan, an increase of 109 million yuan over 1979. The total amount of currency put into circulation in the whole year amounted to 165 million yuan, an increase of 5.43 million yuan.

Income and Livelihood. The livelihood of the

people in Gansu was improved. The majority of peasants, workers and staff increased their income. According to incomplete statistics, all peasants in the province increased their income — except those living in Pingliang and Qingyang prefectures where agricultural production went down due to the year's natural disasters, thus reducing the income of commune members. The total wage bill for workers and staff in state-owned enterprises and departments was 1,346 million yuan, an increase of 14.8% over 1979. The annuance wage for each worker averaged 890 yuan, an increase of 98 yuan over the previous year. By the end of 1980, an additional 105,500 persons had been given jobs. The betterment of the people's livelihood was also demonstrated by the large increases in bank savings. At the end of 1980, total savings deposits of urban and rural residents reached 479 million yuan, of which 107 million yuan were deposits held by the commune members. Urban savings rose by 33.4% and those in the countryside by 34.2%.

Current Problems and Goals for Future Development

The facts mentioned above show that Gansu's economic situation is good. There are, however, many problems. The major ones are that no fundamental changes have been brought about in farming conditions: grain output is low and unstable; the province is not yet self-sufficient in cereals; the rate of marketable grain is low; the province can only supply itself with 1,000 million catties of grain out of total requirements of 2,200 million catties; and the output of cash crops such as oil-bearing crops, cotton, sugar beets and tobacco is limited and cannot hope to supply light industry with more raw materials within the next future. Furthermore, the structure of agriculture is irrational: forestry output value makes up only 2.16% of the total agricultural output value; that of animal husbandry occupies 10.08%. Major sectors of the economy are seriously out of proportion. Over the 30 years since the founding of New China, investments in industry and agriculture were 15,130 million yuan, or 77.6% of total investments of 1,950 million yuan. Of that total, 9.9% went to agriculture, 3.2% to light industry and 64.5% to heavy industry. This trend obviously produced a much greater proportion in heavy industry. In 1980, heavy industrial output value made up 80.1% of the total industrial output value. Thus, overall industrial production has fluctuated due to large decreases in heavy industrial production caused by the on-going economic readjustment. The year 1981 will see a further decline of 4.7% in industrial production. More than 85% of Gansu's

revenue comes from industrial taxes. Fluctuation in industry will seriously affect its revenues as well as the development of agriculture, culture and education. Revenues have shown a steady decline in recent years: from 1,530 million yuan in 1979 to 1,840 million yuan in 1980.

Unemployment is also a serious problem. Because of reduction of the scope of capital construction, as well as some enterprises being shut down, temporarily suspended, combined into bigger ones, or switched to producing other items, about 100,000 workers and staff now must work either part time or else have nothing to do at all. Moreover, at the end of 1980, 100,000 people in the province were still jobless. The fact that there are too many workers from state-owned enterprises, and that the collective and individual economies have developed very slowly, has made it more difficult to solve this problem. These existing problems show fully the correctness of the decisions made at the working meeting of the Party Central Committee to further readjust the national economy and to achieve further political stability. In line with conditions in the province, economic readjustment is therefore a task that brooks no delay.

To extricate ourselves from this stagnant situation and to remove potential dangers, we must accomplish the following:

1. *Do all we can to achieve a good harvest, focusing our attention on the production of grain and the development of forestry, animal husbandry and a diversified economy in line with local conditions.*

2. *Do well in industrial readjustment and transformation and try to increase production of most-needed commodities.*

3. *Promote the circulation of currency, improve market supply, continue to stabilize prices, and solve the unemployment problem.*

4. *Try to increase revenues and cut expenditures so as to bring about a balanced budget.*

Apart from increasing production and revenues, efforts must also be made to cut down expenditures and lower production costs. At the same time, we must reduce the scope of capital construction and achieve good economic results from invested capital.

From a long-term point of view, in order to ensure rapid growth in Gansu's economy, we must blaze a new path in line with concrete conditions in the province. In the first place, in industry we must make full use of existing

economic, material and technical conditions, adopt effective measures and tap the potential of enterprises so as to increase production. In other areas such as agriculture, finance and trade there is also great potential which needs to be tapped through vigorous efforts. We should gradually restructure the province's economy; try to set up an agricultural structure that suits the conditions of our province and that combines farming, forestry and animal husbandry; and restore and rebuild the ecological balance so as to free agriculture from vicious cycles. Industrial readjustment must be carried out actively and in a planned and systematic way. Light industry must be developed on a large scale. Priorities for heavy industrial

products must be readjusted, and products that are in demand and fit for sale should be increased. We should develop on a large scale the collective economy in cities and small towns so as to better solve the problem of unemployment. Finally, we should continue to look into experiences in transforming the systems of economic and enterprise management, including further perfecting methods of expanding the rights of enterprises in making their own decisions, improving labour, wage and incentive systems, enhancing market regulation as guided by the state plan, and implementing reforms in the leadership system of enterprises. A set of practical methods for reform should be put forward to speed economic readjustment.

62. ECONOMIC DEVELOPMENT IN GUANGDONG PROVINCE

By the Geography and Population
Investigation and Research Division, General Office,
Guangdong Provincial People's Government

Guangdong Province is the southernmost province in China. It is located in both the tropical and subtropical zones, so its natural environment is relatively favourable. Guangdong has a total area of 212,000 sq. km., with a cultivated area covering 47.95 million *mu*. The population in 1980 was 57.8 million, including 50.47 million rural inhabitants. Within 30 years since Liberation, economic development in the province has achieved great success, establishing a leading position in the national economy and laying a primary material and technological foundation. The industrial sectors, with comprehensive and diversified divisions, has achieved a fairly large scale of mechanization, and the production has reached a relatively high level. Light industry in particular has developed quite rapidly. As for agricultural production, conditions have been improved dramatically and the ability to cope with natural calamities has been enhanced. As a result, agricultural output continues to grow steadily. Today, the population's material and cultural life has improved and tremendous changes have taken place both in urban and rural areas.

Review of Economic Development Since 1949

Agriculture. Over the past 30 years, agricultural production has improved greatly due to more effective irrigation of farmland; the total irrigated area has increased more than 7-fold to 32.23 million *mu*. The quantity of agricultural machinery and the use of chemical fertilisers and electricity have continued to increase. In 1979, the total aggregate of agricultural machinery reached 8,289,000 hp., and agricultural irrigation equipment reached 2,360,000 hp. Cultivated land under mechanization now accounts for 38.6% of Guangdong's total cultivated land. In 1980, an average of 14.2 kg. of chemical fertilizer was used on each *mu* of farmland, and 1,190 million kwh. of electricity were consumed. The seeds of many rural crops, including rice, have improved greatly, giving rise to many improved varieties of rice characterized by high yield, fine quality, the ability to withstand natural calamities, early ripening and short stalks.

Production has developed rapidly with the improvement of working conditions. By 1979, the total output value of agriculture had reached 8,115 million yuan and accounted for 28.9% of

the total output value of industry and agriculture, increasing 3.2 times over the 1949 figure with an average annual growth rate of 3.7%. The total output of grain reached 34,760 million catties, an increase of 2.4 times over 1949 — with an average increase rate of 2.9% per year. There have been increases to varying degrees for other agricultural products; sugarcane, 11.3-fold; peanuts, 6-fold; and jute and ambary, 27-fold. Some 90,000 tons of dry rubber was produced in 1979. There have also been large gains in forestry, animal husbandry, sideline production and fishing. The number of hogs increased by 5.3 times over 1949, while aquatic products increased 3.2 times.

Industry. Many industries have developed from virtual non-existence to high levels of production; from few to large numbers. By 1979, there were 22,000 industrial enterprises in Guangdong, an increase of 14,000 over the 1949 figure. The original value of fixed assets came to 12,910 million yuan, 32 times the total of the early years after Liberation. The total industrial output value in 1979 was 21,040 million yuan, an increase of 32 times over 1949, with an average annual increase of 12.3%. Before Liberation, industry in Guangdong consisted mainly of light industry and handicrafts. After Liberation, a large number of industrial enterprises were built to cover a vast range within light industry. The output value of light industry in 1979 was 11,975 million yuan, ranking fourth in the country; the output of more than 20 kinds of products now rank among the nation's top five. Refined cane sugar is one of the main light industrial products of Guangdong. Sugar output in 1979 was 980,000 tons, an increase of 13 times over 1949, and accounting for 39.2% of the country's total production. Heavy industries such as metallurgy, petrochemicals and machine-building, have been established since Liberation. The machine-building industry consists mainly of light industrial and agricultural machinery, as well as machine tools, chemical equipment, precision instruments and household electrical appliances.

Communications and Transport. There has been great development in transport, posts and telecommunications. In 1979, there were 31,000 km. of highways open to traffic, an increase of 18 times over 1949. A provincial highway network, with Guangzhou as its centre, has been initially

formed. The volume of shipping has increased. The tonnage of local ships in 1979 increased by 25% over 1950. State-run shipping enterprises have developed gradually, and water transportation in particular has reached a high level. Railway transportation has gradually improved. Civil aviation has also been expanding day by day. Transport capacity has been gradually raised along with the development of the national economy. The total freight volume of the province in 1979 was 52 million tons, which showed an increase of 28 times over 1950. With Guangzhou as its centre, postal and telecommunication services have formed a provincial network. Postal and telecommunication offices exist throughout the province. All the counties and communes are connected by long-distance telephone exchanges, and telecommunications equipment has gradually improved. The total value of post and communication services in 1979 increased 8.86 times over 1950.

Commerce and Foreign Trade. The commerce economy of Guangdong Province has been flourishing. After Liberation, the exchange of goods and materials between cities and towns has been increasing. The total volume of retail sales increases annually, having grown by 9.4 times from 1949 to 1979 and now ranking fourth among all provinces in China. In the last ten years the retail prices of agricultural produce and industrial goods have dropped steadily, while the costs of several agricultural products have increased. The ratio of industrial to agricultural products has narrowed. Purchasing power has uninterruptedly risen with the development of production. Sales of major commodities have increased substantially. As has been the case for many years, however, production is still unable to meet growing consumer demands.

Foreign Trade. There has been a relatively rapid increase in foreign trade. The total purchase value of foreign trade in 1979 was 3,040 million yuan, or 11.4 times as much as in 1955. The total export value from Guangdong ports was U.S.\$1,700 million, an increase of 15.5 times over 1950. At present, several thousand commodities are produced for export to 124 countries and regions. Guangdong's exports now account for 10.8% of the national total, ranking second in the country behind Shanghai. Foreign-exchange income from port activity now accounts for 13.9% of the nation's total, ranking third after Shanghai and Liaoning. Guangdong has become a major foreign trade port in South China and the main point of supply to Hong Kong and Macao. In 1979, the Party Central Committee approved

Guangdong's adoption of special policies and more flexible measures in its economic activities with foreign countries. Since then, foreign trade has become more active and exchanges with foreign countries have become more frequent. People going in and out of China through Guangdong totaled over 8.53 million in 1979.

Science, Culture and Health. Significant achievements have been made in scientific and technical fields. By 1979, there were 432 independent research organizations with 230,000 scientists and technicians. Among these units, more than 1,700 were at advanced levels, while over 20,000 were at the middle level. In 30 years, they have completed 1,332 research projects of great significance, of which 414 received awards at the National Science Conference.

Education has developed greatly and a large number of people have been trained in the means of socialist construction. Within 30 years, 199,000 university and college graduates, including spare-time university graduates, have been trained, as well as 269,000 graduates from the secondary technical schools and 12,558,200 graduates from junior and senior middle schools (including the agricultural schools), and 18,599,700 graduates from primary schools. The number of students attending various schools in 1979 reached 11,400,000, or 7 times the total of 1950. Today, Guangdong has 29 universities and colleges, 242 secondary technical and teacher-training schools, 2,957 middle schools and 30,000 primary schools.

After Liberation, a patriotic hygiene campaign was launched energetically and the spread of pestilence was basically stopped. Public health organizations were set up systematically, and health personnel were recruited. In 1979, Guangdong had 2,442 hospitals of various types, an increase of 13.3 times over 1950. Hospital beds increased 10.2 times. Technical personnel in public health increased 4.3 times. Conditions existing in the old society — when there were neither doctors nor medicine — have been greatly changed.

Income and Livelihood. There has been a clear improvement in people's livelihood. In rural people's communes in 1979, the income per capita from collective sources was 88.3 yuan, or double the 1957 figure. The average grain ratio per capita was 491 catties, an improvement over 1957. The average annual wage of workers and staff in state-owned enterprises was 702 yuan, 2.78 times that of 1952 (the average wage of all workers and staff was 676 yuan).

Economic Development in 1980

In 1980, the province continued to imple-

ment the spirit of the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party and carried on the policy of readjustment, restructuring, consolidation and improvement of the national economy. In accordance with the instructions of carrying out special policies and flexible measures in Guangdong Province and of bringing favourable local conditions and advantages into full play, we initially reformed economic management, readjusted the economy, strengthened agriculture, readjusted industry and developed light industry in a big way. We tried our best to enlarge our activities for foreign trade and new trails were blazed in introducing a special economic zone and in moving every undertaking steadily forward in the course of readjustment.

Agricultural Development. Agriculture achieved an all-around bumper harvest and industry grew continuously. We initially readjusted the internal structure of agriculture and tried our best to raise the yield per *mu* and to enlarge the areas planted to cash crops. Both grain and cash crops achieved bumper harvests. In 1980, the area planted to grain decreased. Although part of the early crops suffered from natural calamities, the yield per *mu* and the total output of grain and oil-bearing crops both exceeded the highest levels in history. The total output of grain was 36,200 million catties, an increase of more than 1,400 million catties, or 4%, over 1979, and 2,000 million catties more than the bumper year, 1977 (or an increase of 7.1%). The total output of peanuts was 1,039 million catties, an increase of 182 million catties, or 21.2%, over 1979. The total output of edible vegetable oils was 164.60 million catties, an increase of 6.6%. The total output of soybeans was 236.39 million catties, an increase of 38.4 million catties, or 19.38%, over 1979. Other cash crops such as sugarcane, mulberry, tea and fruits all increased to varying degrees over 1979. Their agricultural output value was 8,810 million yuan, an increase of 6.23% over 1979. The sideline production of the communes and brigades and commune members increased greatly. The total income of commune and brigade enterprises was 4,165 million yuan, an increase of 24.7% over 1979.

Industrial Development. The readjustment of industry achieved excellent results. In 1980, a number of enterprises either closed down, ceased production, amalgamated with other enterprises or converted to other products. These enterprises had high consumption, large losses and irrational layouts, and could not find markets for their products. But then textiles and light industries were

strengthened so as to increase their industrial production and income. Increases in light industry were especially significant. In 1980, the total output value of industry was 22,292 million yuan, an increase of 9% over 1979. The total output of light industry was 13,851 million yuan, 15.7% more than 1979. On the other hand, the total output of heavy industry in 1980 was 8,441 million yuan, a decline of 0.4%. The proportion of light industrial output value to the total for all industry increased from 58.57% in 1979 to 62.1% in 1980. The long-prevailing irrational proportion of light industry to heavy industry began to shift. In 1980, the output value of industry under collective ownership — chiefly that belonging to the Second Light Industry Bureau — reached 6,600 million yuan, rising by 17.8% over 1979 and exceeding the growth rate for state-run industry by more than 4-fold. Heavy industry adjusted its products orientation and increased the commodities supplied to agriculture and light industry and for the people's livelihood.

There was a sharp increase in the output of marketable commodities and the quality of these products improved. In 1980, ten products made in Guangdong won state prizes for fine quality, 47 products won the titles of "fine quality," "brand-name," and "reliability" as granted by various ministries, and 118 were appraised as fine quality products at the provincial level. Twelve products won first prizes in quality appraisals. Light and textile industries trial-produced more than 5,000 new products and varieties. Thanks to the attention paid to economic results and to improved operation and management, various economic and technical targets were over-fulfilled. Profits provided by state-run industrial enterprises increased by 20.2% over 1979, a growth rate far in excess of the increase in output value.

Passenger traffic increased by 17.9% over 1979. The volume of goods transported via the professional transport system slightly decreased because of a large increase in self-transporting capacity.

Revenues and Expenditures. A financial balance was achieved between revenues and expenditures, the market became more active and the people's livelihood improved. Financial revenues from production increased by 11.03% over 1979, while expenditures were reduced by 9.52% (final accounts), yielding a balance with a slight surplus.

Finance and Commerce. Due to production increases in agriculture and light industry, and to lively channels of distribution, purchases and sales, market supplies were notably improved. In 1980, domestic net purchases, net sales and retail sales

increased by 17.8%, 15.8% and 21.3%, respectively, over 1979. Supplies of meat to large and medium-sized cities and to some towns were increased as were supplies of vegetables. Many industrial daily necessities that used to be in short supply can now be supplied without restriction. And there was a large increase in high- and middle-grade products. Agricultural and sideline products in the market were in much greater supply, and the volume of business increased by 8.48 times over 1979.

Income and Livelihood. Due to adjustments in wages, the paying out of bonuses, cost-of-living bonuses and the opening of major new avenues for jobs, the income of workers and staff and of urban dwellers all increased. The average wage of the workers and staff increased from 676 yuan in 1979 to 776 yuan in 1980. Housing conditions of city dwellers improved, with a record 5.12 million sq.m. of floor space added throughout the province, an increase of 50.6% over 1979. Jobs were offered to 457,000 people in cities and towns. Bumper harvests markedly increased peasants' income. The total income of the rural collective economy in 1980 increased by 14.6% over 1979. The average per capita income for commune members was 105 yuan, an increase of 18 yuan over 1979 and the highest level in 31 years. Household sideline incomes of commune members increased greatly. By the end of 1980, the combined savings deposits of commune members increased by 515 million yuan, or 58.65%, over the year before.

Foreign Trade. Economic relations with foreign countries were pursued more actively. With reduced supplies of goods from other provinces, the total purchase value of foreign trade and the total value of exports still exceeded the highest record in history. The total purchasing value increased by 27.4% over 1979, while the total U.S. dollar value of exports increased by 24.9%. Of this, the value of exports originating in Guangdong itself increased by 35.1%. Exports to Hong Kong and Macao increased by 31.3%. There were ever greater achievements in processing and assembling of foreign products, medium-sized and small compensation trade, cooperative production and joint ventures. The province earned U.S.\$2,500 million for the country, an increase by 23.5% over 1979.

Tourism. There was growth in the tourist trade as well. 35 new tourist installations were added. In 1980, Chinese and foreign passengers coming in and out of Guangdong port reached 11,578,000, an increase of 46.4% over 1979. The foreign-currency earnings from tourism and the

sale of tourist articles increased 1.7 times over 1979.

Special Economic Zones. Preliminary blue-prints were prepared for the construction of three special zones in Shenzhen, Zhuhai and Shantou. The first-phase of the Shenzhen Special Zone Project is focused on a 0.8-sq.-km. area that stretches from Eastern Luohu Station to the north of Wenjin Ferry and to the south of the old city area. This area will be used as a commercial service district. The Shangbu Industrial District is to be set up in an area of 3 sq.km. Water and power supplies, as well as land levelling for roads have been carried out and some big projects are under construction. For Shekou industrial district (which began construction earlier), about 700,000 sq.m. have been levelled. Some factory buildings and a residential quarter for workers and staff are under construction. Construction has begun on huge buildings such as Yinhai New Village and Gongbei Hotel in Zhuhai Special Zone. Preparations are being made for the construction of a wharf open to navigation with Hong Kong as well as for the Shuiwantau Seashore Village. A 2-km. avenue connecting Shantou Special Zone and its old town has been built. The project for supplying water and electricity has just started.

Science, Culture and Health. New progress was registered in culture, science and technology and public health. In 1980, more than 400 achievements in scientific research were recorded, of which 64 were major achievements in science and technology. Educational quality was improved. There were 11,329,800 students attending school in the province. In public health, major efforts were made to prevent epidemics and to provide better drinking water to segments of the rural population. Hospital beds and medical personnel were added.

Current Problems and Goals for Future Development

At present, the economic situation in Guangdong is in general very good. But passive attitudes towards economic work have not changed fundamentally. Serious disproportions still exist in the economy. The development of agriculture does not yet meet either the needs of the people's livelihood or of industrial development. Energy resources are in short supply. Traffic volume is dense, while coal, oil and electricity remain grossly insufficient. The supply of many materials in Guangdong Province depends mainly on other provinces. However, the capacity for trains passing

through the short section of the Beijing — Guangzhou Railway is not adequate for these needs. This comprises an obstacle to the economic development of our province.

For 1981, it is necessary resolutely to implement the policy of effecting further readjustment in the economy and realizing further political stability as put forward by the Party Central Committee, and to continue to develop the good situation so as to promote modernization steadily. Economically, subject to state centralization and unification, we will take readjustment as the core and continue special policies and flexible measures, exploit Guangdong's favourable conditions, activate the overall economy, further develop production, significantly raise economic results, harmonize ratios for the national economy, balance revenues and expenditures, stabilize prices, invigorate the market and improve people's livelihoods. In order to attain these goals, we must strive to do the following work in the future:

1. *Continue to readjust the internal structure of agriculture.* At the same time, we must ensure that grain production will increase year by year. We must actively develop a diversified economy and raise the proportion of forestry, animal husbandry, sideline occupations and fisheries within the farming sector so as to make agriculture develop in a major way in the course of readjustment.

2. *Further readjustment of industry.* We must continue to close down some enterprises, stop their production, amalgamate them with other enterprises or convert them to other products. With fewer enterprises closing down and more enterprises amalgamating or converting. We must adjust the ratio of light industry to heavy industry and speed the development of both. We must give energetic aid to light industry and strive to increase the production of those light industrial and textile products that have been found to be marketable. We must pay attention to the balance of energy sources as well as to their rational development and utilization. We must do a good job of reforming the structure of industry and promote technological innovations focused on saving energy. We must implement a variety of effective policies and measures for conserving energy sources. We must strengthen communications and transport. We must actively expand shipping between the south and north and develop coastal and inland water transportation. We must give energetic aid to collectively owned transportation.

3. *Reduce investments in capital con-*

struction and strictly control the scale of construction. We must insist upon the principle of production first and capital construction second; innovation, reforming and tapping the production potential first, and enlarging construction or starting new construction second. We must adjust the direction for investments. All capital should be used for tapping industrial potential, innovation, transformation and developing products which are out of supply, as well as for energy resources and communications, and on education, science and technology, housing and public facilities that serve the livelihood of the broad masses. We must earnestly obey the needs of national and overall readjustment and the province's key readjustments.

4. *Strengthen activities concerning economic relations with foreign countries, strive to expand exports and increase foreign-currency earnings.* We must continue to engage in the processing and assembly of foreign products, while carrying out compensation trade, cooperative production and joint ventures and organizing the export of labour services. We must actively make use of foreign capital and the capital from overseas Chinese and introduce new technology so as to serve the readjustment of the national economy. We must strengthen the construction of the special economic zones and properly enlarge their rights.

5. *Stabilize commodity prices and enliven the market so as to make market commerce brisk.* We must do a good job of market regulation, promote the development of industrial and agricultural production and enlarge material exchange between the cities and the countryside, and within and outside the province. We must actively purchase materials, expand sales and reduce the amount of currency in circulation.

6. *Make a sustained effort to increase production and practice economy, increase revenues and economize on expenditures.* We must strictly obey financial regulations and principles so as to increase revenues. We must decrease expenditures, strengthen the management of credit and control the issuance of currency so as to guarantee the balance of payments. We must earnestly carry out the principle of distribution according to labour, increase the income of the people and raise the people's livelihood on the basis of production development.

7. *Develop educational undertakings, strengthen the work of science and technology, and raise the level of the people's science and culture. Do a good job of family planning and strictly control the growth of the population.*

63. ECONOMIC DEVELOPMENT IN GUANGXI ZHUANG AUTONOMOUS REGION

By the Institute of Economic Research,
Planning Commission of Guangxi Zhuang Autonomous Region

Geography and Population

Located in southern China, the Guangxi Zhuang Autonomous Region faces the Beibu Gulf to the south and borders on Vietnam in the south-west. It covers an area of 236,000 sq. km. At the end of 1980, it had a population of 35,380,000. There are 12 nationalities living in the autonomous region, including Zhuang, Han, Yao, Miao, Dong, Mulao, Hui, Maonan, Jing, Shui and Gelao. The people of the Zhuang nationality number 11,830,000 — about one-third of the population; Hans total 22,030,000. The population in 1950 stood at 18,750,000 and has grown at an annual rate of 2.14% over the past 31 years. The natural growth rate in 1980 was 1.647%.

Guangxi has a complex terrain. Mountains account for 63.9% of its total land area; rolling country, 10.9%; and tableland, 8%. Plains, which account for 14.4%, are generally small and widely scattered; the largest is the Xunjiang Plain, covering only 62,700 hectares. Karst is well-developed throughout the region, accounting for 51% of the total area; about 41% of it emerges above the ground surface, forming world-famous scenery such as that at Guilin. Their beauty notwithstanding, karst areas have more rocks than soil and are vulnerable to both drought and flooding. They are not favourable for agricultural production. The Beibu Gulf offers good prospects for the development of marine fisheries.

Climate. Situated in the subtropical monsoon zone, Guangxi has abundant solar radiation and heat, and abounds in aquatic animals and plants. Annual sunshine totals 1,600–1,800 hours in most parts of the region and the mean annual temperature increases from 17°C in the north to 22°C in the south. The frost-free period in the northern and central parts of the region lasts 10–11 months and almost no frost occurs in the south. A small area south of 24°N falls within the northern tropical zone. Annual rainfall is between 1,250 and 1,750 mm., but it is concentrated in spring and summer. The annual surface runoff is 184,000 million cu.m., accounting for 7.1% of the national total. Rain and heat occur in the same seasons and therefore benefit agricultural production.

Economic Development Since 1949

At the end of 1980, Guangxi had 2,636,000

hectares of farmland. About 1,650,000 hectares are paddy fields and the rest dry fields. Forests cover 23% of the total area.

Guangxi contains known reserves of 96 of the 160 usable minerals that exist in the world at present. Quantified reserves of 81 minerals have been verified. These include tin, aluminium, tungsten, antimony, lead and zinc. Deposits of manganese, limestone for cement, barite and talc rank high within China.

Although natural and climatic conditions in Guangxi are favourable, both industrial and agricultural production were backward before the founding of New China in 1949. Soils are mainly mountain yellow and red soil, and are infertile. Low-yield fields make up 30% of total farmland. Rice is the leading crop, followed by maize. Sugarcane, jute, ambary and subtropical fruits grow in abundance.

Under the leadership of the Chinese Communist Party and the people's government, the people in Guangxi, together with the rest of the Chinese people, have been active in socialist construction and have made tremendous achievements in the past 31 years.

Agriculture. In the area of water conservancy, the autonomous region has built 98,500 reservoirs and ponds with a total storage capacity of 20,800 million cu.m.; pumping stations with a total capacity of 947,000 hp.; and 2,385 km. of sea and river dykes. It now has 22,000 large and medium-sized tractors and 104,000 mechanized hand tractors. About 1.83 million tons of chemical fertilizers were used in 1980, an average of nearly 700 kg. per hectare. Grain output rose from 4,324,500 tons in 1950 to 11,904,500 tons in 1980, increasing at an average annual rate of 3.4%. Sugarcane output rose from 427,500 tons in 1950 to 4,019,200 tons in 1980, yielding an average annual growth rate of 9.74%. Jute and ambary hemp output rose from 3,800 tons to 102,500 tons — an average annual increase of 23.3%. High growth was also recorded in the production of tobacco, tea, silk-worm cocoons and fruit. The total agricultural output value was 5,016 million yuan in 1980, representing an average annual growth rate of 4.2%.

Industry. Metallurgy, power, coal, chemicals, machine-building, electronics, light industrial products, textiles, timber, building materials and defence industries, as well as modern communi-

cations networks, have begun to take shape. Total industrial output value in 1980 amounted to 7,758 million yuan, representing an annual growth rate of 13.1%.

Output of major industrial products in 1980 were: steel, 208,000 tons; pig iron, 180,000 tons; manganese ore, 849,000 tons; aluminium, 2,900 tons; tin, 3,000 tons; coal, 5.9 million tons (representing an average annual increase of 17% over 31 years); electricity, 5,360 million kwh. (an average annual increase of 20.2%); sugar, 416,000 tons (an average annual increase of 9.1%); cigarettes, 506,000 cases (an average annual increase of 16.2%); and gunny bags, 24 million. The output of logs also showed a major increase.

Transport and Communications. Railway lines in operation now total 1,710 km. (including local railways, 308.6 km.), and annual rail freight carried amounts to 20.34 million tons. Highways in operation total 31,673 km., with annual road freight 21.43 million tons. Motor traffic now extends to 96% of the rural communes. Navigable inland waterways total 4,663 km., moving 13.33 million tons of freight a year. Ships and boats sail to 56 of Guangxi's 86 counties and cities.

Capital Investments. Total investment in 1980 amounted to 1,030 million yuan. Investment in agriculture accounted for 27.2%; light industry, 12.2%; and heavy industry, 60.5%.

Culture, Education and Health Services. With the growth of the economy, cultural, educational and health work in Guangxi have also expanded. There are now 18 institutions of higher learning with a total enrollment of 25,500 students; 227 secondary technical schools with a total enrollment of 23,700 students; and 16,000 middle and primary schools with a total enrollment of 6.58 million students. There are 5,359 medical establishments with a total of 53,000 hospital beds and medical staff numbering 66,667 persons. The number of film projection units is now 5,113.

Employment and Livelihood. Workers in state-owned and collective enterprises and undertakings and in government departments have increased in line with the development of production. Workers and staff members employed in state-owned units numbered 2,085,500 at the end of 1980; average annual pay per worker was 736 yuan. Per capita labour productivity of state-owned industrial enterprises was 8,664 yuan. Revenues and expenditures were balanced. The total volume of retail sales amounted to 5,049 million yuan in 1980; the average annual growth rate has been 9.43% over 31 years. The region sold

421,000 watches, 143,000 sewing machines and 440,500 bicycles last year.

Economic Conditions in 1980

In 1980, the people of Guangxi made gratifying achievements in all fields through concerted efforts and by carrying out the policy of readjusting, restructuring, consolidating and improving the national economy as adopted at the Third Plenary Session of the 11th Central Committee of the Communist Party of China. Total industrial and agricultural output value was 12,774 million yuan, an increase of 5.73% over 1979. The livelihood of the people was also improved.

Agriculture in 1980. In agriculture, the job responsibility system was further implemented and the authority of production teams in managing farm production was respected in accordance with the principles and policies of the Central Committee of the Party concerning the development of agricultural production. At the same time, natural laws were observed, guidance over production through planning was strengthened and preliminary readjustments were made in agricultural structure and distribution on the principle of attending to local conditions and making the most of advantageous factors. In 1978 and 1979, 152 communes were designated as sugarcane growing bases and 35 counties as cattle breeding centres; last year, 150 communes were designated as commodity grain producing bases and 28 counties as bases for the development of forestry, animal husbandry and special local products.

Despite unfavourable natural conditions, Guangxi gathered a good harvest in 1980. Total agricultural output value rose by 4% over 1979. Grain production achieved a new local record, increasing by 150,000 tons over 1979 and by 900,000 tons over 1978. More grain than ever before was sold to the state.

Diversification within the economy also increased. Sugarcane output increased by 2.3%, a new record achieved despite the fact that area sown to the crop decreased by 15,300 hectares. Guangxi produced 209,000 tons of oranges, tangerines, bananas, pineapples and other fruits - 34.3% more than in 1979. Mulberry silkworm cocoons increased by 7.7%; medicinal herbs, 12.5%; dried fungus, 11%; and dried mushrooms, 125%. Output of marine fish rose by 22%, and fresh-water fish by 2.4%. The total income of enterprises run by communes and production brigades rose by 2.5%.

Industry in 1980. In industry, new progress was made in the work of readjustment and re-

structuring. Through integration and transfer, the region reorganized 448 enterprises that were irrationally distributed, had no ensured supply of raw materials, consumed more raw materials and fuels than necessary, produced unwanted goods or suffered bad losses for many years running. The number of enterprises that were given more power in self-management increased from 86 in 1979 to 146 in 1980, accounting for 9.7% of the total number of industrial enterprises in the autonomous region. The output value of this group was 12.3% higher than in 1979 and they accounted for 39% of Guangxi's total industrial output value. The profits they earned increased by 10.96% as compared with 1979 and they accounted for 80.5% of the total budgeted amount of profits from all industrial enterprises in the region. The profits they turned over to the state increased by 2.7% over 1979, which was above the budgeted rate of increase for all industrial enterprises in the region.

Under the guidance of state planning, regulation by the market was brought into play, enabling some enterprises to improve management, find new outlets for their products and reduce or eliminate losses. The new financial system of "apportioning local revenues and expenditures among different levels and holding each responsible for balancing its own budget" helped many enterprises to increase incomes and reduce expenditures and to fulfil their financial targets.

These changes were rewarded. Industrial production grew despite the short supply of electric power and raw materials. Total industrial output value in 1980 was 7.4% greater than 1979; that of light industry, 15.17% greater; and that of heavy industry, 2% less. The proportion of light industrial output value to total industrial output value rose from 54.7% in 1979 to 58.7% in 1980. Of the 78 major products made in Guangxi, the output of 44 was greater than in the previous year. The output of television and radio sets was more than doubled, while the output of chemical fibres, bicycles and watches increased by more than 30%.

The quality of 35 products — including refined tin, hand tractors and calcium-magnesium-phosphate fertilizer — was improved. Three products won state silver medals and eight were recommended as top-quality products by relevant ministries or state bureaux. More than 2,000 new varieties, designs and styles were added and 47 of them won Guangxi's "Hundred-Flowers Prize." New progress was made in saving energy: annual energy consumption was 4.3% less than in 1979. The amount of profits earned by the industrial enterprises within the budget increased by 15% as compared with 1979, while the amount of losses fell by 9.4%.

Good results were also achieved in communications, postal services and telecommunications, and geological work.

Capital Construction and Investments in 1980. The scale of capital construction was reduced and a number of projects were halted. Planned total investment in 1979 was reduced by 13.8% as compared with 1978 and that for 1980 was further cut by 13.7% over 1979. Most of the 61 projects that were halted were heavy industrial projects. The proportion of investment in housing, scientific, cultural, educational, health work, and urban construction rose from 19% in 1979 to 28.5% in 1980. Eighteen of the 19 projects included in the construction plan were completed.

Revenues and expenditures in the autonomous region were balanced with a small surplus. The market was brisk, with more commodities purchased and sold. Total purchases of commodities were 12.6% greater than in 1979 and the total volume of retail sales was 11.5% greater. Transactions made at the rural fairs increased by 25%. The purchase of commodities for export and the total volume of exports increased by 25.5% and 27%, respectively.

There were new achievements in education, scientific research, health work, cultural work, the press, publishing, broadcasting, sports and tourism.

People's Livelihood in 1980. The livelihood of the people was further improved. The peasants received more income from collective production and they earned even more from household sideline occupations. Most of peasants had more food grain to eat and their purchasing power was raised. Most of workers in enterprises and offices increased their income as a result of increased pay for some workers, the issuing of bonuses and expanded employment. Bank savings deposits in urban and rural areas throughout the region rose by 42% over 1979. The total floor space of housing estates for workers completed in 1980 was 2.86 million sq. m., 54% more than in 1979.

Problems and Goals for Future Development

On the whole, economic work in 1980 was successful and the situation was excellent. However, some problems remain to be solved:

1. The scale of capital construction is still overextended and materials for capital construction were in short supply. There is also a shortage of capital funds for a portion of the projects under construction. As a result of the

overissuance of currency, social purchasing power surpasses the actual supply of commodities and the price of some commodities has gone up.

2. *The economic structure is not yet rational and the special advantages of Guangxi were not yet being exploited.* The inner structure of agriculture is not rational and the advantages of the mountainous areas were not being fully utilized. The share of light industry in the economy is relatively small and the growth rate of consumer goods production lags behind the growth rate of social purchasing power. Electricity is in short supply. Mineral resources for nonferrous metal and cement have yet to be developed.

3. *Economic results were not satisfactory.* Fixed assets formed through capital construction in Guangxi over the past 31 years account for 66.9% of total capital investment. The average amount of taxes and profits turned over by state-owned industrial enterprises per 100 yuan of funds is only 17.47 yuan.

It is necessary to continue to eradicate the ideological influence of "Left" deviations and to further readjust the economic structure; reform the management system; speed up the development of agriculture, light industry, hydroelectric industry, cement industry and nonferrous metal industry; increase economic results; and give full play to the advantages of the autonomous region in light of existing geographic conditions, resources and economic and technical conditions, and on the basis of reducing capital investments and production funds and reducing spending so as to strike a balance between revenues and expenditures and between credit payments and receipts, and to keep prices stable.

Goals for future development should focus in the following areas:

Sugarcane. Natural conditions in Guangxi are suitable for growing sugarcane. Twelve and a half tons of sugar can be produced from each 100 tons of cane. Cane is grown over 111,000 hectares;

4,019,000 tons of cane and 416,000 tons of sugar were produced in 1980. About 287,000 tons of sugar were supplied to other parts of China. In the future, major efforts will be made to raise the per-hectare cane yield.

Hydroelectric Resources. Hydroelectric resources in Guangxi are abundant and concentrated. The conditions for the development of these resources are favourable, and development of water power resources along the Hongshui River is important.

Nonferrous Metals. Guangxi has many kinds of nonferrous minerals of rich content and these large reserves occupy an important place nationally. Conditions exist in the region for the development of tin and aluminium resources and for construction of major nonferrous metal producers.

Forestry and Local Products. There are many species of trees in Guangxi that grow fast. Pines and China firs mature for use as timber in 20-30 years, while commercial forests can produce fruit in 3 or 4 years. Some trees provide hardwood, including *Burretiodendron hsiemmu* and *Garcinia panchinensis*. There are still barren hills, rocky hills and rolling country suitable for afforestation. Native and special products include anise, tung oil, fennel oil, mushrooms, fungus and Luohan fruit. Prospects exist for the development of subtropical fruits such as pineapple, banana, longan and lichee.

Guangxi has abundant limestone resources of good quality, providing good conditions for developing cement production.

The landscape and scenery at Guilin are beautiful and fascinating in all seasons, drawing large crowds of visitors from inside and outside of China and providing superb conditions for expanding the tourism industry.

An important task for economic work in Guangxi is to make surveys of local economic conditions, to make full use of the local resources, to ensure rational distribution within the economy and to establish a rational economic structure.

64. ECONOMIC DEVELOPMENT IN GUIZHOU PROVINCE

By Jin Yanshi

Geographical Setting

Situated in southwest China, Guizhou Province covers an area of more than 170,000 sq. km. The population in 1980 was 27,770,000, of whom 25,190,000 lived in rural areas and 2,580,000 in cities and towns. Guizhou is a multi-national province. Apart from the Hans, there are Miao, Bouyei, Dong, Yi, Shui, Hui, Gelao, Zhuang, Yao and other nationalities who make up one-fourth of the population.

Guizhou is located on a vast ladder-shaped slope on the eastern part of the Yunnan-Guizhou Plateau, with the western part at a higher altitude than the eastern part and lying at an average altitude of 1,000 m. above sea level. Of the total area, 87% is mountainous, 10% hilly and 3% intermontane basins. The climate is subtropical, with an average temperature of 15°C or above for most of the province. Annual rainfall is about 1,100 mm.

Guizhou is rich in natural resources. There are 984 rivers which extend over 10 km. each. The potential capacity for water power is about 18,769,000 kw. There are 28,580,000 mu of cultivated land, or 11% of the total area; more than 38,000,000 mu of forests, or 14.5% of the total; 42,000,000 mu of grazing land, or 16.1% of the total area, and 120,000,000 mu of sparsely wooded areas and barren hills and slopes. There is a broad prospect for all-around development of agriculture, forestry and animal husbandry. Among grain crops, rice and corn are the main crops. Among industrial crops, forest products and animal husbandry, cured tobacco, rapeseed, bast fibres, tung oil, raw lacquer, tussah silk, tea, tallow tree, *gastrodia elata*, *Eucommia ulmoides*, China fir and cattle are dominant locally and occupy an important place in the country as well. Among mineral deposits, reserves of mercury are the highest in China; phosphorous, coal and aluminium deposits are also significant in the nation. There are also considerable deposits of manganese, antimony, zinc, rare earth minerals and limestone, all of which exist in exploitable quantities.

Economic Development Since Liberation

During the anti-Japanese war period, there was a short-lived development in industry and

commerce in Guizhou due to the shift of some industrialists and businessmen from southeast coastal areas and the lower reaches of the Changjiang River. Breweries, cigarette making, pottery and porcelain, chemicals, machinery, mining, metallurgy and other industries sprang up successively. Their production was mainly performed by manual labour. However, adversely affected by the imperialists and beauracrat-capitalists, most of these enterprises declined rapidly and closed down after the victorious conclusion of the anti-Japanese war. By 1949, both industry and commerce in Guizhou were on the verge of extinction. On the eve of Liberation, there was only individual and subsistence agriculture in Guizhou. There was virtually no modern industry and the province was inaccessible via modern communications and backwards economically.

After the founding of New China, the people of all nationalities, under the leadership of the Communist Party of China and the people's government, fundamentally transformed this backwardness. They achieved great success in economic reconstruction through their hard efforts during the past 30 years. By 1979, the output value of industry and agriculture reached 7,334.24 million yuan, 14.8 times the total of 1949 and growing at an average annual rate of 5.4%

Agricultural Development. Before Liberation, there was only a one-crop economy in Guizhou's agriculture. The production level was low, with widespread practice of slash-and-burn techniques and widely scattered cultivation. Improvements have been made in the conditions of production and reforms have been introduced in methods of cultivation during the past 30 years. Hence, agriculture production has been strengthened. The total output value of agriculture in 1979 amounted to 2,859.42 million yuan, which was 2.07 times that of 1949, yielding an average annual increase rate of 2.5%. The grain yield went up to 12,460 million catties, which was 3.1 times that of 1949, and with an annual rate of increase of 2.5%. Cured tobacco increased 16 times; rapeseed, 3.6 times; and the number of pigs in stock, 3 times. Electricity is available to 43% of the production teams, thus bringing an end to the situation where pine resin was used for lighting and when people had to husk rice with mortar and pestle late into the evening.

Industrial Development. During the past 30

years, industry in Guizhou Province started from scratch and developed through three stages: the period before 1957, when the main task was to reform existing enterprises; the period from 1958 to 1965, when a number of local industries and enterprises were set up; and the period after 1966, when large-scale construction was carried out in China's interior, enabling Guizhou's industry to develop rapidly. Metallurgy, coal mining, phosphate mining, electricity, machine-building, chemicals, electronics, building materials and textiles and light industries have been set up successively. There are altogether more than 7,200 industrial enterprises with 6,980,000 employees and net fixed assets valued at 5,640 million yuan. Moreover, Guizhou now has more than 47,000 metal-cutting machine tools. The considerable production capacity has made it possible to exploit and utilize Guizhou's rich resources.

A great variety of modern industrial products in great demand for national construction as well as for people's livelihoods can now be manufactured. In 1979, the total output value of industry increased to 4,470 million yuan, 31 times that of 1949 and representing an annual growth of 12.1%. The share of industrial output value of combined agricultural and industrial output value rose from 14.8% in 1949 to 61% in 1979. The formerly backward economic structure in Guizhou has thus been transformed, and an important material and technological foundation for the four modernizations has been laid.

Development in Transport and Communications. There was a saying in the past that "there was not even three *li* of flat ground" in Guizhou Province. Communications were truly difficult then. In 1949, there were only 150 km. of poorly maintained railways and 1,950 km. of highways actually open to traffic. There was no bus service for half of the county towns. Most links among cities and towns were provided by "post routes" built during the Ming and Qing dynasties. In the vast rural areas, especially in the areas inhabited by minority peoples, there were only meandering footpaths. By 1979, after the founding of New China, highway mileage came to 27,367 km., or 14 times that of 1949. This was thanks to the large investment put into the development of communications and transport services by the state. Four railway lines — Guizhou—Guangxi, Sichuan—Guizhou, Guiyang—Kunming and Hunan—Guizhou — were built in succession together with provincial branch lines. The railway mileage open to traffic in 1980 was over 1,391 km., 9 times that of 1949. A communications and transport network has been established, with Guiyang as its centre, linking up Sichuan, Yunnan,

Hunan, Guangxi and various points within the province. Now, all county towns, 99.7% of the districts and 80% of the communes are accessible by automobile. The former situation of inaccessibility and backwardness when "birds could not even fly through" has been changed. Suffering from "sore shoulders and bleeding feet" because of portage through the mountain areas of Guizhou has been greatly reduced.

Development of Minority Areas. After Liberation, the party and people's government have given tremendous support and help to the economic development in the minority areas. In Guizhou's two autonomous prefectures and nine autonomous counties, grain yields increased by 2.16 times in 1979 over 1949 and the output value of industry increased 28 times. Before Liberation, there were only a few manually operated workshops and mills in Kaili, capital of the Qiandongnan Autonomous Prefecture of the Miao and Dong nationalities and in Duyun, capital of the Qiannan Autonomous Prefecture of the Bouyei and Miao nationalities. Now, both towns have become new industrial cities with important industries in cement, electronics, machine tools, bridge construction, metallurgy, paper-making, tanning, chemical fertilizers and textiles.

"Miasma" (the source of malignant malaria), which used to pose a serious threat to people's lives in minority areas, has been wiped out. Today, people have extricated themselves from the hard times before Liberation when they wore clothing made of palm leaves, used straw and stalks as quilts and lived in caves.

Research, Education and Health. For 30 years, science and technology, education and public health have continuously developed. In 1979, there were 207 natural science research institutes with combined staffs of 1,800. At the 1978 National Science Conference, some 148 scientific research projects won awards. In 1979, the province had a total of 39,824 schools, including universities and colleges, middle and primary schools; these had a total of 234,000 teachers and an enrollment of 5,415,000 students, 49.3 times, 34.1 times and 43.3 times more than the totals of 1950. In 1979, there were 14 universities and colleges, an increase of 5.7 times over 1950; these had 3,350 teachers — an increase of 14.8 times, and 17,800 students — an increase of 17.6 times.

In 1979, the province had 6,200 medical and health centres with 60,600 professional personnel and 42,800 hospital beds — representing increases of 75.5 times, 92.2 times and 46.8 times, respectively, over 1950. There was also some progress in rural medical care where problems in lack of

medical care and medications were greatly improved.

Improvements in People's Livelihood. People's lives in Guizhou have improved greatly since the early post-Liberation years as the result of developments in the economy. In 1979, there were 1,423,200 employees in enterprises owned by the whole people, an increase of 44 times over 1949. The average annual wages of employees increased by 3.47 times over 1950; the average net income of peasants increased by 4.06 times. The purchasing power of people in cities and rural areas was 7.5 times more than in 1950, and the situation of "nobody has three pieces of silver" has become a thing of the past.

Problems in Development. Guizhou's national economy has achieved great progress during the 30 years since the founding of New China. However, there were serious mistakes and setbacks in economic construction because of the influence of "Left" errors and incorrect guiding thought after 1958. The three years of the Great Leap Forward and the ten-year disorder of the "cultural revolution" brought serious difficulties to the economy and caused imbalances between accumulation and consumption; in the proportion between agriculture, light and heavy industries; in the ratio of production to capital construction and to economic construction; and in science, culture, education and population growth. The economic structure was unreasonable and economic results were very poor, as best reflected by the fact that the rate of population growth was greater than the means of subsistence. The average grain yield per capita in 1979 was 181 catties less than in 1957. The agricultural foundation was fairly weak and heavy industry developed beyond the ability of agriculture; light industry developed rather slowly and Guizhou was self-sufficient in only about one-third of its requirements for daily industrial products; science and education lagged behind; housing space for employees and the public service facilities lagged far behind planned targets; technology and management levels were very low; and major technological and financial quotas in the province were in the main lower than average levels in the country. The economic situation began to improve during the first two years following the downfall of the Gang of Four. But serious proportional imbalances in the economy were not given enough attention and further mistakes were made during the economic reconstruction, with the result that the situation of imbalance was intensified in some respects. At present, the economy of Guizhou Province is still among the worst in China. Since the Third Plenary

Session of the 11th Party Central Committee, the economic situation began to change. Economic construction has begun a new turning point with the implementation of the principle of readjusting restructuring, consolidating and improving the national economy.

Economic Development in 1980

The year 1980 saw new improvements in the national economy in the province over 1979 with the further rectification of the "Left" errors in economic construction and the continued implementation of the principle of readjusting the national economy.

Agriculture in 1980. In agriculture, the passive situation began to come to an end and the national economy obtained stability with the relaxation of agricultural policies and the establishment of various responsibility systems in agricultural production. Commune members in mountainous areas were widely dispersed and the actual levels of economy and management in these areas were very low. Thus, the overwhelming majority had long cried for transition to centralized management. Thus, in 1980, various responsibility systems in production were fundamentally established in the rural areas, and more than 70% of the production brigades voluntarily chose the method of fixing farm output quotas and tasks on the basis of households. Therefore, the problem of some aspects of production relations not matching the level of productive forces was primarily solved; peasants' initiative for production was effectively mobilized; and the agricultural production was promoted. Grain output amounted to 12,970 million catties in 1980, an increase of 4.1% over the year before. As for cash crops, rapeseed output was 269.1 million catties, a 51.9% increase over 1979 and the highest level ever recorded. There were increases to varying degrees of ramie, jute, ambar and tea.

Animal husbandry has developed continuously. The number of pigs in stock at the end of 1980 was 8,957,000, 2.4% more than in 1979; the number of cattle rose to 3,795,000, increasing by 2.9% — both represented the highest figures in history. There were relatively large achievements in economic diversification and in household sideline occupations, which effectively utilized natural resources in agriculture along with surplus labour force, and expanded the base of commodity production. Thus, rural economic activities became increasingly active. Total agricultural output value reached 2,930 million yuan, an increase of 2.4% over the year before, and its pro-

portion in total combined industrial and agricultural output value rose from 39% in 1979 to 40% in 1980.

During the past two years there were some improvements in proportional divisions within agriculture because of the implementation of the principle of developing agricultural production by "paying attention to farming, animal husbandry and forestry; by developing farming, sideline occupations and industry together." The proportion of farming output value in the total value of agriculture declined from 66.11% in 1978 to 63.81% in 1980, while the proportion of output value of forestry, animal husbandry, sideline occupations and fisheries in the total output value of agriculture increased from 33.9% to 39.19%. The rural areas displayed good signs that had not appeared in many years. For example, production brigades that had once been reliant on loans for production, had spent money on relief and bought grain back from the state have taken on a new look. The quantity of resold grain declined rapidly. Trading markets for agricultural goods are flourishing and prices for grain, oil and meat have shown a stable downward trend.

The lives of commune members have been greatly improved. According to a typical survey of 690 peasant families in 23 counties, the average income per capita in 1980 was 189.5 yuan, an increase of 21.79% over 1979. The number of well-off families increased 2.5 times, while needy ones were reduced by two-thirds. The spending power of commune members was 139.2 yuan per head, up 19.7%. The number of families which built new houses increased; residential space by the end of 1980 increased by 4.1% over that of the year before. There was a total of about 72,330,000 yuan in bank deposits by commune members, an increase of 53.7% over the year before. Thus, the problems of basic livelihood for most peasants have been fundamentally solved.

Industry in 1980. In industry, plans called for textiles and light industries to develop faster, while production tasks for heavy industry were reduced. Thus, the internal structure of industry began to change. The year 1980 saw an increase of 10.6% in textiles and light industries and a decrease of 7.5% in heavy industry. In the total industrial output value, the proportion of light and textile industries increased from 32.3% in 1979 to 36.3% in 1980 and the proportion of heavy industry was reduced accordingly. There were large increases in quantities of main products of textiles and light industries and of household electrical appliances. Traditional local products were increasing, cigarettes reached 439,700 cases, an increase of 28.1%; soft drinks came to 43,600 tons, up 13.8%; and pro-

duction of world-famous Mao Tai liquor increased by 5%. Quality was improved and new styles and designs were developed for many products.

Heavy industry geared its production according to demands, expanded those products that could realize the quickest returns; and reduced those products which had not been well received. The principle of closing down, stopping production, merging and diversifying was carried out in those enterprises which had a high rate of national and full consumption, poor quality in their products, which failed to meet demands and had long suffered losses. As a result, many enterprises now enterprises which had a high rate of material and fuel consumption, poor quality in their products. Output of electricity was 4,517 million kwh. increasing by 0.6%; chemical fertilizers for agricultural use reached 303,400 tons, an increase of 38.3%.

The economic reforms brought many enterprises back to life. In 1980, 50 industrial enterprises which were experimental units for enlarged decision-making power accomplished 115% of their industrial output value quotas and 119% of their profit plans, up 7% and 10%, respectively, over the year before and higher than the average rates of other enterprises. Many enterprises took the initiative in their own hands and practiced more flexible management in line with market regulation and under the guidance of the national plan. Output value achieved through market regulation comprised about one-third of total industrial output value. Average energy consumption (of standard fuel) per 10,000 yuan in industrial enterprises owned by the whole people was reduced by 1.21 tons. Losses by local industrial enterprises were 22% less than in 1979. Net profits after deducting losses were about 90,410,000 yuan, an increase of 5.9% over 1979. Five products won state gold or silver medals and 126 products were designated as high-quality or good products by the province.

Capital Construction in 1980. The proportion of grants from the national budget for capital construction in Guizhou was markedly decreased. In 1980, investments in the province's budget totalled 646,000,000 yuan, or 14.2% less than the year before. Adjustments were made in areas earmarked for investment. The proportion of investments in science, culture, education, public health, housing and urban construction in the local comprehensive plan was 28%, an increase of 2.6% over the year before. Housing space under construction totalled 2,310,000 sq.m., and completed space was 1,300,000 sq.m., or 230,000 sq.m. more than in 1979 and the highest rate in Guizhou since the founding of New China. Investments achieved

much better results. The completion rate for construction during 1980 was 48.4%, a small gain over the year before.

Transport and Communications in 1980. In transportation, the volume of freight carried by rail reached 11,920,000 tons, or 110.3% of the planned target and an increase of 5.3% over 1979. But rail transport was still a weak link in the national economy. Because of insufficient orders, freight transported by truck totalled only 7,240,000 tons, 29% less than in 1979.

Commerce in 1980. In commerce, markets in cities and rural areas were active and purchases and sales flourished. Total purchase value was 1,770 million yuan, an increase of 11.1% over the year before. Total retail sales came to 2,790 million yuan, an increase of 9.3% over 1979. There was a large increase in purchases for foreign trade and exports. The market supply was further improved, with more styles and designs and more high-quality commodities. Recently, the growth of industrial and commercial enterprises under collective ownership in cities and rural areas was encouraged and more than 10,000 families engaged in private commerce and services were given licences. The realm of commodity distribution began to take on an active, positive situation — a variety of economic sectors, channels of distribution and forms of management existed together, and city and rural markets flourished. The quantity and variety of agricultural products and native produce were both large, and turnover increased greatly. All of these factors were of great convenience to the people.

Finance and Budget in 1980. In finance, the system of fixing responsibilities at various levels and setting quotas for revenues and expenditures was carried out in 1980, bringing into play the initiative of various departments in increasing production and practicing economy and in increasing revenues and cutting down on expenses. Local financial revenues totalled about 583.8 million yuan, 13.46% above the plan and 3.48% more than in 1979. Financial expenditures (including subsidies from the central government and special grants) came to about 1,210.36 million yuan, comprising 74.85% of the fiscal year budget and a slight decrease from 1979.

Employment and Livelihood. While developing industrial and agricultural production, many channels were opened up for exploiting the potential for employment, and thus the lives of most of the masses continued to improve. In 1980, an additional 123,500 people were employed in

Guizhou. According to a survey, the average number of persons to be provided for by each urban worker in 1980 was 2.3, as compared to 2.5 in 1979. The average income per capita in workers' families reached 316 yuan, or 50 yuan more than in 1979. The average annual wage per capita in enterprises owned by the whole people reached 797 yuan, an increase of 15.2% over 1979. A survey conducted in Guiyang and Zunyi cities and in Kaili and Meitan counties showed that the average housing space per capita in 1980 was 0.5% more than in 1979. There was some increase in the construction budget for minority regions in 1980. The province built and rebuilt highways in those regions, as well as about 26,000 sq.m. of space for housing, schools and clinics. Conditions for transportation, schooling, medical care and drinking water in these regions all improved.

Generally speaking, the economic situation in Guizhou Province in 1980 was good, but there were still many difficulties and problems. Grants in the capital construction budget were reduced, but investments outside the budget increased and the scale of capital construction was even larger than in 1979. Some industrial products did not meet quantity standards and total industrial output value did not reach the planned target. There was a large decrease in the output of tobacco, which had a bad influence on the tobacco industry and its financial revenues. Popular consumer goods developed too slowly. And the scale of losses in industrial enterprises expanded while profits submitted to the state decreased. Thus, levels of local financial revenues and expenditures were quite low, too much money was issued, the gap between supply and demand for goods widened and prices went up. All these developments showed that the national economy needed further readjustment.

Problems and Prospects for Future Development

The problems and difficulties the economy of Guizhou Province is now facing in its forward progress are inheritances of a long period of poor economic work. After the Third Plenary Session of the Party Central Committee, the situation in the province clearly changed significantly. The rectification of the internal structure of agriculture began to achieve good results. Nevertheless, the entire national economy did not fundamentally reverse the tide of passiveness. The tasks facing the national economy in the province remain to rectify "Left" mistakes continuously, to take a correct attitude in guiding economic work and to further adjust the national economy in its particular appli-

cation to Guizhou. At present, measures are being taken to continue to reduce the scale of capital construction and to decrease financial expenditures; at the same time, the province must go all out to develop its agriculture, textiles and light industries in order to meet the people's needs for consumer goods and services; it must reduce the money in circulation, increase financial revenues and stabilize prices and the economy. The main task for readjustment is to gradually change the situation of serious imbalances in the national economy and the economic structure.

First, the economic structure must be adjusted to meet both the demands of the people for clothing, food, housing, transportation and services and the demands of the country from the province. Agriculture, textiles and light industries must be fully developed and the orientation of heavy industry — especially the machinery industry, which formerly mainly served capital construction and itself — must be turned to the service of agriculture, textiles and light industry as well as markets, exports and technical innovations.

Second, well-received products must be developed and the product mix must be adjusted. The province must go all out to develop its important products like cigarettes, spirits and textiles and must produce more products such as leather goods, garments, furniture, household electrical

appliances, sewing machines, washing machines, bamboo and straw ware, motorcycles, oil presses, trucks and building materials — for which the province has adequate raw materials, markets and processing abilities. Guizhou should strive to increase coal output in order to meet the demand of other provinces and of exports. At the same time, it must continuously speed up production of traditional products, increase styles and designs of its products and enhance their quality.

Third, barriers between regions and departments must be broken down and consolidations and reforms focusing on products in given industries must be carried out. It is necessary to do a good job of closing down, stopping production, merging and diversifying enterprises and readjusting the structure of industry. On this basis, the province should do a good job of innovation within enterprises and tapping potential, of restructuring enterprises and bringing the role of existing enterprises into full play so as to enhance economic results. Through readjustment, a reasonable regional economic structure should be set up in the province's national economy suiting the socialist aims of production and realizing its superiority. Thus, the national economy of Guizhou Province will proceed gradually along a road of less investment, better results and harmonious development.

65. ECONOMIC DEVELOPMENT IN HEBEI PROVINCE

By the Hebei Provincial Planning Commission

Geography and Population

Location. Hebei Province is situated from $36^{\circ}5'$ to $42^{\circ}37'$ N. longitude, and from $113^{\circ}11'$ to $119^{\circ}45'$ E. latitude, on the northern part of the North China Plain along the lower reaches of the Huanghe (Yellow) River. The province faces Bohai Gulf to the east, and is bounded by the Taihang Mountain range and Shanxi Province on the west. Hebei's northwest, north and northeast sections border on the Inner Mongolia Autonomous Region and Liaoning Province. Its southeast and southern sections border on Shandong and Henan provinces, respectively. Beijing and Tianjin, both centrally governed, are set in the midst of Hebei.

Geographic Characteristics. Hebei covers an area of 185,000 sq. km., with the mountain chains of Taihang and Yanshan accounting for 35% of its territory; low-lying plateaus cover 12%; and plains, hills and river basins, 50%, with most level ground concentrated in the Haihe River Valley and Luanhe River Valley. The remaining area consists of lakes and lowlands. The province has a coastline of about 500 km.

Climate. Hebei has a monsoon climate. The average annual temperature range is $1-13^{\circ}\text{C}.$, with vast contrasts between north and south. Frost-free periods last from 120-220 days. The range of average annual rainfall is 300-1,000 mm., with most precipitation occurring from June through August. Hebei is prone to drought during spring and autumn.

Population and Administrative Divisions. At the end of 1980, Hebei's population stood at 51.68 million, with 91% living in rural areas. The province has 10 prefectures (Handan, Xintai, Shijiazhuang, Baoding, Zhangjiakou, Chengde, Tangshan, Langfang, Changzhou and Hengshui), 2 municipalities under the direct jurisdiction of the provincial government (Shijiazhuang and Tangshan), 7 cities and 139 counties. The provincial capital is Shijiazhuang.

Survey of Economic Development Since 1949

Since the founding of the People's Republic, Hebei's economy has developed rapidly. In 1979,

the value of its industrial and agricultural output totalled 29,797 million yuan — 10.2 times the figure for 1949 and yielding an average annual growth rate of 8%. Of the 1979 total, the value of agricultural output was 9,346 million yuan, a 3.8-fold increase, with an average annual growth rate of 4.5% since 1949; light industry accounted for 8,409 million yuan, a 27-fold increase, with an annual growth rate of 11.6% since 1949; and heavy industry was 12,042 million yuan, an 87-fold increase, with an average annual growth rate of 16.1% since 1949.

During this period, there were dramatic changes in the relationships to gross output value of agriculture, light industry and heavy industry. The proportional contribution of agriculture to total output value dropped from 76.9% in 1949 to 31.4% in 1979, while light industry grew from 17.1% to 28.2%, and heavy industry rose from 6% to 40.4%. The province's gross income for 1979 stood at 16,183 million yuan, yielding a per capita gross income of 318.5 yuan.

During the past 30 years, total investment in capital construction reached 28,300 million yuan, of which 18,460 million yuan, or 65.2%, went for fixed assets. These funds have laid a solid material basis for the province's on-going economic development.

Agriculture. Hebei Province has a long farming history. One of the first areas in China to take up settled agriculture, Hebei's farming plays an important role within China's national economy. Hebei's total cultivated area is approximately 100 million mu, which works out to 1.96 mu per capita. During the past 30 years, Hebei's agricultural sector has undertaken land reform, cooperative transformation and the establishment of people's communes. The Haihe River has been harnessed and capital construction in agriculture has taken place. Each of these developments has greatly improved farming conditions.

The province now has 48 large and medium-sized reservoirs with a total storage capacity of 8,728 million cu.m. Some 573,000 pump wells are in operation. Paddy fields and irrigated land total 55,060 million mu. Agricultural machinery came to an aggregate 16.4 million hp.; some 59.79 million mu, or 60%, of Hebei's farmland is now under mechanized farming. Chemical fertilizers were applied at an average rate of 75 catties per mu. Field crops comprise by far the largest

agricultural sector. Extensive development has also occurred in forestry, animal husbandry, sideline occupations and fishing. Field crops account for 60% of the total agricultural output value. Grain and cotton occupied 80% of the area planted to crops. Hebei is now one of China's major wheat and cotton producers.

Principal Crops. In 1979, Hebei's grain output reached 35,590 million catties, averaging 473 catties per *mu*, and surpassing by about 380% and 440%, respectively, the figures for the early post-Liberation period. Per capita grain share increased from 304 catties in 1949 to 697 catties in 1979, a rise of 130%. Cotton output was 231 million catties, an average of 27.7 catties per *mu*; and oil-bearing crops, 640 million catties, an average of 111.6 catties per *mu*. All registered increases over the early post-Liberation years.

Animal Husbandry. Hogs in stock were 13.52 million head, a 3.9-fold increase over the early post-Liberation period; draught animals, 3,469,000 head, a 15.7% increase; sheep and goats, 7,288,000 head, a 4.3-fold increase; aquatic products rose to 95,000 tons, up by 89.2%; forests amounted to 41,884,000 *mu*, increasing 50 times. Hebei's afforested area rose from 3.4% of its total area in the early post-Liberation period to 15% by 1979. Output of fresh and dried fruits was 1,650 million catties, an increase of 240%.

Minerals and Mining. Hebei is endowed with 80 kinds of minerals of which 50 are known to exist in significant quantities. Coal, iron and petroleum are abundant, and there are large reserves of copper, lead and zinc.

Industry. Hebei was industrially backward at the time of Liberation. The value of industrial output in 1949 totalled only 554 million yuan. Main commodities were steel, 3,700 tons; coal, 4,950,000 tons; and electricity, 260 million kwh. Production of pig iron, oil and chemical fertilizers was non-existent. Textiles were confined to 20,000 spindles for cotton yarn. Machine-building and light industries were operated entirely by manual labour. After 30 years of planned socialist construction, the province has acquired a healthy array of industries. In 1979, there were 14,000 industrial and mining enterprises in Hebei, including 183 large and medium-sized key units such as Kailuan Coal Mine, Fengfeng Coal Mine, North China Pharmaceutical Plant, Yaohua Glass Factory, Qixin Cement Plant, Changzhou Chemical Fertilizer Plant, and Shijiazhuang No. 2 Cotton Mill. The workforce in industry reached 2,535,800. Fixed assets in this sector came to 17,074 million yuan.

Compared with 1949, steel-making capacity has risen 500-fold. In 1979, 1,675,800 tons of steel were produced. Pig-iron output reached 2,348,400 tons. Coal extraction capacity increased eight times, with output reaching 58.41 million tons in 1979; power-generating capacity increased 31 times, with 1979's output at 19,051 million kwh. Cement output rose 51 times to 5,153,700 tons; plate glass stood at 3,990,000 cases; and chemical fertilizers at 904,000 tons. There was a 23-fold increase in the number of spindles, which turned out 195,000 tons of cotton yarn in 1979. Looms increased 40-fold and produced 858 million metres of cloth. Paper-making capacity rose by 536-fold, with 256,000 tons of machine-made paper and paperboard produced in 1979; porcelain ware for daily use came to 267 million pieces. Starting from scratch, the province is now able to produce in commercial quantities products such as motor vehicles, tractors, bicycles, sewing machines, wristwatches and TV and radio sets.

Communications and Transport. Communications and transport also registered rapid expansion. Several trunk railways such as the Beijing-Guangzhou, Beijing-Shanghai, Beijing-Shanhaiguan and Beijing-Baotou lines traverse the province. There are now 2,558.1 km. of trunk rail lines operated by the central government within the province and the 1979 volume of freight transport came to 111 million ton-km.; in addition, province-run railways total 569.4 km., and carried 4,473,000 ton-km. of freight in 1979. A total length of 39,000 km. of highways link all of the counties. Ice-free Qinghuangdao harbour, with 17 berths, now handles 24.08 million tons of cargo annually. With growth in production and construction, commerce, foreign trade, science, education, culture and public health have also been able to expand.

Review of 1980

In 1980, the people of Hebei conscientiously carried out the national policy of readjusting, restructuring, consolidating and improving the economy. Initial successes were achieved. The total value of industrial and agricultural output came to 29,950 million yuan, with revenues reaching 17,970 million yuan. Both totals exceeded figures for the previous year.

Agricultural Development. Marked changes have taken place in the composition of agriculture, with rapid expansion in cash crops such as cotton and oil-bearing plants. In 1980, severe drought, spring frosts, wind and hail storms affected 40.82

million *mu*, or 30%, of Hebei's total sown area. There was a shortfall of at least 30% on 29.47 million *mu*, representing 22% of the total sown area. Thanks to the implementation of new policies in agriculture and to the adoption of the job-responsibility system in production — which triggered the enthusiasm of the peasants for farm production and for fighting against natural disasters — total grain output nevertheless reached 30,449 million catties, the second highest yield since 1949.

Cash crops also achieved good harvests. Cotton output rose to 494 million catties, more than double the 1979 yield and reaching an average of 60 catties per *mu* the highest in Hebei's history; and oil-bearing crops totalled 900 million catties, 40.5% higher than in 1979 and topping all previous records. Meat production also increased substantially. Some 2,788,500 *mu* of land in Hebei was afforested during 1980, bringing the total afforested area in Hebei to 42,429 million *mu*, a 1.3% increase over 1979. The total annual agricultural output value was 8,025 million yuan, a 6.6% decrease compared with 1979 — a decline mainly due to the drop in grain output caused by bad weather.

Industrial Development. In industry, the principles of technological competence, economic efficiency and coordination between specialized units were stressed. As a result, 617 enterprises that had produced high-cost, poor-quality or unmarketable goods, or which operated at a loss, were closed down, merged or switched over to other product lines; 199 integrated economic complexes were set up; and 76 enterprises were experimentally given greater authority to make their own decisions. A more rational balance between light and heavy industry began to take shape, and light industry grew at a faster pace than heavy industry.

The province's total industrial output value in 1980 reached 21.22 million yuan, 3.8% more than in 1979. Of this, light industry contributed 9,620 million yuan, a 14.4% increase; and heavy industry, 11,600 million yuan, a 3.6% decrease. The proportion of output value of light industry to total industrial output value rose from 41.1% in 1979 to 45.3% in 1980, while the share of heavy industry fell from 58.9% to 54.7%. Production targets were reached ahead of schedule or were surpassed for 75 of 94 major products. Steel output reached 1,903,900 tons; pig iron, 2,515,700 tons; rolled steel, 1,258,800 tons; coal, 53.51 million tons; crude oil, 16.027 million tons; electricity, 19,630 million kwh; cement, 5,498,000 tons; plate glass, 3,896,000 cases; chemical fertilizer for agriculture, 499,500 tons

(counted on the basis of 100% effectiveness); and pesticides, 11,100 tons. Hebei also produced 2,212 tractors and internal combustion engines aggregating 369,000 hp.

Textile and light industrial production in 1980 rose by a large margin. Major increases included: 552,000 radios, up 140% over 1979; 334,000 bicycles, up 93.4%; 133,000 sewing machines, up 60%; 41,000 TV sets, up 15.8%; 317 million pieces of porcelainware for daily use, up 18.7%; 36,650,000 light bulbs, up 12.5%; 23,400 tons of soap, up 13%; 523,600 cases of cigarettes, up 9.7%; 5.38 million thermos flasks and glass liners, up 61.7%; 13.72 million metres of silk piece goods, up 40.1%; and 9,901 tons of chemical fibres, up 7%.

To meet the domestic market's needs, both the variety and specifications of industrial products increased and quality of products improved, resulting in improved economic results. A survey of 60 kinds of products showed that 76.7% of them improved their performance over 1979 in per-unit consumption of energy and raw materials; 73.5% of them surpassed the highest previous levels.

Profits from industrial enterprises covered by the provincial budget totalled 1,545 million yuan, a 10.13% increment over 1979. The profit ratio for output value per 100 yuan rose by 7.9% over 1979. Labour productivity in state-owned enterprises responsible for their own profits and losses increased by 0.8%.

Capital Construction and Investment. The scale of capital construction was reduced, with actual investments totalling 1,860 million yuan (excluding the investment allotted for Tangshan's rehabilitation) — a drop of 210 million yuan, or 10.4% as compared with 1979. Some 556 projects were cancelled or suspended in 1980, saving 151 million yuan in investment outlays. The proportional distribution of investments was also changed. Investments for expansion of productivity fell by 13.5%, with the proportional share of this category in total investments decreasing from 66% in 1979 to 59% in 1980; investments in non-productive items increased by 17.8%, with the proportion of total investments rising from 34% to 41%. Investments in housing construction totalled 353 million yuan, a 21.9% increase over 1979; work began on 5,606,000 sq. m. of new floor space, 4,038 million sq. m. more than in 1979, or an increase of 75.7%; 3,370,000 sq. m. of housing were completed, 497,000 sq. m. more than in 1979, or an increase of 17.3%. Investment efficiency improved. Labour productivity in state-owned construction units performing independent accounting was 4,650 yuan, an increase of 12.9% over 1979; the proportion of total floor space

completed rose from 52.2% in 1979 to 57.1%; 1,926 million yuan's worth of fixed assets were added through capital construction in 1980.

Tangshan City. Tangshan city has made good progress in reconstruction following the devastating earthquake of July 28, 1976. Industrial and agricultural production in 1980 reached or surpassed pre-quake levels. Total investment in capital construction for the city was 930 million yuan, exceeding the previous year by 17.3%. The city gained an additional 600 million yuan worth of fixed assets through capital construction in 1980, an increase of 180% over 1979. The rate of availability of such assets rose from 24.1% in 1979 to 65.1%. Of the work begun on 3,764,000 sq. m. of total floor space of housing, 2,218,000 sq. m. were completed, representing an increase of 10.2% and 34.8%, respectively, over the previous year.

Finance and Commerce. In finance and trade, revenues for 1980 reached 3,512 million yuan, an increase of 0.6% over 1979; of this total, revenues from industrial enterprises accounted for 33.2%; receipts from various duties and taxes made up 64.3%; and other income accounted for 2.5%. Expenditures amounted to 28.47 million yuan, a decrease of 16.8% over 1979.

Urban and rural markets were brisk. The total value of commodities purchased by the province was 8,640 million yuan, an increase of 11.6% over 1979; retail sales came to 10,240 million yuan, an increase of 10.8%; urban sales rose by 13.4% and rural sales by 4.8%.

Foreign Trade. Hebei's foreign trade has expanded steadily. In recent years, the province has established economic trade relations with 115 countries and regions. Principle commodities for export include coal, plate glass, pottery and porcelain, cotton yarn, cotton cloth, leather and fur products, woven and plaited products, chestnuts, walnuts, jujubes, pears, red beans and canned goods. Local products include Qianxi's chestnuts, Shexian's walnuts, Changzhou's jujubes, Hebei Ya pears, Zhangbei's furs and leather, and Ahuxian's gold interwoven tapestries, all of which have a long-standing reputation at home and abroad. The total value of ready-for-export commodities purchased by the province in 1980 reached 1,319 million yuan, a 29.9% rise compared with 1979. Export value totalled over U.S.\$607 million, a 45.1% increase over 1979.

Science, Education and Health. Science, education, culture and health work developed vigorously. The province now has a total of 162 research institutes. The number of people engaged in sci-

tific and technological work at all levels came to 300,000 in 1980. One hundred research projects were completed during the year and some have already been applied to production with good results. The province had 28 institutions of higher learning in 1980. Their total floor space, including dormitories, was 958,000 sq. m., of which 11,000 sq. m. were added in 1980. Student enrollment totalled 41,400 in 1980, 34.5% over the previous year. The province also set up TV, broadcasting, correspondence and spare-time colleges and other higher education classes for adults. The total number of people attending these classes exceeded 290,000. The 120 secondary technical schools had an enrollment of 60,000. The 10,000 regular middle schools had a student body of 3,250,000. To reform the structure of secondary education, a number of agricultural and vocational schools were added recently, enrolling 25,600 students.

Primary education is now universal. In 1980, 97% of school-age children were at school. In 1980, there were 4,336 hospitals and clinics with 87,000 hospital beds; professional medical workers came to 152,000. Some 65% of all production brigades in rural areas took part in cooperative medical services, employing a total of 111,400 "barefoot" doctors.

The natural population growth rate stood at 9.2 per one thousand; one-child families made up 61.5% of the total, while 78.65% of newly married couples have offered commitments to bear just one child.

Income and Livelihood. Readjustment of the economy brought improvements in the livelihood of the people. Pay increases for 40% of the workers and staff, coupled with increased wage grades in some areas and the institution of a bonus system, brought significant increases in the income of workers and staff in cities and towns. The average annual wage of workers and staff members employed in units owned by the whole people was 753 yuan in 1980, or 98 yuan more than in 1979; the average annual wage of workers and staff in collectively owned units was 591 yuan, or 72 yuan above the 1979 figure. The total income of the majority of rural commune members increased substantially over 1979. Per capita income derived from the collective in rural people's communes rose from 98.2 yuan in 1979 to 105 yuan in 1980.

Savings. At the end of 1980, individual savings deposits of the urban and rural population totalled 2,106 million yuan, an increase of 671 million yuan or 46.8% over the 1979 figure. Of this sum, urban savings deposits came to 1,246 million yuan, an increase of 41.4%, and rural savings deposits to 860 million yuan, an increase of 55.2%.

Current Problems and Goals for Future Development

Although economic readjustment has made remarkable achievements in Hebei in 1980, long-established disproportions in the national economy cannot be substantially resolved within a short period. Agricultural production is not yet stable; the ability to overcome natural calamities is weak; and the development of forestry, animal husbandry and fisheries has been slow. The internal structure of industry remains irrational, with excess emphasis on heavy industry. Moreover, heavy industry tends to disproportionately serve its own interests rather than those of agriculture and light industry. Light industry is a distinctly weak link within the national economy. Capital construction is still over-extended and beyond the country's financial and material resources. Science, education, culture and public health are backward. Levels of management and technology are low and

economic results are not satisfactory. All these problems have yet to be resolved.

Hebei will continue economic readjustment in 1981. The province plans to further scale down capital construction. Total investment in capital construction within the province's budget in 1981 will be 40% less than that in 1980, with more cuts in heavy industry; meanwhile, the sum allotted for science, education, culture and public health is to go up 28.5%. There will be appropriate controls over the production of heavy industrial commodities that consume too much energy or which are in over-supply. Efforts will be made to increase the production of light industrial and textile goods and other urgently needed commodities such as bicycles, sewing machines, wristwatches, TV sets, chemical fibres and garments. In agriculture, while assuring increased grain output, efforts will continue to readjust the internal structure, to develop cash crops and diversify the economy in accordance with local conditions.

66. ECONOMIC DEVELOPMENT IN HEILONGJIANG PROVINCE

By Zhong He
Heilongjiang Provincial People's Government

Geographical Setting

Heilongjiang Province is situated in the northernmost border region of northeast China. It has an area of more than 460,000 sq.km. — 5% of the total area of China. Heilongjiang has 130 million *mu* of farmland and 50 million *mu* of reclaimable land. Forests make up 49% of the province's area, with stands of 1,760 million cu.m. There are five large rivers in the province, namely, the Heilongjiang, Songhua, Nen, Nenjiang and Suifen rivers. In addition, there are 1,741 relatively large rivers and streams, with a total length of 4,900 km. The fresh-water surface area totals 30 million *mu*. Prairies and grasslands come to 75 million *mu*, placing the province among the ten leading stock-raising regions in the country.

The province is rich in minerals. Apart from coal and petroleum, deposits of gold, copper, aluminium, lead, zinc and other nonferrous and rare metals also occupy an important place in the country. Heilongjiang is not only an important base for commodity grain but is also one of China's main centres for coal, petroleum, timber and machine-building industries.

Economic Development Since Liberation

Since the founding of New China, great changes have taken place in the economy of the province under unified state planning. During the period of the First Five-Year Plan, Heilongjiang was one of the country's high-priority construction provinces. Twenty-two major projects were built in the province, and some 20 large and medium-sized enterprises were transferred in from other parts of the country. This, plus the development of forests in the Daxingan Mountains and the construction of the Daqing Oilfield in the early 1960's, combined to lay a solid technical and material foundation for the development of industry. In the meantime, the state set up a cluster of state farms in the province. Heilongjiang now has 872 state farms with an aggregate cultivated area of 30 million *mu*, accounting for 23.2% of the province's cultivated land, or 40% of the area of all state farms throughout the country.

Agriculture. In agriculture, total output value in 1979 was 3.4 times that of 1949, with an average annual growth of 4.2%. Grain output in 1949 was 11,500 million *jin*; it topped 20,000 million *jin* in 1966; and stayed above 29,000 million *jin* each year between 1978 and 1980, a rate 2.6 times that of 1949. During the past 30 years, the average annual growth rate for grain output was 3.1%, and the average commodity rate for grain and soybeans was 40%.

The use of farm machinery has developed rapidly. The province now has 56,000 farming tractors which plough an area of 90 million *mu*, 69% of the province's total farmland.

Animal husbandry has also expanded in the past 30 years. The number of pigs in stock in 1979 was 7,983,000, an increase of 4.4 times over the 1949 total.

Industry. By 1979, the province had 14,000 industrial enterprises, 2.6 times those of 1949; fixed industrial assets amounted to 22,600 million yuan, 17.2 times that of 1952; total output value of industry reached 21,100 million yuan, 32.3 times more than in 1952, with average annual growth of 12.3%. Of this total, heavy industrial output was valued at 14,750 million yuan, a 40.7-fold increase over 1949, or an average annual growth rate of 13.1%; light industry stood at 6,300 million yuan, 21.8 times that of 1949, or an average annual increment of 10.8%.

Transport and Communications. Transportation and communications have developed rapidly along with increased production in agriculture and industry. The mileage of railways open to traffic in 1979 was 5,048 km., some 1,100 km. more than the 1949 figure; highway mileage was 42,000 km., more than 7 times the 1949 figure; and civil aviation and inland waterways navigation also increased considerably.

The development of production has resulted in higher living standards and expanded purchasing power in both urban and rural areas. The volume of retail sales in 1979 registered an increase of 20 times over 1949, while the average consumption of consumer goods per capita went up 6-fold. Urban housing projects investment during the period from 1953 to 1979 amounted

to 3,000 million yuan, or 9.5% of the province's total investment. In 1979, 40 million sq.m. of housing were completed, and 0.8 million workers' families moved into new houses.

Education and Health. Progress was also made in education and culture, science and technology, the press and broadcasting, and public health and publishing. The number of institutes of higher learning increased from 5 in 1949 to 27 in 1979, with the student body growing some eight times. That of professional secondary schools (including skilled workers' schools) increased from 11 to 272, with the student body increasing 25 times. The number of secondary school students increased 112 times, and primary school pupils, 5.5 times. The number of scientific and technical personnel in natural sciences amounted to 280,000. There are about 400 scientific institutions in the province. The number of medical and health establishments grew from 213 in 1949 to 8,372 in 1979; hospital beds increased from 2,800 to 10,000; and medical personnel went from 2,300 to 120,000.

During the past 30 years, although the economic development in the province encountered some detours due to the influence of "Left" thinking and the construction speed was delayed because of grave sabotage by Lin Biao and the Gang of Four. Nevertheless, the people of the province under the leadership of the Communist Party, working in the spirit of plain living, hard struggle and self-reliance, managed to transform this once poor and backward "Great Northern Wilderness" into a prosperous "Great Northern Granary."

Economic Developments in 1980

As a result of the implementation of the policy of readjustment, restructuring, consolidation and improvement in 1980, the province's economic structure tended to become more rational, with improved proportions and better economic results. The entire economy of the province has begun to develop in a coordinated way.

Agriculture in 1980. Successive bumper harvests were achieved in agriculture, and the internal structure of agriculture was improved. Farming, forestry, animal husbandry, sideline occupations and fisheries developed in coordination. Although in 1980 Heilongjiang Province suffered from a series of severe natural calamities including low temperatures, windstorms, insect infestations and summer droughts, a good harvest was brought in because party

committees and people's governments at all levels earnestly implemented the party's economic policies for rural areas and strengthened and improved the system of production responsibility, thus arousing the enthusiasm of the peasants for production and enabling them to overcome disasters. Total output of grain in 1980 reached to 29,250 million *jin*, exceeding the 29,000 million *jin* mark for the third time in local history. Of this total, wheat output came to 7,890 million *jin*, 18.5% above the previous year and also a record yield for the province. The province overfulfilled the state purchase quota of grain by 20%. The total value of agricultural output amounted to 6,449 million yuan, an increase of 8.1% over the previous year.

Cash crops developed considerably as a result of the readjustment of the internal structure of agriculture. The area sown to cash crops in 1980 was 102,050 million *mu*, 68% more than the previous year. The output of main cash crops such as oil-bearing seeds, cast fibres and sugarbeets, broke previous records. Oil-bearing crops yielded 263,350 tons, increasing by 3.9 times. The output of cast fibres was 190,200 tons, an increase of 66.3%, of which the output of flax reached 174,900 tons, a 78.6% increase; sugar beets yielded 3.16 million tons, 2.5 times the output of the previous year.

Moreover, significant progress was also made in the fields of forestry, animal husbandry, sideline occupations and fisheries. In 1980, the actual afforested area amounted to 3.45 million *mu*, an increase of 9% compared to 1979. The readjustment in animal husbandry promoted the development of livestock breeding. The number of dairy cattle increased by 21.9% over the previous year; and sheep and goats, by 23.3%, setting a record. As a result of the overall development made in farming, forestry, animal husbandry, sideline occupations and fisheries, the income of commune members increased and their living standards improved. Thus, the collective economy was further consolidated. Per capita income from the collective economy in 1980 increased to 115 yuan, a 5% increase over the previous year, and a record high as well. A total of 6,753 production brigades began to change their backward outlook; 3,000 of these raised per capita income to 90 yuan or more. The proportion of poor brigades in the province dropped from 22.4% in 1979 to 13.3% in 1980.

Industry in 1980. Industrial production developed steadily, with textiles and light industries growing faster than heavy industry and with new changes taking place in the structure of industry. In 1980, Heilongjiang carried out the

policy of readjusting the national economy. Enterprises with poor management, high consumption, low product quality and big deficits were closed down, amalgamated with other enterprises or converted to produce other products. Defence and machine-building enterprises operating at below capacity were reoriented to produce ready-to-sell products. Readjustment has brought about better economic results, a marked increase in the variety of products, and notable changes in the speed of development and in the proportion between light and heavy industries and in the structure of industry and the composition of products, all to better meet social needs. The total industrial output value of Heilongjiang increased by 5.2% over the previous year, of which the output value of light industry was 16.3% more than in 1979. The proportion of light industry to the whole of industry increased to 33.2% as against 30% in the previous year.

The quality of products was improved and their variety increased as a result of better economic management. Of the 759 major products examined by the provincial authorities, 210 were classified as high-quality products, constituting 27.7% of the total. In the nationwide quality contest, Heilongjiang won 12 silver medals as against 6 in the previous year. Incomplete statistics from the cities of Harbin, Qiqihar, Mudanjiang and Jiamusi indicated that more than 600 new varieties of products with 3,000 designs had been manufactured. The readjustment boosted revenues because of increased profits from industry. Profits turned over by industrial enterprises within the budget were 39.3% higher than in 1979, exceeding the initial plan by 27.6%. The number of enterprises operating at a loss was reduced, with deficits falling by 12.7%.

Capital Construction in 1980. In capital construction, investments financed by the state showed a decrease while those provided by the province itself increased. A new record was set in housing construction. In 1980, the investment in housing construction amounted to 610 million yuan, 56.5% more than the previous year. Work was begun on a total floor space of 6.03 million sq.m., constituting 52.3% of all construction work undertaken by the province. Housing completed in 1980 covered an area of 3.58 million sq.m., or 59.4% of all houses under construction, also a record in Heilongjiang unmatched since 1949.

Commerce in 1980. Market purchases and sales were brisk and the people's livelihood improved considerably. Total retail sales in 1980

amounted to 9,270 million yuan, 15.6% more than 1979. Sales of bicycles came to 566,000, 9.7% more than the previous year or 38 times the figure of 1953; 117 million watches were sold, a 38.3% increase over the previous year or 13 times more than in 1953; 132,000 TV sets were sold, 3.6 times more than the previous year; and pork sold was 229,000 tons, 31% more than sales in 1979. Total purchases by commercial departments amounted to 9,020 million yuan, 9.9% more than 1979; and the total value of stocks increased by 9.1%. In addition, 163 million yuan worth of goods were sold at 400 peasant fairs, 26.8% more than the previous year.

Provincial revenues and expenditures were in balance with a small surplus. Revenues totaled 17.4% more than the previous year. Savings deposits of the urban and rural population increased by 48%, also a record.

Commodities purchased for foreign trade in 1980 were valued at 1,770 million yuan, 8.7% more than the previous year. The tourism industry also underwent new development. In 1980, in Harbin alone, 6,346 overseas Chinese, compatriots from Hong Kong and Macao, foreign nationals of Chinese descent and foreigners visited the city, 58.4% more than in 1979. Earnings from tourism amounted to 907,000 yuan, or 2.2 times the figure in the previous year.

Education and Health Work in 1980. Developments were seen in the fields of culture, education, science and technology, public health and physical culture. Students at institutes of higher learning numbered 41,800 in 1980, an increase of 10.6% over 1979. There were 91,900 students in professional secondary schools (including skilled-workers' schools), an increase of 4.4% over 1979. In addition, there were also 23,000 students taking courses at 133 spare-time colleges. In scientific research, 442 projects attained national or provincial advanced levels and achieved effective results in application to production and construction. Medical conditions and health work improved steadily. The province had 133,000 medical personnel and 104,000 hospital beds, an increase of 5.6% and 3%, respectively. In sports activities, Heilongjiang won 25 gold medals in national competitions and broke a world record in model airplane flying in 1980.

Problems and Prospects for Future Development

During the past 30 years, great achievements

have been made in the development of Heilongjiang's economy. However, problems still exist, chiefly the proportions among different sectors of the economy and irrational economic structure. First, agriculture remained unable to meet the needs of the state and the province due to unstable yields and low rates of growth. Agriculture in Heilongjiang still lags behind the average national rate of growth in both total output value and grain output. The share of forestry, animal husbandry, sideline occupations and fisheries in the total value of agricultural output has continued to decline yearly. Forest resources have been seriously depleted because timbering has far exceeded afforestation. Forest stocking has decreased by 30.4% as compared with the 1950's. Within animal husbandry, priority has been given only to the development of pigs, to the neglect of herbivorous animals such as cattle, sheep and rabbits. Second, the light industry remains the "shorter leg." Even though its proportion has increased to 33.2% following the readjustment, this is still below the average national level of 43%. Heavy industry is also disproportionate within its own structure. There is a great strain on transportation and a serious shortage of fuel and power. Third, social welfare facilities cannot keep up with the needs of people's lives. Heilongjiang is still far from self-sufficient in consumer goods for daily use. Culture, education, public health and urban construction lag behind population growth. All these problems must be solved in the course of economic readjustment.

In line with the province's economic basis, its present conditions and natural resources, a tentative plan has been mapped out for development during the 1981-90 period. The plan is designed to bring our strong points and superiority into full play, to continue to boost the production of raw materials and basic industries and to speed up development of secondary and tertiary processing of agricultural and forestry products, animal byproducts and minerals. The purpose is to change the situation in which there

is an over-abundance of primary products being supplied to processing industries. It is necessary to establish centres for animal by-products, sugar and paper-making, while continuing to strengthen the existing centres of grain, timber, coal, petroleum and machine-building industries. The level of the provincial economy is to be doubled on the basis of higher technology and labour productivity. To this end, it is imperative to control strictly the growth of population and to accelerate the development of industry, to readjust the economic structure and to speed up rural construction and the development of culture, education and scientific research.

As regards the population, the rate of natural growth will gradually be reduced to 0.6% by 1985 and thereafter to 0.5%. By 1990, the population of the province must be kept to below 35 million. Gross output value of agriculture and industry should increase by an average annual rate of 6.1% during the period 1981-85, and by an annual rate of 7.1-8.2% during 1986-90. Over the next ten years, economic structure must be properly readjusted with stress on speedier development of rural construction, coordination between agriculture, industry and commerce, and increases in the income of peasants so as to avoid an influx of rural population into the cities. Industries owned by communes and production brigades should be developed on a large scale on the basis of expanding agriculture and diversification. It is envisaged that per capita income of the rural population derived from the collective will reach 150 yuan by 1985 and 200 yuan by 1990. Efforts should be made to expand culture, education and scientific research and train more qualified personnel to cope with the growing needs of economic development and the four modernizations.

These are arduous tasks in view of the actual conditions in Heilongjiang Province. However, the tentative plan for the next decade can eventually be realized through the hard work of the entire people of the province.

67. ECONOMIC DEVELOPMENT IN HENAN PROVINCE

By the Financial and Economic Department,
General Office of the Henan Provincial People's Government

Henan Province is situated in the central plains of China. It has a population of 72,000,000, covering a area of 167,000 sq.km. Henan is relatively rich in natural resources. Before Liberation, under the dark rule of the Kuomintang reactionaries, the people of Henan were oppressed by "the three big mountains" of imperialism, bureaucrat-capitalism and feudalism, and they were constantly harassed by the four evils — floods, drought, locusts and the Kuomintang warlord Tang Enbo. Thus the economy was exceedingly backward. The province had only one coal mine and a few small power plants, textile mills, oil-pressing mills, cigarette factories and egg products plants. In 1949, the population of Henan came to 7.7% of the national total, whereas total output value of industry and agriculture was only 4.5% that of the whole country. Per capita income derived from industrial and agricultural production averaged 50.4 yuan. This was 58.5% of the level of the whole country. Because the economy was backward, the people lived in extreme poverty.

Review of Economic Development Since 1949

After Liberation, under the leadership of Communist Party of China, the people of Henan rapidly healed the wounds of war, restored the economy and initiated socialist economic construction on a large scale. Having overcome many difficulties, they have made quite rapid progress in industry, agriculture and in the entire national economy through 30 years of hard work, although they encountered setbacks along the way.

Agriculture. Great changes have taken place in agricultural conditions and the level of agricultural production has been greatly increased. By the end of 1979, the province had 613,000 power-operated wells and more than 2,400 reservoirs. These brought over 54,000,000 mu of farmland under irrigation; there were over 52,000 large and medium-sized tractors for agricultural use, over 100,000 hand tractors and more than 780,000 drainage and irrigation machines. The

area of machine-ploughed land comprised 47% of total farmland. Electricity for agricultural use and chemical fertilizers have also increased. The improvement of conditions has significantly promoted the development of agricultural production. In 1979, total agricultural output value reached 10,300 million yuan, nearly 4 times that of 1949; total grain output reached 42,690 million catties, which was 2.9 times the amount of the early post-Liberation years; the per-mu output of grain reached 518 catties, 3.8 times that of those days. Forestry, animal husbandry, sideline occupations and fisheries also showed great increases.

Industry. Starting from scratch and then growing from small to large, provincial industries have advanced with great strides. In Zhengzhou, Luoyang, Kaifeng, Pingdingshan, Xinxiang, Anyang, Jiaozuo and Hebi, a number of large, modern enterprises have been set up, including tractor, bearing, mining machinery, iron and steel, aluminothermy, textile and chemical plants. In 1979, the province had 14,959 industrial enterprises, with more than 4,400,000 workers and staff members. Industrial output value reached 16,990 million yuan, 75 times that of 1949.

Transport and Communications. With the upsurge of economic construction, communications and transport, of which land routes are the backbone, have sped up. The Beijing-Guangzhou and Longhai railways, two important trunk lines, crisscross the province. The Jiao-Zhi and Xin-Jiao branch railway lines were newly added. Local railways have sprung up from scratch and are developing quickly. New narrow-gauge rail lines extend over 1,200 km. Highways, totalling more than 36,000 km., lead out in all directions, with all-weather surfaces coming to over 19,000 km. These roads form a highway network, with Zhengzhou, Luoyang, Kaifeng, Xuchang, Nanyang and Xinyang as the hubs. Paved roads link up all counties and communes in Henan. There are regular bus services between most communes and towns. The volume of freight transported throughout the province in

1979 was more than 170 million tons, or 51 times that of 1949. There was also further development in posts and telecommunications in 1979. Newly-added postal routes totalled more than 160,000 km. The volume of employment in this sector was 38 times higher than in 1949.

Financial revenues and the supply of commodities have grown year by year. In 1979, total provincial revenues were 3,280 million yuan, 12 times higher than in 1950, and representing an annual growth rate of 9%. Retail sales increased from 480 million yuan in 1949 to 10,290 million yuan in 1979, a 21-fold increase. The total value of purchases was 9,190 million yuan, a 12-fold increase.

Economic Developments in 1980

In line with the policy of readjusting, restructuring, consolidating and improving the national economy as set by the Central Committee of the Party, much work was done in 1980 to readjust Henan's economy on the basis of 1979's encouraging achievements, and this brought about definite results.

Agriculture in 1980. Agricultural production went up by a fairly large margin. In 1980, in the countryside and throughout the province, the party's rural economic policies were implemented. About 400,000 production teams, in accordance with local conditions, introduced the system of responsibility in production. All this greatly stimulated the peasants' enthusiasm for production and promoted the overall development of agricultural production. Although the province suffered from natural disasters in 1980 (droughts, floods, hailstorms, insects, etc.), the harvest was a fairly good one. Total agricultural output value amounted to 11,080 million yuan, representing an increase of 7.5% over the previous year. Total output of grain reached 42,970 million catties, or 280 million catties more than in 1979, which was also a good year.

While keeping to the principle of placing grain production in the dominant position, we readjusted the internal agricultural structure and the proportion of various crops in accordance with concrete local conditions. As a result, cash crops did unprecedentedly well. Total output of cotton reached 8,120 million catties, more than double the figure of 1979. Total output of oil-bearing crops was 9,240 million catties, 24.5% more than in 1979. Total output of roasted tobacco was 3,740 million catties, 5.1% more than in 1979. Total output value of commune-

and brigade-run industries and sideline occupations reached 3,500 million yuan, 15.5% higher than in the previous year. Owing to the development of agricultural production and to substantial increases in state purchasing prices for major farm and sideline products, peasants' incomes increased remarkably and their average per capita income was some 20 yuan higher than in 1979. There were considerable increases in incomes of both collectives and individuals.

Industry in 1980. Industrial structure advanced in a rational and coordinated way. Industrial production grew continuously in the course of readjustment. In carrying out the principle of readjustment in Henan Province, special attention was paid to the proportion between heavy and light industries and the development of textiles and light industries was placed in a prominent position: one-third more investments were made in these sectors than in 1979, and over 81 million yuan in loans were provided to transform and renew these industries. Moreover, they were given priority in the supply of raw materials, fuel, power and the means of transport. All this accelerated the development of textiles and light industries. Their total output value in 1980 came to 9,400 million yuan, 18.2% more than in 1979. The rate of increase greatly surpassed that of heavy industry (which grew by 0.1%). The ratio of textiles and light industries to total industrial output value rose from the previous year's 46.9% to 51% in 1980. Output of key products such as cigarettes, bicycles, sewing machines, watches, electronic products, domestic electrical appliances, high-grade cotton cloth, woollen fabrics, silk and chemical fibres, famous wines, building materials, leather, clothing, earthenware and chinaware for daily use each increased by at least 23% over 1979.

At the same time, the quality of products was gradually improved and varieties increased. In heavy industry, products in over-supply were cut back while marketable goods in high demand increased. Steps were taken against some small steel and iron works, ammonia plants and machinery plants which were known for their high consumption of materials and fuel and for low quality, and whose operations had resulted in waste and losses for a long period and had competed with large enterprises for raw materials. These units were either closed down, suspended, combined or transformed. By so doing, higher overall efficiency was achieved.

Commerce and Finance in 1980. On the

financial and commercial fronts, inspiring achievements were recorded. On the premise of keeping the state-owned economy as the dominant sector, collective trade has been developed actively and private trade is being developed appropriately so as to open up and broaden various channels of distribution. At the same time, methods of management have been improved, promoting purchases and sales and creating brisk urban and rural markets. In 1980, net purchases amounted to 11,090 million yuan, 20.6% higher than in 1979; net sales reached 12,380 million yuan, 12.5% higher; retail sales amounted to 11,850 million yuan, 15% higher. Trade at village fairs was even more prosperous, with transactions amounting to 1,900 million yuan. This kind of trade is playing an active role in augmenting the state-owned and collective economies.

Foreign Trade in 1980. Foreign trade has developed remarkably, with purchases of exports increasing by 31% over 1979 and total export value increasing by 49%. Revenues and expenditures were roughly in balance, and in fact showed a slight surplus. Financial revenues came to 3,180 million yuan, or 7.8% more than in 1979.

Capital Construction in 1980. Investments budgeted for capital construction were drastically reduced, leading to improved results. In 1980, 26 capital construction projects in Henan, each of which had been planned to absorb more than 1 million yuan in investment, were halted or postponed, bringing the total number of curtailed projects since 1979 to 116. The allotment of investments has been drastically readjusted, with more appropriated for agriculture, textiles and light industries, education, housing and municipal construction.

Readjustment Policy in 1980. Reform of the economic system achieved initial success. Guided by the readjustment policy, 336 enterprises in Henan are engaged in an experiment to enlarge their decision-making powers; these make up 15.5% of all budgeted enterprises in the province. Their output value comprised 53% of the province's total and their profits, 90% of the total. Facts have shown that the expansion of decision-making powers is playing an active role in enhancing the enthusiasm of enterprises and corresponding individuals in enlivening the economy, improving management, raising production and income, and pushing ahead reforms across the entire economic system. According to statistics for 170 such enterprises, their output value in 1980 increased by 14.73% over the

previous year; profits turned over to the state increased by 6.91%.

The Anyang Iron and Steel Works has strengthened its economic accounting and has unfolded a drive to increase production and to practice economy on the one hand and to increase income and cut expenditures on the other. As a result, the enterprise realized 35.76 million yuan in profits in 1980, 3.19 times that of 1979. This is the highest level since the establishment of the Anyang works.

In the course of industrial readjustment, many enterprises have taken the road of integration to develop production according to the principle of economic rationality and specialization. In Henan, 971 enterprises have been integrated into 110 profit-making companies or combined factories. In order to turn out competitive products in a united effort, they have broken with the restrictions of different systems, regions and ownerships, and have demonstrated the superiority of professional coordination and cooperation, as well as the superiority of integrated production.

Owing to the readjustment, economic results improved in various areas in 1980. Energy consumption fell by about 6%, while industrial output increased by 8.2%; the proportion of industrial enterprises suffering losses dropped from 32% in 1979 to 30.7% in 1980, and overall losses went down by 39.4% compared with the previous year. Meanwhile, the cost of comparable products fell by 2.29%.

Problems and Prospects for Future Development

Although further progress was made in economic readjustment in Henan in 1980, quite a few problems remain. Owing to the fact that "Left" mistakes in economic construction have not been rectified for a long time, the proportions among various sectors of the national economy are out of balance; furthermore, the consequences of the ten-year destruction (of the "cultural revolution") were underestimated during the first two years following the downfall of the Gang of Four, and "Left" mistakes in directing economic work were not sorted out. As a result, imbalanced relations in the national economy have not been fundamentally reversed, and the task of readjustment will thus be arduous.

In agriculture, backward working conditions have not been fundamentally changed, and agricultural production is still badly affected by natural conditions. The economic structure in agriculture is not yet sufficiently rational. Pro-

portional distribution of areas sown to different crops are basically appropriate, although these areas are still somewhat dispersed. Forestry and animal husbandry are backward and sideline occupations are still too few. The combined value of the above three sectors only occupies 30% of the total output value of agriculture.

Nor is Hebei's industrial structure rational enough. Quotas and tasks for the machinery industry are drastically insufficient; although textile and light industries have plenty to do, their production capacities are low. Because of undue emphasis on the development of heavy industry and on "taking steel as the key link," capital construction projects were undertaken at random; iron and steel and machine-building enterprises were aimlessly set up and often overlapped one another. Hebei has more than 370 machine-building enterprises (at or above the county level), mostly "big and all-embracing" or "small but all-embracing" types.

It follows from this situation that economic results are poor. Because insufficient investments are made in textiles and light industries, they are unable to produce enough to meet the needs of the market; along with the growth of industrial and agricultural production, purchasing power is increasing rapidly. That is why the contradiction between supply and demand is becoming sharper.

Enterprises under collective ownership have been restrained for too long, and rash demands were imposed on them, thus inhibiting the growth of collective enterprises. Production techniques and management levels, on the whole, are low, giving rise to poor efficiency. The products of quite a few enterprises are of high cost, consume excessive energy and do not meet the needs of consumers; in short, they are not competitive. In 1980, 112 yuan of output value was obtained from each 100 yuan worth of fixed assets in Henan — a rate 16.6% below the best record in history; 9.2 yuan in profits were obtained from each 100 yuan of output value, 40.1% below the previous record; every 100 yuan of output value required 39.51 yuan in working capital — 6.75 yuan more than the best previous record or 12.9 yuan more than the national average. The capacity of spinning and weaving equipment in Henan ranks sixth nationally, although its output value and profits rank only ninth in the country, while the amount of profit for each

100 yuan of output value ranks only 15th. The amount of currency in circulation is enormous, and there is a big gap between social purchasing power and the supply of commodities. If effective measures are not taken to develop the production of consumer goods, the contradiction between supply and demand would sharpen, and that would affect political stability and unity.

In order to change the above-mentioned backwardness as soon as possible, further adjustment is necessary for the national economy of Henan. The "heavy structure" (in which heavy industry is placed in the dominant position) should give way to the "light structure" — that is, agriculture should be developed on a large scale and textiles and light industries should be placed in the dominant position; energy resources, communications, transportation and those branches of heavy industry that serve agriculture and light industry should be correspondingly developed. In agriculture, grain production should be strengthened and great attention paid to the development of diverse economic undertakings. Under the prerequisite of guaranteeing increases in grain yield, cash crops are to be developed actively so as to reap good harvests of both grain and cash crops. In industry, conscientious readjustment is to be carried out, the development of textiles and light industries is to be accelerated, more consumer goods are to be produced and production within various divisions of heavy industry is to be reorganized so as to suit the production of consumer commodities and to change the situation of too much heavy industry and too little light industry.

Priority is to be given to cities such as Zhengzhou, Luoyang, Kaifeng, Anyang and Xinxiang, since they are more crucial to the development of Henan's national economy. Great attention is to be paid to such products as textiles, cigarettes, liquor, watches, bicycles, sewing machines, garments, furniture, plastics and building materials. At the same time, concern is to be shown for the production of small articles of daily use. Through readjustment, the economic structure is expected to be rationalized and present conditions of poor efficiency and huge waste are to be changed so as to pave a new road in economic development where more is gained with less investment.

68. ECONOMIC DEVELOPMENT IN HUBEI PROVINCE

By the Research Department of the General Office,
Hubei Provincial People's Government

Geographical Setting

Hubei Province is in China's central plain. It has a total area of over 180,000 sq. km., with a population of 46,840,000. The Changjiang (Yangtze) River flows through the province from west to east. The Beijing-Guangzhou Railroad traverses from north to south. Highways also extend in all directions. Thus, Hubei is the hub of inland waterway and land communications in China.

The Jiangnan Plain is situated in the central part of the province. The Wushan and Daba mountains are in the west; the Tongbai Mountains are located in the north; the Dabie Mountains found in the east; and the Mufu Mountains are in the south. There are many rivers and lakes within Hubei, and its soil is fertile. It has a temperate climate and is rich in rice, wheat, cotton and oil-bearing crops. Freshwater fishing and aquatic breeding flourish: Hubei is known as "a province of a thousand lakes and a land of fish and rice."

Raw lacquer, tung oil, tea, ramie, citrus fruit and white fungus are well-known native products. Hubei abounds in mineral resources, especially iron, copper, phosphorus, gypsum, barite and rock salt. The output of gypsum ranks first in China. The province's white fibre gypsum is of the highest quality and is sold both at home and in foreign markets. Large quantities of high-grade iron ore are widely found in Hubei. The Daye Iron Mine is well known throughout China. Hubei is also rich in water resources.

Wuhan, the capital of Hubei, is situated at the confluence of the Changjiang and Hanshui rivers. Wuhan's urban district consists of three towns — Wuchang, Hankou, and Hanyang, each one separated from the others by the rivers. Wuhan is the political, economic and cultural centre of Hubei, as well as one of the largest cities in China with a population of 4,007,000.

Economic Development Since Liberation

Hubei has undertaken intensive socialist construction and has achieved great successes in all fields since Liberation over 30 years ago. The province's investment in capital construction ranks third in the country, valued at 37,560 million yuan. There are 285 large and medium-sized pro-

jects in operation including such famous ones as the Jing-Jiang Flood Diversion Project, Wuhan Iron and Steel Company, Wuhan Changjiang Bridge, Danjiang Key Water Conservatory Project, Han-Dan Railroad, Xiang-Yu Railroad, Jiao-Zhi Railroad (Hubei section), No. 2 Motor Vehicle Plant, Hubei Chemical Fertilizer Plant, Jingsha Cotton Mill and the first stage of the Gezhouba Water Control Project.

Industry. Over the past 30 years, Hubei has built up an industrial system with a wide variety of physical equipment and technical capabilities. The province's 1979 total output from industry and agriculture reached 28,539 million yuan. This figure yields an average annual growth rate of 8.6% over the past three decades. Pig iron output in 1979 ranked second in the country; steel and rolled steel ranked third; cotton yarn ranked fifth; cotton cloth and printed and dyed cloth ranked fourth; the generating capacity of hydroelectric power was 1.56 million kw. for generated energy of 4,000 million kwh., ranking Hubei fourth in that category; output of automobiles and hand-tractors ranked third and fourth, respectively.

Agriculture. There has been significant growth in agriculture through constant improvement of production conditions. There are now 6,200 reservoirs, either completed and near completion, in the province, with a designed storage capacity of 47,200 million cu. m. About 62.68% of the cultivated land is effectively irrigated. The aggregate power of agricultural machinery is 9,757,100 hp. Some 34.3% of all cultivated land is worked by machine. Agricultural output value in 1979 reached 9,417 million yuan, 3.78 times that of 1949; grain output was 36,990 million catties, 3.2 times that of 1949. Cotton output was 8,951 million catties, 7.8 times that of 1949. The output of oil-bearing crops was 6,409 million catties, 2.4 times that of 1949.

With the development of the national economy, education, science, technology, and public health in the province have also achieved remarkable progress. National income has been increasing steadily, and living standards of the people have been rising progressively.

The year 1980 was one in which the people of Hubei continued to march forward under the guidance of the Third Plenary Session of the 11th

Central Committee of the Communist Party of China. People all over the province conscientiously carried out the policy of readjusting, restructuring, consolidating and improving the national economy. The readjustment of the national economy has made some progress. Relationships among major sectors of the economy have moved towards balance.

The 1980 Flood. Meanwhile, we won the battle against a great flood and stabilized the situation in the countryside. It rained heavily in Hubei from May to August, 1980, and we suffered from severe flooding. The peak flood water at Wuhan-guan was 27.76 m., which was 3 to 4 m. higher than the elevation of central Wuhan. Since Liberation, the water level reached a higher level only once — in 1954. Flooded area in Hubei was 19.5 million *mu*, or 34.6% of the province's total farmland. Out of the flooded area, there were either no harvests or poor ones on 5.9 million *mu*. Thanks to the concern of the Party Central Committee and the State Council, the people in Hubei struggled hard against the flood and made full use of a series of flood control installations built since the founding of the People's Republic to drain flooded fields. As a result, they saved the main dyke of the Changjiang River and protected industrial cities such as Wuhan, Huangshi and Shashi. The damage suffered from the flood was reduced. Compared to 1979, the total output of grain, cotton and oil-bearing crops decreased by 16.9%, 29.3% and 35.8%, respectively.

Rural Reforms. As rural economic policies and the system of job responsibility were implemented, some readjustment were made in the infrastructure of the agricultural system. Diversified production — including forestry, animal husbandry, sideline occupations and fisheries — has developed. Gross output value from commune- and production brigade-run enterprises was 10% higher than in 1979. Average per capita income from the collective economy was less than the previous year, but commune members' income from household sideline production increased. So there was a small net increase in real income over 1979.

Capital Construction. The use of investments for capital construction and the ratio of investments were readjusted. The proportion of investments used for productive construction was reduced from 74.5% in 1979 to 67% in 1980, and the proportion of investments used in non-productive construction rose from 25.5% to 33%. This included a 28% investment increase for science, culture, education and public health, and

a 46% investment increase in housing. In industry, the proportion of heavy industry decreased as the proportion of light industry went up.

Industry in 1980. As industrial output went up, income also increased. The gross output value of light industry topped 10,000 million yuan for the first time ever. In 1980, enterprises in industry and transportation throughout the province launched a movement to increase production and practice economy with a focus on saving energy and improving quality. The gross output value of industry grew substantially for three years running, reaching 22,410 million yuan in 1980 or 17.2% more than in 1979. This figure had doubled in the four years beginning in 1977. Total profits from industrial enterprises which keep separate accounts increased by 22.9% over 1979. Productivity rates rose by 12%, reaching 12,716 yuan and surpassing previous levels in history. The quality of products was improved further during 1980.

The quality of more than 20 products ranked first in comparison with comparable products all over the country. Winners of state gold and silver medals were: Type Z3040 x 16 Radial Drilling Machine, made by Shashi No. 1 Machine Tool Plant; Heaven Goose Feather Brand 28/28 Big Flowers Venetian Cloth, produced by the Wuhan Printing and Dyeing Mill; East Lake Brand Printed and Dyed Coloured Sheets, produced by the Wuhan Textile Mill; Ginjang-5 thermos bottles, produced by the Thermos Factory of Shashi; Silver Sparrow Brand 17g. Carbon Paper, produced by the Hanyang Paper Mill; Ginseng Brand Bi Yan Pian, produced by the Wuhan Zhonglian Drug Factory; Wuhan Brand Benzoic Sodium Acid, produced by the Wuhan Organic Synthetic Chemical Factory; 55-SMNVB Double Channel and Single Surface Steel Spring Plate, produced by Daye Steel Works; Wuhan Brand Compressed Vacuum Gauge, produced by the Glass and Instrument Plant of Hubei Province; Peasant-Worker Brand JT-815 Trailer, produced by the Truck Plant of the Transport Department of Hubei Province.

Factories in light industry are being developed rapidly and are producing varieties of products to meet the needs of society. Output value of light industry in 1980 was 10,700 million yuan, an increase of 23.3% over 1979. The share of the textile industry in gross industrial output value increased from 45.4% in 1979 to 47.4% in 1980. Most products increased to varying degrees, with high-grade and middle-grade goods increasing more rapidly; radios increased by 95.5% as compared with the previous year; TV sets, 75.8%; bicycles, 62.2%; watches, 57%; and sewing machines,

82.6%. We have clearly changed the situation in which too much attention was paid to the development of heavy industry without realizing the importance of developing light industry.

Experiments in Self-Management. We made achievements in some areas where we had been experimenting with economic reforms. In 1980, while concentrating on the work of economic readjustment in our province, we actively promoted the experimental work of extending enterprises' powers of self-management. As many as 290 experimental units in industry and transport extended their self-management. Prospects for these units changed greatly because of improvements in their management and strengthening of the responsibility of personnel in charge of production. The total output value of these units increased by 29% over the previous year, while profits increased by 30%. The economic results are obvious.

By adhering to the principle of exploiting advantages and avoiding shortcomings and on the basis of voluntary participation and mutual benefit, 212 economically associated enterprises of various forms were set up in Hubei. Shashi, the famous light industry city, transformed 50 enterprises into 7 companies and 5 general factories without changing either the ownership of the enterprises, the worker's original relationships or the relationships of their financial affairs. As a result of these mergers, the motivation of existing enterprises was brought into full play. In the past, several electronic instruments plants, electrical appliances factories and instruments and meter plants decentralized their management and thereby "used their neighbour's field as a drain," shifting their own troubles to others. New production was also unable to move forward. As a result, a new instruments and meter company was founded. Electric instrument production rose from 30,000 units per annum to 200,000.

In 1980, the output value and profits of 11 out of 12 economically integrated enterprises in the city increased by 27.75%, and 29.4%, respectively, over the year before. This great alliance brought about substantial growth and a new life to many enterprises which originally had difficulties in supply, production and marketing. These alliances improved enterprises seeking to merge and reformed various enterprises that were in the process of readjustment. Further, collectively run enterprises throughout the province have been growing rapidly with the implementation of the policies for the collective economy. Annual gross output value from the collectives in 1980 totalled 4,130 million yuan, 21% higher than in the previous year. Moreover, more collective commercial units, individual traders and merchants have been

recruited to help those people waiting for job assignments.

Family Planning. A new achievement in family planning was made. In 1980, Hubei strengthened the leadership in family planning and firmly coordinated the growth of economic construction with the population programme. In 1980, the province's population grew by 1.1% over 1979. Some 4,780,000 couples of child-bearing age wisely used birth-control measures. The success rate of the birth-control programme increased from the previous year's 78% to 83.5% in 1980. The 384,000 couples of child-bearing age with only one child had certificates for their single offspring.

Environmental Protection. Environmental protection has also improved. In 1980, a monthly public information programme, "Environmental Protection," reached all residents. Moreover, the provincial People's Congress, the provincial government and the provincial People's Political Consultative Conference organized an inspection team. The team laid special stress on examining large factories and mines in six cities with concentrated industries. The provincial people's government published temporary provisions for collecting fees from the enterprises for work in draining polluted water, stopping gas pollution, and disposing of garbage and dangerous chemicals. Hubei conscientiously managed programmes and installations which counteracted environmental pollution and at the same time we required projects of new construction, rebuilt construction and extension construction to carry out the above measures. We strictly observed environmental design guidelines, construction demands and production mandates across the board.

As information efforts were combined with economic measures, the problem of pollution from factories near residential areas, natural water sources and tourist spots decreased. About 65% of the boilers in Huangshi, a city with severe air pollution, were changed with the aim of eliminating smoke and dust. These boiler conversions radically decreased air pollution.

Finance and Commerce. Finance and trade registered remarkable increases, and the people's living standards progressively improved. Revenues of the province in 1980 were 3,382 million yuan, 12.5% higher than in 1979. Operating expenditures decreased. Income was 719 million yuan more than overall expenditures. Commodities for purchase, sale and storage in the province increased. The total volume of retail sales for the whole year (not including sales by peasants to non-agricultural

residents) was 9,710 million yuan, 16.7% higher than in 1979. The total value of commodities purchased for foreign trade increased by 33% over the preceding year. The total value of exports increased by 11.3%.

People's Livelihood. With the development of the economy, the people's living standards improved steadily. The total outlay for wages in the province was 3,500 million yuan, an increase of 15.1% over the previous year (after deducting price adjustments). The income of most workers increased. A total of 308,000 people were given jobs in the cities and towns. Some 5,350,000 sq. m. of floor space for workers and staff housing in units owned by the whole people were constructed, a 30.5% increase over 1979.

Research and Education. Science and education also made progress. There were 255,000 scientific and technical workers in the province. There were 580 scientific research institutions at the county level and above, with 15,000 scientific research personnel. There were 57 institutions of higher learning, with 73,000 students; 1,356 post-graduates and 16,842 faculty members (including 1,957 professors and associate professors, 7,238 lecturers and 7,647 assistants). Wuhan University, Central China Engineering Institute, Wuhan Cartographical Institute, Wuhan Institute of Water Conservation and Power, Wuhan Institute of Building Materials, Wuhan Geological Institute, and Central China Agricultural College are Hubei's key institutions of higher learning.

Problems and Prospects for Future Development

For more than 30 years since the founding of the People's Republic of China, Hubei's economy has witnessed great development. Problems still exist, however, stemming from disproportions in the national economy resulting from doing things against objective economic laws. Such problems include the following: the scale of capital construction is over-extended and its scope is too wide, while the proportion for non-productive construction investment is too small; plant construction has been redundant and not clearly directed. Further, the production of the means of consumption lags behind that of the mean of production, while agriculture lags behind industry. Also, the structure of both industry and agriculture is out of proportion. The quantity and quality of light industrial products cannot meet market needs. And business management remains at a low level.

Within a certain period, the focus of attention in readjusting the national economy in Hubei Province should be to balance the relationship between the two major sectors of the national economy. This will cause social production to adapt to the demands of social consumption and will help all branches of the province's national economy to progress toward a more coordinated development programme.

The scale of capital construction should be reduced and controlled according to the dictates of the national plan. The direction of investment should be adjusted so as to produce better results. In accordance with the need to rationally readjust the structure of agriculture, light industry and heavy industry, investments in industry should first be assured, after which agricultural investments should be appropriately increased; at the same time, expenditures for education and science should be increased. The investment method formerly used neglected agriculture to the advantage of industry, thereby squeezing light industry to the benefit of heavy industry. This approach paid more attention to capital construction than to production, leading to high accumulation and low efficiency. This tendency must be changed. In using investment funds, the demand for equipment renovation and technical transformation should be assured, so as to operate existing enterprises in a more satisfactory way.

So as to develop agriculture in an all-around way, we must continue to implement rural economic policies, perfect those systems of responsibility and management which are suited to the level of development of agricultural productive forces, actively spread the results of research in agricultural science, and strive to use scientific methods to enhance the level of planting. Further, we must insist that large and medium-sized cities link up with mining operations and other enterprises for the purpose of boosting agriculture; we must fortify ourselves to fight natural calamities so as to achieve a good harvest in 1981. We must increase research and education, proceeding from natural conditions in the whole province, and in this way do a good job of planning for agricultural districts; adjust measures to local conditions so that they are managed according to classifications; and rationally transform the structure of agricultural production.

We should do an especially good job in construction of rice/cotton bases on the Jiangnan Plain and other bases for industrial crops. We should strive to change gradually the long-established heavy industry-light industry-agriculture priority structure in Hubei into a new structure that emphasizes agriculture as the base

with a well-coordinated structure of agriculture, light industry and heavy industry.

We should strive to speed up the development of light industry. As an important province for cotton production, Hubei normally accounts for 20% of the country's total cotton output. Hubei has ideal conditions for textile industry development and has a wealth of resources suited to the development of light industry. Moreover, it has clear superiority in metallurgy industry, machinery and power. All of these factors offer good conditions for the development of light industry.

We must persist in implementing the policy of developing light industry, tapping the potential, renovating and transforming existing enterprises, adjusting the structure of production and increasing marketable products, improving production management, practicing economy and pursuing good economic results, and promoting industrial organization and consolidation. It should then be entirely possible to raise the proportional value of light industrial output within the total value of industrial output in Hubei from last year's 47.7% to 50% in 1981.

Under the premise of facilitating adjustment and enlivening the economy, we should speed up

the pace of industrial reorganization and consolidation in light of the principles of specialization and cooperation. We should overcome the ideas of "big and all-embracing" and "small but all-embracing," break the boundaries of different branches, areas and ownerships; and fully utilize economic measures and necessary administrative intervention to create conditions for accelerating industrial reorganization and consolidation.

In line with the national programme, we must gradually consolidate and improve the coordinated activities of enterprises. Proceeding from actual conditions, we must first form loose combinations in order to increase production of light industrial products, daily necessities, and scarce items required by society. Then we must gradually consolidate and strengthen these combinations. Industrial reorganization and consolidation should be stressed in six cities: Shiyang, Huangshi, Shashi, Xiangyang, Yichang and, particularly, Wuhan. Through industrial reorganization and consolidation, we will be able to make full use of the resources of our province, and further mobilize Hubei's more than 20,000 existing enterprises to make greater contributions to socialist modernization.

69. ECONOMIC DEVELOPMENT IN HUNAN PROVINCE

By the Research Division, General Office,
Hunan Provincial People's Government

Geography, Population and Resources

Population and Administrative Divisions. Hunan Province covers an area of 204,300 sq. km. with a population of 52.31 million, of whom 4.49 million live in cities and towns and 47.82 million are rural inhabitants. The province is subdivided into ten prefectures, one autonomous prefecture, five municipalities under the direct jurisdiction of the provincial government and 99 cities.

Geography and Climate. Hunan enjoys favourable conditions for economic development. Located south of the Changjiang River and north of the Wuling Mountains, the province benefits from a subtropical climate with plenty of rain, a long frost-free period, an annual mean temperature of 16° – 18° C., an annual mean precipitation of 1,300 to 1,700 mm. and 1,300 to 1,900 hours of sunshine a year. Its terrain is composed of 13.3 million hectares of mountains, 3.44 million hectares of farmland and 1.33 million hectares of water surface. Both water and land transportation are well developed; the Xiangjiang, Zishui, Yuanjiang and Lishui rivers flow north into Dongting Lake; the Beijing-Guangzhou, Zhijiang-Liuzhou and Changsha-Guiyang railway lines crisscross the province; and a network of highways extends to every nook and corner.

Agriculture and Natural Resources. Richly endowed in natural resources, Hunan has long been known as a "land of rice and fish" and a "centre of nonferrous metals." Sizeable reserves of 70 minerals have been verified. Hunan's deposits of tungsten, bismuth, antimony, realgar and fluorite are the largest in China, and those of lead, zinc, manganese, molybdenum, beryllium, mercury, sulphur, phosphorus, kaolin and diamonds are also quite significant. The more than 4,000 rivers and streams in Hunan have a total power-generating capacity of 13 million kw. Timber reserves are estimated at 180 million cu. m. and bamboo reserves at 890 million sticks. There are some 5,000 species of plants, including 2,000 kinds of trees. The main farm crops and sideline products include rice, cotton, tea, ramie, tobacco, citrus fruit, oil-bearing seeds, hogs and aquatic products. There are also plenty of wild animals and plants. Among the best-known local products are Hunan embroidery, ceramics, fireworks and

firecrackers, leather, bamboo carvings, feather and down products, tung oil and lotus seeds.

Survey of Economic Development Since 1949

Hunan was economically backward before it was liberated in 1949. At that time, the total value of industrial and agricultural production stood at only 1,902 million yuan, of which 1,584 million yuan came from agriculture and 318 million yuan came from industry. Farming conditions were poor and yields were extremely low. There were neither farm machines, nor large reservoirs, and the province was constantly pestered by flood, drought, insects and plant diseases. Total grain output reached only 6.4 million tons, averaging 1,940 kg. per hectare. Total cotton output came to only 7,000 tons, averaging 120 kg. per hectare. Production and average yield of the other crops were also very low.

There was little industry to speak of in 1949. The province had only 24 state-owned and joint state-private enterprises. All other production took place in 1,376 poorly equipped private workshops and 193,000 households of individual handicraftsmen. Transport, postal and telecommunications services were also quite underdeveloped. Thirty-seven counties had no motor roads and there were no telephones in the countryside.

Following Hunan's liberation in August 1949, land reform was initiated, the new democratic revolution was completed and industrial and agricultural production revived under the leadership of the Communist Party and the People's Government. This was followed by the systematic socialist transformation of the system of ownership of the means of production and tremendous efforts to expand production and construction. There was considerable economic progress despite momentary diversions and setbacks. Important successes were achieved in capital construction, farming conditions were greatly improved and a definite industrial infrastructure was laid.

Capital Construction. The province spent altogether 20,840 million yuan on capital construction between 1950 and 1979, increasing the value of fixed assets by 13,370 million yuan. Its reserve funds were used primarily to develop agriculture

and those branches of industry serving agriculture. A great deal of work was done to dredge Dongting Lake, build reservoirs in mountainous and hilly areas, develop electrically powered irrigation and drainage facilities in lake areas, and construct small water conservation and hydropower projects in hilly areas, greatly improving irrigation, drainage and power supply in the countryside.

By the end of 1979, Hunan had completed 20,175 water conservation projects, 317 of which were large or medium-sized. The total generating capacity of small hydropower stations was 640,000 kw. The total volume of water stored, channelled and pumped rose from 2,100 million cu. m. in 1949 to 29,800 million cu. m., and the area of irrigated land grew from 1,358,600 hectares in 1949 to 2,416,000 hectares, or 71.1% of the farmland in the province. Farmland with stable yields despite drought or excessive rain increased from 268,000 hectares in 1949 to 2,220,000 hectares, or 65% of total farmland. By 1979 some 60,000 hectares were irrigated by sprinklers.

Farm machinery in the province had a combined capacity of 6.87 million hp. in 1979, and irrigation, drainage, threshing, plant protection and the processing of farm and sideline produce were for the most part mechanized or semi-mechanized. The amount of chemical fertilizers used totalled 3.25 million tons a year, averaging 945 kg. per hectare.

Industry. In industry, a number of new branches and key projects were established. At the end of 1979, the province boasted 20,198 industrial enterprises, with a combined staff of 1.68 million and total fixed assets worth 13,800 million yuan. Of these enterprises, 3,576 were state-owned, with a combined staff of 1.184 million. Major industrial products included metals, coal, electric power, basic chemicals, building materials, heavy machinery, tractors, electronic instruments and meters, cotton yarn and cloth, chemical fibres, cotton knitwear, soap, cigarettes, salt, pesticides and plastic sheets for farm use. Hunan's non-ferrous metals, cement, chemical fertilizer, paper, ceramics and linen textile industries occupied an important place in the national economy.

Transportation and Communications. Rapid growth also occurred in transport, posts and telecommunications. The total length of railways in operation in the province grew from 950 km. in 1949 to 2,255 km. in 1979, while highway mileage increased from 3,142 km. to 59,541 km. In the 30-year period, the total volume of freight carried by water and land increased about 20 times. By 1979, telephone services were available in 99.9%

of the commune offices and 80.8% of the production brigades.

Industrial and Agricultural Production. The province's total agricultural output value in 1979 reached 9,416 million yuan, which was 3.87 times the 1949 figure and represented an average annual rate of increase of 4.6%. Total grain production increased 3.46 times to reach 22.18 million tons, for a 4.2% annual rate of increase. Total cotton output increased 13.4 times to reach 93,500 tons, for a 9% annual rate of increase. The number of live pigs sold increased 8.55 times to reach 16.25 million, for a 7.4% annual rate of increase. Output of vegetable oils, bast fibers, cured tobacco, tea, citrus fruit and aquatic products all went up by a wide margin. Commune-run enterprises earned a total of 2,897 million yuan, accounting for one-quarter of the revenues of the communes and their subdivisions. Hunan's total industrial output value in 1979 amounted to 15,306 million yuan, which was 56 times what it was in 1949 and represented an average annual growth rate of 14.4%. Of this total, light industry production came to 5,948 million yuan, an increase of 26.3 times, representing an annual growth rate of 11.5%; and heavy industry production accounted for 9,359 million yuan, an increase of 203.5 times, for an annual growth rate of 19.4%.

Over the last 30 years, the province's industrial enterprises have contributed altogether 20,000 million yuan to the nation's total accumulation, of which more than 8,000 million yuan was net income after deduction of state investment.

Finance and Commerce. With the rapid growth of revenues, domestic and foreign trade have expanded steadily. The province's total revenues in 1979 reached 2,863 million yuan, which was 7.03 times the 1952 figure and represented an annual growth rate of 7.2%. Total revenues over the last 30 years came to 35,290 million yuan, of which 7,528 million yuan was turned over to the state treasury and the rest used to cover the province's own expenditures. Total purchases of commodities in 1979 equalled 7,740 million yuan, which was 11.2 times the 1952 figure and represented an annual growth rate of 9%. Retail sales amounted to 7,780 million yuan, 8.2 times the 1952 figure, for an annual growth rate of 7.7%. The total value of exports reached US\$223 million, 7.7 times the 1952 figure, for an annual growth rate of 7%. The varieties of export commodities increased from a dozen to 323, and the number of countries and regions buying from Hunan increased from 10 to 86.

Science and Technology. Considerable pro-

gress was made in science and technology as well, with the establishment of a number of new scientific and technological departments. Statistics at the end of 1979 showed that the province had 565 research institutions at or above the county level and a total of 216,700 scientific and technical personnel, including 9,800 professional research workers. During that year, the province issued awards for 265 scientific and technological achievements, including the cross-breeding of rice and theoretical studies in mechanics.

Income and Livelihood. The people's standard of living was improved. Hunan's state-owned enterprises had a combined staff of 2,993,600 at the end of 1979, or 5.95 times the number in 1952. The workers' annual wages averaged 644 yuan per capita, 2.06 times the 1952 figure. The state has invested a total of 1,186 million yuan in housing construction for workers in the last 30 years, and the houses built had a total floor space of 20.95 million sq. m. The peasants' annual per capita spending increased 2.26 times, from 64.4 yuan in 1952 to 145.7 yuan in 1979. Average grain consumption per capita rose from some 150 kg. in the early post-Liberation years to 287 kg. in 1979. The average commune members' net income was 92.3 yuan in 1979. All this was a sharp contrast to the peasants' miserable plight before Liberation.

Review of Economic Developments in 1980

Hunan scored new successes in economic construction in 1980 by continuing to carry out the policy of readjustment, restructuring, consolidation and improvement of the economy and by adopting flexible measures to stimulate the economy. The province's total industrial and agricultural output value stood at 26,154 million yuan, a 4.6% increase over 1979.

Agriculture. The rural communes reaped a good harvest after overcoming serious natural adversities. The province was plagued with abnormal weather conditions in 1980 — low temperatures and excessive rain in the spring, floods in the north and drought in the south during the summer, and frequent windstorms and hailstorms. Natural calamities affected 1.33 million hectares of farmland, resulting in a complete loss of crops on 270,000 hectares. The damage, however, was greatly reduced as a result of the implementation of the Communist Party's new policies for the rural economy: including greater decision-making power to the production teams and the introduction of various systems of responsibility in production, which fired the commune members'

enthusiasm. Total grain output in 1980 came to 21.24 million tons, the second highest yield since the founding of the People's Republic. Although somewhat smaller than the 1979 harvest, the 1980 harvest was 369,000 tons more than that of 1978, which was also a good year.

A notable development in agriculture was the emphasis given to crop diversification, an encouraging step toward changing the age-old one-crop farming economy. The distribution of cash crops was readjusted and a number of centres producing cotton, oil-bearing crops, bast fibres, tea, citrus and sugarcane were established. The provincial government appropriated 200,000 tons of food grain to aid the peasants in these centres, earmarked 15 million yuan for the construction of sprinkler irrigation and other such facilities, and raised proportionately the purchasing prices of certain farm and sideline products.

These measures boosted the production of cash crops. Now, 1.4 million hectares of forest land in Hunan have been cultivated to produce tea, oil, tungoil, citrus fruits and tea, while another 586,000 hectares of farmland have been sown with various cash crops. Total earnings from the diversified economy in 1980 exceeded those of the previous year by 122 million yuan. All cash crops showed increases, except for oil-bearing crops, fruits, tobacco, jute and ambary, which were seriously damaged by natural calamities. Cotton output reached 96,245 tons, up 2.7%; tea, 60,835 tons, up 6%; sugarcane, 733,800 tons, up 10.6%; and silkworm cocoons, 2,110 tons, up 30.6%. In 1980, there was also considerable growth in forestry, animal husbandry, sideline occupations and fishing. An additional 245,000 hectares of barren land were planted with trees, 4% more than in 1979.

Animal Husbandry. The number of pigs raised in 1980 was 38 million, an increase of 1.7% over 1979. Of this number, 17.78 million live pigs were sold, an increase of 9.4%. The number of sheep raised went up by 44,100; the number of domestic fowls rose by 3.69 million; and output of aquatic products reached 159,000 tons, up 14.5% from 1979 and 6% from the previous peak year of 1959.

Industry. Industrial production continued to grow, with rapid progress especially in the light and textile industries. Despite the tight energy situation and the serious shortage of work and raw materials for a number of enterprises, Hunan's industry managed to meet its targets by enlarging the enterprises' decision-making power, organizing their cooperation and integration, extending their scope of production, applying market regulation, improving product quality and business manage-

ment, and encouraging contributions to the modernization programme. The total industrial production of the province in 1980 was 16,840 million yuan, an 8% increase over 1979. Economic performance was also improved, and the locally-administered state industrial enterprises turned in 1,237 million yuan of profits, 8.15% more than the previous year.

Emphasis was placed on the expansion of the light and textile industries, which were provided with more raw materials, fuel, power and funds. The central and provincial authorities invested a total of 220 million yuan, 46% more than in 1979, or the greatest single annual outlay since 1949. The provincial authorities spent US\$13 million out of their foreign exchange reserves for imports of raw materials badly needed by the light and textile industries. Machinery and defence industry plants began to change their lines of production to serve the needs of agriculture and the light and textile industries, as well as to turn out durable consumer goods. Total output value of the province's light and textile industries in 1980 came to 7,075 million yuan, an increase of 18.3% over 1979, greatly exceeding the growth rate of heavy industry. The proportion of light and textile industries in total industrial production rose from 38.3% in 1979 to 42%. All light industrial and textile products except detergents and electronic products for civilian use exceeded their targets, and both their quality and variety showed improvement.

Heavy industry cut down on items that were overproduced and expanded those in short supply, with a slight increase in total output. Communications and transport met by and large the needs of industry and agriculture as well as the personal needs of the people. New progress was also made in the postal and telecommunications services, geological prospecting, surveying and mapping.

Capital Construction. The scale of capital construction was curtailed and efforts were made to tap the potential of existing enterprises, to update and renovate their techniques and facilities. Appropriations for capital construction were 31.7% less than in 1979. Seventy-eight projects, each requiring an investment of 100,000 yuan or more, were either cancelled or deferred, saving a total of 230 million yuan.

Available financial and material resources were used in a relatively concentrated way to accelerate the construction of major projects. Eight key industrial projects were completed and put into operation and 810 enterprises underwent technical renovation or transformation, thereby increasing the province's total industrial production capacity by 1,200 million yuan. The new

projects included two pairs of coal shafts with a combined production capacity of 120,000 tons a year, power-generating units with a total capacity of 178,000 kw. and 358 kw. of transmission lines of 110 kilovolts or higher. Transmission lines connecting Hengyang and Zhuzhou were completed and the power grids in southern and northcentral Hunan were linked up.

Finance and Commerce. Revenues and expenditures balanced with a small surplus, and new increases were gained in home and foreign trade. The new system of "apportioning local revenues and expenditures between the central and local authorities and holding each responsible for its own profit and loss" aroused enthusiasm at all levels for improving finance and promoted the movement to increase revenues and cut back expenditures. Total revenues in 1980 amounted to 2,986 million yuan, topping the annual target and exceeding the 1979 figure by 4.3%. Total expenditures came to 2,344 million yuan, 6.9% less than in 1979. Savings deposits in town and country totalled 1,020 million yuan toward the end of 1980, an increase of 326 million. Total purchases of commodities reached 8,748 million yuan, up 13% and total retail sales, 9,232 million yuan, for a 17.3% rise. Total purchases of export commodities were 1,139 million yuan, up 25% from 1979. Thanks to the expansion of export business handled by the province itself, total exports equalled US\$314 million, a 41% increase over the previous year. Foreign exchange earnings from processing imported materials, compensation trade and tourism also increased.

The collective economy grew rapidly in both town and country, and the individual economy began to revive and develop. Policies were formulated for expanding collective enterprises in industry, commerce and service trades, and the government provided assistance in the form of investments, loans, tax benefits, supplies of raw materials and purchases of products. This promoted the rapid growth of collectively run industrial, commercial, repair and service establishments. By the end of 1980, well over 100,000 collective enterprises had been established in cities and towns across the province.

The distribution of commodities was greatly accelerated as a result of the coexistence of enterprises belonging to different systems of ownership and forms of business. Collective commercial and service units in the province numbered 7,419, with a combined staff of 53,496. More than 10,000 individual peddlers, repairmen and service workers were licensed in cities and towns. The 190 farm produce markets in 14 cities increased their transactions by 73.8%, while the 1,984 village fairs

increased theirs by 34%. Rural household sideline occupations, such as raising cattle, sheep and rabbits, and bee-keeping, weaving and embroidery also developed extensively.

Science and Technology. New achievements were reported in science and technology, with an impressive growth in research institutions and technical personnel. Twenty-seven research institutions (16 of them independent ones) were established at the provincial or prefectural (city) levels, and 720 professional research workers added. Altogether, there were 268,000 scientific and technical workers in the province, including both professionals and non-professionals. More than 2,400 people were promoted to the position of engineer or chief engineer, and some 7,100 scientific and technical workers and college graduates who had not been properly employed were given jobs in research units. The province produced 440 major scientific and technological results in 1980.

Standard of Living. Great efforts were made to improve the people's standard of living. To help the people in areas stricken by natural calamities, the central and provincial authorities earmarked 72.8 million yuan for relief work, issued 10 million yuan of interest-free loans, allocated 14,000 cu. m. of timber, 350,000 sticks of bamboo and large amounts of grain, cooking oil, sugar, cotton, cloth and other daily necessities and building materials, and reduced or remitted some of the purchase and taxation quotas in the stricken areas. Commune members' income from collective sources decreased slightly because of the natural calamities, but their income from domestic sideline occupations increased markedly. Investigations of 327 households in 26 counties revealed that commune members' income from domestic sideline production averaged 88.4 yuan per capita, 29.3 yuan more than in 1979. The standard of living of urban inhabitants also improved. A total of 208,400 jobless people were employed in the province. The total wage bill increased by 20.7%. Most workers and city dwellers increased their income as a result of either pay raises for some of the workers, the increase of employment and the issuance of bonuses. The central and local authorities and enterprises spent a total of 404 million yuan on housing construction, and new houses with 4.1 million sq. m. of floor space were completed. The provincial government also appropriated 2.4 million yuan and 1,400 hectares of land for building suburban vegetable centres.

Current Problems and Goals for Future Development

Hunan's economy continues to be plagued by a number of problems of long standing which have not yet been satisfactorily resolved. The main problems to be tackled are as follows: (1) the deep-rooted influence of "Left" thinking, which has not been eliminated and which is hampering the implementation of the policy of readjustment; (2) the imbalance between various sectors of the economy which has not been corrected — agriculture, the light and textile industries and energy remain the weak links — and the irrational structure of industry, as well as of the composition of products and the organization of enterprises; (3) the lack of production tasks for 20% of the enterprises, mainly those in the machine-building and defence industries; (4) the low standards and inefficiency of management in industrial production and capital construction, which has resulted in a slackening of the system of control through planning and centralized leadership (e.g., certain localities have inappropriately expanded industries for processing farm and sideline produce, giving rise to the situation in which small and less-developed enterprises are squeezing out the large and technologically advanced ones); and (5) many problems related to the people's livelihood, such as the inadequate supply of vegetables to cities and towns, shortages in housing and transport, environmental hazards, unemployment and inadequate educational facilities. All of these problems call for immediate solution.

The overriding task for Hunan's economy in the immediate future is to continue to concentrate on readjustment. Hence, it is imperative to eliminate the "Left" influence and draw up the province's sixth five-year plan and ten-year programme with an eye on the actual conditions in Hunan. Emphasis should be laid on restructuring the irrational economic set-up and further strengthening the weaker elements, such as agriculture and the light, textile, electronics, building materials and energy industries, communications and transport. While continued efforts are needed to increase grain production, steps must also be taken to make full use of the province's mountainous areas and water surfaces for the expansion of forestry, animal husbandry, sideline occupations and the fishing industry, giving attention to the improvement of production conditions and raising the average yield. Reorganization and integration in industry should be carried out with a view to expanding the production of consumer goods, turning existing fixed assets to better

account and tapping the potential of existing enterprises. Scientific research should serve the economic readjustment by developing and designing important products and products currently in short supply, and by popularizing new techno-

logies, processes and materials. Continued steps should be taken to readjust the ratio between accumulation and consumption, and efforts should be made to resolve the problems relating to the people's standard of living wherever possible.

70. ECONOMIC DEVELOPMENT IN THE INNER MONGOLIA AUTONOMOUS REGION

By the General Office,

Inner Mongolia Autonomous Region People's Government

Geography and Population

Population and Administrative Divisions. Founded on May 1, 1947, the Inner Mongolia Autonomous Region was the first region to be granted national autonomy under the People's Republic of China. According to the 1980 census, the region had a total population of 18.765 million, of whom 2.09 million were Mongolian, and the rest were divided between Hans — who made up the majority — and several other minority nationalities. The total area of the region is 1.183 million sq. km. The region now administers nine leagues (administrative divisions of the region) and three municipalities, which are subdivided into 99 banners (administrative divisions at the county level), counties, cities and districts. The capital of the region is Hohhot.

Location. The Inner Mongolia Autonomous Region is situated on China's northern border, in the shape of a long narrow strip extending from northeast to southwest. It is bounded on the east by the provinces of Heilongjiang, Jilin and Liaoning, on the west by Gansu Province and the Ningxia Hui Autonomous Region, on the south by the provinces of Hebei, Shanxi and Shaanxi, and on the north by Mongolia and the Soviet Union.

Geographic Characteristics. The entire region is on a plateau with an elevation ranging from 1,000 m. to 1,500 m. above sea level. In its eastern part stand the Daxingan Mountains covered with dense woods; traversing the central part from east to west are the Yinshan Hills, the great bend of the Huanghe River and the Tumd Plain; in the south lie the Ordos Highlands, and in the west is the vast expanse of the Tengger Desert.

Climate. The whole region is under a continental monsoon climate of the temperate zone, with a long winter and short summer. The mean annual precipitation is 300 mm. and the frost-free period in a year is 150 days.

Agriculture and Natural Resources. The Inner Mongolia Autonomous Region is richly endowed with resources. As one of China's main bases for animal husbandry, it has 88 million hectares of grassland which account for 30% of the country's

total pastureland. Grasslands such as Hulun Boir, Xilin Gol, Ulanqab, Ordos and Horqin, are all famous natural grazing grounds. Sheep, cattle, horses and camels are the main animals being bred. The "Sanhe horse," "Sanhe cattle," "Inner Mongolia fine wool sheep," "Ujumqin cattle" and "Ujumqin sheep" are all well-known within and outside the region. The cultivated area of the region is 5,252,000 hectares.

The Hetao (Great Bend of the Huanghe River) Plain, with vast expanses of fertile land and a crisscross network of irrigation channels, is an important grain producer for China. Other important grain producers are the Horqin Plain of the Liaohe River valley, the Tumd Plain of the Huanghe River valley, the Yinshan Hills and the areas east and south of the Daxingan Mountains. The main varieties of grain are wheat, naked oats, millet, sorghum, maize and potato. Industrial crops are soybeans, linseed plant, rapeseeds, sunflower seeds and beets. The region offers a wide range of native and special produce, such as mushrooms, hedgehog hydnum, black moss, hoanchty, licorice root, fennel, black melon seeds, Hetao honeydew melon, goat's blood, Chinese ephedra and Herba boschniakiae, all enjoying a good reputation within China and abroad.

The region is also rich in forest and mineral resources. The Daxingan Mountains have more than 13 million hectares of natural forests, their timber reserves accounting for one-sixth of the national total. Over 60 types of minerals have been located in the region, distributed in more than 500 deposits. The reserves of rare earth minerals in the region rank first in the world, and the deposits of niobium and natural soda are the biggest in China. The coal reserves rank second in the country with four coal fields each having a deposit exceeding 10,000 million tons. The deposits of gold, mica, asbestos, chromium, iron, copper, zinc, lead, salt and mirabilite are all important for the country's livelihood.

The major rivers within or running through the region are the Huanghe, the Xiliaohe, the Ergunhe and the Nenjiang with a combined length within the region of 3,472 km., draining an area of 614,700 sq. km. Their combined average annual flow is 66,700 million cu. m. In addition, there are lakes such as Dalai Nur, Daihai, Ulanusuhai Nur, Qagan Nur and Lamawan. These lakes, with a total

area of approximately 357,000 hectares, teem with many varieties of fish.

Survey of Economic Development Since 1949

The Inner Mongolia Autonomous Region has been an inalienable part of China's territory since ancient times, when Chinese minority nationalities — Xiongnu, Linhu, Loufan, Donghu, Wuhuan, Xianbei, Rouran, Tujue, Huihe, Khitans, Nuzhen, Tanguts, Mongols — and the Hans began to labour and live in this part of the motherland. However, in the disaster-ridden old society, the people of the various nationalities, the Mongolians in particular, lived in misery under the class and national oppression imposed by the ruling classes of the successive dynasties. The rich natural resources could not be exploited and utilized. After the Opium War, the imperialist powers, in collaboration with the traitorous warlord government and the traitors from the Han and Mongolian peoples, stretched their tentacles into Inner Mongolia and greedily plundered the natural resources of the province and the property of its people. In an area where once "Vast was the sky, boundless the wilds and cattle and sheep were everywhere in sight when grass inclined in a breeze," the pastures deteriorated and livestock died in large numbers. The economy and culture of the region remained extremely underdeveloped. Diseases of all kinds ran rampant, reducing the population of the Mongolian and other minority peoples year by year. When the Inner Mongolia Autonomous Region was founded, the combined output value of industry and agriculture was only 525 million yuan, of which agriculture accounted for 90%, light industry 8.3% and heavy industry 1.7%.

After the establishment of the Inner Mongolia Autonomous Region, and particularly after the founding of the People's Republic of China, the people of the various nationalities in the region united to work together with one heart under the leadership of the Communist Party and the people's government and with the guidance of the party's policies for nationalities. Following the smooth accomplishment of democratic reform in the pastoral areas and land reform in the farming areas, they carried through the socialist transformation of capitalist industry and commerce, and of handicrafts and agriculture in 1956, thus establishing a new, socialist organization of production in town and country. This promoted a rapid and vigorous development of economic and cultural construction. Inner Mongolia, once poor, backward and ravaged, is now a socialist region of national autonomy with growing prosperity.

Agriculture. Agricultural production which includes farming, forestry, animal husbandry, sideline occupations and fishing, is of primary importance to the region's economy. According to 1979 statistics, the total output value of agriculture, which made up 35% of the combined output value of industry and agriculture, was 2,850 million yuan, 3.29 times that of 1949. Grain output was 5.1 million tons, 2.76 times that of 1949. The total number of livestock was 39.02 million head, four times that of 1949 or an average increase of 4.2% a year, and the percentage of the total output value of animal husbandry as compared to the gross output value of agriculture grew from 20.3% in 1949 to 29.3% in 1979. There was also a marked improvement in the quality of the animals. Improved breeds of sheep accounted for 49.4% of the total. In a 31-year period, the region delivered to the state 423,000 tons of meat, 270,690 tons of wool, 58.54 million furs and pelts, and 2,343,000 draught animals, totalling 3,750 million yuan in value, thus making a contribution to the economic construction of the motherland. In addition, fairly rapid advances were also made in forestry, production of oil-bearing crops and beets, and fishing.

Over the past 30 years, the conditions for agricultural production have been greatly improved. In 1979, the region had 5,466 million hp. in machinery for agricultural and stock-raising use and 1.28 million hp. in drainage and irrigation machinery for rural use — 55 times that of 1959. The number of major tractor-drawn farm implements totalled 42,000, 13.5 times that of 1959. At present, every production brigade owns an average of 2.6 large and medium-sized tractors. One-third of the region's farmland is ploughed by machinery. Grain processing and fodder crushing have been basically mechanized.

As a significant improvement of the transport and communications facilities, carrying of loads on human backs, on horseback and with barrows is giving way to the use of horse-drawn rubber-wheeled carts, tractors and lorries. The numbers of lorries and rubber-tired carts were 44.8 times and 10.2 times, respectively, those of 1959.

In the expansion of water conservation works, effective irrigation was extended to an area of 1.18 million hectares by 1979, 4.5 times that of 1947. The consumption of electricity and chemical fertilizers in the farming and grazing areas increased greatly. Good progress was made in the development of hailstorm dispersion and cloud seeding techniques. All of this effectively promoted agricultural production.

Agricultural production in the Inner Mongolia Autonomous Region has the following features:

(1) With a long winter and short summer, a large amount of sunshine, a high annual cumulative temperature and a wide temperature range between day and night, the region is suitable for the growing of grain crops with a relatively short growing period and industrial crops such as linseed plants and beets.

(2) The vast territory of the region has diverse natural and economic conditions, requiring that farming, animal husbandry and forestry should be developed in a manner suitable to local conditions. Most areas in the region are suitable for growing trees and grass. This should be considered as the fundamental way to improve the natural conditions for agricultural production and to ensure a steady growth of agricultural output in the region.

(3) The vast expanses of natural pastureland provide exceptional advantages for developing animal husbandry. Even in farming and semi-farming areas, favourable conditions are also present for developing animal husbandry. Efforts should be stepped up to improve the grasslands, increasing their capacity to support animals and to produce animals for market, so as to supply more raw materials to light industry and increase the share of animal husbandry in the combined output value of industry and agriculture. This will ensure a greater role to animal husbandry in the national economic construction.

(4) Native and special products and rare birds and animals command a considerable share of the region's exports. Products such as licorice root, Chinese ephedra, black moss, honeydew melon and hoantchy, all sell well on foreign markets. Production of such products should be encouraged through better management, proper utilization of all resources and by giving full play to those areas not able to produce these products. This policy will not only bring life to the economy in the farming, pastoral and forest areas, and improve the welfare of the people there, but also promote foreign trade.

Industry. The Inner Mongolia Autonomous Region has built industry to its present size almost from scratch. In the early period following the establishment of the autonomous region, the industry was limited to power plants for lighting, coal mines for home fuel, and grain processing and fur processing workshops. The fixed assets of industry at that time were only a little over 20 million yuan. After 31 years of efforts, the region has established such large and modernized enter-

prises as the Baotou Iron and Steel Company and many nonferrous metals enterprises as well as small and medium-sized iron and steel plants. Coal, electrical power, forest, machine-building, chemical, electronics, building materials, light, textiles and defence industries have all been added and developed rapidly. Rapid progress has also been made in the modernized production of woollen textiles, dairy products, processed meat and leather and felt goods. As compared with 1947, the output of coal increased 65 times to 22.75 million tons in 1979; electricity, 339 times to 4,400 million kwh.; timber, 62 times; salt, 7.5 times; and leather, 13.8 times. The output of dairy products in 1979 was 3,776 tons, 64 times that of 1950 when the dairy industry was started; and output of woollen fabrics was 2.991 million m., 1,495 times that of 1952 when the production was in its initial stages; sugar output (machine-made) was 45,668 tons, 5.5 times that in the initial stages in 1955. The region began to produce steel, iron, cement and chemical fertilizer for agriculture in 1958. By 1979, its output of steel had reached 1.21 million tons, an increase of 173 times; of pig iron, 1.21 million tons, an increase of 24 times; cement, 1.03 million tons, an increase of 3,452 times; and chemical fertilizer for agricultural use showed an increase of 235 times. Statistics show that the total number of industrial enterprises in the region in 1979 was more than 7,000, almost 11 times the 1947 figure; the total workforce in the industrial branch was 681,000, up 70 times; the total output value of industry reached 5,290 million yuan, up 116 times from 1947; and the original value of fixed assets was more than 9,000 million yuan.

The major characteristics of industrial production in the Inner Mongolia Autonomous Region are:

(1) Industry has advanced by leaps and bounds as a result of both the hard-working spirit of the local people who have started the various industries almost from scratch and of the energetic support from the state. The cumulative investment up to 1979 of the state in capital construction for the industrial branch exceeded 8,000 million yuan. The output of various industrial products has thus increased by between ten and a hundred times. This fully testifies to the superiority of the socialist system.

(2) Products with natural and local characteristics have a promising future for development. The woollen textile industry is a good example. Since the 1950's when this industry started, the output of knitting wool, woollen fabrics and woollen blankets has increased a great deal. Their

quality has also improved steadily and the variety of products has expanded. Of the products selected by the autonomous region as being of exceptionally fine quality in 1980, light industrial and textile products made up 70%. Some of the products were also appraised by the state as being of fine quality and have become brand-name products, with a ready market at home and abroad.

(3) The region has a large number of small and medium-sized enterprises and enterprises under collective ownership. By the end of 1979, small and medium-sized enterprises accounted for 99.7% of the total industrial enterprises in the region, and their output value made up 76.4% of the region's industrial output total; enterprises under collective ownership accounted for 73% of the region's total enterprises, and their output value made up 19.5% of the total.

(4) Quite a few enterprises located in the region are affiliated to ministries of the central government. These enterprises are well equipped, have strong technical capabilities and can be counted on to help the region better utilize its industrial potential.

(5) The region has a large number of newly-established enterprises, with great potential to be tapped further through technical innovation and transformation. In addition, these enterprises have fairly strong technical capabilities.

The development of industrial production has played an important role in transforming the autonomous region. The proportion of industrial output value to the combined output value of industry and agriculture increased from 10.1% in 1947 to 65% in 1979. The proportion of taxes from industry to the region's total taxes increased from 19.4% in 1949 to 68.6% in 1979. The cumulative taxes industrial enterprises have paid in the past 30 years and more amount to 4,600 million yuan.

Communications and Transport. Before Liberation, there were only three railways in Inner Mongolia, with a total length of 1,577 km. Trains were few and far between and operated at low speeds. After Liberation, communications and transport services developed by leaps and bounds. By 1979, the main railway lines in the region had all been connected with Beijing, the capital of the country, the Northeast, Taiyuan, and the important cities in the Northwest — Lanzhou and Yinchuan. These, plus the Jining-Erlan line for international train service, and feeder railways and sidings for the Baotou Iron and Steel Company and forest zones, have facilitated economic exchanges

within the region and between the region and other parts of the country. The total mileage for train service has increased 2.4 times and the volume of goods transported 11 times.

By 1979, there were more than 23,700 km. of highways, 12 times more than in 1947. All-weather highways, which had been non-existent, totalled 6,900 km. The volume of goods transported by highways had increased over 20,000 times and the number of motor vehicles for civilian use had increased 444 times. A network of roads now link up towns and reach farming and pastoral areas of the region.

Between 1952 and 1979, the number of postal and telecommunications offices went up 13.2 times, the overall length of postal routes increased 5.3 times, the length of long-distance telecommunication lines 2.1 times, and the number of telephones in towns 474 times. Farming and pastoral areas, which knew nothing of telephones in the past, are now serviced by 80,000 km. of telephone lines. According to the 1979 statistics, 96.9% of the communes and 89.4% of the production brigades could be reached by telephone. As a result of more than 30 years of construction, a postal and telecommunications network has been established in the region, radiating from its capital, Hohhot, to industrial enterprises, mines, various organizations and offices, farming and pastoral production brigades in all parts of the region and hooked up with the national network.

Civil aviation service was inaugurated in the region in 1958. At present six air routes for civil use are in operation, connecting the main cities of the region with Beijing, Lanzhou and Yinchuan as well with each other. The total mileage of air services has more than trebled.

Finance and Commerce. Before the establishment of the autonomous region, commercial activities in Inner Mongolia involved mainly the collecting and marketing of wools, hides, grains, various small merchandise and medicinal herbs. Rich merchants and tradesmen travelling between Inner Mongolia and other parts of the country offered cigarettes, alcoholic beverages, tea, cloth and sugar in exchange for cattle, horses, camels and sheep at an extremely unfair ratio, making exorbitant profits. Now, a unified socialist market has been set up, linking up the towns with the rural areas, and the workers with the peasants and herdsmen. The total value of goods purchased by the commercial departments has increased significantly. The net total value of goods purchased for domestic trade in 1978 exceeded 2,300 million yuan, 67.5 times more than in 1949. The value of industrial goods purchased increased more than 2,000 times and that of farm and sideline produce

grew 27 times. The volume of retail sales came to 3,915 million yuan, 38 times more than in 1949. In the purchase of livestock and by-products, the volume of sheep meat purchased in 1979 was three times that of 1953; that of eggs, twice that of 1953; the volume of cattle hides increased 3.2 times; sheep skins, 5.4 times; and wool, 5.7 times. Foreign trade has steadily developed from nothing. The value of export-oriented purchases totalled 250 million yuan in 1979 and the export volume was US\$12.62 million.

Since the establishment of the autonomous region, the difference between the prices of industrial and agricultural products has been greatly reduced. In 1947, a sheep with 18 kg. of net meat could only be exchanged for 3.68 kg. of refined sugar, less than 2.8 m. of plain white cloth, or 1.25 pieces of brick tea. In 1979, it was worth 20 kg. of refined sugar, or 33 m. of plain white cloth, or 11 pieces of brick tea. After the purchasing prices for farm and sideline produce were raised in 1979, the region's comprehensive index of rates of exchange between farm produce and animal by-products on the one hand and industrial products on the other was reduced by 15% as compared with 1978. In an effort to serve the rural and pastoral areas, the commercial departments supplied more than 5,000 million yuan worth of means of production for farming and animal husbandry to people's communes and commune members in such areas between 1952 and 1979.

Education, Science and Technology. Before the autonomous region was founded, there were only 30 middle schools and 3,700 primary schools in Inner Mongolia, and 90% of the population was illiterate. In 1979, by contrast, the region had 15 colleges and universities with a total enrollment of 15,000, 25.4 times more than in 1952. Inner Mongolia University is one of China's major universities. As compared with 1947, the number of students in secondary technical schools in 1979 was up 19.2 times, the number in middle schools was up 355 times and enrollment in primary schools was up 13.7 times.

Education for minority nationalities has rapidly developed. In 1979, about 4,000 minority nationality students were studying in institutions of higher learning, of whom more than 3,000 were Mongolian. Some colleges and universities have added courses on the Mongolian language and classes in which teaching is conducted in the Mongolian language. In 1979, there were 501 secondary schools for minority nationalities, 167 times more than in 1947; and more than 4,000 primary schools for minority nationalities, 11 times more than in 1947. In 1979, close to 6,000 Mongolian students were studying in 12 secondary

technical schools run specially for them; 150,000 students were studying in 203 middle schools of the same nature; and likewise, 330,000 children of Mongolian extraction were studying in 3,167 special primary schools. The number of students in these three types of schools represented an increase of 420 times, 329 times and 15.8 times, respectively, as compared to 1947. The advancement of education has augmented the supply of managerial, technical and research personnel for economic construction and scientific and technological undertakings throughout the region.

Scientific and technological undertakings, which were started only after the establishment of the autonomous region, have been steadily expanded and increased. In 1979, there were altogether 252 scientific research institutions operating independently at or above the level of banners (counties), indicating an increase of 28 times over 1956. They were staffed by 2,453 scientific personnel, an increase of 7.5 times over 1956. Following the establishment of the Academy of Social Sciences of the Inner Mongolia Autonomous Region, the region's Academy of Animal Husbandry Science, Academy of Agricultural Sciences and Academy of Forestry Sciences were set up simultaneously. Encouraging results have been achieved in particular in the study of animal husbandry and grasslands, and of the comprehensive utilization of iron ores and rare metals. The region has reached an advanced level in the application of potato seedlings in production; the breeding of the Aohan fine wool sheep; the study of the three-axle sliding, the common gear mechanism; the theory of elementary particles and high-energy astrophysics; and haemoglobin. One hundred and fifty-one items of research were commended at the National Science Congress. The advancement of science and technology has played a positive role in developing the province's productive forces.

Standard of Living. On the basis of a steady growth of industry, agriculture and animal husbandry, the living standards of the people have improved. Between 1952 and 1979, the number of workers employed in the state-owned enterprises increased 11.4 times and the total amount of wages, 20.1 times. The average annual wage per staff/worker increased from 454 yuan to 750 yuan. There was also a big increase in the number of workers and staff of minority nationalities. The number of workers and staff of Mongolian extraction was only 7,000 in 1947, but went up 22.4 times to 157,000 in 1979. During the same period, the number of workers and staff of other minority nationalities increased 57 times from 1,000 to 57,000. Because of the rapid increases in employment rates, the growth rate of real income for

families of workers and staff greatly surpassed the growth rate of average wages. The income of peasants and herdsmen also increased greatly. In 1979, the average income for each herdman and peasant derived from the collective was 127 yuan and 72.56 yuan respectively, increasing by 8.3% and 33.1% over 1959. The purchasing power of the workers and staff and commune members grew along with their incomes. Between 1952 and 1979, the average purchasing power of peasants and herdsmen for consumer goods increased 2.59 times, that of city residents increased 2.64 times. The urban and rural savings deposits increased 111 times.

Housing. There has been marked improvement in the housing conditions for urban people. Take Hohhot and Baotou for example. By 1979, the cumulative floor space of housing projects completed was 2.34 million sq. m. and 4.31 million sq. m. respectively. Each resident lived on an average of 4.75 sq. m. in Hohhot and 4.9 sq. m. in Baotou.

Health Care. Health work has developed rapidly. Around the time of the establishment of the autonomous region, diseases ran rampant in towns and throughout the countryside, endangering the lives of the people. After Liberation, the people's government made great efforts to develop health undertakings. The number of hospitals and sanatoriums in the region increased 67 times from 26 in 1947 to 1,743 in 1979; the number of hospital beds went up 94 times to more than 40,000 in 1979; and the number of professional medical workers rose 11 times to more than 60,000. Commune clinics have been set up extensively in rural and pastoral areas, and the cooperative medical service has been introduced to 63% of the production brigades. And a three-tier medical network covering banners (counties), communes and brigades has been formed to meet the needs of the region.

Economic Developments in 1980

The economic growth in the Inner Mongolia Autonomous Region has been fast and achievements have been remarkable. However, there have been difficulties. Different periods and years varied greatly in speed of growth and economic results. Things had been going well before 1957, but the ensuing years saw drastic rises and falls, resulting in a serious imbalance among the sectors of the national economy. New changes have taken place in the region through its initial effort to implement the policy put forward by the Central

Committee of the Party to "readjust, consolidate, restructure and improve" the national economy.

Initial readjustment of the region's economy alleviated the existing imbalances and a good, stable economy has emerged.

Agriculture and Animal Husbandry. More flexible policies for agriculture and animal husbandry have heightened the people's enthusiasm for production. In the course of implementing the two documents of the Central Committee of the Party which deal with work in the rural areas, the region has, taking into account its actual conditions, formulated the guideline: "Lay emphasis on animal husbandry, combine farming, animal husbandry and forestry and allow various localities to give particular attention to certain areas of production in light of their specific conditions to ensure a diversified economy and all-around development." The region also advanced a series of specific economic policies and regulations concerning rural and pastoral areas, causing the enthusiasm of the peasants and herdsmen to be greatly enhanced. In 1980, an extremely serious drought hit over 50% of the areas cultivated with grain, reducing the yield by 20%. However, thanks to the implementation of various economic policies, such as the introduction of the production responsibility system in a variety of different forms, the decision to allow the peasants and herdsmen to have an appropriately greater amount of farm plots, cattle and trees for private use, the exemption of animal husbandry taxes and exemption of agricultural taxes for those communes and brigades that had been hard hit by the drought, etc., the income of the peasants and herdsmen increased from the previous year and a sense of security prevailed in the rural and pastoral areas. By the end of June 1980 (animal husbandry production year), the total number of animals in the region registered 40.58 million head, a net increase of 4% over the corresponding period of 1979, approaching the best record in local history. Good harvests of beets and oil-bearing crops hit an all-time high. The output of beets in 1980 was 811,500 tons, an increase of 60% over the previous year, satisfying the needs of the local sugar refining industry for the first time in many years. The output of oil-bearing crops was 250,000 tons, over 30% more than in 1979. About 323,000 hectares were harvested, 8.2% above the yearly plan. The number of enterprises at the commune and brigade levels increased by 10%, and their profits rose by more than 15%.

Industry. Major relationships among industrial branches are moving in the direction of harmony. In spite of the fact that a considerable number of

enterprises operated under capacity in 1980, the region registered a total industrial output value of 5,483 million yuan, which was 1.04% more than in 1979, 7.59% more than in 1978, and 21.96% more than in 1977. Of this total, 2,326 million yuan came from light industry, 10.88% more than in 1979, and 3,023 million yuan from heavy industry, a drop of 5.41% from 1979. There was a significant change in the ratio between light and heavy industry: the share of light industry in the total industrial output value increased from 39.6% in 1979 to 43.5% in 1980. Among the 45 kinds of light industrial products covered in a statistical survey for 1980, 36 products increased their output significantly. The balance of products also changed markedly, with 338 new products in 1,190 designs and styles entering the market. High-grade commodities in urgent demand, such as bicycles, sewing machines, pure wool dress suits and woollen fabrics with silver strips were produced in greater quantity. A number of products received silver medals for fine-quality and brand-name certificates from the state, and sold well on the domestic and foreign markets. The uniform woollen fabric produced by the Inner Mongolia No. 3 Woollen Mill is exported to Japan, United States and other countries, with profits in 1980 being 72 times more than in 1979.

Capital Construction and Investment. The scope of capital construction has been reduced to improve the balance between the "bones" and the "flesh." The actual investment for capital construction in 1980 was 1,312 million yuan, a drop of 143 million yuan or 10.3% from 1979. After two years of efforts, 273 projects, each requiring an investment of 50,000 yuan and more, have been stopped or postponed, trimming 355 million yuan off the original investment plan. As regards the orientation of investment, priority is now given to agriculture, animal husbandry, light and textile industries, and at the same time greater sums have been spent on education, health, housing, and municipal construction, so that the proportions between the "bones," essentially meaning heavy industry, and the "flesh," essentially meaning production of consumer goods and undertakings that are closely linked with people's livelihood, have been relatively harmonized.

In 1980, the actual investment in agriculture was 152 million yuan, accounting for 11.59% of the total actual investment; that in light industry was 96.07 million yuan, or 7.32% of the total; and that in heavy industry was more than 400 million yuan, or 37.23% of the total. Of the money spent on heavy industry, 56.92% went to the energy industry. The ratio of agriculture to light industry to heavy industry in 1980 was 1 : 0.63 : 3.21,

almost the same as the ratio during the period of the First Five-Year Plan.

Investment in capital construction of productive projects in 1980 accounted for 60.5% of the total investment, 7.8% less than in 1979; investment in capital construction of non-productive projects accounted for 39.5% of the total, 7.8% more than in 1979; the ratio of investments in productive projects to non-productive projects was 1.53 : 1. Of the investment in non-productive projects, the share of science, technology, culture, education and housing increased considerably. The share of investment for scientific research as compared to the total investment spent in 1980 increased from 0.56% in 1979 to 1.21% in 1980; that for cultural, educational and health undertakings rose from 6.75% to 8.35%. School buildings with a total floor space of 259,000 sq. m. were constructed in 1980, providing 72.94 million additional places for students. Investment in housing projects increased by 21.87%, and housing projects with a total floor space of 1.81 million sq. m. were completed, the highest yearly increase since 1949.

Finance and Trade. 1980 saw a brisk market throughout the region. The net purchases by the commercial department for domestic supply totalled 2,560 million yuan in value, 8.7% more than in 1979. In spite of bad weather, the total value of agricultural and sideline products purchased in 1980 increased by 15.4% to 1,030 million yuan. Local industrial goods purchased totalled 1,510 million yuan in value, an increase of 5.2% over 1979. Net sales by the commercial departments on the home market reached 4,680 million yuan, 6.8% more than in 1979; retail sales amounted to 4,310 million yuan, 10.2% more than in 1979. Flexible economic policies boosted the turnover of rural and urban trade fairs by 40.5% to 190 million yuan in 1980. The total purchase value of export-oriented commodities in 1980 increased by 18.47% and the total value of exports more than doubled. The total value of imports increased by 58.97%, of which the share of light industrial goods and textiles made up 71.62%. In 1980, Inner Mongolia traded with 22 countries and regions, as against 10 in the past.

In 1980, the Inner Mongolia Autonomous Region maintained a balance between revenues and expenditures with some surplus. It overfulfilled the plan for local revenues in the revised budget by 5.7% and cut the expenditures by 10.6%.

Many new changes have resulted from the restructuring of the economic system. In 1979 and 1980, experiments were carried out in 49 enterprises in expanding the power to make decisions, including the system of allowing them to keep a

certain percentage of profits. The experiments showed good results. The 24 enterprises included in the experimental programme of 1979 registered an output value of 430 million yuan, 4.4% more than in 1978, and turned over 32% more profits to the state than planned. In 1980, 49 enterprises were involved and they combined to produce 1,128 million yuan in value, 2.9% more than in 1979. They turned over 109 million yuan of profits to the state, 13.1% more than in 1979, and their growth rate of output value and profits was better than that of other enterprises. Meanwhile, under the guidance of state planning, enterprises were allowed to adjust their production to the needs of the market. This gave a new life to those enterprises that used to operate under capacity. Such enterprises were thus able to find new orders for themselves, and some of them even had more orders than they could fill.

Education. Education in the region expanded rapidly after Liberation. During the "cultural revolution," grave damage was done to educational projects. The schools for the Mongolians and other minority nationalities were particularly hard-hit. After the downfall of the Gang of Four, educational projects were given new life and made new progress. In 1980, there were 14 colleges and universities in the region, with a student body of close to 20,000, of whom 4,049 were of Mongolian extraction. Secondary technical schools (including secondary teachers' training schools) numbered 72, with a total number of 30,000 students, of whom 6,842 were of Mongolian extraction. Middle schools numbered 2,870, of which 253 were for the Mongolian nationality, with a total number of 1.35 million students, of whom 140,000 students were of Mongolian extraction. Primary schools numbered 20,000, of which 2,880 were for the Mongolian nationality, with a total number of 2,898,579 pupils, of whom more than 330,000 were of Mongolian extraction. A television university was started in 1979 and is now attended by 5,078.

The quality of teaching on the whole has also improved. In addition to the large number of teachers giving lessons in the Mongolian language in primary and secondary schools, colleges and universities have professors and associate professors specializing in this language, some of whom have begun to offer post-graduate courses.

Standard of Living. After the smashing of the Gang of Four and particularly after the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, the party and the state took a series of steps to raise the wages of the staff and workers and to improve their standard of

living. In 1980, the average annual wages for workers and staff members in units owned by the whole people was 88 yuan more than in 1979, with the region paying 283 million yuan more in wages. According to a survey of economic conditions among 460 peasant families and 80 herders' families which were chosen as being representative of the population, the net income per capita for commune members in the farming areas was 186 yuan in 1980, 26 yuan more than in 1979, while the net income per capita for commune members in the pastoral areas was 265 yuan, 29 yuan more than in 1979.

Between 1979 and 1980, 416,000 people were provided with jobs throughout the region. This was six times greater than the total number of new jobs provided in the previous two years, 1977 and 1978.

Remarkable progress was made in family planning. In 1980, the natural population growth rate was 11.53%, a drop of 1.67% from 1979; the natural growth rate of urban population was 8.5%, a drop of 0.1%.

The higher average income resulted in the rapid growth of social purchasing power. The social purchasing power of the whole region in 1980 was 4,720 million yuan, 12.7% more than in 1979. Savings deposits in cities and towns increased by 48% to 465 million yuan at the end of 1980, with each resident depositing an average of 37 yuan. 1980 was the best year for the region in the growth of bank deposits.

Current Problems and Goals for Future Development

Though serious economic imbalances were significantly improved after two years of readjustment, there were too many problems to be resolved in a short time. The main problems awaiting solution are as follows:

(1) For years, the region has been spending more than it can pay, with the combined amount of accumulation and consumption funds budgeted greatly surpassing the output value. Therefore the central government has had to subsidize the region to cover the deficit.

(2) Economic results are generally poor, management is not adequate and the economy has sustained big losses. Though industrial production has been developed on a considerable scale, the output value and income of enterprises have not increased accordingly. The main reasons are the drop in labour productivity, the low utilization rate of equipment and enormous losses

and waste. In 1980, the state-owned enterprises which operated as independent accounting units showed a drop of 0.6% in labour productivity from 1979, or a drop of 28.3% from 1966. The rate of output value realized for every 100 yuan of fixed assets in 1980 decreased by 20.2% as compared with 1965 and the rate of profit realized for every 100 yuan of output value decreased by 42.6%.

Capital construction has been overextended as a result of poor investment and there have been considerable losses and waste. A large number of enterprises have suffered serious losses and are poorly managed. They have failed to fulfill the eight economic and technical targets set down by the state, turning out substandard products at high costs or products that do not sell, and tying down circulating funds. In addition, too many intermediate links in the distribution network impede the flow of goods and result in serious overstocking.

(3) The population growth rate has far exceeded the increase of grain output. In particular, too fast a growth of the urban population buying food grain from the state has created a big gap between the population's needs and the amount of locally available grain. For a long time, the region has remained deficient in its supply of grain. In a period of 30 years, the output of grain only doubled, while the population more than trebled. Thus the per capita supply of local grain has dropped sharply.

(4) There are many problems concerning the standard of living. For the last ten years or so, the development of industry and agriculture has slowed down, and the tendency to seek too high a rate of accumulation has reduced the proportion of funds for consumption. As a result, problems concerning the standard of living have begun to accumulate. The increase in the average income has been slow and the real living standard has not significantly improved. The small proportion of investment in nonproductive projects has resulted in an inadequate development of cultural, educational and health projects, a serious urban housing shortage, inadequate public transport services, serious environmental pollution, reduction of labour productivity and a rather high rate of unemployment. These problems cry out for solutions.

To address these problems, the Inner Mongolia Autonomous Region will develop its economy according to the following guidelines:

a) The region will firmly implement the party's policies and principles concerning agriculture and animal husbandry. It will continue to act

upon the guidelines formulated by the Party Committee of the Inner Mongolia Autonomous Region, namely, to "lay emphasis on animal husbandry, combine farming and forestry and allow various localities to give particular attention to certain areas of production in the light of their specific conditions to ensure diversified economy and development in all areas." The region will further put into practice and improve the various systems of production responsibility in a manner suitable to local conditions, so as to bring the relationship between all levels of production into harmony with the development of the productive forces.

On the basis of a steady and continuous increase in the total grain output, efforts will be made to develop industrial crops. In animal husbandry, great attention will be paid to the protection and rational utilization of grasslands by encouraging the construction of enclosed pastures on the basis of groups or families. At the same time, attention should be paid to the increase of the quality and the amount of livestock for supply and the share of furs, pelts, hides and meat to be used as commodities.

The vast expanses of Inner Mongolia are frequented by strong sandstorms and serious droughts. Therefore, planting of trees and grass will be energetically promoted to improve vegetation and reach a new ecological balance. This is a plan of vital strategic importance.

b) Light and textile industries have bright prospects for development. The region already has a considerably production capacity and an abundant supply of raw materials. To fulfill the targets set by the state, the region will devote great efforts to speeding up the growth of light and textile industries, bringing into play the advantageous conditions that the region affords these industries. Heavy industry will be geared to the needs of agriculture, animal husbandry, light and textile industries as well as to the individual's needs.

The Inner Mongolia Autonomous Region is very rich in energy resources but its transport capacity is limited. Thus, the energy industry does have broad prospects for development. This, plus the availability of soda and salt in large quantities, promises a large-scale development of a multiple-chemical producing industry in the future.

c) There is a great potential for making those enterprises running at a loss yield profits and for increasing the revenues and reducing expenditures of all enterprises. This is one of the keys to overcoming the financial difficulties of the region. In 1980, the enterprises in the fields of industry, communications, finance and trade throughout the

region, after balancing their profits and losses, including losses entailed by policy-related subsidies, showed deficits instead of contributing to the local treasury. The regional authorities had to subsidize them with income gained from taxation. Therefore, it is an important, long-term task to improve management and economic results. The overstocking of commodities equivalent to 900 million yuan calls for determined efforts to make an inventory of warehouses and put the materials and goods to use again after necessary remodelling or reprocessing. This is certain speed up the flow of funds.

d) Home and foreign trade will be promoted energetically. The Inner Mongolia Autonomous Region has a huge market but the supply of goods, particularly daily necessities, still falls far behind the local demand. The improvement of the stan-

dard of living raises new demands on production of commodities. Inner Mongolia, with its rich resources and many special products native to the region, should strengthen the management, utilization and processing of such resources, improve the quantity and quality of traditional products for export and further develop more varieties of products. The region must investigate all possible avenues for increasing income and enlivening the economy.

e) Scientific and educational projects will enjoy further development and attention will be paid to the development of intellectual resources. In this way, the various branches of the economy will be supplied with trained personnel and can keep up with the needs of the Inner Mongolia Autonomous Region in its efforts to realize its modernization programme.

71. ECONOMIC DEVELOPMENT IN JIANGSU PROVINCE

By Mao Junyi

Jiangsu Provincial Statistical Bureau

Geography and Population

With a dense population, mild climate, moderate rainfall, rich resources and a rather good foundation for industrial and agricultural production, Jiangsu province has one of the better developed economies and cultures in China. The province covers an area of 102,600 sq. km. and has a population of 59,380,000 with a density of 579 people per sq. km. Within the province are 7 prefectures, 11 municipalities under the jurisdiction of the provincial or prefectural governments and 64 counties.

Survey of Economic Development Since 1949

Under the rule of the Kuomintang, before Liberation, the people of Jiangsu lived in misery with a bankrupt economy and soaring inflation. After the birth of the New China, the people of Jiangsu, under the leadership of the Chinese Communist Party, strove to revive and develop the economy rapidly. In the 30 years of socialist economic construction, the province has attained remarkable achievements in spite of some setbacks.

In 1979, the total value of industrial and agricultural output in the province amounted to 52,526 million yuan, ranking second in China. This was an increase of 12.2 times as compared with 4,317 million yuan in 1949. Of this total, the output value of agriculture rose 4.6 times, light industry 16 times and heavy industry 242.6 times. There has been a significant change in the proportions between agriculture, light industry and heavy industry. The proportion of agriculture fell from 69.9% in 1949 to 26.6%, while that of light industry rose from 28.3% to 37.4%, and heavy industry from 1.8% to 36%.

In the last 30 years, there has also been a marked increase in the national income. The national income in 1979 amounted to 24,796 million yuan (421 yuan per capita), growing 4.4 times over 3,563 million yuan in 1952 (95 yuan per capita).

Agricultural Production. In 1979, the province's grain yield ranked second in China, total-

ling 25.14 million tons, an increase of 3.4 times over 1949. Although Jiangsu's population grew by 67.8% during the same period, the growth of the grain yield actually exceeded that of the population. Its cotton yield ranked first in China, totaling 531,700 tons, an increase of 18.9 times over 1949. The output of oil-bearing crops increased 2.4 times. The number of pigs in stock went up 5.7 times.

Industrial Production. The output of steel was up to 621,900 tons in 1979, as compared to 1,000 tons in 1949. Coal output was 17,257,000 tons, an increase of 21.2 times over 1949. Total electricity generated in 1979 reached 14,700 million kwh., up 74.2 times over 1949. Chemical fertilizers for rural use amounted to 914,000 tons (counted on the basis of 100% effectiveness), up 228.6 times. Cotton yarn totalled 318,000 tons, an increase of 7.4 times. And output of cotton cloth amounted to 1,568 million m., up 6.8 times. Many products, such as pig iron, rolled steel, crude oil, insecticides, tractors, motor vehicles, plate glass, chemical fibres, electronics, sewing machines, bicycles and wrist-watches have been developed from scratch. The output of machinery, cement, machine-made paper, salt and soap has increased up to one hundred times.

Transport and Communications. In 1979, the volume of passenger traffic carried by the local transportation system and that of freight increased by 23.4 and 23.1 times, respectively, over 1949. The total amount of chargeable postal and telecommunications services rose 11.7 times.

Capital Construction and Investment. In the past 30 years, a total investment of 19,640 million yuan has been put into capital construction: 2,980 million yuan, or 15.2%, for water conservation projects; and 11,318 million yuan, or 57.6%, for industrial construction. The major projects which have been undertaken include: the Main Irrigation Canal in Northern Jiangsu; the waterway from the Huaihe River to the Changjiang River; the key water control project at Jiangdu through which the Huaihe River has been brought under permanent control; the Nanjing Iron and Steel Works; the Nanjing Oil Refinery; the Xuzhou Coal Mine; large thermal power stations at Xuzhou, Jianbi and

Nanjing; the Lianyungang Harbour Project; the extension of the Nanjing Chemical Industry Corporation; the China Cement Works; and a large number of other chemical, light industrial, textile and building-material enterprises. Through the self-reliance of the Chinese people, the Nanjing Changjiang River Bridge — a highway-railway bridge, built in 1968 to link up the north and the south — and hundreds of large and medium-sized capital construction projects were completed and put into operation.

Other Developments. Since 1957, the province's annual coal-mining capacity has risen by 13.25 million tons and its power-generating capacity by 2.22 million kwh. These are important factors underlying the rapid growth of industrial and agricultural production and other undertakings. These factors provide an essential base from which the modernization programme can develop.

Income and Livelihood. In 1979, the number of workers and staff in state-run and collectively owned enterprises in cities and towns totalled 6,038,000. The number of people employed in the state-run enterprises totalled 3,739,000, an increase of 7.8 times over 1949. The total volume of retail sales reached 12,440 million yuan in 1979, an increase of 16 times over 1949. According to a survey of rural families, the annual net per capita income of peasants in 1979 averaged 200.2 yuan, or 2.3 times the 1954 figure. A survey of urban workers and their families conducted in the first quarter of 1980 showed that the monthly per capita living expenses of these families averaged 30.91 yuan, an increase of 58.4% over 1957. The standard of living of people in both urban and rural areas has improved markedly.

In addition, there was also fairly rapid development in education, culture, public health, municipal construction and housing. In 1979, the number of students in all levels of schools increased 4.6 times as compared to 1953. There were 13.7 times as many hospital beds as there were in 1952. And between 1951 and 1979, the province built housing with a total floor space of 19.31 million sq. m., of which 7,457,200 sq. m. were erected between 1977 and 1979, thus improving the living conditions of workers and their families.

Survey of Jiangsu's Economy in 1980

In 1980, the total output value of industrial and agricultural production in Jiangsu Province

amounted to 60,440 million yuan, an increase of 15.1% over the previous year. Agriculture accounted for 14,692 million yuan of this total, up 5.2%; light industry accounted for 24,988 million yuan, up 27.2%; and heavy industry was responsible for 20,757 million yuan, up 9.7%. A change also took place in the balance between agriculture, light industry and heavy industry in the province's economy. The proportions of agriculture and heavy industry fell from 26.6% and 36% in 1979 to 24.3% and 34.3%, respectively, whereas that of light industry rose from 37.4% to 41.3% during the same period.

Agriculture. In 1980, due to the considerable development of brigade-run enterprises regarded as sideline occupations, the total output value of agriculture increased somewhat despite a drop in the output of major crops, such as grain, cotton, oil-bearing seeds and cast fibres, as a result of natural calamities.

In 1980, total grain yield was 23.57 million tons, a decrease of 6.2% from the previous year, but still the third best harvest since 1949. The cotton yield was 420,000 tons, a drop of 21.5%. The yield of oil-bearing seeds was 386,300 tons, a drop of 10.9%, and the cast fibres harvest was 38,830 tons, a decrease of 34.9%. The number of pigs in stock at the end of the year was 20.89 million, a drop of 11.3% from the previous year.

The output value of the brigade-run enterprises increased to 4,343 million yuan, a rise of 48.3% over the previous year. The yields of silkworm cocoons, tea and aquatic products showed increases of 18.2%, 10.5% and 9.7%, respectively. However the number of draught animals and goats dropped by 6.8% and 11.4%. And the output of sugar crops and tobacco decreased by 17% and 57.3%, respectively. Approximately 427,000 mu of land was afforested.

There was a further change in the balance of agricultural production. The proportion of farming fell from 63.5% in 1979 to 55.4% in 1980, while that of sideline occupations rose from 21.5% to 29.9%, of which the proportion of brigade-run enterprises increased from 21% to 29.6%.

In 1980, the total power of farm machinery reached 15.15 million hp. with 16,000 large and medium-sized tractors, 256,000 hand tractors and irrigation and drainage equipment totalling 6.02 million hp. A total of 1.181 million tons of chemical fertilizer (counted on the basis of 100% effectiveness) were used, and the average amount applied per mu increased by 3 kg. over the previous year. Some 544 million more kwh. of power were consumed in rural areas as compared to 1979. And meteorological observatories were more accurate in their weather forecasts.

Industry, Communications and Transport. In 1980, the total output value of industry amounted to 45.74 million yuan, an increase of 18.6% over the previous year. The output value of state-run industries rose by 10.8% while the collectively-owned industries, including the commune-run enterprises, showed an increase of 30.4%. A further readjustment was effected in the proportions within industry. The proportion of light industry rose from 50.9% in 1979 to 54.6% in 1980 while that of collectively-owned industry rose from 34% to 37.3%.

The production targets for 94 of the 110 products included in the economic plan were fulfilled. The output of 37 of the 39 products of light and textile industries included in the plan increased. And the output of marketable consumer products which were highly in demand rose considerably. Among them, the output of radios, television sets, cameras and tape recorders more than doubled. The output of chemical fibre products, sewing machines, bicycles, wrist-watches, knitting wool, gunny bags and leather rose by more than 30%. The output of cotton yarn, cotton cloth, printed and dyed cloth, woolen piece goods, silk, silk fabrics, cigarettes, bulbs, soap, battery cells and beverages rose by more than 10%.

The output of some of the equipment used in agricultural production increased while some decreased. The growth rates for producers of chemical fertilizers and insecticides were 22.2% and 12.8%, respectively, while the growth rates for manufacturers of machine-driven threshers, machine-driven rice transplanters, hand-dusters and hand-sprayers, fishing boats and plastic film for farm use ranged from 105 to over 110%. There were decreases in the production of tractors, farm pumps and rubber-tired handcars. The output of five metallurgical products increased, while that of pig iron, coking coal and ferro-alloys dropped. The output of cement, plate glass, glass fibre and artificial boards all increased. Among 19 chemical products, the output of 15 increased. The machine-building industry, which is one of the main departments which requires readjustment, registered a drop in output in 18 of its 32 products.

In 1980, 22 gold and silver medals were awarded to civil industrial products made in Jiangsu.

As a result of the initial readjustment of the light and heavy industrial structure, bringing under control the production of products which consume much energy and improving business management, some progress has been made as regards energy-saving. Although power generation increased by only 6.3% and the output of coal dropped by 2.1% the amount of standard coal used per 10 million yuan of output value de-

creased by 15% as compared with the previous year, thus bringing about a large increase in the total industrial output value. This shows a healthy trend in industrial readjustment.

In 1980, the volume of passenger traffic carried by local transport systems increased by 16.2% and the volume of freight traffic increased by 14%. The total amount of postal and telecommunications services rose by 11.4%.

In 1980, labour productivity, calculated in terms of the total workforce in the state-owned independent accounting industries, went up to 15,755 yuan, an increase of 4.2% over the previous year.

Capital Construction and Investment. In 1980, the total capital construction investment fulfilled by state-owned enterprises amounted to 2,610 million yuan, an increase of 18.6% over the previous year. Of this total, state-budgeted investments accounted for 1,470 million yuan, 30 million yuan or 16.4% less than last year, while the investments fulfilled by localities and enterprises climbed to 1,141 million yuan, an increase of 71.1 million yuan or 160% over the previous year due to the relaxation of controls on investments outside the budget.

In 1980, the fixed assets brought into use for the state-run capital construction projects were 2,330 million yuan, an increase of 38%. The rate of fixed assets brought into use accounted for 89%, an increase of 12.5% over the preceding year. A total floor space of 8,342,000 sq. m. was completed, an increase of 35.2%. Of this, the floor space of residential housing came to 4,619,000 sq. m., an increase of 41.4%.

Two large-scale projects and 15 individual projects were completed and put into operation in 1980, four more than during the previous year. The production capacity increase, due to the completion of construction projects, accounted for 950,000 tons of coal, generating sets totalling 451,000 kwh., 323.7 km. of power transmission lines, 250,000 television sets, 165,000 bicycles, 164,000 sewing machines and 510,000 wrist-watches.

Of the total capital construction investments undertaken by the state in 1980, the proportion used for non-productive sectors, such as housing for workers and staff, urban public utilities, scientific, educational and public health establishments, rose from 25.1% in 1979 to 34.5%. Results of the readjustment of capital construction investment policy are already becoming evident.

Finance and Commerce. In 1980, the total volume of commodities purchased by commercial departments amounted to 20,760 million yuan, an

increase of 14.7% over the previous year. Of this total, industrial products accounted for 14,490 million yuan, an increase of 20.3%. Agricultural and sideline products accounted for 6,160 million yuan, an increase of 3.5% (but a small decrease as compared with last year if the increase in the state's purchasing prices of major agricultural and sideline products is not taken into account). The total volume of retail sales reached 14,970 million yuan, an increase of 20.3% over the preceding year or an actual increase of 16.4% if the price hikes are not taken into account. This is the highest rate of growth since the founding of New China. This also shows a notable rise in the living standards and purchasing power of the people. In 1980, the volume of sales of major consumer goods, such as foodstuffs, clothes, fuel, and other daily necessities, increased significantly: 15.3–25% for grain, vegetable oil, pork and sugar; 10–50% for chemical fibre cloth, polyester fibre cloth, silks and satins, woollen goods, knitting wool, leather shoes and cotton jerseys and trousers; 20–100% for wristwatches, bicycles, sewing machines, television sets, radios and electric fans; and 410% for tape recorders. The total volume of goods in stock at the end of the year increased by 7.5% as compared with the same period of the previous year.

Of the total volume of commodities purchased, 3,450 million yuan was purchased for foreign trade, an increase of 24.8%. The total volume of exports handled by the localities themselves in 1980 rose to U.S.\$850 million, an increase of 37.2% over the previous year.

In 1980, the number of compatriots from Hong Kong and Macao, overseas Chinese and foreign nationals who came to Jiangsu to visit friends and relatives, on sightseeing tours or on business, totalled 238,000, which was 56,000 more than the previous year.

Science, Culture and Health. By the end of 1980, the number of scientists and technicians in state-owned enterprises and establishments totalled 189,800. They had accomplished 938 scientific research projects during the year.

In 1980 there were 43 institutions of higher learning in Jiangsu, seven more than during the previous year. The enrollment increased by 8,600 to a total of 82,500 students. 17,700 of these students were admitted during the year, an increase of 1,800 more than were admitted during the previous year. In addition, there were 25,500 students in broadcasting and television colleges, an increase of 7,700; 15,300 at the technical schools, an increase of 2,300; 61,000 at secondary vocational schools, an increase of 9,000; 3,205,000 students at the middle schools, a drop of 274,000;

8,369,000 pupils at the primary schools; and 1,237,000 children in the kindergartens.

New progress was also made in culture, broadcasting and publishing during 1980.

There were 127,500 beds in public health establishments in 1980, of which hospital beds accounted for 116,000, an increase of 2,224 over the previous year. The number of professional medical personnel totalled 150,000, an increase of more than 4,000.

Jiangsu's athletes also enjoyed a considerable measure of success in 1980. They won honours for the country by taking 77 gold medals in competitions at home and abroad.

Income and Livelihood. In 1980, the standard of living for the majority of the urban and rural population was improved. Despite a drop in agricultural production as a result of natural calamities, the actual total income of commune members increased because of significant developments in brigade-run enterprises, the diversification of the economy, the further rise of the purchasing prices of agricultural and sideline products, the expansion of household sideline production and the increased yields on private plots of land. Data on rural and urban families shows that the annual net per capita income of the peasants averaged 217.91 yuan in 1980, 17.8 yuan more than the previous year. The monthly per capita living expenses of the workers' families averaged 33.47 yuan in the fourth quarter of 1980, an increase of 8.3% over that in the first quarter.

In 1980, jobs were provided for 388,000 people in cities and towns of Jiangsu, including graduates from colleges and secondary vocational schools who were assigned jobs under a unified state plan. The numbers of workers and staff in the province exceeded 6,400,000, an increase of 370,000 over the previous year. Of this total, 3,980,000 were employed by state-run enterprises and establishments, an increase of 248,000 over the previous year, while 2,420,000 were working in collectively-owned enterprises and establishments, an increase of 120,000.

Owing to the increased number of workers and staff, plus the pay rise for 40% of the workforce, the readjustment in wage scales, the institution of a bonus system and the monthly subsidy to offset the increased prices of nonstaple foodstuffs to all workers and staff, the total wage bill for 1980 reached 4,140 million yuan, an increase of 24.9% over the previous year. Of this, the payroll for workers and staff in establishments owned by the whole people totalled 2,727 million yuan, an increase of 23.4%.

In 1980, the average annual per capita wage of workers and staff in establishments owned by the

whole people went up to 720 yuan, an increase of 102 yuan or 16.5% over 1979.

Current Problems and Goals for Future Development

Over the past 30 years, the economic development of Jiangsu Province has been uneven, handicapped by disproportions in the economy on several occasions. The causes leading to these disproportions were complex. According to a quantity analysis, "high speed," "high accumulation rates" and "high targets" were the essential causes. Because of several rash economic policies after 1958, the accumulation rate was as high as 30%. At that time, the economy seemed to be developing rapidly. But serious disproportions were brought about and it was necessary to make retrenchments. The over-extension of the scope of capital construction, the emphasis on the expansion of production capabilities and the failure to allocate investment for capital construction according to our capabilities led to the lack of co-ordination between the basically irrational economic, industrial and production structures and to poor economic results. There was also the waste of a considerable amount of manpower, material and financial resources. This affected the consumption of products, the completion of municipal construction projects and the development of scientific, cultural, educational and public health establishments. Even if we had been able to issue more banknotes, we could not have maintained stable prices, and the living standards of the people could not have been raised significantly.

The major steps that must be taken for future economic development in Jiangsu Province are as follows:

(1) *We must continue to propagate and study the principles and policies formulated by the Third Plenary Session of the 11th Party Central Committee, to rectify the influence of "Left" ideology and to clarify political, ideological and organizational policies.* As regards the study of economics, it is essential to improve the collection, sorting, analysis and study of economic information in order to carry out economic calculations and forecasts. Great efforts must be made to achieve an overall balance in the local economy. Effective measures should be adopted to prevent possible "Left" mistakes, both in ideology and methods of work, so that the national economy can develop in a healthy way.

(2) *We must use every possible means to develop all aspects of agricultural production.* The

rural population of Jiangsu Province is 50 million, making up nearly 85% of the total population. From a strategic point of view, agriculture is the lifeline and foundation of Jiangsu's economy. During the past 30 years we have gained the valuable knowledge that a prosperous agriculture will enliven the province's economy as a whole. We must develop agricultural production through scientific and technological research. Because Jiangsu Province is characterized by a large population but a small area of cultivatable land, it is necessary to organize and utilize rural labour power and use the land to its fullest.

Rural areas should strive to diversify their economy while raising the output of grain. Readjustment and consolidation should be undertaken in the industries run by the people's communes, production brigades and production teams. Suitable measures should be taken, depending upon local conditions, to institute various systems of organizational responsibility in agricultural production so as to arouse the enthusiasm of the rural cadres and commune members for production and to stabilize the rural labour force. In addition, efforts should be made to popularize agricultural science and technology; maintain and develop the fine tradition of intensive cultivation; strengthen management and administration over production; significantly increase crop yields and income to contribute to the nation's economy; undertake careful calculations and strict budgeting; reduce the cost of agricultural production; raise the commodity rate of farm and sideline products; increase the earnings of the people's communes, production brigades and production teams; improve the standard of living of commune members; and continue to progress in the modernization of our agriculture.

(3) *We must move towards consolidation of various enterprises and, in certain cases, shift production to other items.* It may be necessary to close or suspend the operation of various enterprises. Economization of energy consumption is of great importance. This may be achieved by the innovative readjustment, transformation and reorganization of the more than 32,000 existing industrial enterprises run at or above the people's commune level in Jiangsu. In particular, stress must be laid on the readjustment and reorganization of the machinery and textile industries. In addition, it is essential to promote increased production and, by relying on the abundant labour force, develop the light and handicraft industries and the production of arts and crafts. These enterprises are labour-intensive; they turn out high-quality products that sell well on the market, have low energy consumption and can be produced at a low cost.

Thus, such enterprises are more competitive on the domestic and international markets.

(4) *We must continue to reduce the scope of capital construction and control the flow of funds raised for capital construction purposes.* A reasonable allocation of construction expenditures should be made for integration and combination of enterprises, shifting of production to other items, technical innovation and transformation, urban public utilities, housing, scientific, cultural, educational and public health establishments and environmental protection. The proportion of construction investment between the productive and non-productive sectors should be readjusted.

(5) *Reform of the economic system is fundamental to economic construction.* At present, such reform is under way. Only by an overhaul of the economic system can the realization of socialist modernization be ensured.

(6) *It is to our advantage to develop our intellectual resources to their fullest capabilities.* This can be achieved by the specialization and intellectualization of the cadre contingent, the enhancement of the quality of teaching at schools of all levels and the popularization of education and scientific and technological research. Moral, intellectual and physical education should be enforced not only in schools, but also throughout the population, so that a healthy population can develop their intellectual capabilities to help promote the socialist modernization.

(7) *We must promote good family planning.* According to an analysis of age groups of the population in Jiangsu Province, there will be two peak periods of child-bearing before the year 2000. The first one is beginning this year. Strenuous efforts will be required to maintain the population growth rate at 6.25%, the 1980 level.

72. ECONOMIC DEVELOPMENT IN JIANGXI PROVINCE

By Zhen Yanchu

Geography and Population

Geographic Characteristics and Climate. The province of Jiangxi lies south of the Changjiang River. It has a total area of 166,600 sq. km. (64.5% mountains, 15.2% arable land and 10% water). The terrain varies greatly, the southern part lying at a higher altitude than the northern part. It is mountainous on three sides, with the northern border being made up of numerous rivers and lakes. The climate is subtropical, generally warm and humid, with an average temperature during the year of 16.3–19.7°C and an annual rainfall of 1,350 to 1,910 mm.

Population. At the time of Liberation in 1949, the population was 13,140,000. In the past 30 years since Liberation, the population increased at an annual rate of 3% to 32,280,000 in 1979. By 1980, the total population of the entire province was more than 32,700,000, of which 27,620,000 lived in rural areas.

Natural Resources and Agriculture. Jiangxi is rich in natural resources. Among the mineral products which can be found are tungsten, copper, silver, tin, lead, zinc, manganese, molybdenum, coal, iron, salt, phosphate rock, dolomite, serpentine, kaolin and other rare metals and rare earth minerals.

Animals and agricultural resources are abundant in the six nature conservation areas of Jinggangshan, Lushan, Jiuliashan, Wuyishan, Guanshan and Taohungling. There are many species of wild life, some of which are unique and valuable and have been given special protection. More than 5,000 species of plants can be found in the province. The mountainous areas are covered with trees, bamboo, oil-bearing plants, amyllum and fabric plants and herbs, which are of high economic value. The Poyanghu Plain in northern Jiangxi, the Jitai Basin in central Jiangxi and the hilly land in southern, central and western Jiangxi are rich in rice, cotton, oil, sugarcane, hemp, tobacco, fruit and tea. Nearly 100 kinds of fish and various aquatic plants and animals can be found in the province's rivers and lakes, which cover more than 20 million mu. By the time of the Han Dynasty, Jiangxi's land had already been cultivated. Even then it was known as a land of fish and rice.

Survey of Economic Development Since 1949

Before Liberation, owing to the reactionary rule of the Kuomintang, the province's population decreased sharply. The rural economy nearly went bankrupt because of the damage done to forests, the neglect of the water conservancy system and the abandonment of cultivated land which was allowed to go barren and wild. Industry was extremely underdeveloped. Apart from a few small power, textile and machinery repair plants and grain processing factories, there were literally no modern industries. The rich deposits of tungsten and coal could only be extracted by manual labour. The province's world-famous china, locally produced paper and linen were also made by hand.

In the last 30 years since the founding of New China, the economy of Jiangxi has made great strides under the leadership of the Communist Party and the people's government. New industries have been set up and developed. Industrial enterprises such as steel works, rolling mills and coking plants and industries for nonferrous metal products, crude oil processing, both organic and inorganic chemical industries, tractors and trucks, machine tools, electrical machinery and other machinery-building, cement, salt, electronics, synthetic fibre, refined sugar, paper, daily necessities and other manufactured items have come into being. The total value of agricultural and industrial output increased 7.7 times from 1949 to 1979, at an annual rate of 7.1%. Industry increased 41 times, at an annual rate of 13.1%, while agricultural output increased 3.5 times, at an average annual rate of 4.2%. The total yield of grain alone increased 3.3 times. And revenue increased 10 times.

However, there have been twists and turns in the economic development of Jiangxi during the past 30 years. During the three-year period of economic recovery and the First Five-Year Plan period, industrial production in the province developed fairly rapidly. From 1950 to 1957 the total value of industrial and agricultural output increased at an average annual rate of 10.8%. And a number of industrial enterprises were set up in the province during the first two years of the Second Five-Year Plan, thus paving the way for economic development. But owing to the influence of the erroneous "Left" ideology, the total

value of output only increased at an annual rate of 0.7% from 1958 to 1962, resulting in a disproportionate development of the economy. After the readjustment of the economy from 1963 to 1965, industrial and agricultural production in Jiangxi gained new momentum. The total output of industry and agriculture in 1965 increased by 41% over 1962, representing an annual rate of 12.2%. But it was followed by ten years of turmoil during which the economy in Jiangxi suffered a tremendous setback. From 1967 to 1976, the total output value of industry and agriculture only increased at an annual rate of 3.8%. In particular, the agricultural output increased by only 1.7% which was below the growth rate for the last 30 years.

Review of Jiangxi's Economy in 1980

In 1980, the Party Committee and the people's government of Jiangxi Province further implemented the policies and guiding principles of the Third Plenum of the Central Committee, so that the provincial economy could make new headway in the process of readjustment. Good harvests were achieved, even during years of natural disasters. There was also a big increase in the light and textile industries. Markets thrived and buying and selling were brisk, while the income of the people in both urban and rural areas increased considerably. The total output value of industry increased by 8.2% in 1980 over 1979, light industry showing an increase of 19.3% and heavy industry decreasing by 0.3%. The total investment in capital construction increased by 10.2%. The total volume of retail sales increased by 14.1%. There was an 8.2% increase in revenue and a 7.9% decrease in expenditure. And the national income increased by 6.4%.

Agricultural Development. In agriculture, attention has been paid to the flexibility of policies, the improvement of management, the introduction of measures specifically suited to local conditions, the development of production and the implementation and improvement of various systems of production responsibility. Despite some serious natural disasters in 1980 which affected quite a few areas in the province, a moderately good harvest was still achieved and the grain yield was still the second highest since the founding of New China — all due to the party's policies being put into effect, the great efforts of the cadres and commune members and the success of the system defining responsibilities in production. The harvest of industrial crops, apart from cotton, oil-bearing crops and tobacco which dropped in production, increased in output by varying degrees.

Progress was made in the diversification of the agricultural economy, in industry run by the communes and in commune families' sideline production. The proportion of the output value of forestry, animal husbandry, sideline activities and fishing to the total value of agricultural production increased from 28.6% in 1979 to 32%. In the two years of 1979 and 1980, both the average growth rate of the total agricultural output value and of the total grain yield for the whole province were greater than the average growth rates for the province since Liberation. The state purchasing quota for grain has been overfulfilled for many years running, while marketable grain purchased by the state according to the set quota and grain purchased at a negotiated price hit an all-time high. In addition, great changes have taken place in some communes and brigades that used to be fairly poor. Much improvement has been made in the standard of living of the peasants. A sign of this is the fact that the savings deposits in rural areas increased by 74.9% from 1979 to 1980, the highest annual increase since the founding of New China.

Industrial Development. Benefitting from the readjustment, industrial production has been developing steadily. The total output value in 1980 increased by 8.2% over 1979, profits turned over to the state from enterprises registered an 8% increase over 1979, while labour productivity increased by 5.8%.

Priority has been given to the light and textile industries. Consequentially, the growth rate of light industry is greater than that of heavy industry. The output value of light industry in the province increased by 19.3% over 1979. In particular, the output value of the textile industry increased by 31.3%, with a profit increase of 60%. That is to say, a profit of 15.96 yuan was made out of every 100 yuan in output value, a rate which ranks seventh in the nation in terms of profit making. The province's textile output increased by 27% and the output value of the textile machinery industry increased by 48.2%. As for other light industrial products, the output of high and medium-grade durable commodities have greatly increased. The output of watches increased by 81%, sewing machines by 5.8 times and bicycles 3.3 times. Also, electronic products both for industrial and civilian use have seen a fairly rapid development. Production of TV sets increased 3.2 times and radios 3.6 times. Of the 43 primary light and industrial chemical products, the output of 22 items exceeded the highest record in history.

The output value of heavy industry decreased by 0.3% compared with 1979. As compared to the total value of industrial output, the proportion of

light industry increased by 43.4% in 1979 to 47.8%, while the proportion of heavy industry was reduced from 56.6% to 52.2%. Formerly, heavy industry had dominated the province's industrial economy. Now, the internal structure of the province's industry has begun to incline towards light industry.

Although the growth rate of heavy industry is slowing down, products and specifications have become more diversified and their quality improved. The output of electricity in the province has been increasing year by year. The quota for coal production last year was fulfilled and timber production also met its quota. Production in the electronics industry has increased considerably, and there has been an increased diversification of production in the iron and steel and machinery industries. Products are geared to the needs of agriculture, light industry and the markets. Railway freight volume has increased and local communications and passenger transport is now better than the transport of goods and freight.

In 1980, Jiangxi Province actively and consistently undertook preliminary steps towards reform. The experimental units in industry and enterprises where autonomy of economic management was expanded increased from 34 in 1979 to 103. These enterprises have been further reorganized in the experimental process, bringing about satisfactory changes. As a result of this, the output value and rate-of-profit increase in those enterprises with expanded autonomy are higher than the average levels of those still running on the old models in the province.

Finance and Commerce. The marketing rate of agricultural and sideline products has gone up considerably thanks to the flexibility in the rural economic policy, especially now that family plots of land are rationally allocated, that the development of family sideline production is permitted and encouraged and that country fairs are opened. The total amount of agricultural and sideline products purchased by the state in 1980 increased by 16.3% over 1979, setting a record for the province.

The total amount of commodities purchased by the province increased by 16.7% over 1979. The commercial departments have reorganized wholesale departments of certain areas and begun to plan commodity circulation according to economic areas. So the rate of expenditure on commodity circulation was somewhat reduced in both the province's commercial establishments and in supply and marketing units from 9.03% and 12.83% in 1979 to 8.11% and 10.46% respectively.

The market is brisk. Compared with 1979, there was a 14.1% increase in 1980 in retail sales, of which consumer goods bought by local in-

habitants increased by 17.9%, and capital goods purchased by production teams and commune members increased by 7.6%. More and more commodities are available now because of the increased quantity of goods purchased by the state and resold to the people.

As regards local industrial products, the commercial departments have changed the practice of state-guaranteed purchase and marketing into state monopoly of purchasing and marketing, purchase according to plan and purchase by order and by choice, thus contributing to the development of rational sales of needed commodities. Improvements have also been made where goods in high demand and high-grade commodities were in short supply. In 1980, the amount of local products purchased by the province's commercial departments constituted 31.3% of the total amount of goods purchased in the province, a 16.2% increase over 1979. Purchases of export commodities rose by 19.6%.

With the present state of the economy, where state commerce still predominates and state planning plays a leading role, tolerance of many diverse forms of enterprise, distribution channels and different ways of running business is shown, thus enlivening the economy as a whole. Collective or individual businesses in cities and towns of the province increased to more than 20,000 in 1980. Also in that year, the total amount of commodities sold wholesale by commercial establishments and supply and marketing units to collective businesses or individual traders constituted 5.8% of the total amount of the province's commodity supply, increasing by 84.8% over 1979. The number of open markets in the urban and rural areas of the province was restored to over 1,400. Both the variety of commodities marketed and the volume of business increased. The volume of business in 1980 had a 40% increase over that of 1979.

Standard of Living. Because of the development of production, the standard of living continued to improve. The per capita income both from commune and family sideline production increased by 7.5% in 1980 over 1979. The average level of consumption in the countryside increased by 5.4%. The per capita income of staff and workers (including those employed in both state and collective enterprises) increased at an average rate of 17.7%, while the average level of consumption in cities and towns increased by 10.7%. By the end of 1980, the savings deposits of city residents had increased by 46.1%, while those of commune members had grown by 44.8%.

The housing conditions of city residents and commune members have also improved to a certain extent. In 1980, the province built new

residential housing in towns and cities totalling 1,924,800 sq. m., which was a 43.9% increase over that of 1979. The average per capita housing space for city residents is 3.5 sq. m. About 29,000 households of staff and workers in cities have now moved into new houses, while more than 10% of the commune members in the countryside have built their own new homes.

Current Problems and Goals for Future Development

Since the Third Plenum of the Party Central Committee, vast numbers of cadres and people at all levels in Jiangxi Province have achieved remarkable success in carrying out the policy of readjustment, restructuring, consolidation and improvement under the leadership of the party and the government. However, there are still some problems: capital construction is overextended in scope, being far beyond the financial and material means of the province. The investment in capital construction has been reduced by the state budget in the last two years, but the money spent on construction coming from different channels other than the state budget has increased. And much of the construction that is carried out is redundant and useless. Not enough attention has been paid to doing things according to capacity and to balancing revenues and expenditures. The result has been too much spending. The economic structure is not rational, managerial skill still remains low and the economic performance is inefficient. As far as agricultural production is concerned, the diversified economy is still not satisfactory: the

development of industrial crops, forestry, animal husbandry, sideline activities and fishing has been slow, as a result of which the light and textile industries in the province have been affected by a short supply of raw materials, and the profit rate of the industrial enterprises has remained rather low.

After the Working Conference of the Central Committee of the party in December 1980, the party committee and the people's government of Jiangxi Province, in keeping with the party's policy for further readjustment of the economy and for further political stability, have made specific arrangements for the economic readjustment of the province in 1981, proposing measures suitable to the specific economic situation in Jiangxi. In order to carry out the readjustment, it has been determined in the 1981 economic plan of Jiangxi Province that the total value of agricultural and industrial production will increase by 4% over 1980. This means that the total value of agricultural production will increase by 5.6% and that of industrial production by 3%; the general scale of capital construction will go down by 34.5%; revenues will increase by 5.6% and expenditures will be reduced by 30% as compared with the final accounts for 1980; and the total amount of retail sales will increase by over 3.1%. It has also been decided that the province's limited capital should be carefully used only for important projects: to improve the standard of living; to develop agriculture, especially industrial crops, and a diversified economy; and to develop the light and textile industries as well as the energy industry. It is expected that with these readjustments, the economy of Jiangxi will develop even more steadily in the future, and the standard of living will accordingly be improved to a considerable extent.

73. ECONOMIC DEVELOPMENT IN JILIN PROVINCE

By the General Office,
Jilin Provincial People's Government

Geography. Situated in the central part of Northeast China, Jilin Province is a beautiful place with fertile land and rich natural resources. It covers an area of more than 180,000 sq. km. and has a population of 22,098,000. Its mountainous eastern part is covered with dense forests of high economic value. It has a wide distribution of mineral deposits. The central plains, with fertile land and a mild climate, have a great potential for agricultural development. The vast grasslands in the west are suitable grazing grounds for developing animal husbandry.

Survey of Economic Development Since 1949

However, these rich natural resources lay unexploited and unutilized before Liberation. Agricultural production in the province was very backward and the industrial foundation very weak. The working people lived in dire poverty.

After the founding of the People's Republic of China, the people of various nationalities in the province, under the correct leadership of the Chinese Communist Party, carried out socialist transformation with regard to the ownership of the means of production and large-scale economic construction. The national economy developed in an all-around way, registering great advances in all fields.

Economic Changes. Starting from scratch and proceeding from a small scale to a big scale, the province has built a large number of industrial and mining enterprises. Among them are the Changchun No. 1 Motor Vehicle Plant, the Changchun Coach Plant, the Changchun Rolling Stock Plant, the Changchun Tractor Plant, the Jilin Chemical Company, the Fuyou Oilfield, the Yunfeng Hydroelectric Power Station, the Tonghua Iron and Steel Plant, the Jilin Paper Mill, the New China Sugar Refinery, the Changchun Textile Mill, the Changchun Sewing Machine Plant and the Changchun Bicycle Factory.

At the same time, vast efforts have been made in farmland capital construction and the level of farm mechanization and electrification has been greatly raised. Much has been done also in applying chemical fertilizers and in bringing irrigation to farmland. The development of industrial and agri-

cultural production has been accompanied by growth in communications and transport, and in scientific, technological, cultural, educational and health undertakings. Jilin Province has effected a fundamental change in its economic structure. This is a sizeable material foundation for the province to realize the Four Modernizations.

Ups and Downs. The economic development in Jilin Province, as in other parts of the country, suffered ups and downs over the years, especially during the disastrous decade when Lin Biao and the Gang of Four were in power. As a result, there was a serious imbalance among agriculture, light industry and heavy industry and grave damage was done to economic construction. However, with the downfall of the Gang of Four, especially with the convocation of the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, the province quickly brought an end to economic stagnation and backsliding by earnestly implementing the principles and policies put forward by the Party Central Committee. It was able to restore the economy and to make new advances in a matter of two or three years.

Economic Growth. In economic construction in 1980, Jilin Province acted upon the eight-character policy centering around readjustment; devoted its main attention to agricultural and light industrial production and to arrangements for the people's livelihood; and carried out experiments on restructuring the management system in selected areas. The economy continued to grow in the course of readjustment. The industrial and agricultural output value totalled 16,950 million yuan in 1980, 5.5% more than in 1979 or 127.6 times more than in 1949. The share of industrial output value in total industrial and agricultural output value rose to 77.6% in 1980 from 28.7% in 1949.

Agriculture. A fairly good harvest was gathered in spite of very bad weather. In 1980, the province, acting on actual conditions, readjusted and relaxed agricultural policies, introduced the system of responsibility in production and new measures to restructure the management system. This stimulated the enthusiasm of the peasants and resulted in the development of production. Although bad weather seriously affected crops in

an area of 1.44 million hectares, the output of grain and soybeans totalled 8,585,000 tons in 1980 — the fourth best year since Liberation. Output of industrial crops increased by a big margin and beets amounted to 1,176,625 tons, more than double the 1979 figure. Production of oil-bearing crops came to 266,045 tons, or 87.1% more than in 1979. Both surpassed the best years in history.

There was also new growth in forestry, animal husbandry, sideline production and fishing. The province afforded 170,000 hectares, or 12,200 hectares more than in 1979. A total of 5,929,000 pigs were raised, which was on a par with the province's best record. The number of sheep aggregated 1,707,000 head, 14.4% more than 1979, and this set a new record in local history. Collective and household sideline production showed considerable growth. The output of ginseng and deer antlers — known as "treasures of the Northeast" — amounted to 2,170,000 kilograms and 27,715 kilograms, respectively, or 14.5% and 30.6% more than in 1979, respectively.

Total output value of commune-operated and brigade-run enterprises was 880 million yuan, a 17.4% increase over 1979. The output of industrial crops rose by a large margin thanks to the readjustment of the agricultural structure, while a fairly balanced development of farming, forestry, animal husbandry, sideline occupations and fisheries was ensured. This broke the past pattern of a drop in grain production resulting in a simultaneous drop in total agricultural output value. Although the province produced 450,000 tons less grain than in 1979, total agricultural output value increased by 3.8%. This was an outstanding feature of agricultural production in 1980.

The conditions for agricultural production in the province have been greatly improved. By the end of 1980, the province had built 81 large and medium-sized reservoirs and 6,200 km. of river dykes, and had sunk 53,387 pump wells. These facilities ensured effective irrigation for 730,000 hectares. About 457,000 hectares of farmland had been improved to ensure high and stable yields. As 1980 ended, the province had 65,470 powered irrigation and drainage machines for rural use and 25,961 tractors, 25,873 hand-tractors and 59,199 large and medium-sized tractor-drawn farm implements. At present, one-third of the province's farmland is plowed by machine.

The amount of chemical fertilizers applied in a year totalled 1,201,000 tons (calculated on the basis of 100% effectiveness) and averaged 304.5 kilograms per hectare. Electricity is available in 99.4% of the communes, 97.5% of the production brigades and 95.4% of the production teams.

In accordance with a decision of the State Council to build marketable grain-producing bases

in Northeast China, Jilin in 1980 designated 14 more counties as such bases, bringing the total to 23 in the province. With 3,298,000 hectares of farmland, or 81.6% of the province's total, these counties combined to produce 7,115 million tons of grain and soybeans in 1980, making up 82.9% of total output in the province. They sold 2.5 million tons of grain to the state, accounting for 86% of the total amount of grain the province sold to the state in the year. The marketable grain from these counties averaged 215 kg. per capita for the rural population, or 40.5 kg. more than the average for the province. This is of major significance to the province in its efforts to make the best use of its favourable conditions in order to promote grain production and speed up agricultural modernization.

Industry. Industry continued to advance in the course of readjustment, with light industry showing greater expansion. In 1980, the light and textile industries grew at a fast pace. With regard to heavy industry, the province readjusted its internal structure and product mix by closing, merging or retooling for alternate production a number of enterprises which had turned out sub-standard products, consumed much material and fuel or operated at a loss for a long time. Efforts were intensified to improve the management of enterprises. Experiments in expanding the authority of enterprises to decide their own affairs were conducted at selected places. The regulating role of the market was given greater scope under the guidance of planning and economic policies were further implemented. The result was that the workers and staff members were able to bring their enthusiasm into full play.

The province achieved fairly good economic results and increased both production and revenues. In 1980, total industrial output value was 13,160 million yuan, a 5.8% increase over 1979. The output value of heavy industry came to 7,980 million yuan, increasing by 1.7% over 1979. Production of light industry amounted to 5,180 million yuan, an increase of 13.3%. Light industries surpassed heavy industries in growth rate. The share of light industry in total industrial output value rose from 36.8% in 1979 to 39.3% in 1980. The enterprises covered by the province's budget met the target of profits one month ahead of time. The amount of profit realized from every 100 yuan of output value rose from 7.85 yuan in 1979 to 8.75 yuan in 1980, a 9.2% increase.

The work to put enterprises in order resulted in better management, higher quality of products and a great variety, and lower consumption of raw materials and fuel. The light and textile industries alone added 136 new varieties, 222 new products

and 2,439 new styles. Twenty-two industrial products manufactured by the province won first prizes in the national trade-wide quality appraisals. Five products were awarded state medals for good quality. "Lujin" Brand plywood won the state gold medal and the state silver medals winners included "Peony" Brand H acid, "Changbaishan" Brand potash prussiate and "Shenhua" Brand An Nao Niu Huang Pian.

Jilin Province produced an excellent situation in the light and textile industries by giving them priority in the supply of raw materials, energy and other things. Foodstuffs, clothing and other light industrial goods for daily use increased by big margins. In the early post-Liberation days, the province did not produce such high-grade goods as bicycles, sewing machines, radios and wrist-watches. In the period 1957-1962 of the second five-year plan, the province retained an annual capacity of producing about 5,000 bicycles, roughly the same number of sewing machines and 8,000 radios. In 1980, however, the province turned out 170,000 bicycles, 135,000 sewing machines, 700,000 radios and 310,000 wrist-watches. It also began to manufacture TV sets and washing machines. In an effort to supply the people with more clothing, the province produced 11,750 tons of chemical fibres in 1980, as against something over 5,000 tons in 1966, thus expanding production 2.4 times during this period.

Transportation and Communications. There was also a big development in communications and transport. Targets for both passenger traffic and freight by rail and road for 1980 were over-fulfilled. Total volume of freight amounted to 78,670,000 tons and the number of passengers totalled 132,370,000. The total railway mileage within the province stood at more than 3,400 km., or 46% more than in 1949. Highway mileage was more than 23,000 km., or 6.9 times more than in 1949. All the people's communes and 60% of the production brigades are now accessible by motor road. The management of transport enterprises was improved in 1980 and the number of traffic accidents dropped by 4% from the previous year.

Capital Construction and Investment. By readjusting the areas of investment, capital construction achieved better results. In 1980, state-budgeted investment in the province and funds raised by the province itself shrank from the 1979 total, but the province invested 2.2 times more money than in 1971 in the light and textile industries and 25.1% more in housing. Construction of key projects progressed at a faster pace. The 13 projects designated by the state as key items over-fulfilled the plan for the year by 10.2%. Three key projects were

completed as scheduled. The results of investment were markedly improved.

The province maintained a balance between revenues and expenditures and had a slight surplus. In 1980, a financial system was introduced by which each administrative level was entitled to keep a portion of the surplus after fulfilling the quota set by the next higher authority. Thus, departments at various levels became more eager to increase production and revenues and to cut costs and expenses. The province increased the revenues and over-fulfilled the annual financial plan. Urban and rural savings deposits increased considerably to a total of 1,060 million yuan at the end of 1980 — five times the 1962 figure and 2.6 times the figure for 1976.

Commerce. Trade was brisk in urban and rural markets during 1980. A commercial system embracing multi-economic sectors, with units under public ownership as the predominant sector and having multichannels of distribution and multi-forms of operation, began to take shape. This was made possible by introducing market regulation under the guidance of state planning, opening all possible avenues for production and restructuring channels for commodity flow to reduce intermediate links. Market supplies were significantly improved. The supply of sugar, cigarettes, liquors and candies were ample and the shortage of certain industrial goods was eased. The network of restaurants, snack shops and service units was expanded and their range of business and services was extended so that the volume of trade increased.

In 1980, retail sales totalled 5,800 million yuan, or 15.6% more than in 1979. This range of increase was unprecedented in the province since the founding of the People's Republic. Compared with 1976, the supply of pork, eggs and sugar all increased by more than 30%, and that of wrist-watches and bicycles increased by at least 60%. The supply of TV sets and tape recorders rose by 140% and 270%, respectively, over 1979.

Foreign Trade. The year 1980 was also the best for the province in the purchase of export-oriented commodities and in export volume. The volume of such purchases was valued at 470 million yuan, a 50% increase over 1979 and the highest since Liberation. The volume of exports handled by the province itself amounted to 93 million yuan, which was 53.5% more than planned and an increase of 111% over 1979.

Science, Culture and Health. Scientific, technological, cultural and educational undertakings continued to develop. In 1980, there were 440 institutions of natural sciences run at various levels

throughout the province. Their professional staff from assistant researchers on up numbered 3,780 and accounted for 33% of the total personnel working in the field of science and technology. The year also saw the largest number of scientific research items completed. Of the 158 research projects, 47 were verified and 14 were up to advanced levels in the country. Industrial and mining enterprises made headway in conducting research projects geared to production as part of the effort to make scientific research serve production directly.

The teaching quality of primary and secondary schools and of institutions of higher learning was raised markedly. The cut in the number of middle schools and a great expansion of vocational (technical) schools of various forms both in towns and rural areas brought a change in the structure of secondary education. The province enrolled 10,515 college students in 1980, or 1,035 more than in 1979. In addition, united, spare-time, television and correspondence universities and universities for day students were founded.

Health and medical work also progressed. A total of 2,829 beds were added to hospitals throughout the province in 1980. More than 537,000 patients suffering from any of five endemic diseases received free medical treatment.

The province also showed good results in physical culture. The provincial women's basketball team won the national championship. Seventy-four athletes placed first in eight national contests, including speed skating, track and field, weightlifting and cycling. Mass sports activities were also developed. And new successes were scored in the fields of culture, arts, broadcasting, television, the press and publishing.

Income and Livelihood. The people's livelihood was also improved in 1980. As production developed and the state readjusted the ratio between the accumulation fund and the fund for consumption, the income of the urban and rural populations generally increased. After two pay raises, the average annual wages for workers and staff members in the province in 1980 rose to 810 yuan, or 130 yuan more than in 1979 and an annual increase of 32.5 yuan. In the last two years, thanks to the implementation of the party's policies, higher state purchasing prices for farm and sideline products and the expansion of peasant household sideline production, the overwhelming majority of the peasants in the province earned more income. The net income per peasant in 1956 averaged 85 yuan (based on a survey of 432 typical peasant households) and it increased to 244 yuan in 1980 (based on a survey of 360 households), a rise of 159 yuan. The purchasing power per urban resident in 1980 was 205.6 yuan, or 14.2% more

than in 1979. As urban employment increased, the number of dependents that a worker supported decreased. A survey of 13,643 families in early 1980 revealed that each family had an average of 2.37 wage earners, one more than in the corresponding period of 1965, while each wage earner had to support an average of 1.97 dependents, 1.7 less than in 1965.

In 1980, housing projects under construction in towns and rural areas totalled 3.56 million square metres of floor space, an increase of 15% over 1979, and 1.91 million square metres of floor space were completed, an increase of 23.2% over 1979. More than 5.91 million square metres of housing were built in the countryside in 1980 and 100,000 peasant families moved into new homes.

Current Problems and Goals for Economic Development

Jilin's economy made certain progress in 1980, but the results were still far from satisfactory in readjusting the proportions among agriculture, light industry and heavy industry and in the ratio between accumulation and consumption. The scale of capital construction is still larger than appropriate, a fact compounded by overlapping or ill-conceived projects. The problem of inferior products, high prices and lack of competitiveness has not been fundamentally solved. There was no marked improvement with regard to the low level of enterprise management, substandard technical levels and poor economic results. Further economic readjustment is necessary in view of these problems. The general requirements are: a sufficient retreat in capital construction, a balance between revenues and expenditures, stable prices, significant growth of agriculture, expansion of light industry, readjustment of heavy industry, and steady and moderate development of scientific, technological, cultural, educational and health undertakings.

Agricultural Growth. The province envisages the vast development of agriculture. While grain production is ensured, vigorous efforts will be made to diversify the economy in the light of actual conditions. In order to increase production in an all-around way, the province will further implement the two documents of the Party Central Committee concerning agriculture, eliminate the influence of "Left" mistakes, make serious efforts to correct past erroneous practices, and stabilize and implement the rural economic policies. It will continue to readjust the distribution of crops and the pattern of production, strengthen the construction of the bases for marketable grain,

forestry, animal husbandry and oil-bearing crops, carry out a series of measures to increase production, such as farm mechanization and farmland capital construction, and raise the level of scientific farming.

Industrial Readjustment. Industrial readjustment is one of the focal points of the economic readjustment in the province. In view of the fact that the province's industrial structure is on the "heavy" side, the province plans to readjust heavy industry and speed up the growth of light industry in order to promote the restructuring of industry as a whole and gradually establish an industrial structure tipped to the "light" side. Through readjustment, the output value of light industry will further increase and so will its share of total industrial output value. In accordance with people's needs and along the lines of specialization and cooperation, the province will carry out industrial reorganization and integration in nine cities in 1981, centering around the enterprises producing brand-name items or goods in short supply.

Enterprises that produce inferior products, consume too much materials and fuel or operate at a loss for a long time will be closed down, suspended, merged or switched to other lines of production, with emphasis on merging and switching over. In view of the fact that local energy supplies are not likely to increase significantly in the near future, the province will concentrate on increasing production through saving energy and will try to do a good job in the comprehensive utilization of energy resources.

Capital Construction and Investment. The scale of capital construction will be further curtailed. Efforts will be made to improve the results of investment. In 1981, the main areas of investment will be projects producing goods in short supply and those that have long been neglected, such as agriculture, light industry, science and technology, education, housing and municipal public utilities. To ensure timely completion of the key projects, centralized management will be enforced over capital construction projects, with strict control over the number of new projects. Effective measures will be taken to look after projects to be stopped or deferred.

Finance and Commerce. In financial and commercial work, stress will be put on the effort to achieve a balance between revenues and expenditures — with a slight surplus — by increasing revenues and cutting expenditures. The main steps to be taken are: make vigorous efforts to open more sources of finance and to reduce expenditures and promote production, in order to achieve the two-fold target of higher output and greater revenues; help those enterprises running at a loss to eliminate deficits and yield profits; tighten financial regulations and discipline; continue to enforce the financial system of letting each administrative level retain part of the profits above the set target; strictly control expenditures and cut spending for nonproductive purposes. In order to ensure a lively market and a thriving economy, commodity distribution will be further improved, while resolute measures will be taken to stabilize prices and to control price hikes.

Science, Education and Culture. The scientific, technological, cultural and educational undertakings in the province will continue to progress amidst readjustment. The focus of scientific research will be on those sectors of the economy which will grow in the course of readjustment, such as agriculture, light industry, energy sources and communications, and on the development of new products which are in demand on the market. Further readjustment will be conducted with regard to scientific institutions and efforts will be made to quickly apply the results of research in production. The internal structure of education will be further readjusted to ensure the harmonious development of all types of schools. The restructuring of secondary education will continue so as to expand vocational and technical education by taking vigorous and appropriate steps. Cultural and health undertakings will develop correspondingly in the course of readjustment.

Under the correct leadership of the Party Central Committee and the State Council, Jilin Province will, by making full use of favourable conditions and by mobilizing all people to work with one heart and mind, achieve a stable development of its economy through readjustment, and it will create favourable conditions for its long-term development in the future.

74. ECONOMIC DEVELOPMENT IN LIAONING PROVINCE

By the Liaoning Provincial Statistical Bureau

Geography and Resources

Location. Situated in the southern part of Northeast China, Liaoning Province borders Hebei and Inner Mongolia on the west, adjoins Jilin on the northeast, faces the Democratic People's Republic of Korea across the Yalu River to the south-east, and reaches the Yellow and Bohai seas in the south.

Geography. The province covers an area of 140,000 sq. km., of which 62% is mountainous, 30% flat and 8% water surface. Of this total, 3.76 million hectares or 26% is farmland, 39.4% forest and 3.6% pasture.

Climate. Lying in the north temperate zone, Liaoning benefits from a mild climate with much sunshine and rain, which is salubrious for farm crops.

Population and Administration Divisions. Liaoning has a population of 34,869,000, of whom 94% are of the Han nationality. Among the minority nationalities in the province, the Manchus number 1,147,000 and account for 45% of the total Manchu population in the country. Urban residents make up 31.8% of the total population and rural inhabitants 68.2%. There are altogether 7,615,000 wage earners, 71% of whom work in state-owned units, and 6.78 million able-bodied farm workers, or 30% of the rural population. The province consists of 12 municipalities and prefectures, 45 counties, 2 cities under the administration of prefectures, 42 districts (28 of which are urban districts) and 1,149 people's communes.

Transportation. Liaoning is linked with other parts of the country and the neighbouring Democratic People's Republic of Korea by rail. It has such important sea ports as Dalian, Yingkou and Dandong. Thus, Liaoning is a major foreign trade outlet for Northeast China.

Minerals. Being an area with abundant mineral resources, Liaoning boasts a quarter of China's total iron deposits and leads the country in magnesite and borax reserves. It also has rich resources of coal and oil. Deposits of a variety of rare metals which can be used for the atomic energy and space industries have been discovered in recent years.

Principal Crops. The main cereal crops include rice, maize, sorghum and soybeans and cash crops are cotton, tobacco, peanuts and sunflowers. The province also produces tussah silk, ginseng, apples, prawns and other seafoods. Liaoning's tussah silk output accounts for 75% of the national total and apple exports are about the same percentage.

Water Resources. With well over 360 rivers, both big and small, Liaoning has abundant water power resources. Apart from the boundary river, the Yalu, the main inland waterways in the province include the Liaohe, Taizi, Hunhe and Daling rivers, which have a total flow of 46,500 million cu. m. per year. Liaoning's coastline extends for 2,187 kilometres and provides excellent conditions for developing aquatic products. The province ranks among the five major sea salt producers in China.

Survey of Economic Development Since 1949

Despite its favourable natural conditions and rich resources, Liaoning was not sufficiently developed in the pre-Liberation years as a result of the prolonged rule and plunder by the Japanese imperialists and Kuomintang reactionaries. Since Liberation, the local people have worked hard under the leadership of the Chinese Communist Party and people's government and have won tremendous successes in socialist revolution and construction, with substantial assistance from other parts of the country.

Liaoning has now become an industrial centre with the steel and machine-building industries as the main producers. The province's industrial enterprises numbered 16,000 at the end of 1980, and their position among the provinces in the national economy was: combined fixed assets, first; total industrial output value, third; heavy industrial output, first; light industrial output, fourth; and financial revenues, second.

Impressive progress has been made in Liaoning's industry, agriculture, transport and commerce over the past 30 years. A breakdown shows that provincial income has gone up by an annual average of 9.1%; industrial production, 13.7% (heavy industry, 16.5%; light industry, 10.4%); farm production, 4.5% (grain output, 3.7%); and retail sales, 9.8% (per capita sales of consumer goods, 6.8%).

With the growth of the economy, the standards of the people's livelihood, cultural life and medical conditions of both the urban and rural population in Liaoning Province have improved too.

Review of Liaoning's Economy in 1980

In accordance with the policies formulated by the Third Plenary Session of the Chinese Communist Party Central Committee held in December 1978, Liaoning Province made considerable progress in economic readjustment in 1980, as evidenced by the new achievements of various departments.

1. *Preliminary readjustment of the economy was made in the course of development.* In agriculture, the peasants' socialist enthusiasm rose tremendously thanks to the implementation of the two documents of the Party Central Committee on agricultural development and the party's various economic policies, the establishment of the responsibility system in production, and increases in the purchasing prices of farm and sideline products. Good harvests were reaped despite serious natural adversities.

The province's grain output in 1980 totalled 12.215 million tons, an all-time high. Considerable increases were also registered in cash crops: the output of oil-bearing crops exceeding the 1979 mark by 64% and the per hectare yield of cotton rising by 27.6%. The output of tussah silkworm cocoons topped the 50,000-ton mark, surpassing the previous year's output by 32.5%. All these items hit their highest levels since the founding of the People's Republic. Initial restructuring was carried out in agriculture, with progress made in forestry, animal husbandry, sideline occupations and fisheries as well. Total output value of the commune-run industry also showed a fairly large increase. The rural economy began to take on a new look.

In industry, notable changes were made in the industrial structure and a great impetus was given to the growth of light industry by taking full advantage of the concentration of heavy industry and the abundance of raw material industries in the province, by breaking the barriers of different departments, localities and systems of ownership and forming combines or encouraging cooperation between specialized units, and by carrying out the principle of giving priority to certain industries.

Liaoning's industrial production for 1980 totalled 45,600 million yuan, an 8.4% increase over 1979. Of this, light industry rose by 28% while heavy industry was up 0.9%. The proportion

of light industry in total industrial production rose from 27.7% in 1979 to 32.4% in 1980. Collectively run enterprises also made great progress, scoring a 19.2% growth in total output — as compared with 3.9% chalked up by state-owned enterprises.

Some 550 enterprises which had long been running at a loss because of substandard products and high consumption of materials and energy, were either closed down, stopped, merged with other enterprises or switched to different lines of production. This made it possible to divert the limited supplies of energy and materials to those enterprises whose products are of good quality and have a ready market and whose energy consumption is low and profits are high. Satisfactory economic results were gained as a result.

Preliminary success was also made in ameliorating the serious dislocation between stripping and extraction in the major coal mines in the province. All of them overfulfilled the 1980 targets for tunneling, development opening and stripping and made up for some of the previous losses. The recoverable amount of coal in a shaft during the three stages of development opening, preparation and extraction was greater than in the same period of the previous year.

The steel, machine-building and other heavy industries strengthened their own readjustment, broadened their scope of service and tried in many ways to produce goods in short supply which were needed by agriculture, light industry and the market. While meeting their own production targets, defense industry enterprises also took active steps to produce goods for civilian use.

The scale of capital construction was further reduced and changes were made in the use of funds. Projects involving a total investment of 3,380 million yuan were completed in 1980, an increase of 20.5% over 1979. Of this total, 1,440 million yuan was spent on nonproductive projects, or 53.3% more than the previous year, and its proportion rose from 33.5% of total investment to 42.6%. The investment in housing was up 55.1%, with its proportion of total investment growing from 25.6% to 31.8%. Appropriations for the cultural, educational, health, scientific research, municipal construction and other departments were also larger than in 1979. Improvement was made in the quality of the projects built and in the results of investment.

2. *Active steps were taken to restructure economic management.* The province's 262 industrial enterprises which had been chosen to experiment in broadening the powers of decision increased their total output value by 6.4%, turned over 9.5% more profits, or 330 million yuan, to the state and received an additional 66 million

yuan as their share of profits. While the state and the enterprises themselves increased revenues, the workers also earned more. The same experiment was carried out in a number of financial, trade and scientific research units.

In the spirit of taking full advantage of the strong points of enterprises, protecting competition and promoting combination, Liaoning Province established 173 specialized companies (comprising 1,900 enterprises), 507 economic integrations and nearly 500 joint industrial-agricultural-commercial enterprises in 1980 to give fresh momentum to the growth of industry and agriculture.

Financial departments in the province adopted the new system of "apportioning the revenues and expenditures among different levels and holding each to account for its profits and losses" — which fired the enthusiasm of all units for increasing revenues and economizing on expenses. The restructuring of the banking, credit and taxation systems also produced fairly good results.

3. The regulating role of the market was given full play under the guidance of unified planning.

The machine-building industry sought orders from all possible quarters and thus began to overcome the difficulties arising from a serious shortage of production tasks. Total production of the enterprises under the provincial machine-building bureau in 1980 amounted to 4,370 million yuan, maintaining the 1979 level. The commercial departments encouraged the simultaneous development of various economic sectors, channels of distribution and forms of business, increased the number of distributive and catering facilities, and thus greatly promoted the growth of commerce and service trades.

In 1980, Liaoning established 6,401 collectively run distributive, catering and service units, which accounted for 27.1% of the total number of such units in the province. Some 60,000 people were licensed to run private units of this nature, more than four times the number in 1979. More trading warehouses were built, the number of urban and rural trade fairs rose to 963, an increase of 147, and they did 600 million yuan's worth of business, which was 62.2% more than the previous year. Government departments of supplies discarded the outdated concept that means of production is not a commodity, overcame the drawback of overstrict control, adopted the practice of procuring materials through a multitude of channels and encouraging multilateral cooperation, and thus enlivened the supply of materials and benefited production as a result.

4. *Great efforts were expended to increase production and practice economy, thereby improving economic performance as a whole.* While striving to increase production, industrial enterprises tried in every way to improve product quality, lower the consumption of raw materials and fuel, eliminate deficits and increase profits, raise income and cut expenses — and these efforts yielded satisfactory results. The average coke consumption for each ton of pig iron stood at 508 kg. in 1980, or 7 kg. less than in 1979; the average coal consumption for each kwh. of electricity was 385 grams, or 6 grams less; and the average coke consumption for each ton of synthetic ammonia was 1,503 kg., or 137 kg. less.

Twenty-five products in Liaoning won gold or silver medals issued by the state in 1980, and 174 others were given certificates for superior quality by the ministries in charge. Fifteen products of the first light industry and 14 of the second light industry won first prizes in a nationwide competition. The textile industry had 12 products selected as outstanding brands and 60 others as superior quality goods. Of the 65 products of the machine-building industry subjected to state examination, 25 were rated as first grade. State-owned industrial enterprises which practiced independent accounting turned in 6% more profit tax in 1980 than in 1979; the amount of profit yielded by each 100 yuan's worth of products increased by 2%; and the amount of circulating funds tied down by each 100 yuan's worth of products decreased by 2.55%. Statistics of 1,081 light industrial enterprises showed that their production costs decreased by 1.43%.

5. *The people's livelihood improved with the growth of production.* A total of 708,000 urban residents got jobs in 1980 as various localities and departments enlarged employment opportunities by a variety of ways. Some 40% of the workers were upgraded and 350,000 received a pay raise through an upward revision of their wage rates. The province's total wage bill grew by 21.5%.

Investigations of 960 workers' families in six cities revealed that the average monthly income per capita in the fourth quarter of 1980 reached 36.37 yuan, a 57.9% increase over the 1977 average. The rate of increase in the average income of workers' families during the three years after the fall of the Gang of Four exceeded the figure for the 12 years between 1965 and 1977. Statistics toward the end of 1980 showed that there were, on the average, 123 bicycles, 68 sewing machines, 93 radio sets, 240 wrist-watches and 31 TV sets for every 100 workers' homes. The peasants' average per capita annual income derived from the collective was 122.5 yuan, 7.5 yuan more than in 1979.

Investigations of 500 peasant families distributed in 50 different communes in 18 counties revealed that the net income per capita in 1980 totalled 273 yuan, an increase of 16.2% over 1979. Of this, 152 yuan was furnished by the collective, growing by 4 yuan, and 84 yuan came from household sideline occupations, up 19.3 yuan. There were, on the average, 67.8 bicycles, 55.9 sewing machines, 62.9 radio sets and 174 watches and clocks for every 100 peasant homes.

Liaoning's total retail sales in 1980 were valued at 11,600 million yuan, or 20.7% more than in 1979. Increases were registered in all consumer goods — foodstuffs, garments and everyday articles. Pork, soda, electric bulbs, soap, detergent and other such items which had long been rationed were now in ample supply. Sales of high-grade and durable goods such as TV sets, tape recorders, radios, sewing machines, bicycles, wrist-watches and woollen fabrics rose by a big margin.

New housing with a total area of 5.36 million square metres of floor space was completed and turned over for use in 1980 — more than four times the amount built in 1976. The average living space for each urban worker increased from 2.94 sq. m. in 1976 to 3.41 sq. m. The peasants' living conditions also improved with the construction of new houses comprising a total of 770,000 rooms. Total savings deposits in both town and country aggregated 2,420 million yuan, an increase of 44.3% over 1979.

6. *Progress was made in scientific, educational, medical and cultural undertakings.* Research institutions in Liaoning produced more than 2,000 new results in 1980, some of which reached or approached advanced national or international standards. Their application in industry and agriculture yielded satisfactory economic results. The principle of "walking on two legs" by running different types of schools was carried out in the field of education. The institutions of higher learning in the province had a total enrollment of 63,000, which was an all-time high. Radio, television, correspondence, workers' and evening colleges grew rapidly and enrolled a total of 88,000 students. The restructuring of secondary education got under way following experiments at selected spots and a number of secondary technical, vocational and skilled workers' schools were established. Medical institutions were reorganized, with improvement resulting in the quality of medical service. Effective measures were taken to popularize family planning and to encourage each family to have only one child.

Current Problems and Goals for Economic Development

As a result of the influence of "Left" mistakes

in economic construction over the years, and especially of the serious disruption caused by Lin Biao and the Gang of Four counter-revolutionary clique, Liaoning Province suffered from a serious imbalance in its economy, a weak agricultural foundation, a shortage of consumer goods and an acute dearth of energy. A great deal of work was yet to be done to improve the people's livelihood. This state of affairs began to take a turn for the better following the fall of the Gang of Four, but the serious dislocation of the basic proportional relations in the economy has not yet been fundamentally reversed. Liaoning still faces arduous tasks in readjusting, restructuring, consolidating and improving its economy. To make matters worse, while consumption grew in 1980, the rate of accumulation was not reduced. This resulted in inflation and price hikes and added to the difficulties for the future tasks of economic readjustment. To cope with this situation, it is imperative to solve the following problems:

1. *Expand agriculture and light industry and increase the production of consumer goods.*

Liaoning's agriculture is weak and incapable of meeting the needs of the present industrial and urban population. Over the 30 years since the founding of the People's Republic, Liaoning's total industrial production has grown 47 times, heavy industry 97 times and light industry 20 times, whereas total farm production has risen only 3.76 times and grain 2.9 times. Despite the improvement in agricultural production in 1979 and 1980, the weakness of local agriculture has not been fundamentally changed. Agriculture still accounts for only a tiny fraction of total industrial-agricultural production and Liaoning remains the province whose proportion of agriculture in the entire economy is the smallest in China. A large portion of the food grain, cooking oil, meat, eggs and raw materials it needs for light industry still has to be shipped in from other provinces. The backwardness of agriculture also hampers the growth of those branches of light industry which use farm and sideline produce as raw materials. As a result, Liaoning's light industry is a shorter leg than its heavy industry.

Although light industry has developed somewhat in the past two years, its production still constitutes only 32.4% of total industrial production — far below the national average of 46%. Many kinds of consumer goods fall short of the growing demands of the urban and rural population in terms of quantity, variety, specification and design. To increase the production of consumer goods, it is essential to turn the advantages of Liaoning's industry to good account while tapping the potential of agriculture and light industry to the fullest possible extent.

During the present restructuring of industry, steps should be taken to increase products for farm use, including chemical fertilizers, insecticides, certain types of rolled steel and farm machinery best suited to farming in the province. Steps need also to be taken to make use of the advantages of Liaoning's heavy industry and to provide better service for light industry. The metallurgical industry should strive to produce more rolled steel of lighter types and smaller sizes and other items in short supply which are needed for the light and textile industries, the people's livelihood and city construction. The machine-building and defense industries should make use of their favourable conditions and spare equipment to produce goods for light industry and civilian use. The chemical industry should carry out multiple utilization and produce more chemical fibres as raw materials for the textile industry. Besides, it is necessary to break the bounds of different departments, localities and systems of ownership in the course of industrial organization so as to increase the production of consumer goods through combination of and cooperation between specialized lines.

2. *Take firm steps to curtail the scope of capital construction.* Curtailment of the over-extended scope of capital construction is the central link in economic readjustment. In 1980, Liaoning spent 3,380 million yuan on capital construction — the highest level of investment in history. This magnitude of construction overstepped the limits of the province's financial and material resources, resulting in a tremendous strain on material supplies, an increase in unfinished projects and poor returns on the investment. There were 3,329 state-owned projects, each calling for an investment of at least 100,000 yuan, under construction in 1980, which represented an all-time record, comprising 616 more projects than in 1979. Projects left unfinished by the end of the year numbered 2,043, also a record. The huge investment in 1980 was mainly occasioned by spendings outside the budget.

During the readjustment, it is essential to make circumspect arrangements and to strengthen guidance through planning. It is imperative to tighten control over the scale of construction started by local authorities and enterprises with funds collected by themselves and over their use of such funds. Every possible effort should be made to use the limited financial and material resources to strengthen energy, transport and other weak links such as light industry, urban construction and housing — all of which are closely associated with the people's livelihood. Resolute steps must be taken to stop those projects which lack the neces-

sary conditions for construction or which, even when completed, will lack the necessary conditions for going into production. This also applies to those duplicate projects which will contend with existing enterprises for raw materials, fuel and power supplies. All this is aimed at matching the scope of capital construction with the country's financial and material capabilities.

3. *Carry out the movement to increase production and practice economy, strengthen management of enterprises and improve their economic performance.* There has been serious chaos over the years in the areas of production, construction and distribution, and especially in the management of certain enterprises — a consequence of errors in the principles guiding the economy and drawbacks of the economic management system. A fairly large number of enterprises still fall short of their own previous peaks or that of their own trades in terms of product quality and consumption of raw materials and fuel. Quite a few enterprises have produced large amounts of goods which find no ready market, and this has resulted in over-stocking products, lowering the rate of profit, increasing circulating funds needed and raising production costs. Some enterprises to this day are running at a loss because of very poor economic performance. The scope of capital construction is over-extended, resulting in poor returns on investment and striking losses and waste. There are too many links in the distribution of commodities and capital turnover is slow.

Firm steps must be taken during the readjustment to change the practice of stressing capital construction to the neglect of production and stressing the value and quantity of production at the expense of quality, consumption and management. Liaoning will have to rely mainly on tapping the potential of existing enterprises to enable them to expand production by their own efforts if the province is to develop its economy in the foreseeable future. To achieve this objective, it is necessary to carry out technical transformation rationally. Efforts should be made to raise product quality, increase variety, cut down the consumption of raw materials and fuel, reduce expenses on distribution and all other items, improve management, expand the movement to increase production and practice economy, try in every way to increase revenues and curtail expenditures, and fulfill the province's financial targets. In order to meet these targets, it is imperative to resolve the shortage of energy while strengthening management and achieving an all-round improvement of economic performance.

The shortage of energy has seriously hampered Liaoning's economic and financial growth in

recent years. To tackle this problem, the coal industry should speed up its readjustment and the construction of new shafts to boost coal production, the oil industry should strengthen exploration and increase the production of crude oil and natural gas, and the power plants should improve the maintenance of existing power-generating units, carry out technical transformation and strive to increase power output under normal operations. At the same time, great efforts are required to conserve energy and raise the utilization rate of heat so that the energy saved can be used to increase production.

4. *Improve market supplies, stabilize prices and raise the people's living standards.* With the growth of industrial and agricultural production and the introduction of market regulation under the guidance of planning, commodity supplies have increased and retail sales have gone up considerably in the last two years. In spite of this, ready cash and savings deposits in the hands of urban and rural inhabitants have likewise increased

by a wide margin, because the amount of money put into circulation has grown at a faster rate than the retail sales of commodities. In view of this, efforts should be expended to increase the production of consumer goods, appropriately reduce the stocks held by the commercial, supply and marketing and foreign trade departments and augment market supplies. Resolute and effective measures should be adopted to increase revenues and retrench expenditures, stop the indiscriminate handing out of bonuses, strictly control the issue of banknotes, strengthen price control and further stabilize the market and the economy as a whole.

Work should be done to make a good arrangement for the people's livelihood on the basis of expanded production. It is now necessary to expand employment opportunities for jobless people in cities and towns. More workers' housing should be built where the necessary funds and materials are available. On the other hand, firm and effective measures should be taken to improve family planning and control the growth of population.

75. ECONOMIC DEVELOPMENT IN NINGXIA HUI AUTONOMOUS REGION

By the Research Division,
General Office of the Ningxia Hui Autonomous Region People's Government

Geography, Population and History

Location. Ningxia Hui Autonomous Region is situated in the northwestern part of China. It lies in the middle and upper reaches of the Huanghe River and borders on Inner Mongolia Autonomous Region in the north, Shaanxi Province in the east and Gansu Province in the west and south.

Geography and Population. The region has a total area of 66,400 square kilometres and can be divided into two geographical districts: the southern loess highland formed by ranges of the Liupan Mountains and others; and the northern alluvial Yinchuan Plain around the Huanghe River. The total population of Ningxia is 3.737 million, among whom there are 1.167 million Huis as well as Manchu, Mongolian, Tibetan, Miao, Dongxiang, Uygur, Zhuang, and Korean nationalities.

History. Ningxia has a long history. As early as the Spring and Autumn Period, it was inhabited by Qiang people. From the Qin and Han dynasties, administrative organs under the central government were set up in this region and it became a place where army troops camped. At the end of the Tang Dynasty and beginning of the Yuan Dynasty, a kingdom named Western Xia was founded here. Later it was destroyed by Yuan and the region was called Ningxia Lu (at the provincial level). During the Ming Dynasty it was called Ningxia Wei (at the provincial level), and in the Qing Dynasty, Ningxia Fu. During these dynasties, immigrants came from Shanxi, Jiangsu and Anhui. At the beginning of the Republic of China, the name was changed to Suo Fang Dao, meaning "northern district." Not until 1929 was Ningxia Province established.

In 1935, Chairman Mao and the Central Committee of the Communist Party of China led the Red Army on the Long March across Mt. Liupan and through several counties in Ningxia (Longde, Xiji, Guyuan, Haiyuan, Tongxin and Yanchi) to Northern Shaanxi. Red regimes were set up in Yanchi and Yuhai counties as part of the Shaanxi-Gansu-Ningxia Border Region. After Liberation, according to the party's policy for national regional autonomy, Guyuan and Wuzhong autonomous prefectures and Jingyuan Autonomous County were founded. The Ningxia Hui Autonomous Region was established in 1958.

Before Liberation, the region's economy and culture were backward. In 1949, this province had a population of only 1.19 million people, but Ma Hongkui, the ruler of the region, enrolled 100,000 soldiers to support his reactionary rule. He colluded with despotic landlords and reactionary religious leaders to force people into his army and extorted taxes and levies. In particular, the Hui nationality was cruelly exploited. In those days, all business languished and prices kept rising. The people were struggling for places in the hunger line.

In September 1949, Ningxia was liberated. Then the grain output was only 642 million catties, the total value of agricultural output was 94.03 million yuan and industrial output was only 12.15 million yuan. As for industrial enterprises, there were only some handicrafts, an electric company with a 20-kw. generator (once used in the Empress Dowager Ci Xi's court) and a machine repair shop. Transport was provided by cattle, donkeys, camels and a few wooden boats and sheepskin rafts. The conditions of education and health were even worse. There were only 9 middle schools, 639 primary schools, and 3 makeshift hospitals with a total of 40 beds.

Survey of Economic Development Since 1949

After Liberation, especially after the establishment of the Ningxia Hui Autonomous Region, the regional economy was developed rapidly with the help of the state and the energetic efforts of various nationalities. Great changes have taken place in agriculture. On the basis of reconstructing some famous canals dug in ancient Ningxia, such as the Qin Canal, Han Canal, Tanglai Canal and Huinong Canal, the Qingtongxia Water Conservancy Project was built. Later, some main canals were dug: the No. 1 and No. 2 Farm Canals, West Main Canal, East Main Canal, Yuejin Canal and Dongxin Pumping Project. The irrigated area has been enlarged from 1.93 million *mu* in the early years after Liberation to 3.577 million *mu*. Farm machinery was developed from practically nothing. By the end of 1980, there were 5,811 big and medium-sized tractors and 16,404 walking tractors; the motive power for farming and irriga-

ting machinery was 188,000 hp.; and the total motive power of farm machinery was 1,145,000 hp. Over 65% of the farmland can be cultivated by machine. In the plains, 90% of the communes and brigades have electric power, and so have 40% of the communes in the mountainous area. The level of scientific farming is up to par. Grain output was 3.75 times that in the post-Liberation period and the total value of agricultural output had increased by 470%.

Industrial Development. Industrial production developed rapidly. The number of industrial enterprises has increased from 293 handicrafts plants before Liberation to 1,097 and newly built enterprises numbered more than 700, of which 29 were large and medium-sized enterprises. Now a primary industrial system has been formed that consists of coal, petroleum, electricity, nonferrous metallurgy, machinery, electronics, instruments, chemicals, building materials, paper-making, foodstuff-processing, tanning and wool and cotton textile industries. At the end of 1980, there were 11,332 machine tools and 2,539 pieces of forging equipment. The total value of industrial output in 1980 was 112 times that at the time of Liberation.

Transportation and Communication. Great changes have taken place in transport and communications. The railway from Baotou through the Huanghe River irrigated areas to Lanzhou is a major artery in Northwest China. It links the Beijing-Baotou line in the east with the Lanzhou-Xinjiang line in the west. Our region has a total of 421 kilometres of railroads. The highway network, with Yinchuan as the centre, extends to every country, city and industrial base and also goes through Ningxia to Xi'an and Lanzhou. The main roads total 6,848 kilometres in this region. There are also airline flights from Yinchuan to Beijing, Baotou and Lanzhou.

Mineral Reserves. Initial achievement has been made in geological work. The reserves of coal have been verified to be 8,490 million tons and gypsum reserves are 1,270 million tons. Other minerals such as glass sand and limestone are also abundant.

Science and Education. Achievements have been made in science, culture, education and public health. Now there is one scientific academy, 39 research institutes and 46 academic societies. All together, there are 2,398 scientific personnel. Ningxia has 5 universities and colleges with 4,156 students; one TV university, 5,150 students; 20 secondary technical schools, 8,174 students; 508 middle schools, 223,700 students; and 5,107 primary schools, 583,700 pupils. There are 14

libraries at the county level and above with collections totalling 1,853,000 volumes. There are 20 cultural centres. Some 60 hospitals have 7,866 beds and 12,709 medical workers.

Survey of Economic Development in 1980

In 1980, under the leadership of the Regional Committee of the Communist Party of China and the people's government, the people of all nationalities conscientiously carried out the party's policy of readjusting, restructuring, consolidating and improving the national economy that was adopted at the Third Plenum of the 11th Party Central Committee to make up for the loss incurred during the ten-year "cultural revolution," and Ningxia made initial achievements so that the economic situation became better than ever.

Agriculture. A bumper harvest was reaped in 1980. In the rural areas, governments at various levels carried out the provisions of the documents on agriculture issued by the Party Central Committee, readjusted economic policies, implemented the party's economic policy and instituted various production responsibility systems. The people's government of Ningxia Hui Autonomous Region reduced or exempted the state grain-purchasing quotas for the communes and brigades in mountainous areas and fixed the state grain-purchasing quotas for the brigades and communes on the plains. After readjusting the agricultural structure, peasants became more active in production, and they worked very hard to make themselves richer.

Thanks to good weather conditions in 1980, a harvest was yielded in agriculture, forestry and animal husbandry in the region, except for some mountainous areas which suffered from natural disasters. The grain output totalled 2,400 million catties, or 13.4% more than in 1979, and an all-time high. The output of oil-bearing crops reached 71.964 million catties, or 65.1% more than in 1979. Sugar beet production amounted to 125 million catties, or 3.75 times what it was in 1979. The output of the fruit of Chinese wolfberry was 836,000 catties, a 12% increase over 1979.

Despite a drought on the grasslands, the number of livestock and sheep increased by 3.5% and 0.9%, respectively. The commodity rate of sheep and hogs was up. Livestock and poultry bred privately by peasants also grew remarkably in number. Some 265,000 *mu* of land were afforested in 1980.

The total value of agricultural production was 534 million yuan in 1980, or 15.7% more than in 1979. Now the countryside presents a new look.

Industry. Through readjustment, industrial production was marching forward. The industrial departments of Ningxia reduced the output of some products which were not competitive because of poor quality and high prices and of those products already in stock. Some enterprises with high consumption, poor quality and long-time deficits were stopped, closed down or merged or converted to producing other items. On the other hand, stress was put on existing enterprises carrying out the industrial production plan practically, so that industrial growth remained constant.

The value of industrial output was 1,367 million yuan in 1980, 5% less than in 1979. Of this total, the output value of light industry reached 367 million yuan, an increase of 7.8% over 1979, and that of heavy industry was 1,000 million yuan, a decrease of 9%. The imbalance between light and heavy industries was improved during the year. The proportion of light industrial output value to total industrial output value increased from 23.6% in 1979 to 26.8% in 1980. The quality of products was much improved. Of the 35 indexes listed for quality examination, 20 met the planned requirement and accounted for 57.1% of the total. In contests, 20 high-quality products were chosen from the region, among which 6502-Type Jacquard Woollen Blanket and 40T Carrier with Scrapers were awarded state silver medals.

Some work was done in reforming the economic system and the reorganization and amalgamation of industry got off to a good start. Under the guidance of planning regulations, market regulation was brought into play. The industrial departments steadily did experiments in giving more authority to some enterprises. These measures played an active part in improving the management of enterprises, boosting production and raising economic efficiency. The collectively owned industry and individual handicrafts in cities also were developed to a certain extent.

Investment and Finance. The investment in capital construction was reduced so as to modify the conditions of wide coverage, multiple items and less efficiency. In 1979 and 1980, 75 projects — each with investments exceeding 50,000 yuan — were suspended or cancelled so that 750 million yuan was saved. The stress on invested items was shifted: in agriculture, the investment was raised from 13% in 1978 to 16.4% in 1980 and in light and textile industries, from 1.9% to 6.1%; but in heavy industry it decreased from 70.9% to 33.4%. For the last three years, the average annual investment in culture, education, public health and housing was five times the average annual amount of what has been invested since the founding of New China.

The initiative of the local authorities was aroused by the financial system of apportioning revenues and expenditures among different levels and by holding each responsible for profits and losses. Due to decreased incomes of the enterprises in the course of industrial readjustment, our region's revenue in 1980 was 194.57 million yuan, a drop of 22.5% compared with the previous year; expenditure was 584.16 million yuan, 8.2% less than the year before.

Commerce. With the bumper harvest, the increase of light industrial products and the relaxing of some policies, the market supply was much improved. Some major commodities which are closely related to people's daily lives are in ample supply and more varieties and colours are available. The situation of a market slump and deficient goods resulting from the ten years' havoc has initially changed. A great number of traditional items and farm and sideline products which had not been seen for many years running, have appeared again on the market. Even some goods in short supply in past years, such as eggs and sugar, are now available without limit.

The total purchasing value of farm and sideline products in 1980 was 157.23 million yuan, up 39.3% over 1979; and retail sales came to 784.95 million yuan, a 9.7% increase. At the time when state-run commercial units expanded their purchasing and improved their service, many enterprises under collective and individual ownership sprang up and developed, such as the shopping, catering, servicing, and repair businesses. As the number of shops was increased, the distribution of commodities appeared more active.

Science and Technology. Science and technology showed fresh growth. In 1980, 149 achievements in scientific research were approved; some of them were up to advanced domestic standards. The W-I 1500KG Pendulum Impact Tester paved a new path for the development of high-energy impact testing machines; some technical performances of Magnetic Power Clutch of DGF-2.5 type and DGF-5 type surpassed those of imported models; No. 204 Alkaline Protease opened a new source of fermenting for our tanning industry; the 864 Needles Electronic Jacquard Blanket Loom filled a gap in our textile industry; and the Laser Velocity Meter ushered in a new field in the development of instruments and tools. Some experts and units put forward proposals on how to rationalize the structure of agriculture, forestry and animal husbandry in the Huanghe River irrigated areas and how to bring about scientific farming, which formed an important scientific basis for

agricultural modernization in the Ningxia irrigated area. In addition, much progress was made in the fields of education, culture, public health and physical culture.

Income and Livelihood. The people's life showed some actual improvement. The income per person from collectives in the countryside was 77 yuan in 1980, up 12.4% over 1979; the grain ration per person was 449 catties, or 67 catties more than in 1979. Having money in hand and grain in store, the peasants were in high spirits to build new houses and purchase clothing and medium and high-grade consumer goods. Based on typical investigations, the average housing space enjoyed by each peasant in our region in 1980 was 8.8 square metres, an increase of 0.5 square metre over 1979. Every 100 peasant families on the average possessed 90.5 bicycles, 25 sewing machines, 24 radios and 52 wrist-watches. Some peasant families even began to buy TV sets. The average savings deposit per peasant was 16.3 yuan in 1980, up 40.5% over 1979. As life becomes better, people live longer than before, and the number of people aged 70 to 90 is growing fast in the rural areas. In 1980, 37,516 persons obtained employment, including casual labourers and contract workers.

More than 40% of the workers and staff members had their wages raised. A bonus system was widely carried out in enterprises. The annual average wage of workers and staff members in units owned by the whole people was up 10% compared with 1979. The increased income for most families lightened living burdens. The space of new houses totalled 470,000 sq. m., which meant an average of 0.46 sq. m. for every urban resident. According to a survey of urban families, every 100 families had 209 wrist-watches, 26 TV sets, 130 bicycles and 56 sewing machines. Some families had record players and tape recorders.

Facts prove that the economic situation in Ningxia is excellent indeed. The line and policies adopted since the Third Plenary Session are correct and have won the support of the masses. The people of all nationalities in Ningxia are confidently marching along the socialist road.

Current Problems and Goals for Future Development

In the past 30 years since Liberation, Ningxia has been marching forward rapidly with many achievements in socialist construction. But certain problems still exist because of the "Left" mistakes

in the guiding ideology of our economic construction. They are:

(1) Owing to incorrect estimation and vague understanding about our own economic foundation and ability, and regardless of our poor condition and backward economy and culture, we always intended to go faster and blindly pursued distant targets at high speed and with an exaggerated degree of self-sufficiency, so we were led into an alley of much accumulation and less consumption for quite a long time. To deal with a great number of problems, we put forward some slogans so divorced from reality that we were unable to fulfill them.

(2) In capital construction, we went in for grandiose projects and hoped to achieve quick results. Therefore, our battle line was over-extended, economic structure was out of proportion and light industry lagged behind for a long time. Our investment did not produce much effect and was generally wasted.

(3) The way of attaching importance to accumulation, not consumption, and to production, not people's living, created an imbalanced ratio between the "bone" and the "flesh." As a result, cultural and educational undertakings and the people's livelihood were badly affected.

(4) In our economic work, we copied some things from other provinces mechanically. And subjectivism and formalism still exist in our work.

(5) On the question of ownership, premature transition was practiced and our people's communes were still too large in size. In spite of the actual limitations of our productive forces, we once confiscated private plots in some rural areas and forbade country trade fairs, because the slogan urged us "to cut off the tail of capitalism." In urban areas, we did not take the collective economy into full consideration but put a ban on individual economy so that the path for the unemployed to get jobs became narrower and narrower.

Influenced by the above-mentioned "Left" thinking, the economic construction of the whole region suffered a great deal. From this we must learn a profound lesson.

In line with the guiding principle laid down by the Party Central Committee and the State Council for further readjustment of the national economy, our main task in the next few years is to pursue readjustment resolutely, to concentrate our efforts on promoting agricultural production, and to correct the relations between agriculture, forestry and animal husbandry. This will turn the

Huanghe River irrigated areas into a farm produce base as soon as possible and should quicken the development of forestry and animal husbandry in the mountainous areas to enable farming, forestry, sideline production and fishing to progress in a coordinated manner.

We are going to make the most of Ningxia's coal resources and devote major efforts to develop the energy industry. With the development of animal husbandry, forestry and cash crops, light and textile industries will be going on at a greatly accelerated pace, as will the tanning, woollen textile and food industries — including meat packing,

dairy production, sugar refining and wine making. The structure of heavy industry will be well adjusted so as to raise the production level. We will enhance the construction of communications facilities to ensure that transport will be the vanguard of the national economy. In capital construction, we must act according to our capability.

And we must stabilize prices and rearrange the market in order to increase financial income and to give more persons employment so as to enable the people to live a happy life and to permit our region to advance steadily in the course of economic readjustment.

76. ECONOMIC DEVELOPMENT IN QINGHAI PROVINCE

By the Economic Research Office,
Qinghai Provincial Planning Commission

Geography and Population

Location. Situated on the Qinghai-Tibet Plateau, Qinghai Province covers an area of 720,000 sq. km. and has a continental plateau climate. Most of the province consists of pastoral areas intermingled with small farming plots, except for the northeastern part which has 14 towns and counties in the Huangshui and Huanghe river valleys and whose agricultural area accounts for 5% of the total area of the province.

Population. Qinghai Province is inhabited by seven nationalities, namely: the Han, Tibetan, Hui, Tu, Salay, Mongolian and Kazakh. At the end of 1980, the population was 3,770,000, of whom 1,430,000 or 38% were minority peoples.

Survey of Economic Development Since 1949

Before Liberation, Qinghai had long been subjected to the shackles of semi-feudalism and semi-colonialism, with pastoral areas still in the grip of the slave system. Locked in an inland area, lacking means of communication and with a backward economy and culture, the people lived in utter poverty. After Liberation, democratic reform and socialist transformation and construction were carried out under the leadership of the Chinese Communist Party, giving Qinghai a new look. The major economic achievements may be summed up as follows:

Industry. Before Liberation, there were only eight handicraft workshops and a 223-kilowatt water turbine generator in the entire province. Since Liberation, however, such modern industrial departments as light industry, textiles, metallurgy, coal, power, petroleum, chemicals, machine-building, electronics, building materials and timber processing have been set up. By the end of 1979, enterprises in the province totalled 1,310, of which 38 were large or medium-sized undertakings. Enterprises owned by the whole people with independent accounting had 2.3 million yuan's worth of fixed assets and employed 187,000 workers and staff members. The variety of products increased to more than 400 from under 20 before Liberation.

Total industrial output value grew from 18.9 million yuan in 1949 to 1,390 million yuan in 1980 (at constant 1970 prices). The provincial capital, Xining, has become a new-rising city of more than 500,000 people. With the development of industry, the unitary agricultural and stock-raising economic structure has been initially changed. The proportion of industrial output value in the total of industrial and agricultural output value shot up to 68.3% in 1979 from 12.3% in 1949. The light and textile industries with 9,100 spindles for wool spinning and the machine-building industry with 16,500 machine tools accounted for about 30% each of the gross industrial output value.

Major industrial products included plush, knitting wool, woollen blankets, leather products, furs, salt, potassium chloride, asbestos, gypsum, copper concentrate, rolled steel, machine tools, tractors and heavy-duty lorry and mining machinery. But generally speaking, Qinghai is an economically underdeveloped area and industry is still in its initial stage of development.

Animal Husbandry. Animal husbandry is a major component part of the provincial economy. In 1949, the number of draught animals, sheep and goats in stock was 7,480,000 head and output of wool was over 2,500 tons. Since Liberation, the party and government have energetically helped and supported livestock breeding in the form of finance, credit, supplies and technology. The purchasing price of animal by-products has been markedly raised three times. Livestock breeding and veterinary stations have been widely set up at various places for the prevention and cure of animal diseases. Movements have been unleashed to wipe out insect pests and rats in the grasslands and to improve the breeds of sheep. All this has brought about a rapid development of livestock breeding. By the end of 1979, animals, sheep and goats in stock numbered 21.53 million head, an increase of 2.87 times over that of 1949.

Agriculture. Qinghai Province has a dry climate. Since Liberation, the people of various nationalities, under the leadership of the party and government, have devoted major efforts to building irrigation projects on a large scale. 69 irrigated zones with at least 10,000 mu of land each have been built. The effective irrigated area has risen to 2,340,000 mu from 750,000 mu before Libera-

tion. Meanwhile, the opening up of wasteland in the Qaidam Basin and other areas suitable for farming has brought the farmland of the whole province up to 8.7 million *mu*. Though grave natural calamities occurred in 1979, grain output still totalled 820 million kg. and production of oil-bearing crops was 58.5 million kg., rising 2.77 and 7 times, respectively, as compared with 1949; and average per-*mu* yield jumped respectively from 64.5 kg. and 25.5 kg. to 130 kg. and 53 kg. Growth was also registered in other industrial crops and sideline products.

Transport and Communications. There was no railway or airline in Qinghai Province before Liberation and there were only 472 kilometres of make-shift highways. After Liberation, a highway network around Xining was built and roads to other provinces were opened. Highways within the province totalled 15,495 kilometres, of which all-weather highways reached 11,349 kilometres. The Xining-Lanzhou railway was completed in 1959 and construction of the Qinghai-Tibet railway started a few years ago. Railway tracks have been laid to Golmud in the first stage of a construction project. Civil aviation also has begun to move forward. Thus, the state of inaccessibility in the province has been changed drastically.

Science, Education, Culture and Public Health. Before Liberation, there was no institution of higher learning or of scientific research in the province. The people of all nationalities had long been shackled in superstition and ignorance and illiterates were seen everywhere, while epidemic diseases spread widely. Since Liberation, great efforts have been made by the party and government to develop science, education, culture and public health. Now, there are 30,000 scientists and technicians of natural science and 31 independent institutions of scientific research. These institutions achieved success in selecting and breeding improved seed strains and spreading advanced cultivation techniques for spring wheat, potato and rape. They have improved animal breeds and have prevented and cured animal diseases. Scientists are selecting and cultivating forage seeds, surveying plateau biological resources, exploring and utilizing the resources in salt lakes and studying petroleum deposits and geological structures.

There are now six institutions of higher learning with 3,736 students, and 614 middle schools and 6,000 primary schools with a total enrollment of 820,000, a 19.6-fold increase over that before Liberation. There are 1,029 hospitals and other health institutions, with the number of hospital beds increasing to 11,621 from 100 before Liberation. A number of epidemic and endemic diseases

that gravely endanger people's health have been basically eliminated or brought under control. Population mortality has dropped by a big margin. Culture, arts, the press, publishing, broadcasting, sports and other public undertakings have been rapidly forging ahead.

The great changes in the national economy and social look of Qinghai Province during the past 30 years fully proves that the leadership of the Chinese Communist Party and the socialist system is the fundamental guarantee for the people of all nationalities to rid themselves of poverty and advance along the road to common prosperity. On the other hand, under the influence of "Left" thinking in the past 20 years, economic construction in Qinghai suffered from major blunders and met with serious setbacks. The "big leap forward" in 1958-1960 and the calamitous ten-year "cultural revolution" in particular incurred heavy losses for the national economy and caused serious difficulties for the people's livelihood. Since the crushing of the Gang of Four, the national economy has taken on a new look as a result of the readjustment which began in 1979.

Economic Readjustment in 1980

The economic readjustment in Qinghai actually began in the second half of 1979 and had achieved initial success by the end of 1980.

(1) *Rational readjustment was made in the structure of agriculture and animal husbandry.* In the last two years, agricultural policies of the party and government were carried out conscientiously. All forms of the job responsibility system were instituted and improved, and purchasing prices of agricultural and sideline products were raised by a large margin. Some taxes on poor production brigades and communes were reduced or remitted. Thus, initiative in production by peasants and herdsmen was brought into play. At the same time, the proportions between and within agriculture and animal husbandry were readjusted to an appropriate rate.

In 1979, some farmlands in the stock-raising areas were turned back into pastureland. Further measures were taken to preserve and build up the grasslands. Readjustment of the composition of animal groups was started by increasing the ratio of female animals. Instead of the common practice of seeking one-sidedly high stock quotas at the end of the year, much attention was attached to raising the survival rate, marketing rate and commodity rate. The total growth rate of livestock was about 15% in 1980, or 2% higher than the previous year. The total number of cattle, horses and sheep in

stock at the end of the year was 21.66 million head. Meat output (including pork) was 84,855 tons and wool output totalled 16,660 tons, up 18.4% and 7.6%, respectively, over the previous year. The number of livestock also rose markedly in agricultural areas where commune members were given fodder-land, and unreasonable restrictions on livestock breeding for personal needs were lifted.

Within agriculture, the distribution of crops was readjusted in line with local conditions. The natural advantages for growing rape were brought into full play in areas where the frost-free period was short, while in mountainous areas the acreage of drought-resistant crops was appropriately enlarged and proper rotation of crops was carried out. Thanks to plentiful rainfall and proper temperatures in the summer and autumn of 1980, a bumper harvest was gathered. Output of grain totalled 955 million kg. and of oil-bearing crops 70.5 million kg., up 16.5% and 20.5%, respectively, over the previous year. Both topped the previous highest levels.

Much attention was paid to forestry. Afforested areas in 1980 increased by 7,333 hectares — a record high in the past 20 years.

New developments were also made in collective and household sideline production in rural and pastoral areas. Income from collective sideline production in 1980 was 79.78 million yuan.

(2) *The readjustment of industry got under way.* Measures were taken in 1980 to speed up the development of light and textile industries; quotas of certain heavy industrial products were lowered; regulation by the market under the guidance of the state plan was brought into play; and production of commodities which were in great need in the market was increased. In the last two years, 43 enterprises which had insufficient raw material supply and outlets for their products and had suffered losses for a long time were either closed, stopped or transferred to produce other products. After initial readjustment, changes took place in the industrial structure.

Total industrial output value of the province reached 1,390 million yuan (at constant 1970 prices) in 1980 and stood at the same level as the previous year. The output value of light industry was 470 million yuan, up 9.4%, and that of heavy industry was 920 million yuan, down 6.4%. The proportion of the output value of light industry to that of industry as a whole rose to 33.9% in 1980 from 30.8% in the previous year.

There are favourable conditions in the province for the development of a number of products which are needed in the market and for export — such as plush, coarse woollen fabrics,

knitting wool, woollen blankets, carpets, leather goods, furs, milk powder, minimotors, cream separators, salt and potassium chloride. Output of these products generally increased by 10%. Production of goods for minority nationalities was also developed and their varieties were increased and quality improved. Plush and insecticide powder No. 2 for oats were awarded the nation's high-quality silver medals. Twenty-one of the province's high-quality products were chosen. Comparable costs of products dropped by 2% as compared with the previous year.

The priorities of capital construction investments were rearranged in a proper way and 61 projects were stopped or postponed. Reasonable investments were earmarked for light industry, salt, nonferrous metals and other industrial departments.

(3) *Markets tended to be brisk.* The commercial departments paid attention to arranging commodity interchange between different economic areas, enhancing the supply network, properly developing collective businesses and the trade of individual pedlars, opening more country fairs, encouraging purchases and sales at negotiated prices — and thus promoting the interchange of goods between cities and countryside. The total volume of retail sales in the province in 1980 was 900 million yuan, up 9% over the previous year. If the factor of price hikes is deducted, there was still an increase of 5.6%. Retail sales of collective and individual businesses rose by 54.9% and 33% respectively. Trade between nationalities was restored and promoted. Special goods for minority nationalities increased from 400 to more than 600 varieties.

In foreign trade, the total purchasing value of export goods in 1980 stood at 75.43 million yuan (at 1974 planned prices), up 33.5% over that of the previous year, of which industrial and mineral products rose by 47.5%.

(4) *Local finances improved.* Since Liberation, the central government has paid much attention to economic development in Qinghai and has given it special treatment as an autonomous nationality region. Some 400 million yuan of financial subsidies and 86 million yuan of development funds for economically underdeveloped areas, as well as other special allocations, constituted the main components of Qinghai's financial sources in 1980. Local financial income totalled 164.93 million yuan and expenditure were 588.51 million yuan, accounting respectively for 115.6% and 79.1% of the budget. Reserve funds of local governments increased slightly.

(5) *New growth was achieved in education.* The energetic promotion of education is one of the important tasks of the readjustment. Investment in capital construction for education in 1980 was 128% more than that of 1978. Allocations for operating expenses in education also increased. During the last two years, newly constructed school buildings had a total floor space of 146,000 sq. m., with newly added seats for 45,000 students in primary and middle schools. The serious shortage of classrooms in middle schools was somewhat eased.

As specific measures were taken in the past two years to push nationality education forward, boarding primary schools have been set up in some production brigades and most communes in pastoral areas. There are middle schools for minority nationalities in most counties, and teachers' training schools for minority nationalities and secondary medical schools in all autonomous prefectures. The Qinghai Institute for Minority Nationalities was enlarged and it opened preparatory courses. Enrolled pupils and students from minority nationalities throughout the province totalled 186,000, doubling the 1966 figure. Generally speaking, however, education in the province is still underdeveloped; there are insufficient teachers and the quality of education is relatively low.

(6) *The people's livelihood was improved.* Despite a bumper harvest and improved livestock breeding in 1980, the purchasing prices of agricultural and sideline products were raised in the last two years. Some taxes on poor communes and production brigades in rural and pastoral areas were reduced or remitted, while state purchase quotas of grain were also reduced. Therefore, the livelihood of peasants and herdsmen was improved.

Grain rations for peasants were 24% more than the previous year. Meat and dairy products for herdsmen also increased. Per capita income that peasants and herdsmen received from the collective in 1980 was 86.4 yuan and 189.4 yuan, respectively, up 13.7% and 6%, respectively, from the previous year. Commune members' income from household sideline production increased markedly. The livelihood of the people living in the cities also improved. The income of workers and staff members showed an increase. Newly built housing for workers and staff members in 1980 came to 550,000 sq.m., a record high since Liberation. However, the income of peasants and herdsmen is still rather low and they are living a difficult life in some areas. The livelihood of workers and staff members is still rather hard.

Family planning made headway. The natural

population growth rate in 1980 was lower than the previous year. The people of minority nationalities in pastoral areas have demanded family planning.

Current Economic Problems and Goals for Future Development

During the past 20 years, the economic construction in Qinghai was greatly influenced by "Left" thinking. Those in charge of the construction work paid little attention to local realities, were overanxious for quick results, ignored economic results and acted blindly. Therefore, an irrational economic structure was formed. Since inadequate care was given to the development of livestock breeding, forage grass is the most urgent problem today. Gross output in the pastureland is low and only a small quantity of animal by-products can be provided to the market.

The superiority of resources has not been brought into full play in developing industry. Too much importance has been attached to capital construction, while little attention has been paid to management. Most enterprises are operating under poor management and at low technical levels. Their products are of poor quality and are not competitive. Capital construction requires a long building time and high costs. Investment results are not up to standard. Cultural and educational levels are low. Scientific, technological and managerial personnel are in short supply. All this is a far cry from meeting the needs of economic development. Population growth is too fast and has led to serious problems. These problems should be studied seriously and settled systematically in the economic readjustment.

Under the guidance of the unified state plan, the national economy of Qinghai should raise its economic results and make greater contributions to the state by proceeding from reality, readjusting structures on the existing basis, reforming the system, tapping full potential and renovating equipment. The following measures are to be taken to achieve these ends:

(1) *We must bring about a great advance in livestock breeding.* Qinghai has 500 million mu of pastureland, but its capacity to support animals is low. In the coming years, we should step up pastureland construction. At present, we should put emphasis on preservation and rational utilization, improve and rejuvenate natural pastures and build artificial grazing ground in places where conditions permit, so as to raise the production capacity. At the same time, we should continue to

restructure the composition of animal groups, heighten livestock quality, raise more young animals, butcher more meat animals in the fall and provide more market stock and animal by-products.

(2) *We should develop a diversified economy while increasing grain production in agricultural areas.* Since the area of arable land is limited, intensive and scientific farming is the main way to raise per-unit output. Much attention should be paid to animal husbandry, forestry and sideline production and to the all-around development of farming, animal husbandry, forestry, sideline occupations and fisheries. A diversified economy should also be developed in pastoral areas.

(3) *We must continue to readjust the industrial structure and bring into full play the superiority of our resources.* We should develop in a planned way the light and textile industries with animal by-products as raw materials; exploit and

utilize the resources of water and salt lakes and of nonferrous metal ores and asbestos; readjust the product mix of the machinery industries and reorganize them in line with the principle of co-ordination among specialized departments; rely on old factories, tap their potential and carry out their renovation and transformation; strive to raise management and technological levels; and increase the competitive power of products and their economic effects.

(4) *We must energetically develop science and education.* We should train qualified personnel for science, technology and management; continue to take measures to speed up the development of education for minority nationalities; and make great efforts to heighten the quality of education.

(5) *We should control the speed of population growth by lowering the natural population growth rate.* We should advocate family planning among minority nationalities in the pastoral areas.

77. ECONOMIC DEVELOPMENT IN SHAANXI PROVINCE

By the General Office,
Shaanxi Provincial People's Government

Geography and Resources

Location. Shaanxi Province occupies a large part of the Huanghe River basin and adjoins Shanxi, Henan, Hubei, Sichuan and Gansu provinces and the Ningxia Hui and Inner Mongolia autonomous regions. It is an important passage linking East China with the Northwest and Southwest. It has an area of more than 190,000 sq. km. and a population of 28,310,000.

Land and Climate. Shaanxi has three natural regions: the northern part falls in to the loess plateau and the climate is temperate; the central part, the Guanzhong Basin, is historically known as the "Qin Valley 800-li long", and with a warm-temperate climate it is a notable production area for wheat and cotton; and the southern part, in the Qin-Ba mountainous region, is in the subtropic zone and is a rice producer.

Principal Products. Shaanxi's principal agricultural products include: raw lacquer, tung oil, tea, mulberry and silkworm cocoons, fungus, gastrodia, cotton, rapeseed, walnuts, apples, dates, chestnuts and oranges. In output of raw lacquer, Shaanxi ranks first in China; in persimmons, second; in dates and apples, fifth; in tung-oil seeds, sixth; and in silkworm cocoons and chestnuts, eighth.

Minerals. The province is rich in mineral resources, both metallic and nonmetallic. Nearly 100 kinds of minerals have already been found, and deposits of 57 kinds have been verified. Metals such as iron, manganese, molybdenum, chromium, aluminium, copper, cobalt, vanadium, lead, mercury, nickel and gold are found mainly in the prefectures of Hanzhong and Shangluo. Shaanxi's deposits of molybdenum, aluminium, vanadium, mercury and nickel are among the largest in the whole country. Nonmetallic minerals include coal, phosphorus, barite, fluorite, dolomite, limestone, clay and building stones. The province's coal reserves are estimated at 200,000 to 220,000 million tons, of which about 21,270 million tons have been proven; these reserves are located mainly in northern Weinan and the northern part of the province.

Hydropower. Shaanxi's water resources include 587 rivers, the smallest of which has a drain-

age area of 100 sq. km. The province's potential hydropower reserves total 12,740,000 kw. At 322 selected dam sites, power-generating units producing up to 5,500,000 kwh. can be installed.

Survey of Economic Development Since 1949

Prior to Liberation, Shaanxi's economy was extremely poor. Grain output in 1949 barely reached 6,620 million catties, with a per-mu yield of 119.7 catties. Cotton output totalled 87,400,000 catties, with an average per-mu yield of only 27.8 catties. The industrial base was quite weak, with a total output value of only 277 million yuan, or 18.4% of the total output value from industry and agriculture. The annual output of coal amounted to a meagre 610,000 tons. Power-generating capacity was 130,000 kw. and the annual output of electricity was less than 30 million kwh. There were a few small, poorly equipped factories located in Xi'an and Baoji which used manual labour to turn out a dozen or so light industrial products, such as cotton yarn, matches, textiles, and some flour-processing mills and distilleries.

Agriculture. Since the founding of the People's Republic, Shaanxi's economy has made great progress despite some difficulties and setbacks. The conditions of agricultural production have improved greatly, the composition of crops and farming methods have undergone enormous changes and levels of production have risen considerably. By the end of 1980, the province had over 1,500 reservoirs and 150,000 pump wells. In the past 31 years, the increase in areas under irrigation amounted to 15,410,000 mu, or 3.5 times the total irrigated land just after Liberation, for a total effective irrigated area of 18,720,000 mu. The total power of farm machinery amounted to 6,410,000 hp., including 20,400 large and medium-sized tractors and 68,900 walking tractors. The amount of agricultural chemical fertilizers applied in 1980 totalled 296,000 tons. The total amount of electric power for rural consumption was 1,210 million kwh.

The total output value of agriculture in 1980 amounted to 3,556 million yuan, three times what it was in 1949. Grain output reached 15,140

million catties, an increase of 130% over 1949. Cotton output was 161,690,000 catties, or a net increase of 85%. Forestry, animal husbandry, sideline production, and commune- and brigade-run enterprises all registered considerable growth. Bast fibre plants, sugar-bearing crops, tobacco and industrial crops, the staple products of mountainous areas and special local products all showed big increases.

Industry. Shaanxi's industries have developed rapidly. The older coal, oil, electric power, engineering, and textile industries have grown at a good pace, while new industries, which started from scratch in 1949, have also developed quickly. Shaanxi's fuel, power, manufacturing and electronics industries play a particularly important role in the national economy.

The coal industry has established as its bases in Tongchuan, Hancheng and other counties of northern Weinan four mines with an annual output of 15 million tons. In 1980, coal output in the province amounted to 17,920,000 tons, or 29.4 times the output in 1949. A huge power network has been set up, with Xi'an as its centre, extending to Baoji in the west, Yan'an in the north, Hanzhong in the south, and Huayin in the east; the total capacity of 1,678,000 kw. is 127.3 times the power output in 1949. In 1980, Shaanxi's output of electricity totalled 7,914 million kwh., or 264 times the output in 1949.

The engineering industry of Shaanxi is one of the most important bases in the whole country. In 1980, the output value of the engineering industry reached 3,730 million yuan, an increase of 341 times over that of 1949, and accounted for 34.8% of the province's total industrial output value. Other products of Shaanxi that occupy an important place in their respective fields of production include: high-tension transmission and transforming installations, precision machine tools, cutting tools, industrial automatic meters, heavy-duty forging equipment, metallurgical equipment, oil industry installations, coal mining equipment, textile machinery and farm machinery.

The textile and light industries have developed rapidly as the key industries in recent years. Guanzhong Prefecture, famous for its cotton, has been built up as one of the up-to-date bases for the textile industry in China, with a total of 887,000 spindles and 22,000 looms. In 1980, its total output of cotton yarn was 150,000 tons, and that of cotton cloth, 558 million metres. The textile industry in Shaanxi also produces wool yarn, printed and dyed silk, knitwear and needlework. The variety of products is great, and many of the best-quality products have made inroads into the market for textiles in dozens of countries and

regions. There is also large-scale production of enamelware, watches, sewing machines, bicycles, bulbs, paper, detergent and large special-use weighing apparatus. Shaanxi's "Camel" Brand enamelware, "Yan'an" Brand watches and "Standard" Brand sewing machines are among the best-selling items on the domestic market.

Transportation. Transportation in Shaanxi has grown rapidly since the founding of the People's Republic. The railways within the province, the Longhai, Baocheng, Xiantong, Xihan, Yangan and Xiangyu, have a total track length of 1,855 km., or 4.27 times more than that in the period right after Liberation. Of this total, 830.7 km. have been electrified, accounting for 49.8% of the nation's total electrified lines. The total mileage of highways in the province has extended to 33,600 km. In recent years, 5,860 km. of highways have been built in the mountainous regions. By the end of 1980, 98% of the communes in the province had been linked by highways. The improvement of transport played an important role in the exchange of goods between the cities and rural areas, greatly promoting economic growth. Now a highway network has been formed which runs through counties and communes in all directions, with Xi'an as its centre.

With the development of the economy and transportation, trade and commerce are also flourishing in Shaanxi Province. Xi'an, the provincial capital, is one of the eight major cities of China and the commercial centre of the province. Baoji and Xianyang are now the important trade centres in the west on the Longhai Railway. In 1980, the total volume of retail sales in the province reached 4,960 million yuan — 14.7 times the figure in 1950 — of which 3,010 million yuan of goods were sold to urban consumers and 860 million to rural commune members. Foreign trade, which started on an insignificant scale, grew rapidly to a considerable magnitude. The value of commodities purchased for export in 1980 came to 514 million yuan, or 386 times the figure soon after Liberation. "Qin" pepper, textiles, raw lacquer, walnuts, sheepskins, rare medicinal herbs, and other products from Shaanxi are all welcomed in world markets.

Education and Culture. After Liberation, there was great development in education, science and culture in Shaanxi Province. By the end of 1980, there were 34 institutes of higher education — 30 more than in 1949 — enrolling 53,200 students or 23.4 times as many as in 1949. The number of college students for every 10,000 people was 18.9, ranking Shaanxi fourth in the country. The province had one TV university with

14,000 students; 79 secondary vocational schools with 45,200 students, or 10.7 times as many as in 1949; 181,000 natural science and technology workers; 3 academies of science and 143 scientific research institutes; 1,600 natural science and technology personnel; and 206 professors, 814 associate professors and 6,352 lecturers, who made up 57.9% of the teaching staffs at institutions of higher learning. In 1980, 409 achievements were registered in scientific research and technology, of which 282 were applied techniques. There were 118 cultural centres, 33 museums and memorial halls and 15 libraries housing over 4.82 million volumes.

Tourism. Shaanxi Province is one of the birthplaces of the Chinese nation. Thirteen dynasties, including the Zhou, Qin, Han, Sui and Tang, had made Shaanxi the site of their capital. It therefore is rich in cultural relics and is now one of the important places under special protection and preservation; 20 cultural sites are state-protected and 28 are sites of the revolution. The Qin Dynasty tomb figures, the ruins of ancient Banpo Village, Yuaqing Pool, the Forest of Steles, the Dayan and Yaoyan pagodas, and the Qian and Zhao tombs are all well-known to the world. Shaanxi is also famous for its scenery. The Huashan, Lishan and Aibai mountains and the Foping Preserve — one of the 10 major panda reserves under state protection — are among the most famous. Xi'an, which is being developed as one of China's six major tourist regions, attracted a total of 32,000 foreign tourists in 1980.

Review of Economic Developments in 1980

In 1980, Shaanxi Province continued to carry out the policy of readjustment, restructuring, consolidation and improvement of the national economy, and some progress was made in various areas of economic work.

Agricultural Readjustment. In agriculture, readjustment of the structure of agriculture and the distribution of production was begun in 1979. The guiding principle of agricultural production followed the principle of adapting economic measures to local conditions and of giving full play to special regional features. Accordingly, central Shaanxi will be developed into a major producer of grain, cotton and oil-bearing plants. Southern Shaanxi will develop a diversified economy based on special local products, forestry and animal husbandry and will strive to be become self-sufficient in grain. Northern Shaanxi will focus on developing forestry and animal husbandry, while trying

to achieve self-sufficiency in grain production.

In 1980, the proportion of forestry, animal husbandry, sideline production and fishing in the total output value of agriculture rose to 30.5% from 25.89% in 1978. The distribution of crops began to be readjusted according to plan. The 390,000 *mu* of low-yield cotton fields not suitable for cotton-growing was allocated for different purposes to Dali, Weinan, Lintong and Juaxian counties and to Xianyang City. In Baoji, Hanzhong and Ankang prefectures, where growing conditions favour rapeseed and the local people are experienced in its cultivation, the land under cultivation was increased and the per-*mu* yield was raised, thus making the area a base for the production of rapeseed. Proper readjustment was also made for other crops and the distribution of crops was made more proportionate.

In the spring and summer of 1980, central Shaanxi and Yulin Prefecture were exceedingly dry, while in southern Shaanxi there were natural calamities such as floods, excessive rain and low temperatures. Forty-one counties were severely affected by natural calamities; the calamity-stricken areas totalled 32,700,000 *mu*, representing 46% of the land under crops. This brought about great difficulty for both agricultural production and the people's livelihood. With the support of the Party Central Committee and the State Council, the provincial party and administrative organizations at different levels sent large numbers of cadres to the calamity-stricken areas to organize the masses. Relying as much as possible on the original capital construction in agriculture, the workers brought an additional 300,000 *mu* of land under irrigation. The various policies of the Party Central Committee concerning the rural areas were warmly and earnestly propagated and carried out. Some 91% of the production brigades in the province adopted various methods of the system of job responsibility and succeeded in stimulating the peasants' enthusiasm for production. The losses caused by natural calamities were greatly lessened.

Although the output of grain and cotton in the province dropped by 16.8% and 21.1%, respectively, as compared with 1979 — a year of bumper harvests — the output of oil-bearing crops was the highest in history, amounting to 2,194,000 catties, or a net increase of 14.3% over the previous year. The afforested area amounted to 4,760,000 *mu*, over one million *mu* more than planned. The number of draught animals, pigs, sheep and goats also increased. The income of the commune- and brigade-run enterprises reached 930,000,000 yuan — 19.5% more than that of the previous year. Progress was also made in other agricultural and sideline productions as well as in the commune members' household sideline production.

Industrial Advances. In 1980, the total value of Shaanxi's industrial output amounted to 10,717 million yuan, up 2.4% from 1979. In capital construction investment, emphasis was placed on agriculture, light industry, science and education, as well as the people's livelihood. In the readjustment of industry, attention was paid to tapping potential production, to innovation and transformation, to the problems of raw materials, power, communications, transport and capital construction. As a result, the textile and light industries advanced rapidly in 1980.

The output value of light industry in 1980 was 5,189 million yuan, 14.3% higher than that of the previous year. The proportion of the output value of textile and light industries to total industrial output value increased to 48.42%, as against 43.4% in the previous year — approximating the proportion of heavy industry and restoring it nearly to the 1965 level. The quality of the main industrial products for civilian use was restored to the highest level in history. Of the textile products, 8 were honoured with state awards and 37 were acclaimed as excellent products. Nearly 300 kinds of new products were manufactured and over 8,000 styles and designs were added in the textile and light industries.

The output of industrial products for daily use increased by a big margin. Some 167,000 bicycles were produced, 4.1 times higher than in the previous year; 123,000 radio sets, 11 times higher; 40,500 TV sets, 3.5 times; 453,000 sewing machines, up 20%; 1,023,000 watches, up 25.2%; and increases in the output of chemical fibre cloth, silk products, shoes and furniture ranged from 18% to 30%. All this played an active part in keeping the market brisk, increasing state revenues and meeting the daily needs of the people.

Some experimental units were chosen where the reform of the economic system was carried out steadily and actively. In consequence, the enthusiasm of the enterprise and its working staff was aroused and production and distribution were facilitated. In 1980, 119 industrial enterprises were granted more decision-making power, accounting for 9.16% of the total number of locally administered state enterprises covered by the provincial budget, but their output value accounted for 55.55%, and their profit amounted to 82.19%. The experimental enterprises earned 3,113 million yuan, an increase of 9.36% as compared with that of the previous year; and their profits handed over to the state amounted to 469,700,00 yuan, an increase of 9.15%. In 94 experimental enterprises in the departments of commerce, food, supply and marketing, where more initiative was given to run the business, general improvement in management and administration was achieved and remarkable

economic results were realized.

In 1980, 473 enterprises were merged into 51 economic organizations in accordance with the principles of economic rationalization and co-operation between specialized trades, totally regardless of the department, region, subordination and ownership to which they belong. Of the 51 enterprises, 32 belong to the textile and light industries group. Such reorganized enterprises played a very active part in promoting production, tapping full potential, improving product quality and reducing production cost.

Commerce. Experiments were also made in the administrative systems of commerce, finance, credit and capital construction. Collective and individual economy in towns were restored to some extent. In 1980, commercial service shops run by collectives in the towns and cities numbered 6,100, with 54,100 employees. Individual commercial services in towns and cities involved 10,680 households, employing 12,600 people. With the preliminary reform of the economic system, under the guidance of state planning, a combination of planning and marketing regulation was put into effect. This brought about a new situation in which a number of economic sectors began to grow, various channels were opened and several forms of purchasing and marketing began to coexist, thus making the market more brisk, the economy more prosperous and improving the production and distribution of commodities.

Through readjustment, the ratio between accumulation and consumption in the province in 1980 was improved, i.e., the accumulation ratio was reduced to 32.1% as against 36% in 1978. In the state budget's allocation of investment for capital construction, the proportion of agriculture increased by 1.39% as compared with the previous year; that of textile and light industries increased by 0.57%; and that of culture, health and education, by 1.77%; while the proportion of investment for heavy industry was reduced by 29%. Housing with a total floor space of 2,286,000 sq. m. was built in 1980, an increase of 29.6% over 1979 — the largest increase since the founding of the People's Republic. The economic structure and the composition of commodities began to develop more evenly.

Current Problems and Goals for Future Development

Although rapid progress has been made and proper proportions of the economic sectors improved in Shaanxi Province, the tasks of readjust-

ment are still quite arduous. The chief problems may be summed up as follows:

(1) *Agriculture is still not strong enough to overcome natural disasters.* The main agricultural products produced in the province, such as grain, oil and cotton, are not as yet self-sufficient. Agriculture still remains a weak link in the whole chain of the national economy. Particularly owing to natural disasters in 1980, the crop output dropped and exerted an unfavourable influence on the people's welfare as well as on the work of readjustment.

(2) *The industrial technical level is not high and equipment capacity has not been fully tapped.* The variety of products is still limited and the management and administration of enterprises are relatively backward. Within the industrial sectors, the development of light industry lags behind that of heavy industry. In 1957, the output value of light industry made up 72% of total industrial value. In 1979 it dropped to 43.4% and in 1980 it was raised to 48.2%. Of all light industrial branches, the textile industry has a fairly good foundation, but its production level and rate of profits are lower than those in Shanghai and other municipalities and provinces. The food industry and secondary light industries are too backward to meet the needs of the people.

(3) *The output value of the machine-building*

industry is as high as 34.8% of the total industrial output value, and 75% of its production is essential to the country. Owing to the readjustment of the national economy and the reduction in the scale of capital construction, some enterprises cannot obtain their full quota of machines to carry out production, leading to the overstocking of materials and parts.

(4) *Capital construction projects are not well arranged and the channels of financial resources are too numerous.* It is thus impossible to exercise unified administration and achieve an overall balance, hence the scale of capital construction cannot be effectively controlled and tends to become over-extended.

In order to develop the national economy, the policy of readjustment, restructuring, consolidation and improvement must be pursued, with readjustment as the key. Priority should be given to the development of agricultural production and workers should strive for a bumper harvest all around. Readjustment of industry should be further implemented and the textile and other light industries should be developed at a rapid pace. Management should establish a plan and an overall balance. Strict measures should be taken to curb capital construction, to increase revenues and reduce expenditures, and to achieve a balance between income and expenditure on the basis of increased production and a higher standard of living for the people.

78. ECONOMIC DEVELOPMENT IN SHANDONG PROVINCE

By the Economic Research Centre,
Shandong Provincial Planning Commission

Geography and Population

Location. A coastal province in eastern China, Shandong is located in the lower reaches of the Yellow River between $34^{\circ}30'$ – $38^{\circ}15'N$. and $114^{\circ}50'$ – $122^{\circ}50'E$. The province is made up of two parts, the peninsula and the interior. Jutting out between the Bohai Sea and the Yellow Sea, the Shandong Peninsula faces the Liaodong Peninsula to the north across the Bohai Strait. The interior borders on the four provinces of Jiangsu, Anhui, Henan and Hebei. Shandong has a total area of more than 150,000 sq. km. and a coastline of more than 3,000 km.

Climate. Shandong lies in the warm-temperate zone and its climate is influenced by monsoons. There are four distinct seasons. Summers are hot and rainy, winters are cold and dry. Annual rainfall ranges from 600 mm. to 900 mm. The frost-free period lasts 180–220 days and sunshine is plentiful.

Population and Administrative Divisions. Shandong has a population of over 72 million, averaging 477 persons per sq. km. It ranks second in the country both in absolute number and density of population. Administratively, Shandong consists of four municipalities under the direct jurisdiction of the provincial government – Jinan, Qingdao, Zibo and Zaozhuang; and nine prefectures – Yantai, Changwei, Linyi, Tai'an, Jining, Dezhou, Heze, Huimin and Liaocheng. Under the prefectures are five cities – Yantai, Weifang, Jining, Dezhou and Weihai; and 106 counties.

Minerals. Shandong's complex geological structure yields abundant mineral resources. So far, more than 90 varieties of minerals have been found or are being mined. They include coal, petroleum, natural gas, iron, gold, copper, aluminium, diamonds, graphite, gypsum, magnesite, barite and amargosite.

Agriculture and Industry. The province's major agricultural products include: grain, cotton, edible oils, tobacco, bast fibres, fruits, aquatic products and animal by-products. Major industries and industrial products include: coal, petroleum and petroleum products, electricity, rolled steel, pig iron, machine tools, motor vehicles, cement,

synthetic ammonia, tractors, cotton yarn, cotton cloth, salt, cigarettes, clocks, wrist-watches and bicycles.

Survey of Economic Development Since 1949

After the founding of the people's republic in 1949, Shandong carried out land reform and the socialist transformation of agriculture, handicrafts and capitalist industry and commerce. Placing the economy on the basis of public ownership of the means of production has propelled the development of productive forces and has brought about profound economic changes throughout the province. In 1979, Shandong's total industrial and agricultural output value reached 42,150 million yuan, or 12.8 times the figure for 1949, representing an average annual increase of 8.9%. Total income was 20,680 million yuan, or eight times that in 1949.

Agriculture. Shandong has a rural population of 67.1 million and 108,980,000 *mu* of farmland. Construction of water conservation and farm improvement projects has proceeded on a large scale since 1949. So far the province has built 175 large and medium-sized reservoirs and more than 5,400 smaller ones. It has dredged or otherwise improved 31 big and medium-sized river courses and freed over 70% of low-lying areas from the threat of floods. It now has more than 700 irrigation zones, each benefiting at least 10,000 *mu* of farmland, and 423,000 pump wells. The irrigated area has expanded from 3.7 million *mu* in the early post-Liberation years to 66 million *mu* today.

In the same period, the area under forest has increased from 4.5 million *mu* to 20.87 million *mu*. Forest belts, previously nonexistent, now protect 30.5 million *mu* of farmland. Serious soil erosion has in the main been brought under control.

Farm mechanization has been upgraded. The province now has large numbers of farm machines, totalling 17 million hp. There are 194,000 tractors and 236,000 tractor-drawn implements. About 64.8 million *mu* of farmland is ploughed by tractors.

Improvement in farming conditions and the

application of advanced farming techniques have made the peasants less dependent on the vagaries of the climate for food. Shandong Province has set up 184 agricultural research institutes and a network of stations to disseminate farming techniques extending from the provincial to the prefectural, county and commune levels. This network has effectively promoted the popularization of advanced science and technology in agriculture, animal husbandry, forestry, fruit growing, fishing, water conservation and farm mechanization. For instance, four generations of fine-strain wheat and maize have been popularized. Lu Mian No. 1 cotton, a strain of high and stable yield, has been grown on an increasing scale since 1977. Early ripening and midway ripening varieties of peanuts have been popularized. Chemical fertilizers and insecticides have become important factors in increasing farm yields.

All this has increased the amount of marketable farm products and improved the structure of agriculture. In the early years of the People's Republic, crop planting accounted for 80% of Shandong's total agricultural output value, while the combined output of forestry, animal husbandry, sideline occupations and fishing accounted for 20%. The proportion of the latter grew to 28.2% in 1979, when the total output value of agriculture was 12,370 million yuan, representing an average annual increase of 4.5% over three decades. Compared with 1949, the output of grain was up 2.8 times, that of cotton and peanuts doubled, and cured tobacco, pigs, aquatic products and fruits all showed a seven-fold increase. The growth of agricultural production has prepared the foundation for all-around economic development.

Industry. Shandong's industry has developed rapidly under unified state planning. In the early days of the People's Republic, the province had only a few textile mills, food-processing factories, coal mines, machine shops and light industry plants. Starting almost from scratch, it has set up a fairly complete industrial system in the past 30 years. Now it manufactures both producer and consumer goods. Among its products are: iron and steel, petroleum, chemical fertilizers, motor vehicles, tractors, chemical fibres, woollen textiles, plastics, detergents and wrist-watches. The coal, power, chemical, building materials and electronics industries have grown remarkably. Shandong's fuel, power, major raw and semiprocessed materials and agriculture-oriented industries have attained sizeable proportions. A good foundation has been laid for its light and textile industries.

All counties in Shandong now have their own light and heavy industries. In 1979, there were more than 18,000 industrial enterprises at or

above the commune level, with 20,200 million yuan worth of fixed assets and a workforce of 2,396,000. A network of industrial bases, including Jinan, Qingdao, Zibo, Zaozhuang, Yantai and Weifang, has been formed and a number of new small cities and towns have sprung up.

With improved quality and increased variety, Shandong's industrial goods are entering the world market at a fairly rapid pace. In 1950, industrial goods — some textiles and other consumer goods — accounted for only 2% of the province's exports, but the proportion shot up to 53.8% in 1979, when the province exported not only consumer goods but metals, minerals, chemicals and machines.

Shandong's total industrial output value has been rising at an average annual rate of 12.9% in the past 30 years. Industrial output value now makes up more than 70% of the province's combined industrial and agricultural output value, as against 29% in the early post-Liberation years. Industrial expansion has laid the foundations for the technical transformation of Shandong's economy and for the consolidation of the alliance between workers and peasants.

Transportation and Communications. Railway lines open to traffic have increased by 56% since 1949. Trains now reach all the prefectures and municipalities in the province with the exception of Linyi and Liaocheng prefectures. In 30 years, the total length of highways has increased 11-fold to link up the communes in rural areas. Almost all of Shandong's counties are connected by all-weather roads. Sea transportation has increased, too, due to the improvement of Qingdao and Yantai harbours and a number of smaller ports along the coast. Jinan, the provincial capital, now has air links with Beijing and Shanghai. Compared with 1949, the volume of freight has increased 41-fold and passenger traffic, 11-fold. The development of transportation has effectively promoted rural and urban economic growth, foreign trade, domestic and international economic and cultural exchanges, as well as tourism. More than 22,000 foreign tourists visited Qingdao, Jinan, Qufu, Tai'an and other places of interest in Shandong in 1979.

Culture, Education, Science and Public Health. Great progress also has been achieved in these fields. The province now has more than 95,000 full-time primary and middle schools and colleges, with a total enrollment of 14.73 million. Thus, the number of people in school represents 20.3% of the province's population, as against 4.4% in 1949. Every village has its own primary school and all the communes have middle schools.

Over 95% of school-age children are enrolled. Shandong has 38 universities and colleges, with an enrollment of 44,700. Preschool education, schools for the blind and deaf-mutes and spare-time education have also expanded.

All the counties now have hospitals and disease prevention centres, all communes have clinics and production brigades have health centres, in sharp contrast to the old days when the rural areas lacked both medicine and health facilities. The death rate has dropped to 6.7 per thousand, as against 25 per thousand before Liberation.

In the cultural field, all counties have theatrical companies, cinemas and cultural centres and all communes have film projection teams. Sports, the press, publishing, radio broadcasting and television have all developed.

In science and technology, a contingent of scientists and technicians has come into being through cooperation between specialists and the masses. In 1979, Shandong had 510 industrial, agricultural, medical and other specialized research institutes, more than 780 factory-run research centres and laboratories and 120 academic societies. There were also more than 200,000 peasant groups engaged in scientific experiments and over 11,000 workers' technical innovation groups.

Income and Livelihood. Living standards have been going up with the development of production. The problem of large-scale urban unemployment left over from old China has in the main been solved. More than 4.85 million people in the cities and towns are employed in state-owned and collective enterprises and their average annual wages have increased from 276 yuan to 631 yuan in the past 30 years. An average family now has more wage-earners but fewer dependents to support than in the past. This has brought about a general improvement in living conditions. Retail sales have been rising at an average annual rate of 8.5%. In both urban and rural areas, the people's purchasing power has more than trebled in the past three decades.

Enormous Achievements. Although Shandong's economic development has known setbacks because of interference by "Left" errors, it has scored enormous achievements. The facts show that the socialist system, which represents the common interests of the people, is able to speed up the development of productive forces.

Since the Third Plenary Session of the 11th Central Committee of the Communist Party, Shandong has reviewed its experience and lessons in economic construction in the past 30 years and has thoroughly analyzed its economic situation.

Shandong's rich material and human resources,

relatively strong economic base and flourishing agriculture and industry are considered favourable conditions. Calculated on a per-capita basis, however, the area of farmland and the amount of goods produced and consumed are small, and the province's cultural, educational, scientific and medical resources are insufficiently developed. These are the unfavourable conditions. Since agriculture is a major factor in Shandong's economy and 93% of the population live in rural areas, the conditions of the peasants are decisive to the overall economic situation. In the 1980's, Shandong will proceed from these realities, take full advantage of the favourable conditions and rectify the unfavourable conditions, so as to achieve better results in its economic development.

Economic Developments in 1980

Rural policies were readjusted to give the production teams a free hand in managing their own affairs. A system of job responsibility, varying in form but each linking remuneration to output, was adopted to ensure the implementation of the principle "to each according to his work." This has stimulated the peasants' initiative. Making the best use of local conditions, they actively developed a diversified economy while ensuring grain production, and were rewarded with an all-around good harvest.

Agricultural Development. Though summer crops were affected by natural calamities, total grain output was 23.84 million tons — the second best harvest since 1949. The output of cotton shot up to 537,300 tons and that of peanuts to 1,404,300 tons — both all-time highs. Other production statistics were: cured tobacco, 157,000 tons; silkworm cocoons, 16,900 tons; bast fibres, 163,700 tons; fruits, 1,525,500 tons; pigs, 22.12 million head; and sheep and goats, 10.41 million head. With the exception of fruits and bast fibres, they all surpassed the 1979 output.

The agricultural structure improved in 1980. Cash crops, such as cotton, edible oils, tobacco and bast fibres, accounted for 26% of Shandong's total farm output in 1980, as against 14.4% in 1979. Total output of forestry, animal husbandry, sideline occupations and fishing increased by 13% over the previous year. Total agricultural output value reached 13,470 million yuan, an increase of 8.9% over 1979. The commodity rate went up and so did the peasants' income. Conditions in the rural economy were the best in many years.

Industrial Development. Industrial readjustment continued during the year. Stress was placed

on accelerating the development of light industry to ensure a rapid increase of consumer goods. Output value of light industry was 16,450 million yuan, an 18.3% increase over 1979. In 1980, Shandong produced 1,902,000 radios, 92,000 television sets, 459,000 sewing machines, 1,163,000 bicycles, 1,364,000 wrist-watches and large quantities of chemical fibres, soap and thermos flasks. The increases ranged from 25% to more than 100% compared with 1979. The output of cigarettes totalled 1,728,000 boxes; cotton yarn, 233,000 tons; and cotton cloth, 1,090 million metres. Production of silk and woollen fabrics and knitwear also increased.

The energy industry was strengthened. It produced 42,905,000 tons of coal, 18,318,000 tons of crude oil and 1,420 million cu. m. of natural gas. The machine-building, chemical, metallurgical and defence industries underwent readjustment and reorganization so that they could better serve agriculture, light industry and the market. More than 370 heavy industrial enterprises whose products were not in demand switched to the production of consumer goods and electronic products to accord with market demands. The output of heavy industrial products was kept within certain limits. In 1980, the province produced 1,415,000 tons of pig iron, 901,000 tons of steel, 11,000 motor vehicles, 13,000 tractors of 20 or more hp., 7,800 machine tools and 1,445,000 tons of synthetic ammonia.

Industrial management was improved and market regulation was introduced under the guidance of state plans. Thus the enterprises geared their production to better serve market demands while fulfilling state plans. Competition and various forms of joint operation were encouraged, resulting in better quality goods and a greater variety to choose from. More than 3,000 kinds of new products and 20,000 new designs and styles were added in one year, bringing industrial production closer to meeting the needs of society. Total industrial output value was 32,290 million yuan, up 8.4% from the previous year. During the economic readjustment in 1979 and 1980, light industry grew faster than heavy industry, and in 1980 it made up 50.9% of Shandong's total industrial output value, as against 45.1% in 1978.

Commerce. Trade was brisk in both town and country, thanks to the opening of different economic sectors, new ways of management and more channels for the distribution of commodities. Total purchases of commodities reached 16,890 million yuan, while retail sales amounted to 14,350 million yuan, up 20.1% and 21%, respectively, over the previous year. The number of collectively owned shops increased by 28,000 and

that of individually owned shops by 38,000. Rural fairs exceeded 3,750, including 99 in the cities, with a total turnover of 2,100 million yuan. The fairs played an important part in stimulating the exchange of goods between town and country, invigorating the rural and urban economies and providing much needed services for the convenience of the masses.

Education and Science. Education and science served economic construction in a better way. Preliminary reforms were carried out in the structure of secondary education as required by the situation in employment and the modernization programme. A number of regular middle schools in the rural areas were turned into secondary agricultural or agrotechnical schools, with special courses in agronomy, farm machinery, forestry, pomiculture, water conservation, animal husbandry, veterinary medicine and rural economic management.

In 1980, there were 280 senior secondary agricultural schools, with an enrollment of 26,500. A number of regular middle schools in the cities were turned into vocational schools, and 22 middle schools also offered 35 vocational classes to a student body of 1,900 specializing in light industrial machinery, textiles, semiconductor elements, motor vehicle maintenance, survey and cartography, fine arts and book-keeping. College enrollment increased by 6,300 and new buildings totalling 269,000 sq. m. of floor space were added to the campuses.

Scientific research institutes were readjusted and their management was improved. Encouraging results were achieved in trying out a contract system with some research projects and in giving research institutes greater power in making decisions. The number of factory-run research organizations exceeded 1,200. More than a million people took part in agricultural science experimentation. In 1980, Shandong completed 868 major research projects and popularized 84 major research results, which promoted industrial and agricultural production.

Income and Livelihood. The income of workers grew considerably on the basis of increased production. Total employment in the cities and towns increased by 252,000 in 1980. Average annual wages rose to 745 yuan per worker, an 18% increase over 1979. The annual income for workers in state-owned enterprises was 774 yuan and for those in collective enterprises, 654 yuan. In rural areas, commune members received 29% more income from the collective in 1980 than in 1979 — thanks to good harvests, reduced production costs and a lower rate of

accumulation. The increased purchasing power of commune members greatly boosted the sales of higher-grade goods.

Compared with 1979, sales of TV sets and radios doubled; those of chemical fibres, cloth, bicycles, sewing machines and wrist-watches increased from 30 to 60%; and sales of household electrical appliances, furniture, clothing and leather shoes also rose. A selective survey of 380 families in six cities showed that for every 100 families, there were 151 bicycles, 74 sewing machines, 223 wrist-watches, 93 radios, 28 TV sets, 5 tape recorders and 9 electric fans. Rural and urban bank deposits at the end of 1980 were up 42.2% from the year before. Housing conditions continued to improve with the completion in 1980 of 3,848,000 sq. m. of new housing in the cities and in industrial and mining districts. About 80,000 workers' families moved into new homes. In the rural areas, about 10-15% of the peasant families built new houses.

Shandong's economic development in 1980 proved the correctness of the policy of readjusting, restructuring, consolidating and improving the national economy.

Current Problems in Economic Development

A major problem is that the economic results are not yet satisfactory. The reason lies with the "Left" influence which persisted for many years. In the macro-economy, it led to a failure to handle correctly the relations between accumulation and consumption, between production and livelihood, and between economic construction and the deve-

lopment of science and culture, and by a one-sided pursuit of a high accumulation rate and high-speed growth; in the micro-economy, it led to enormous waste and low productivity in the course of production, construction and distribution. Too much money was put aside for accumulation, thus slowing down the improvement of people's living standards.

Another problem is the gap between different regions in economic development. Yantai and Changwei prefectures on the Shandong Peninsula have more highly developed industry and agriculture, while the northwestern part of Shandong, where nearly one-third of the province's population live, has for years lagged behind. There is a big gap between the advanced and the backward units. For instance, the highest yield of ginned cotton is 125 kg. per *mu*, or nearly treble the provincial average. For peanuts, the provincial average is 150 kg. per *mu*, while the figure for Zhaoyuan County is 234.5 kg. — and for the best production team, over 500 kg. This implies a great potential to be tapped.

A third problem is the dispersal of authority in industrial administration. The industrial enterprises are controlled by different regions and departments without proper stratified organization, specialization and coordination. Insufficient attention is paid to the role of the major cities.

Under the guidance of unified state planning and according to the principle of readjustment to achieve rational distribution and overall balance, Shandong Province will strive to achieve better economic results and to make greater contributions to China's socialist modernization by making full use of its rich human and material resources and its existing economic base.

79. ECONOMIC DEVELOPMENT IN SHANGHAI

By He Gaosheng

Municipal General Office, Shanghai Economic Research Centre

Geography and Population

Shanghai is one of the largest industrial cities in China. It covers an area of over 6,100 sq. km. and has a population of more than 11.4 million (of which over 5.8 million live in the 141-sq.-km. city centre). There are over 7,100 factories, 20,000 stores and 205 rural people's communes. Workers and staff engaged in the various economic sectors number more than 4.4 million—in addition to a suburban rural labour force of over 2.7 million. In 1980, Shanghai's industrial output value reached 62.6 million yuan, its seaport turnover exceeded 84 million tons and its local revenue was over 17.2 million yuan, comprising about 13%, 39% and 16%, respectively, of the national total.

Under the leadership of the Central Committee of the Communist Party of China and the State Council and with the support of the people, the city has taken advantage of its economic and technical superiority to contribute to the socialist modernization of the country.

Survey of Economic Development Since 1949

Shanghai was liberated in May 1949. Old Shanghai was a semi-colonial and semi-feudal city, with a lopsided economic structure, undeveloped industrial production and low technical capabilities. Total industrial output value in 1949 was less than half of the present-day monthly average. At that time, the strongest sectors of the economy were the light and textile industries, accounting for 86.4% of the total industrial output value, while only 13.6% could be attributed to heavy industry. The manufacture of metals and chemicals was particularly insignificant. The city relied heavily on imports of primary equipment, raw materials and many industrial products needed for daily use, because it could not produce them itself. Now, after 30 years of socialist transformation and construction, with a system of socialist public ownership predominating, Shanghai has become a socialist industrial city with high industrial and agricultural production levels, advanced science and technology and developed domestic and foreign trade.

Industrial Development. Industrial production has expanded significantly. The city's total output

value in 1979 rose 24 times as compared with 1949, representing an annual growth rate of 11.2%. Shanghai has renovated or expanded many key factories and developed a number of new industries. The original value of industrial fixed assets is nearly seven times as much as that of the early post-Liberation period. The variety of products has increased, with high and medium grade products occupying an increasingly larger proportion of the total. The city's production of chemical fibres, bicycles, sewing machines, watches and TV sets all have a relatively significant share in the national total.

Agricultural Development. The suburban counties have a non-staple food base, catering to the urban population. Shanghai is nearly self-sufficient in its supply of cooking oils and vegetables. And the city supplies 50% to 60% of the pigs, poultry, eggs and fish that it needs. Per-unit yields of grain, cotton and oil-bearing seeds rank among the highest in the country.

Science, Technology and Education. Science, technology and education have expanded rapidly. In 1979 there were 246 independent scientific research institutes, employing more than 60,000, as compared with only 12 research institutes and about 200 researchers in the early post-Liberation days. The number of scientists and technicians increased in the same period from 30,000 to 240,000, comprising 5.7% of the city's total workforce. There are over 10,000 schools of all levels with an enrollment of more than 2.4 million. Of these schools, 48 are universities and colleges with 70,000 undergraduates.

Other Developments. Foreign trade has grown substantially: business relations have been established with over 150 countries and regions, and the total value of exports has grown at an annual rate of 13.1%. The amount of daily necessity industrial products that the city ships to other parts of the country has risen at an annual rate of 6.9%, and the city's retail sales have increased annually at about 5.8%. Public utilities have witnessed rapid growth too, and the look of the city has changed enormously. Before Liberation, due to the disintegration of the imperialist concessions, Shanghai's public utilities were in a state of divided and decentralized management, which resulted in an extremely irrational distribution, with few public

facilities in the working people's quarters, rendering their living conditions unacceptable. Now the utilities have long been under unified management, and the supply of power, water and gas as well as the public transportation system have all improved substantially. For instance, there were over 610,000 gas-supplied households in 1979 as contrasted with 17,000 shortly after Liberation. Since Liberation, housing with a total floor space of over 15 million sq. m. has been constructed in the city proper, constituting more than one-third of the city's total housing space.

In keeping pace with the transformation of the city proper, more than ten industrial areas and satellite towns have emerged in the suburbs, and a number of key factories and important scientific research institutes have been moved to or built in these areas. The employment rate has grown steadily every year. Approximately 60% of the urban population are wage earners. The number of family members supported by each employee has decreased from an average of 2.97 (including himself) in the early post-Liberation period to 1.67 in 1979. As production expands, workers' wages and peasants' income have risen gradually, so that the standard of living of both the urban and rural population has improved considerably.

In the past 30 years, the citizens of Shanghai have manifested pioneering revolutionary spirit through arduous efforts and have achieved great success. Were it not for the mistakes we made and for the sabotage of Lin Biao and the Gang of Four, Shanghai would undoubtedly have fared even better. For a long time, however, under the guidance of "Left" ideas, there existed a tendency to go after things beyond our capabilities and to be overanxious to make achievements in all fields of work. For example, there were attempts to set up an all-inclusive industrial complex, plans for enormous increases and quick results and indifference to the need for improving the working conditions of the existing enterprises. Industrial construction far outshadowed construction of urban dwellings, public utilities and other necessary facilities occupied a great deal of land, thus worsening the city's growing pains and aggravating the lack of harmony between economic growth and urban construction. The long-accumulating disproportions in the city's economy have reduced the city's role as an industrial base. The rational readjustment of its economic structure by learning from past experience and proceeding from actual conditions in both Shanghai and China has thus become an important task for Shanghai's future economic and social development.

Review of Economic Developments in 1980

In 1980, all of the sectors of Shanghai's

population vigorously implemented the guidelines, principles and policies formulated since the Third Plenary Session of the 11th Party Central Committee. Freeing their minds to see the truth of the matter, they rectified the "Left" mistakes, consolidated and developed political stability and unity, systematically readjusted the economy and thus furthered Shanghai's development. Shanghai's economy advanced steadily in its course of readjustment.

Industrial Development. In 1980, by rigorously increasing the production of daily-needed consumer goods in the light, textile, handicraft and civilian electronic industries, and by gearing the metallurgical, chemical and machine-building industries to the needs of the market and to serve the technical transformation of the light and textile industries and old factories, the city's industrial output value rose by another 6.1% on the basis of an average annual growth rate of 9.4% between 1977 and 1979. Light industry rose by 11.9%, far exceeding the 0.3% increase registered by heavy industry. Its share in the city's total industrial output value advanced to 52.6% from 49.9% in the previous year. The textile industry strove hard to develop high and middle-grade products and its output value grew by 11% as compared with the previous year. Output of the "big three" in light industry (bicycles, sewing machines and watches and clocks) and the "big three" in the electronics industry (TV sets, radios and tape recorders) grew substantially. A total of 2,300 new products and nearly 30,000 new varieties, styles and specifications were developed in 1980. A great number of products improved in quality. In the inter-industry competitions of 596 products sponsored by various ministries of the State Council, Shanghai won 270 first prizes, about 45.3% of the total. A resource-saving drive achieved good results too. In particular, the technical transformation which centered around energy saving helped to realize the goal of increasing production without incurring additional consumption of energy. In consequence, the drive for increasing production and saving resources brought about in 1980 a 6.4% increase in local budgeted revenue as compared with the previous year.

Agricultural Development. In 1980, the weather in the Shanghai area was quite abnormal, bringing about serious waterlogging and resulting in a 20% decrease in the output of grain, cotton, oil-bearing seeds and vegetables. Owing to the implementation of the principle of readjustment and consolidation, and with the stress on planning well the raising of animals, the market supply of pigs reached 3.47 million, surpassing the planned target by 5.3%. The purchasing targets for eggs and

poultry were 1.3% and 15% higher, respectively, than the previous year. There were 6.6% more cows in stock than in the previous year. The catch of fish and seafood was 35% higher than planned. Commune-run industries and sideline production grew steadily. Total agricultural output value, including that of commune-run industries and sideline production, stood at 2.47 million yuan, 5.3% higher than 1979.

Finance and Commerce. In 1980, shipments of daily needed industrial products to other parts of China totalled 10,600 million yuan, an increment of 5.8% over the previous year. The outflow volume of most commodities increased to varying degrees. Owing to the expanded production of light industrial and textile products and the inflow of agricultural and sideline products from other areas, the city's retail sales reached 8,700 million yuan, some 1,190 million or 15.7% higher than the previous year. Accompanying the rise of the average level of consumption, the consumption structure has undergone certain changes. The retail sale of consumer goods recorded a substantial growth: that of clothing rose by 22.9%, of articles for daily use by 19.5% and of edible products by 12.3% (of which about 6% was due to price hikes). Within the categories of clothing and articles for daily use, consumers tended more and more to purchase medium and high-grade products: sales of watches, bicycles, woollen garments, silks and satins grew by about 20%; woollen fabrics increased by more than 30%; TV sets and cameras went up by more than 50%; desk electric fans were up by 120%; production of tape recorders, washing machines and refrigerators was also on the rise; and orders for metal decorations, cosmetics, high-grade confectioneries, winter nutritional items and holiday feasts grew in some cases by nearly 100%.

As for exports, the export value of Shanghai Port in 1980 exceeded the previous year's figure by 16.1%, an unprecedented record due to the vigorous implementation of the import-for-export policy, the improvement of management, the exploitation of multiple trade channels, the employment of internationally prevailing means of transaction and the enforcement of the measure of retaining a portion of foreign exchange. As regards export commodities, heavy industrial products rose by 48.2% as compared with the previous year, light industrial and textile products by 11.5% and agricultural and sideline products by 8.3%. Shanghai's foreign trade departments and manufacturers all worked to expand export supplies. Hence, the purchases of export commodities rose by 16.8% over 1979, of which those procured in the city rose by 25.7%.

Tourism has developed rapidly. In 1980, more

than 310,000 foreigners, tourists, merchants, overseas Chinese and compatriots from Hong Kong and Macao visited Shanghai, a rise of 46% over 1979. While the economic and cultural flow between urban and rural areas and between the city and foreign countries increased and tourism expanded, the turnover of Shanghai Port as well as the volume of freight moved by rail, water and land all overfulfilled their targets, exceeding, for the most part, the previous year's levels.

Capital Construction and Investment. Since the implementation of the principle of readjustment in Shanghai, 339 construction projects and 324 technical undertakings have been cancelled, suspended or postponed, thereby reducing investments by a total of more than 2,000 million yuan. While the scope of capital construction was curtailed, further efforts were made to readjust the orientation of investment, with emphasis laid on the construction of residential housing, environmental protection facilities and public utilities. In 1980, 397 projects were wholly or partially completed. The planned target for housing was 2.5 million sq. m. of floor space. But by adhering to the principle of integrating state-financed construction with locally financed construction, thus bringing into play individual initiative, a total of some 3.04 million sq. m. of floor space were completed, 40.9% more than in the previous year. In the same year, work continued on 252 waste control projects, of which 146 were completed. These projects have begun to show beneficial effects, one after another. In the meantime, by introducing such economic measures as charging industries for the use of water and fining them for discharge of polluted water, water pollution has been reduced to some extent. The precipitating density of floating dust in the air has also declined as compared with the previous year. As regards public utilities, an additional daily water supply capacity of 270,000 tons and gas supply capacity of 80,000 cu. m. were added. Progress also occurred in the construction and improvement of roads, bridges and parking lots.

Science, Technology, Culture and Education. In 1980, by further integrating science and technology with economic construction, Shanghai produced more than 600 significant technological achievements, improving agricultural production, developing new products in the light and textile industries, exploring new basic materials and saving energy. Many of these achievements have already been put into effective use. For instance, the ultra-red drying catalyser made by certain research units, when applied in the manufacturing process of paint finish, coating-fluids and carbon-inks in a

dozen factories, showed good results in shortening drying time by 20% to 50%, saving electricity by 20% to 40% and increasing productivity.

The quality of education at all levels has improved. Primary and middle schools have restored the 12-year schooling system. As regards higher education, some branch universities and specialized institutes were readjusted, and colleges enrolling day students who could cover their own expenses were opened on an experimental basis. In 1980, Shanghai's universities and colleges enrolled over 20,000 freshmen, secondary technical schools nearly 10,000 students, professional schools over 2,500 and technical schools 29,000. In addition, the urban and rural spare-time schools enrolled 823,000 students. Much progress was also made in the fields of culture, physical training and public health. Family planning reported new successes.

Income and Livelihood. In 1980, nearly 2 million employees received wage increases and 230,000 job-seeking youths were employed. Wage increases together with enlarged employment and the introduction of bonuses raised the city's total payroll by 16.3% over 1979. The average monthly pay for workers in publicly owned units reached 76 yuan, or 12.3% more than the previous year. Suburban commune members' annual income derived from the collective maintained the previous year's level of 278 yuan. Although prices rose a little, the real living standards of most urban and rural labourers improved in varying degrees. According to a survey of 500 families, holdings of durable consumer goods increased significantly. At the end of 1980, every 100 families had 99 radios, 250 watches, 79 sewing machines, 64 bicycles, 58 TV sets and 44 electric desk fans. For many suburban commune members, there were five major improvements: namely, new housing was completed, more furniture and more high-quality clothing was purchased, more surplus food grain was accumulated, and more savings were deposited. By the end of the year, total savings deposits for both urban and rural residents exceeded 3,000 million yuan, a rise of 22.8% over the previous year.

In 1980, Shanghai's economy continued to improve due to a thorough implementation of the policy of readjustment, restructuring, consolidation and improvement. With economic readjustment in progress, initial experiments were made to restructure the economic system, to consolidate enterprises and to improve the technical and managerial levels. By the end of 1980, 1,284 locally administered, state-owned industrial enterprises, 53.7% of the total, had been given greater autonomy. The metallurgical and textile industrial bureaux and the bicycle, sewing machine and 26

other industrial corporations also experimented with various degrees of managerial autonomy. The Light Industrial Machinery Corporation, the Shanghai Diesel Engine Plant and the Pangpu Machinery Factory began to keep independent business accounts, to pay taxes rather than hand over profits to the state and to assume responsibility for their own profits and losses. The combination of economic rights, economic responsibilities, economic results and economic interests has enhanced the vitality of these enterprises and increased their economic gains. The growth rates of their production and profits in 1980 were 7.1% and 7.2% higher, respectively, than the previous year and well above the city's overall average. Enterprises under the auspices of the construction, supplies, commercial and foreign trade bureaux and state farms also increased their autonomy by retaining part of their profits or by holding each unit responsible for profits and losses.

Under the guidance of national planning, all economic departments vigorously strove to enliven the economy. By the end of 1980, there were more than 500 industrial sales shops and business and service stores, over 60 farmers' markets and a number of capital goods exchange centres and agricultural and sideline product trade warehouses. 1980 also saw a great variety of exhibitions, fairs and contract negotiating meetings. Various business practices, such as factory-shop links, industry-commerce united sales, compensation trade, trust purchases and sales, negotiated purchases and sales and the planned control and supply of commodities on demand were also introduced, activating the markets and boosting production.

Furthermore, some departments and enterprises, in order to increase production, found it to be to their advantage to coordinate their efforts with one another. They broke many of the barriers between the various regional and departmental systems of ownership, and established, on an experimental basis, 300 economic "combinations" of various types, such as parent factories, joint operation of state and collective enterprises, united industrial and agricultural operations, operations transcending provincial and municipal barriers, combined industrial and trade businesses, combined industrial and commercial businesses and joint ventures with Chinese and foreign investment. The successful combination of the reorganization of enterprises with the restructuring of the economic management system yielded excellent results.

Current Problems and Goals for Future Development

In 1980, Shanghai's economy fared quite well.

However, the economic readjustment was and still is in a preliminary stage. Disproportions in the economy still remain, and there will, no doubt, be problems and difficulties on the road to readjustment. The industrial structure is still irrational; basic facilities such as power and gas supply, dockyards and railway stations still cannot keep pace with the development of industry; the trade and service networks are far from adequate; and some enterprises operate under capacity while others find it hard to cope with their production targets. Problems also remain regarding employment, housing, public utilities, disposal of industrial wastes and industrial distribution. These problems are to be settled in a planned and orderly manner in future economic readjustment.

For the year of 1981, following the policy defined by the Party Central Committee and the State Council of "carrying economic readjustment further and achieving political stability" and pursuing the general goals of the national readjustment plan, Shanghai must continue to readjust the investment orientation in capital construction within the limits set down in the national plan, guarantee the construction of residential units and corresponding public utility facilities and persist in improving the relationship between "bone" and "flesh." Shanghai must go even further to restructure its industry, to enforce the reorganization and technical transformation of enterprises in order to satisfy the demands of the market and to vigorously improve the production of consumer goods in the light, textile, handicraft and civilian electronics industries. Heavy industry must be geared to serve light industry, to facilitate the technical transformation of old enterprises, to energetically manufacture marketable commodities and to expand exports. A city-wide drive for readjustment in order to increase economic gains, promote production, practice economy, expand revenues and economize on expenditures is necessary if we are to fulfill the state quotas. The city must also give full play to the role of market regulation while relying in principle on the implementation of national plans to boost production and distribution. Efforts should be made to stabilize prices and to contribute to the realization of a balance in national finances, credits, materials and foreign exchange, as well as to the

stabilization of the economy. All of these will prepare us for a sustained, coordinated and steady development of the national economy in the future.

The disproportions in Shanghai's economy have come into being over many years, and it will take years of strenuous efforts to rationalize the economic structure. What kind of city will Shanghai develop into in the long run? This is a strategic question calling for in-depth study and careful planning. Shanghai, with its limited area, huge population and few natural resources, is a city of processing industries, dependent on support from the rest of the country. It has a better manufacturing foundation, higher technological capabilities and established and extensive foreign economic relations. In the years to come, we must base our development on Shanghai's actual specific conditions, comply with the demands of the national construction plan and make the most of the merits, avoid the faults and bring into full play the advantages enjoyed by the existing enterprises. It is necessary to combine reorganization of enterprises, technical innovation and system restructuring, to combine technical progress, exploitation of human resources and research facilities and economic development and to combine the expansion of foreign trade, technical transformation and aid to the interior.

Shanghai will proceed along the road to realizing better economic results with less human, natural and financial resources, and push ahead the economic and social construction in a well-organized manner. In the upcoming years, great efforts must be made to improve considerably the irrational organization of the different sectors, the industrial structure, the types of products produced and the organization of enterprises in order to achieve progress in such areas as employment, housing construction, city communications, urban environmental protection, etc. It is imperative to prevent the current urban "growing pains" from getting worse and to make necessary preparations for an effective cure, so as to build Shanghai into an industrially advanced, scientifically well-developed, economically prosperous, administratively well-coordinated, clean and civilized city. In this way we can make greater contributions to the Four Modernizations of our country.

80. ECONOMIC DEVELOPMENT IN SHANXI PROVINCE

By the Shanxi Provincial Planning Commission

Geography and Population

Location. One of the places of origin of the Chinese nation, Shanxi Province has a very long history, excellent cultural legacies and glorious revolutionary traditions. It lies to the west of the Taihang Mountains and in the middle valley of the Yellow River. On the east, it borders on Hebei Province, with the Taihang Mountains as the boundary; on the west, it borders on Shaanxi Province, with the Yellow River as a line of boundary; on the north, it has the Inner Mongolia Autonomous Region as its neighbour across the Great Wall; and on the south, it borders on Henan Province across the Maling Mountains and the Yellow River.

Geographical Characteristics. The total area of Shanxi Province is more than 150,000 sq. km., and 67.5% of the land is mountainous. The width of the province is 290 km. from east to west and 550 km. from north to south.

The topography of the province is relatively high, with most of its districts more than 1,000 metres above sea level. It has the Taihang Mountains in the east, the Luliang Mountains in the west, the Hengshan and Wutai mountains in the north and the Zhongtiao Mountains in the south.

The Fenhe River traverses the province from north to south; the Hutuo River encircles the Wutai Mountains; the Sanggan River washes the Datong Basin; and the Qinhe and Zhanghe rivers flow through the southeastern districts. There are many basins among the mountains, including the Datong, Xinding, Taiyuan, Changzhi, Linfen and Yuncheng.

Climate. The climate of the province is continental. Temperature ranges are wide during the year and between day and night. Rainfall and snow are concentrated in a few months of the year and in some parts of the province. The average annual temperature is 4°C - 14°C . The lowest temperature on record is -44.8°C (on Mount Wutai), and the highest ever recorded was 42.7°C . The average annual rainfall is 400-600 mm. The frost-free period is about 200 days in the south of the province and 90-120 days in the north.

Population. By the end of 1980, Shanxi had a population of 24.76 million, including the Han, Hui, Mongolian and Manchu nationalities. Of

these, 3.37 million people lived in the cities and 21.39 million in the countryside.

Survey of Economic Development Since 1949

Before Liberation, the people of Shanxi were subjected to savage oppression and exploitation by imperialism, feudalism and bureaucrat capitalism. After the 1911 Revolution, Kuomintang warlord Yan Xishan controlled the region for a long period. The Japanese imperialists' aggression seriously destroyed Shanxi's economy and hampered its growth. The province's total industrial and agricultural output value in 1949 was merely 1,340 million yuan, of which agriculture contributed 1,140 million yuan and industry 190 million yuan. Output of principal products included grain, 5,190 million catties; cotton, 40 million catties; oil-bearing crops, 70 million catties; steel, 12,000 tons; coal, 2.67 million tons; cement, 14,000 tons; and electricity, 40 million kwh.

After Liberation in 1949, the Chinese Communist Party and the People's Government led the country in a profound socialist transformation and large-scale economic construction. Great changes took place in the economic situation, the system of exploitation was destroyed, major developments took place in the industrial and agricultural fields, and a heavy industrial base centred on the coal industry was formed. Since the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party, we have executed the policy of readjustment, restructuring, consolidation and improvement, and our national economy has embarked on a road of rational and healthy development.

Agriculture. In 1980 there was 58,822 million *mu* of cultivated land in the province. Through capital construction projects on the farmland, the course of the main rivers in the province were regulated and some 900 reservoirs were built, each with a storage capacity of one million cu. m. of water. The total capacity of these reservoirs reached 4,200 million cu. m. Other projects included the digging of 103,000 pump wells and the establishment of 19,000 power-driven drainage and irrigation stations, which can irrigate 16.727 million *mu* of farmland.

Some 1,804 communes in the province now

can utilize electric power. The total volume of consumption of electricity in 1980 was 1,360 million kwh. Total power of the farm machinery was 7.375 million hp., of which irrigation machinery accounted for 2.475 million hp. There were 33,000 large and medium-sized tractors and 31,000 walking tractors, 6,655 trucks and 303,000 tons of chemical fertilizer for agriculture.

The development of agricultural production was promoted by the improvement of conditions. Though drought hit 66 counties and 8 prefectures and cities in 1980, we still achieved a good harvest of grain crops and a large increase in cash crops by executing the Party Central Committee's two documents on speeding up the development of agriculture, by enhancing the responsibility system and by reorganizing planting plans according to soil conditions.

Total grain output in 1980 was 13,710 million catties, the fourth bumper harvest in this province. Cotton production totalled 160 million catties, an increase of 7.7% over the preceding year. The output of oil-bearing crops was 267 million catties, up 61.5%; bast fibres, 11.6 million catties, up 7%; and beets, 230 million catties, up 19.7%. Production of tobacco was 2 million catties, and beef and mutton, 350 million catties. The total value of agricultural output amounted to 3,870 million yuan, 3.3 times over that in 1952.

Industry. In 1980, there were 9,553 industrial enterprises in the province, and the total value of industrial output was 11,000 million yuan — 1.9% more than in the preceding year, or 6.6 times over 1952. The ratio of industrial production to the total value of industrial and agricultural output rose to 74% from 24.7% in 1952.

The output of main industrial products compared with 1952 was as follows: coal, 120 million tons, up 12.2 times; cast iron, 1.714 million tons, up 8.6 times; steel, 1.494 million tons, up 16.2 times; rolled steel, 975,000 tons, up 10.5 times; coke, 1.609 million tons, up 3.8 times; electricity, 12,000 million kwh., up 78.4 times; cement, 2.879 million tons, up 29.7 times; gypsum, 604,000 tons, up 13.2 times; caustic soda, 43,000 tons, up 86 times; mirabilite, 325,000 tons, up 15.4 times; metal-cutting machine tools, 1,345, up 11 times; cotton yarn, 84,000 tons, up 10.2 times; printed cloth, 184 million metres, up 34.9 times; knitting wool, 775 tons, up 28.9 times; machine-made paper, 115,000 tons, up 35.9 times; and cigarettes, 186,000 boxes, up 5.8 times.

The manufacture of many other important productions has been recently developed. These include electrolytic copper, electrolytic aluminium, sulphuric acid, sodium carbonate, pesticides, synthetic ammonia, chemical fertilizer, plastics,

pharmaceuticals, synthetic rubber, mining machinery, metallurgical machinery, cranes, industrial boilers, tractors, chemical fibres, detergent, thermos bottles, electric bulbs, etc.

Of the total value of industrial output, the value of heavy industrial products was 7,560 million yuan, which accounted for 68.7%; the value of light industrial products was 3,440 million yuan, or 31.1%. Because the output of light industrial products could not meet the needs of the market, about 40% of these products were shipped in from other provinces. In the course of the readjustment of the national economy in 1980, we enhanced the development of light industry. The capital invested in the light and textile industries, as well as for renewal and transformation of equipment, amounted to 160 million yuan — an increase of 58 million, or 112.3% over the previous year, the greatest investment since Liberation. The value of light industrial products increased by 13.3% over 1979.

The growth rate of light industry exceeded that of heavy industry by a substantial margin. The output of many important commodities greatly increased over that of 1979: radios, 150%; bicycles, 100%; TV sets, 94%; sewing machines, 71%; leather shoes, 40%; knitting wool, 27.4%; woollen pieces goods, 14.7%; beverages, 28%; sugar, 17.5%; and furniture, 15.1%.

Minerals and Mining. Shanxi Province is rich in mineral resources, including iron, copper, lead, zinc, molybdenum, cobalt, gold, coal, phosphorus, pyrite, mirabilite, gypsum, graphite, bauxite, feldspar, mica, glass sand and refractory clay. Its coal reserves are especially large. The province is an ideal energy source for the modernization of our country.

The coal industry affords the greatest opportunity for development. The output of mineral coal in the province represents one-sixth of the country's total. Profits from the coal industry amounted to more than 50% of profits from all industrial production and communications services in the province. About one-third of the technicians and workers were employed in the industry.

The prospects for further developing the coal industry are bright because the coal reserves are very rich. All types of coal can be found in the province; the quality is superior; the underground deposits are very shallow; and the layer is thick and continuous, so that investment in exploitation is economical and can achieve early results.

At the national coal industrial meeting held in Benxi in July 1980, it was decided to fully exploit coal resources in Shanxi Province before the end of this century. *People's Daily* published an editorial urging that the province be turned into

an energy resource base, and the provincial people's government submitted a report to this effect to the State Council.

Although investment in heavy industry has been cut drastically, the coal industry in 1981 will still gain a larger investment than in 1980. Simultaneously, in order to encourage enthusiasm in all departments for developing the coal industry, many new management methods are being used. In recent years, the average annual increase in coal output has been more than 10 million tons. In 1980, the output of coal totalled 120 million tons, half of which came from the mines managed by the local authorities, communes and brigades.

Transport, Posts and Telecommunications. Railways open to traffic in the province totalled 2,129 kilometres at the end of 1980. The main trunks were the Jing-Yuan and Shi-Tai lines linking Beijing and Taiyuan, the Jing-Bao line through Datong and the Tong-Pu and Tai-Jiao lines through the province from north to south. New railways under construction are the Han-Chang and Tai-Gu-Lan lines. The total capacity of railway freight was about 110 million tons. The number of travellers in 1980 was 25.22 million, 4.4 times that of 1952.

Highways open to traffic totalled 27,000 kilometres, 11.6 times the number in 1952. Of these, 8,509 kilometres are serviceable in all weather conditions, 21 times over 1952. The volume of goods transported was 70.04 million tons, and the turnover of goods was 1,570 million ton-kilometres. The number of highway travellers was 33.42 million.

Air services were available from Taiyuan to Beijing, Tianjin, Xi'an, Yan'an, Lanzhou, Xining, Chendu and Chongqing. There were also flight facilities within the province between Taiyuan and Changzhi, and Taiyuan and Datong.

Postal routes in the province covered 142,000 kilometres.

Finance. In 1980, financial revenue was greater than expenditure in the province. Total revenue amounted to 2,094 million yuan, an increase of 3.43% over that of the previous year. Expenditure was 1,656 million yuan, 81% of the budget and 5.5% less than the previous year.

Of the 1980 revenue, 44.6% was derived from enterprise profits, 48.5% from industrial and commercial taxes, 3% from the agricultural tax and 7% from other sources. Expenditures comprised 18.5% for capital construction, 15% for agriculture, 23.9% for culture, education, science and technology, 11.6% for administration and 31% for other purposes.

The systems of finance and financial affairs

were reformed preliminarily in 1980. From the beginning of the year, a new system was instituted to "apportion revenue and expenditure at different levels and hold each responsible for profits and losses." As part of a trial programme to enlarge the decision-making power in selected places, the factories and enterprises further executed a number of measures, such as retention of profit according to certain proportions, responsibility for the budget and other financial affairs, independent accounting, assumption of sole responsibility for profits and losses and fixing the amount of revenue and expenditure. These measures encouraged the activities of the administrative departments and units at all levels, enabling them to achieve more effective results in increasing production and realizing economies.

Of the 116 factories and enterprises that tried to enlarge the decision-making power, the total output value and the profits of 30 units increased 9.6% and 30.2%, respectively, over the previous year. Many factories and enterprises were carrying out the policy of combining the regulation through planning with market regulation, and were handling sales themselves.

Investment in capital construction in the province totalled 1,729 million yuan, which, in addition to the fund allocated from the province, included the national fund, internal loans, foreign capital and funds raised by administrative departments, prefectures, cities, counties and factories and enterprises. The distribution of funds was as follows: productive investment, 69% of the total, or 9.2% less than in 1979; and unproductive investment, 31%, or 9.2% more than in 1979. Investment in housing increased by 58.7% over the preceding year and represented 15.3% of total investment, an all-time high.

Commercial Activity. Owing to the policy of combining regulation through planning with market regulation in economic work, as well as the opening of more outlets and improved distribution, sales in the town and country markets were brisk. The supply of commercial products was better, and the purchasing, selling and storing of products all increased considerably in 1980.

The total value of goods purchased in the province in 1980 was 6,100 million yuan, a 5.3% increase over the previous year. Of this, net purchases within the province accounted for 62.8%, and those from the other provinces 37.2%. The total volume of retail sales was 5,090 million yuan, 9.1% more than 1979. Of the total, sales of consumer goods increased by 15.1%, the largest increase in several years. The total value of goods in stock of state-run commerce was 3,350 million yuan, an increase of 4.2% over 1979.

Markets in the town and country fairs were busy in 1980. The number of country fairs rose to 597, or 130 more than in 1979. The volume of business reached 260 million yuan, 48.4% more than in the previous year.

The value of exports was 600 million yuan, an increase of 51.4% over 1979. The sum of purchases in the province was 470 million yuan, up 41.4% over 1979. Of this, purchases of industrial and mineral products increased by 51%, and purchases of agricultural and sideline products and local and special products rose 13.2%.

In 1980, the general level of retail prices in the province increased 3.5% over the previous year (5.7% in the cities and towns, and 1.4% in the rural areas). The real prices of state-run commerce and the negotiated prices went up 3.3%. The government adopted certain measures to stabilize prices in November 1980, and market prices were kept basically under control.

Education, Health and Science. The province has 171 scientific research institutes, with 4,400 research workers; 16 colleges and universities, with 33,000 students, including 218 post-graduates; and 2,422 professors, associate professors and lecturers. There is also a TV college attended by more than 8,000 students. There are 67 spare-time colleges for workers and cadres, enrolling 11,000 students; and 90 secondary technical schools, with 46,000 students. The 9,895 middle schools enrolled 1.79 million students, with 100,000 teachers, and the 38,000 primary schools had 3.84 million pupils and 148,000 teachers.

In 1980, the province had 702 hospitals of all kinds, 69,000 beds and 105,000 doctors and nurses. The number of "barefoot" doctors in the countryside was 58,000.

Many achievements were made in 1980 in the scientific and technological fields; 194 research projects won government prizes. They were being used and applied.

Tourism. Prospects for the growth of tourism in Shanxi Province are good. "Ding-Village Man," which was dug up in Xiangfen County, a site of the ancient cultural remains of the middle period of the Stone Age, has proved that human beings began to live on this land more than 100,000 years ago. It is said that Pingyang was the capital of Yao, Puban was the capital of Shun and Anyi was the capital of Yu — all of which are in Shanxi Province. Of the 541 scenic spots and historical sites

in the province, 14 are designated as important cultural antiquities protected by the government. They include the Yungang Grottoes in Datong; Shanhua Temple, Huayan Temple, Sakyamuni Tower in Yinxian County; Mount Wutai, Nanchan Temple, Foguang Temple, Jin Temple in Taiyuan; Yonle Palace in Ruicheng County; Guangsheng Temple in Hongtong County; Ding Village site in Xiangfen County; and the site of ancient "Jin" in Huoma. Some of these places are not yet open to the public. In 1980, 17,000 tourists visited the province, 88% more than in the preceding year.

Employment and Income. The life of the people improved as a result of the development of production. By the end of 1980, the number of workers and staff was 2,899,000. In 1979-80, 440,000 more people were employed, of whom 365,000 were educated youth.

In 1980, average yearly income for the workers and staff in units owned by the whole people [i.e., "state" ownership — *Ed.*] was 795 yuan, an increase of 36.2% over 1956. In the units under collective ownership the figure was 581 yuan. Average income from the collective for each peasant was 49 yuan in 1956, 63 yuan in 1976 and 82 yuan in 1980. In 1976, the peasants had 190 million yuan in savings deposits; by 1980 the amount had grown to 510 million yuan.

Problems. Through 31 years of socialist construction since the founding of the People's Republic of China, the economy in Shanxi Province has developed greatly. But it suffered much during the 10 years of chaos at the hands of the Gang of Four. Since the smashing of the Gang, under the guidance of the correct line of the Party Central Committee, our provincial economic situation has been much improved. However, the serious disproportions among different branches of the national economy cannot be changed in a short period of time, and we still face many difficulties.

Agriculture, for example, cannot meet the ever-increasing demands of the people. A large portion of commodities must still be purchased from other provinces. The scale of capital construction is overextended. The economic results of some enterprises have yet to be improved. In addition, there are still problems concerning housing, medical and health work, culture and education, public utilities, environmental protection, etc. These will be resolved gradually in the course of economic readjustment.

81. ECONOMIC DEVELOPMENT IN SICHUAN PROVINCE

By the Institute of Economics,
Academy of Social Sciences, Sichuan Province
and the Institute of Economics,
Sichuan Provincial Planning Commission

Geography and Population

Situated in Southwest China, Sichuan Province has a population of more than 98 million and an area of 570,000 sq. km. There are 14 nationalities in the province.

Natural Resources. With a mild climate, plentiful rainfall, fertile soil, rich natural resources and abundant agricultural products, the province, especially the western region, is world-renowned as "the land of abundance." The nearly 100 million *mu* of cultivated land, 110 million *mu* of forested land, large areas of grassland and plentiful water supplies provide good conditions for the overall development of farming, forestry, animal husbandry, sideline occupations and fisheries. More than 70 types of minerals are found in the province, and there are relatively large deposits of titanium, vanadium, nickel, halite, iron, mica and asbestos. Thus, Sichuan has the natural resources for substantial industrial development. The province is rich in water resources and deposits of coal and natural gas, which afford the necessary energy requirements for economic development.

Survey of Economic Development Since 1949

Before Liberation, the province was very backward economically because of the reactionary rule of the Kuomintang. Since Liberation, millions of industrious people have engaged in large-scale economic reconstruction with their own hands under the leadership of the Chinese Communist Party. Although these hard-working people have gone through many reversals, they have achieved tremendous progress and brought about profound changes in the province.

Agriculture. In the past, agriculture in the province consisted mainly of subsistence farming, and productivity was rather low. In 1949, total agricultural output value was only 3,620 million yuan; grain output, 29,890 million catties; cotton, 30.7 million catties; oilseeds, 472 million catties; sugarcane and sugar beets, 1,138 million catties; and pigs, 10.19 million head.

Over the past 30 years, agricultural production has increased greatly. By 1979, total agricultural output value had reached 13,205 million yuan, an increase of 156%; grain output, 64,020 million catties, a 114% increase; cotton output, 222.5 million catties, a remarkable 625% increase; oilseeds output, 130.45 million catties, a 176% increase; sugarcane and sugar beets output, 4,249 million catties, a 273% increase; and pigs, 50.92 million head, an increase of 400%. Now, miraculously, this province can feed 10% of China's population with only one-fifteenth of the total arable land of the country.

After 30 years of reconstruction, the conditions for agricultural production in the province improved significantly. In the western region, for example, the irrigated area before Liberation was reduced from 3 million *mu* to only 2 million *mu* because the famous Duijiangyan irrigation system had long been out of repair. After Liberation, the party and the government organized the people in this area to rebuild the system on a large scale, to intensify planning and management and to make rational use of water. In this way, the ancient weir has been brought back to life.

The irrigated areas have been expanded to more than 11 million *mu* and the grain output in this area has risen from only 400 catties per *mu* before Liberation to over 1,000 catties. With water conservation projects in other regions completed by 1979, the actual irrigated land in the province had expanded to about 44.58 million *mu*, about 45% of the province's farmland.

Power consumption in the countryside is 1,280 million kwh. The average consumption per *mu* is about 12.88 kwh. The consumption of fertilizer is 1,095,000 tons, with the average consumption per *mu* about 22 catties.

The allocation of agricultural production has been gradually established. In addition to the 23 marketable grain bases that already have been determined, the province has preliminarily formed a number of cash crop bases, which are comparatively large in area and output. They include the cotton base covering Jianyang, Renshou, Nanbu and 14 other counties; the oil-bearing crop base covering Guanghan, Shifang, Xindu and 22 other counties; the sugarcane and sugar beet base covering Neijiang, Zizhong, Fushun and 21 other

counties; the ramie base covering Dazhu, Daxian, Quxian and 5 other counties; and the tobacco base covering Yibin, Leshan, and Neijiang prefectures. The formation of these bases provides a better opportunity for the development of light and textile industries in the province.

Industry. The industrial foundation in Sichuan Province before Liberation was very weak. In 1949, total industrial output value was merely 731 million yuan; steel output was 9,000 tons; coal, 2,010,000 tons; natural gas, 11 million cu. m.; electricity, 147 million kwh.; cotton yarn, 6,630,000 bales; and cloth, 99,720,000 m.

Sichuan's industry has developed tremendously during the past 30 years. In 1979, total industrial output value of the province amounted to 24,617 million yuan, nearly 33 times that of 1949. In 1979, steel output was up to 2,929,000 tons, an increase of 325 times; coal, 38,380,000 tons, up 19 times; natural gas, 6,468 million cu. m., up 588 times; electricity, 15,639 million kwh., up 106 times; cotton yarn, 111,400 tons, up 9.4 times; and cloth, 566,770,000 m., an increase of 5.7 times.

Currently, Sichuan's industry is of a considerable size, and its status in the province's economy has changed greatly. By 1979, the portion of the industrial output value in the province's total agricultural and industrial output value had increased from 16.8% in 1949 to 65.1%. At the end of 1979, the province had more than 6,000 state-owned enterprises and more than 37,000 enterprises under collective ownership. It has preliminarily established industrial bases centred around Chongqing, Chengdu, Zigong and Dukou, each with its own features. The bases have played an important role in the development of the country's industry.

Transportation. In earlier times, transportation to and within Sichuan Province was difficult. "Tortuous paths in Sichuan Province were very difficult to walk on, more difficult than going to Heaven." This saying by the famous ancient poet Li Bai gives an idea of travel conditions in the province at the time. At the beginning of this century, local gentry with capitalist ideas proposed to build a railroad from Chengdu to Chongqing and tried to finance it by levying taxes on farmland. After several attempts, however, they were unable to succeed because of the obstacles set by the imperialists and the feudal powers.

In 1949, immediately after Liberation, the construction of this railroad was begun under the leadership of the party and the government. In 1952, the railway for which the people of Sichuan had yearned for 40 years was realized. Soon after

that, rail arteries and feeder lines were also constructed from Baoji to Chengdu, from Sichuan to Guizhou, from Chengdu to Kunming and from Xingfan to Chongqing. Now, the railways open to traffic total 2,639 km.

In 1949, there were only 4,846 km. of highways in the province. By 1979, the province had 59,775 km. of highways open to traffic, up 12.3 times. Air transport is also expanding in all directions. At present, a communications and transport network of railways, highways and waterways centred on Chengdu and Chongqing is virtually completed and the "tortuous paths in Sichuan" no longer exist. All these improvements have laid a foundation for the steady development of Sichuan's economy for the future.

Reconstruction of the Economy in 1980

In 1980, economic reconstruction in Sichuan Province was marching on victoriously with the implementation of the policy of readjustment, restructuring, consolidation and improvement of the national economy. After initial adjustments, the problem of a serious imbalance in the province's economy began to change, and a more rational economic structure has begun to develop. Since Liberation, the preliminary reform of the province's economic management system has brought a new life to the economy, and the province is now a scene of prosperity.

Changes in Agriculture and Industry. In agriculture, the party and the government carried out correct policies for the rural areas and handled affairs according to objective economic and natural laws. Systems of responsibility in production in various forms were instituted. All this fired the peasants to greater enthusiasm. Farming, forestry, animal husbandry, sideline occupations and fisheries began to develop in line with local conditions, as a result of readjustments made in the existing agricultural structure.

In 1980, the province again reaped a good harvest on the basis of large increases in production in the previous three years. Total grain output was about 65,280 million catties, a 2% increase over the previous year. Oil seeds output was up 10.2%; silkworm cocoons, up 23.5%; the number of pigs purchased, up 14.3%; and oranges, up 77.4%. Although there was some decrease in cotton, sugarcane and tobacco output as compared with 1979, agricultural production still kept rising at a regular rate. Total agricultural output value amounted to 13,860 million yuan, a 5% increase over 1979. In industry, the implementation of the principle of economic read-

justment somewhat changed the proportion between light and heavy industry, as well as their internal structures. The proportion of light industry in the total industrial output value reached 45.7%, up from 41.5% in 1979. Faster-growing products in light industry were durable goods and high-grade consumer goods. For example, the production of TV sets increased 2.35 times, radios 3.73 times, sewing machines 69.64%, bicycles 15.4 times and wrist-watches 73%. In light industry, the proportion of output value for those products using agricultural and domestic products as raw materials decreased to 76.6% from 78% in 1979. In heavy industry, products meeting the needs of consumers and serving the light industrial market also increased.

Management Reforms. The experimental reform of the economic management system that started in the last quarter of 1978 continued to make progress in 1980. The number of the province's local industrial enterprises involved in the trial enlargement of decision-making power grew from 84 in 1979 to 417. Their output value accounted for 70% of the province's total local industrial output value, and their profits made up about 80% of the total. With the placing of responsibility in local hands, economic relations among the state, the enterprises and the workers have been preliminarily readjusted, and the interests of these three sectors have been combined. Thus, the enterprises' and the workers' socialist enthusiasm as masters of their own destiny has been mobilized to the full.

The extension of power in enterprises and the readjustment of markets carried out under the guidance of planning have given enterprises an internal impetus while placing external economic pressure on them. In this way, enterprises are being pushed to increase the variety of styles and designs, enhance the quality of their products, produce according to demands, improve management, intensify productivity, do a better job of economic accounting, reduce costs, make every effort to improve their services, create a better image, try by every means to serve end-users and customers, actively do a better job in tapping potentialities, and gradually realize technical innovation and self-development. Planning, materials, commerce, banking, financing, capital construction and other aspects of the managerial system also have undergone reform under the impetus of the enterprises' extension of power. All these factors have played a positive role in the development of the whole economy.

In 1980, the industrial output value obtained by these experimental enterprises increased by 9.7% over the previous year; profits rose by 7.9%.

The growth rate was generally larger than that of the other units. Five enterprises tried out the practice of "independent accounting, paying taxes instead of turning over profits to the state, and assuming sole responsibility for their own profits and losses." The total output value they achieved was 42.7% more than in the year before, their profits increased by 80.7%, and the tax on industry and commerce, income tax and tax on fixed assets that they paid the state increased by 49.1%.

Taking the province as a whole, although there were difficulties such as insufficient energy supply, insufficient work in machinery industry, insufficient supply of certain raw materials, price increases on some raw materials, and price decreases on many manufactured goods, industrial production still kept rising. The total industrial output value of the province showed a 6.78% increase over 1979. Moreover, the quality of industrial products also improved markedly. In 1980, 109 products in the province gained the distinction of high-quality products, and 15 of them were awarded a gold or silver medal by the state. The province also trial-manufactured and developed 2,077 new products and new varieties.

New Investment. After the readjustment, the province changed the direction of capital construction investment, increasing the proportion of investment in areas not directly related to production. In 1979, of the total investment completed in the province's capital construction, the ratio of investment in productive construction to investment in areas not directly related to production was 2.3:1; in 1980, the ratio was 1.7:1. The increase of investment in areas not directly related to production was mainly reflected by the proportion of investment in housing construction, which rose to 25.4% in 1980 from 16.4% in 1979. In 1980, floor space of new housing completed was 6,010,000 sq. m., a one-third increase over 1979, and the largest increase since Liberation. As for investment in productive construction, the proportion of light and textile industries rose from 9.9% in 1979 to 10.9%.

Commercial Gains. Economic readjustment and system reform promoted production and brought prosperity to the market. The number of commercial enterprises involved in extended decision-making power in the province rose from 40 in 1979 to 238 in 1980. The commercial enterprises under both collective and individual ownership also developed rapidly. Their growth rate of retail sales in 1980 was higher than the 8.6% increase of the state-owned commercial enterprises. Collective commercial enterprises up were up

57.3%, and individual commercial enterprises were up 128.9%. Thus, the monopoly of the state-operated commercial enterprises was broken.

On the basis of increased supply of goods and increased purchasing power, the retail sales of commodities in cities and rural areas of the province grew by 20.1% over 1979. The increase amounted to 11.1% if the factor of price hikes was excluded. The commercial department had overall expansion in purchasing, marketing, and transferring and stocking of goods. Total purchases for 1980 showed a 12.9% increase over 1979, of which the purchases of industrial goods rose by 12% and those of agricultural and sideline produce increased by 14.2%. In order to keep pace with the purchasing power that was growing rapidly both in cities and rural areas, the province transferred and transported a large volume of commodities from other provinces. This increase accounted for a 30.7% rise over 1979. The amount of stocking by the end of the year was 10.4% more than in 1979. Because of the obvious improvement in people's lives, there were sizeable increases in the sale of high-grade durables and other consumer goods. For instance, the sale of polyester blended cloth increased by 75.8%; silks and satins, 66%; woollen piece goods, 66.9%; and consumer goods such as radios, TV sets, bicycles, sewing machines and watches registered another increase of 75.8% on top of the 43.5% increase in 1979.

Progress in Other Areas. The province made further developments in science, culture, education and public health, and the people's living standards improved. In 1980, there were 46 universities and colleges in the province, 4 more than one year before. And the number of students in school increased by 14.2% over 1979, or 8.2% more than in 1960 — the previous peak.

The life of the overwhelming majority of peasants improved markedly as a result of continued development in farming and sideline occupations and the increase of purchase prices. According to a survey of 2,181 peasant families, the average net income per capita in 1980 was 20.4% more than in 1979, and the income from enterprises run by communes or brigades was 8.4% higher. Workers in industrial and mining enter-

prises also gained increased wages because of the expansion of employment, readjustment of some workers' wages and wage categories, and distribution of bonuses and subsidies for nonstaple foods.

The total amount of workers' annual wages in enterprises owned by the whole people was 4,310 million yuan, an increase of 720 million yuan over 1979. The workers' annual wage in enterprises under collective ownership in cities and towns was 950 million yuan, about 170 million yuan more than the year before. The average annual wage of a worker was 743 yuan, a 16.3% increase over 1979. The actual increase was 6.3% after deducting the rise in the cost of living.

Remaining Problems. Economic development in Sichuan Province has been enormous, but there are still many problems, two of which have a great bearing on the whole economy. The first concerns the economic structure. The huge industrial and agricultural potentialities have not been exploited to the full because of the serious imbalance among the various departments of the national economy. Therefore, readjustment must be carried out further in order to rationalize the economy gradually.

The other problem involves the economic management system. Despite initial reforms, the old system still remains intact and poses a main obstacle to economic development. Thus, readjustment and reform must be closely linked. Reform that fosters readjustment must be actively carried out, and changes should be promoted through reform. At present, millions of people in Sichuan Province, under the leadership of the party and the government, are summing up their experience and lessons, eliminating the influence of "Left" mistakes, striving to handle affairs strictly according to natural and economic laws, overcoming all difficulties, trying to achieve greater victories in the year to come, and enabling the economy of Sichuan to develop in a healthy manner.

Note: Output value for 1949 is calculated at the constant price of 1952. Output value for 1979 is calculated at the constant price of 1970.

82. ECONOMIC DEVELOPMENT IN TIANJIN

By the Institute of Economics,
Tianjin Academy of Social Sciences

Population and Administrative Divisions. Tianjin is one of China's largest cities and the municipality is a famous industrial and commercial centre. At present, it has a population of 7.51 million and an area of 11,305 square kilometres. Administratively, the municipality consists of nine urban districts, four suburban districts and five suburban counties. The Tianjin New Port is the biggest in North China.

Communications and Transportation. Situated on the eastern edge of the North China plain and facing the Bohai Sea, the city is the gateway to the sea for China's capital, Beijing. Its land and water transportation is highly developed. For overseas shipping, the New Port handles shipping with many foreign countries. For inland navigation, it connects with the Ziya, Yongding and Daqing Rivers and the Grand Canal at the confluence of the Haihe River. Economically, Tianjin is closely linked with the vast region of North China. The Tianjin-Pukou Railway runs south to provinces in Southeast China and the Beijing-Harbin Railway goes north through Shanhaiguan to provinces in Northeast China. The city has a network of highways extending in all directions and linking the broad hinterland provinces. Tianjin Airport will be able to receive large jet airliners and cargo planes after expansion. At present, CAAC airliners fly from Tianjin to all the major cities in the country.

Natural Resources. Tianjin is comparatively rich in natural resources such as salt, oil and natural gas. The famous Changlu Salt Field has an annual output of 4.5 million tons. With over 96% sodium chloride content, this good-quality salt provides an ideal raw material for the chemical industry. For oil, in addition to the Dagang Oil Field, which has been developed since the mid-1960's, joint exploration of offshore oil deposits in Bohai Bay with France and Japan is well under way.

As it is only about 120 kilometres away from the nation's capital, Beijing, Tianjin therefore has several advantages for developing its economy, urban construction, science and technology and its tourist industry by receiving help from the capital.

History. Tianjin has a long history. In 1419, the Ming Dynasty made Beijing the imperial

capital, and the following year Tianjin became a garrison town for Beijing. After that, the city's handicraft industry and commerce began to develop. During the Ming and Qing dynasties, to encourage water transport of grain to the imperial capital, native and special products were allowed into the city free of tax. Thus, Tianjin became at the same time a junction for water transport and a distributing centre for goods, which in turn enabled the city to flourish. In 1860, Tianjin was made a trading port under the so-called Treaty of Beijing, and imperialist powers immediately rushed in one after another to make use of the rich natural resources in and around Tianjin and to take advantage of its cheap labour force. Those activities gave a spur to the development of Tianjin's trade, finance and processing industries. Factories and banks were set up; ports, railways and highways were constructed; and the city moved further towards a capitalist commodity economy.

During World War I (1914-1918), when the imperialist powers were deadlocked in fighting against one another, Tianjin was able to develop its industry and commerce rapidly. Such trades and industries as textiles, salt, alkalies, flour, matches and edible oil, together with their corresponding machine-manufacturing and repairing industries, also developed, and gradually Tianjin became one of North China's most important industrial bases and a centre for domestic and foreign trade.

However, during the Kuomintang period, imperialism, feudalism and bureaucrat capitalism monopolized most of the city's large enterprises and seriously hindered the development of industry and commerce. According to statistics, the city, with an urban population of nearly 1.8 million in 1948, had an industrial output value totalling 500 million yuan, of which 61% was owned by foreign firms and bureaucrat capitalist enterprises, which practically controlled all the railways, ports, navigation, telecommunications, banks, foreign trade and customs. At that time, Tianjin's financing and foreign trade ranked second in the country after Shanghai, and Tianjin was the country's second largest city in economic importance.

Nevertheless, Tianjin was a lop-sided industrial and commercial city. Of the total industrial output value, the textile industry accounted for 64.1% and the food industry for 13.2%, while heavy

industry accounted for only 10%. The engineering industry could only make repairs and supply replacements. All this shows that Tianjin was a colonial and semi-colonial city.

Survey of Economic Development Since 1949

After Liberation in 1949, Tianjin, under the leadership of the Communist Party, confiscated bureaucrat capital, abolished imperialist privileges and carried out land reform, thus completing the new democratic revolution. Ever since then, the city has concentrated on socialist transformation and socialist construction, and great changes have taken place. In spite of twists and turns, the city has made tremendous achievements in developing its economy. The main achievements are as follows:

Industry. Since Liberation, great progress has been made in developing the city's industry, which is of primary importance to the national economy. In 1980, the city's industrial output value totalled 19,400 million yuan, which was 30 times the value in 1949. There are now 4,071 industrial enterprises with 1.3 million workers and staff members. Their fixed assets total 10,000 million yuan.

Tianjin's industry has changed from a lopsided one before Liberation to a comprehensive one today. In heavy industry, such new branches as power, metallurgy, chemicals, oil, electronics and engineering have been established. In light industry, an all-around development has been realized by gradually changing the irrationally high proportion of the textile and food industries. The proportion of those branches of light industry using agricultural and sideline products as main raw materials was reduced from 88.2% in 1949 to 59.9% in 1978. The proportion of those branches of light industry with industrial products as main raw materials went up from 11.8% to 40.1%.

Tianjin's industry has these features:

(1) Industry is characterized by its comprehensiveness, with a large number of closely packed small and medium-sized enterprises and collective cooperatives. Of the nation's 164 branches of industry, Tianjin shares 153. Its small and medium-sized enterprises compose 99% of the city's total of 4,071 enterprises and account for 76% of the total output value, while the collective cooperatives make up 71% of the city's enterprises and 16.7% of total output value.

(2) The city has a number of "backbone" trades and fast-selling products. There are 41

backbone trades, each with an annual output value of 200 million yuan. They combine to make up 77% of the city's industrial output value and hold a considerable position in the country. There are a great number of fast-selling products, 54 kinds of which are each valued at more than 50 million yuan. These products are well received both at home and abroad — for example, cotton textiles, woollen articles, carpets, bicycles, watches, garments, tableware and metal products.

(3) There is a strong industrial technical force of high professional competence in Tianjin: 320,000 veteran workers and about 10,000 scientific and technical personnel in the research institutions and offices of various industrial bureaus. A number of scientific accomplishments have been made. The machine-building sector now has such heavy forging equipment as a 6,000-ton hydraulic presses and 5-ton pneumatic hammers. High-speed centrifugal spindles have replaced plane spindles throughout the textile industry, automatic looms have taken over from hand looms, and such new techniques as air-jet looms, arrow-shaft looms and yarn-weaving have already been partially adopted.

(4) The industrial structure of Tianjin is based on the processing of light industrial products. In the early post-Liberation years, light industry made up 88.5% of the city's total industry, but in recent years the heavy and light industries are by and large equally proportioned. In heavy industry itself, the processing industry accounts for 77% of total output value.

The growth of industry has changed the lopsidedness of Tianjin's economy, which is playing an increasingly important role in socialist construction. The share of industrial tax in the city's taxes increased from 47% in 1952 to 78.6% in 1978. The industrial accumulations of 1978 accounted for 8.12% of the city's total financial income. Over the past 30 years, the industry of Tianjin has contributed more than 52,700 million yuan in profit and taxes to the state, or 6.8 times as much as the total investment in capital construction during the same period. Industry also has submitted 39,100 million yuan in central finance to the state. From 1953 to 1978, it sent to all parts of the country industrial products worth 64,700 million yuan. In addition, it has supplied 13 provinces and autonomous regions with its technical forces, technology and equipment.

Trade and Commerce. The ports of Tanggu and Xingong (the New Port) underwent large-scale repairs and reconstruction after Liberation, and in 1979 the two ports owned 27 docks and berths,

including 12 10,000-ton berths with an annual handling capacity of 12,770,000 tons, or 41 times that in pre-Liberation days. The size of the ports and their handling capacity rank third and fifth, respectively, in the country. Since the crushing of the Gang of Four, the city has made rapid progress in its foreign trade and now has trade and economic relations with more than 150 countries and regions. In 1979, the ports of Tianjin handled U.S.\$1,220 million worth of exports and ranked fourth in the country. If the exports from Beijing and Hebei province via Tianjin were included, the total worth of exports would be over U.S.\$2,000 million. The city's total purchasing volume of exports for 1979 reached 1,530 million yuan, 11 times that of 1953, and ranked sixth in the country. The ports of Tianjin have a promising future, with railroads connecting with highways and sea and river transportation closely linked. The ports are advantageously situated, with a big city and a vast area of hinterland at the rear. If their advantages are tapped to the full, this will further promote Tianjin's economy.

Before Liberation, Tianjin was a gathering and distributing centre for goods from all over northern China. In 1953, Tianjin handled 30,000 million yuan's worth of commodities, or 11.3% of the total volume of sales for the country. There were at that time 689 import and export trade companies. Later, the commerce of Tianjin developed somewhat, but its position was weakened due to the imperialist blockade and other factors. In 1979, there were 313,000 commercial workers in Tianjin including those in the departments of foreign trade and supplies, or nearly four times as many as in 1949.

The city's commercial facilities are relatively comprehensive, with 11 first-grade commercial stations, 14 import and export branch corporations and 47 governmental supply and sales offices stationed in Tianjin. The total purchasing and sales volume of goods for 1978 came to 63,400 million yuan, with 43.6% devoted to the city itself and the remaining 56.4% exported to other places in China and abroad. In 1979, Tianjin transferred 5,400 million yuan's worth of commodities to Northern China, which amounted to 19% of the total volume of goods received from outside. Tianjin has a sound base for both foreign trade and commerce. The city's economy will make further development, once domestic and foreign trade, industry and commerce are combined to promote a socialist commodity economy.

Agriculture. The total area of the cultivated land in Tianjin is now 7 million mu. According to 1979 statistics, total agricultural output value reached 13,500 million yuan, 9.1 times more than

that in 1949. Its total grain output amounted to 27,700 million catties, six times more than that in 1949. Farming, forestry, animal husbandry and fishery contributed 600 million yuan, making up 45% of total agricultural output value, while sideline occupations provided 750 million yuan, covering 55% of the total — thus forming an agricultural economic structure based on half agriculture and half industry. The agricultural mechanization of Tianjin is high, with over 70% of ploughing, harrowing and transportation done by machine. The average annual income peasants get from the collective is 145 yuan per head — 74% higher than the national average of 83.4 yuan per head.

Tianjin's agriculture has the following features:

1. Since the land is low-lying and much of it is subject to floods, the soil is salinated and output is relatively low. However, years of experience have proved to the peasants that rice-growing, reed-planting and fish-raising yield a high output, thus turning the disadvantage into an advantage.

2. As the suburban counties adjoin a big city, they enjoy the advantage of close relations with industry and commerce, since farming provides the city with agricultural products and native produce while industry supplies farming equipment and a technical force in return.

3. There has been a tradition of exporting agricultural products and native produce. Tianjin's red beans, rice, oil-bearing crops, marten furs and rabbit skins are well received abroad and therefore are big foreign exchange earners. In addition, the advantage of having agricultural products close to ports is important in achieving a flexible agricultural economy.

Agriculture must allow for local conditions and ensure an all-around development so as to further diversify the economy in line with national policies and scientific developments.

Science and Technology. The scientific and technological personnel of Tianjin have high professional competence. In 1979, the city had such 120,000 such personnel and 184 scientific research institutions, including the Tianjin Academy of Sciences and the Tianjin Academy of Social Sciences. There are approximately 12,000 people engaged in science and research work, among whom 10,000 people or more in 140 research units are devoted to work related to industry. More than 300,000 workers are of the fourth technical grade or higher. There are 18 universities and colleges in Tianjin.

Tianjin has been fairly quick at adopting new science and technology and is actively developing its own scientific and technological force. Over the past 30 years, Tianjin has accomplished 2,043 important scientific and technological achievements, among which 349 items were credited at the National Science Conference. To name just a few, industrial items include a mobile offshore drilling rig, a 500-ton floating crane and an 11,000-watt water turbo generator. Agricultural items include the Red Flag-16 rice strain, which is capable of resisting *Xanthomonas Oryzae*. Thanks to the improvement of science and technology, the quality of many industrial products is up to advanced domestic standards.

Current Economic Problems

Years of implementing a policy of emphasizing capital construction at the expense of production and pursuing high accumulation while ignoring low efficiency have led to serious disproportions in the economy. Two years of readjustment have brought some improvements but have not solved the problem radically. The main problems are:

1. *There is a discoordinated industrial structure and an imbalance between industrial production and social demand.* The balance between light industry and heavy industry has been upset. Over the past 30 years, while heavy industry has grown too quickly, the light and textile industries have developed at a snail's pace, thus failing to give full rein to the latter. Furthermore, heavy industry has not been clearly oriented because there is too large a proportion of self-service. Statistics show that heavy industry in 1978, compared with 1957, increased 8 times, as against only 2.9 times for light industry. While 71.1% of total heavy industrial products were produced for use by heavy industry itself, only 29% were produced for agriculture and textile and light industries. The processing industry has developed too fast, with supplies of raw materials lagging far behind — chemical raw materials in particular. As a result, not only has the development of heavy industry been adversely affected, but also that of other national economic departments. The mining industry is comparatively weak in exploration. Consequently, the technical force has not been fully tapped in some processing trades. And it is commonplace in all trades that products do not meet the market demand. More striking is that the machine-building industry is operating well under capacity, the overstocking of products is serious and the waste is appalling.

The machine-building industry has yet to change from mainly serving heavy industry and capital construction to contributing to agriculture, light industry, exports and the improvement of old enterprises.

2. *Undesirable economic effects remain a serious problem for the economy.* Prevailing in many enterprises is the fact that they pursue output value only and ignore market demands. As a result, production and sales are dislocated and the overstocking of products is serious, thus affecting the rapid development of Tianjin's industry. Poor management and the failure to replace old equipment and improve production methods have caused many enterprises to remain in a backward state, resulting in high consumption, low quality and poor performance of their products. As far as capital construction is concerned, neglect of preparatory work, failure to observe construction procedures and indifference to economic effects have brought about such grave results as prolonged cyclical periods, high cost, low efficiency, great consumption and poor performance. This is the consequence of implementing the erroneous "Left" policy of emphasizing capital construction at the expense of production and of pursuing high accumulation while ignoring low efficiency.

3. *The serious disproportion between, so to speak, the "bone" and "flesh" in urban construction leaves much to be desired.* Over the past 31 years the total investment in the capital construction of Tianjin has amounted to approximately 14,900 million yuan, among which investment in production projects makes up 80%, while that in non-production projects accounts for only 20%. The proportion of the latter experienced a gradual decrease in the last 20 years from 40% in the First Five-Year Plan period to 23% in the Second Five-Year Plan period; and the "cultural revolution" caused a further decrease to 13%. As a result, improvement in this area has come to a standstill and leaves much to be desired as far as the housing situation and urban facilities are concerned. To make things worse, the violent earthquake of 1976 brought great destruction to the city and caused a more tense housing situation, heavily loaded traffic, serious pollution, a water shortage and a lack of shopping centres. All these problems cry out for solution.

Review of Tianjin's Economy in 1980

Ever since the Third Plenary Session of the 11th Party Central Committee, the city's participation in the national economy has shown im-

provement. On every front, advances were made in the readjustment of the national economy during 1980.

1. *Changes in the ratio of light and heavy industries.* The proportion of investment in light industry rose from 35.4% of the total investment in 1978 to 49.5% in 1979 and 55.1% in 1980. The industrial output value of Tianjin in 1980 totalled 19,399 million yuan, of which 10,316 million yuan was accounted for by light industry, an increase of 19.2% over 1979, while heavy industrial output value amounted to 9,083 million yuan, a rise of only 2.6%. The speed of development of light industry greatly surpassed that of heavy industry. The ratio between the two underwent a change from 49.4: 50.6 in 1979 to 53.2: 46.8 in 1980. A change also occurred in product mix. For example, bicycles, watches, woollen piece goods and dyestuffs developed not only in scope but increased in the quality of high- and middle-grade goods. Heavy industry, which used to serve itself and capital construction, began to turn to serving agriculture and light industry.

Production of the Iron Ox Type-55 tractor increased in output from 6,020 in 1978 to about 9,000 in 1980, showing an output capacity of 10,000. In the steel industry, the proportion of steel, wire and welded tubes or pipes required by light industry rose from 50.7% to 59.9%. The not easily saleable medium-gauge plates decreased by a wide margin.

There was a rapid development in the production of export commodities. The output value of direct exports in 1980 was double that of 1978.

2. *Changes in the ratio of foreign trade and domestic trade volume.* In 1980 the commercial departments prospered in purchases and sales. The market was brisk and supplies of commodities grew. The purchase value for the domestic trade totalled 6,070 million yuan, a 6% increase over 1979. Tianjin's purchasing value for foreign trade increased from 1,100 million yuan in 1978 to 2,122 million yuan in 1980. It had almost doubled within two years.

The commodities purchased for export effected a structural change. Grain, edible oil, foodstuffs, and other agricultural and sideline products rose from 8.2% to 9.4%. Heavy industrial products such as minerals and metals, chemical products and machinery increased from 20% to 25.2%. The proportion of general light industrial products dropped from 71.8% to 65.4%. The above figures show that over 90% of Tianjin's exports were industrial products. This is essentially different from pre-Liberation Tianjin, which exported mainly agricultural and sideline products, and indicates

the improved level of development of the national economy in Tianjin.

3. *Changes in the agricultural structure.* After the Third Plenary Session of the 11th Party Central Committee, Tianjin implemented the decision for the acceleration of agricultural development to bring the initiative of the peasants into full play. As a result, the situation in the rural areas of Tianjin has been prosperous for the past two years. There was a bumper harvest in agriculture in 1979: grain yield topped 2,770 million catties — a record high for Tianjin. In spite of the fact that 1980 was a year of serious drought in Tianjin, its grain yield was still near the 1979 level. Output of cash crops increased by a big margin. An improvement in the internal agricultural structure also occurred. There was a reversal in the declining tendency in the ratio of forestry and animal husbandry, which began to move upwards. In these two years the local financial departments and district banks gave substantial support to agriculture and the amount of investment and loans increased each year — all of which helped to promote Tianjin's agriculture.

The public revenue of Tianjin was valued at 4,094 million yuan in 1980, overfulfilling the yearly plan by 107% and surpassing that of 1979 by 10.8%. Expenditures came to 1,467 million yuan, which was 420 million yuan under the budget figure and 3.6% less compared with 1979. Cash deposits in banks exceeded outgoing withdrawals and thus the withdrawal of currency from circulation in 1980 amounted to 88 million yuan, an increase of 55 million yuan over the previous year.

4. *Readjustment of the ratio between the "bone" and the "flesh."* In order to coordinate the relationship between the "bone" and the "flesh" and to speed up the reconstruction of disaster-ridden areas, Tianjin reduced capital construction investment and suspended 74 projects that were under construction (amounting to over 500 million yuan). The nonproductive investment rose from 17.9% in 1978 to 39.3% in 1980. During these two years new residential housing space totalled 4.4 million square metres. The floor space of new housing construction equalled the total housing area that had been completed from 1971 to 1978. The investment in education, culture and public health also showed an increase, rising from 1.7% of the total investment in 1978 to 3.9% in 1980. These two years saw the addition of 40,000 seats in middle and primary schools and of 1,330 beds in hospital wards.

5. *Improvements in economic results.* The quality of industrial products improved. Of the 419 products under the charge of Tianjin's muni-

cial bureaus, 97.9% either reached or outstripped the quality criteria of the 1979 level. In the nationwide appraisal of the quality of different products held in November 1980, 283 kinds of products came in first, second and third or won the title of "famous product" or "quality product," accounting for 55.2% of the total number of products entered in the appraisal. Labour productivity was enhanced. The labour productivity of state-owned industry in 1980 was 19,085 yuan, a 13.9% increase over 1978. The labour productivity of the units in charge of capital construction under way rose from 5,185 yuan in 1978 to 5,933 yuan in 1980, showing a 14% increase. The quality of civil engineering was augmented considerably. The quality rate reckoned in terms of square metres rose from 37% in 1978 to 59% in 1979 and 69% in 1980. The construction cycle of housing construction was shortened.

6. *Preliminary reform of the economic system.* Beginning in 1979, 495 locally administered state enterprises have been set aside consecutively in Tianjin as pilot projects for practising the maintenance of a certain percentage of profit for the enterprises themselves and extending power to make decisions. In 1979, these enterprises registered an increase of 13.1% in their output value as compared with that of 1978 and an increase of 12.9% in the profits turned over to the state. In the first half of 1980, they registered an increase of 15.2% in output value and an increase of 23.6% in turned-in profits. Both grew at a higher speed than the other enterprises. These pilot enterprises achieved three things at the same time: more income for the state; more profit for the enterprises; and more personal gain distributed among their staff members and workers.

Under the guidance of the state plans, planning regulation and market regulation were put into practice simultaneously. As a result, a new situation has appeared in which all economic elements, distribution channels and purchasing and marketing forms are put to use at the same time. They have brought about a brisk market and a prosperous economy, facilitating the interflow of goods between countryside and city, strengthening economic connections between provinces and cities, and stimulating production and distribution of commodities.

7. *Improved standard of living.* In 1980, the average wages of the workers and staff members of state-owned units reached 872 yuan, an increase of 24.4% compared with 1978. The average income of the peasants increased greatly in the past two years: the per capita income from collectives and from household sideline occupations and private

plots averaged 155.8 yuan and 48 yuan, respectively, showing increases of 7% and 60%, respectively, over 1979.

In 1979 and 1980 alone, 400,000 people were given jobs. The number of employed people in the city in 1980 was 2,260,000. As employment expanded, fewer people were dependent on wage earners for support. Every worker now supports an average of one dependent, compared with two in the early post-Liberation days.

8. *Restoration and readjustment of education.* Tianjin's educational undertakings suffered great setbacks during the "cultural revolution," notably due to sabotage by the Gang of Four and the damage caused by the 1976 earthquake. During the period, teaching staffs were disbanded, school buildings were wrecked and teaching equipment was damaged. The number of institutions of higher learning in the city was reduced from 16 in 1965 to 11 in 1976 and the number of students fell from 28,000 to 17,000. After the downfall of the Gang of Four, and especially since the Third Plenary Session of the 11th Party Central Committee, Tianjin's educational undertakings have been undergoing gradual recovery and readjustment.

In 1980, there were 18 institutions of higher learning and 10 branch institutions with 30,000 students, of whom 590 were postgraduates. At present, these institutions have a teaching staff of 8,312, including about 574 professors and associate professors and 3,350 lectures. In addition, there are 29 foreign experts and teachers working in these institutions and 41 foreign students. The institutions offer 188 specialized courses and have 13 scientific research institutes and 36 discipline research offices, with a library collection of 4.85 million books.

With their long history and good teaching staffs, both Nankai and Tianjin universities are key institutions of nationwide importance where the party's policy toward the intellectuals is better implemented.

The city has 999 middle schools with 528,000 students and 3,399 primary schools with 789,000 pupils. In the last few years, the level of education in middle and primary schools — particularly in the key middle and primary schools — has been greatly raised.

The city's adult education, which takes the form of in-service training, spare-time training and broadcasting and TV correspondence universities, has made much progress over the years. In 1980, 30% of the 2.19 million workers and staff members participated in the adult education programme, which was an increase of 10% over 1979. Under the leadership of the city's council for Worker-Peasant Education, adult education has been compre-

hensively organized at elementary, intermediary and advanced levels. This complements the regular education programme and therefore contributes much to the economic construction of the city.

9. Recovery and development of medical and health work. Like education, Tianjin's medical and health work also suffered serious setbacks during the ten years of turmoil, when the medical structure was disrupted, medical instruments were damaged and medical personnel were sent away to all parts of the country. Much progress has been made in this field since the downfall of the Gang of Four. In 1980, the city had 3,535 medical establishments, including 332 hospitals. There were 20,911 hospital beds, an average of 2.8 beds per thousand, and 5,066 medical and health personnel, an average of 6.76 qualified persons per thousand. In 1980, 32,743 million persons sought diagnosis. Tianjin Medical College and the College of Traditional Chinese Medicine have famous specialists and doctors in their medical, surgical, obstetrics and gynaecology departments, as well as in paediatrics and other departments. In 1980, progress in the health service was highlighted by a higher rate of bed utilization from 84.2% in 1979 (11th in the country) to a record 93.3% in 1980 (first in the country), and an increase in the number of in-patients to an all-time high of 250,000 in 1980, representing an increase of 28,000 over the previous year. With the development and popularization of the city's medical and health work, there has been a higher life expectancy. In 1980, Tianjin's average life expectancy was 70.6 for males and 72.49 for females, ranking it third in the country after Beijing and Shanghai.

10. Development of the tourist industry. Over the years, Tianjin has made great efforts to develop its tourist industry. Founded in 1979, the Tianjin International Travel Bureau received 17,770 tourists from 54 foreign countries and regions in 1980, or 2.4 times the number in 1978. Direct revenue from the tourist industry totalled U.S.\$5 million. Of course, this marked only the beginning of the tourist industry in the city.

Though not rivalling Beijing in charm and entertainment, Tianjin's scenic spots and historical sites have their own distinctive features. The Tiancheng and Dule temples and Cuiping Lake in suburban Jixian County are famous both for their picturesque landscape and for such cultural antiquities as the colour modelling of the Liao Dynasty and the fresco of the Ming Dynasty. The beautiful scenery of the "Park on the Water" can be compared favourably with that of the Summer Palace in Beijing. Many other cultural relics which were damaged during the 1976 earthquake are

being repaired and will be open to the public in the future.

Tianjin's Goals for Future Development

The development of Tianjin's economy continues to be centred on the principle of readjustment. Innovation in the economic system must be made only when it is favourable to and in conformity with the work of readjustment. We shall continue to march forward on all fronts in our work.

1. *In industry, stress is to be laid on readjustment, and frugality in the use of water and power is our key work.* To raise the level of economic efficiency is our aim. Our enterprises must be chiefly engaged in tapping their full potential and making innovations and transformations. The functions played by existing enterprises must be further developed to the full, with incessant improvement in product quality and repeated raising of labour productivity, so that we can develop, in the spirit of cooperation between specialized lines, production on a grand scale.

Industry ought to display its special capabilities according to its own characteristics. First, it has to develop the light and textile industries, laying special stress on those products that enjoy popularity and command ready sales on the competitive world market. It is necessary to expedite the development of light and textile industries at a higher speed than heavy industry. Second, it is required to make the inner structure of heavy industry further resemble that of light industry. Heavy industry must be put on the track of being serviceable to agriculture and the light and textile industries. Third, from strategic and long-term points of view, it is desirable to develop the favourable trend of Tianjin's oceanic chemical engineering as well as petroleum chemical engineering. It is also recommended that we combine the two branches of engineering organically so as to push the advancement of the national economy, and especially of industry.

2. *We shall develop greatly our domestic trade and foreign trade — with special attention to foreign trade — in order to take advantage of the favourable nature of the port city of Tianjin.* We have to combine production with transportation, revive every channel of communication and vitalize progress in production. At the same time, we have to make investigations of the world market, to chiefly produce such commodities as are suitable for that market and to accomplish innovation in our foreign trade pattern. The purpose is to

revitalize our foreign trade. Meanwhile, we have to make our domestic trade serviceable to the interflow of the internal economy and to produce such articles as are badly needed by our fellow cities and fellow provinces so as to combine domestic trade and foreign trade into a united effort in activating the national economy. Simultaneously, we have to modernize our harbour with modern equipment for the means of transport, posts and communications.

3. *In agriculture it is necessary to realize our party's rural policy and to make full-fledged development as far as local conditions permit.* Attention must be paid to ecological balance and also to the fact that agriculture should cater to the needs of the city, industry and export trade. This means that we must develop tremendously our socialist commodity economy.

4. *We have to develop scientific work and education enthusiastically.* In educational work, stress must be laid on the betterment of teaching quality and on the training of teachers. We have to continue to improve our work on key schools — with

special regard to key universities — in order to meet the needs for economic construction on the road of the Four Modernizations. The purpose is to provide personnel not only for our city but also for the whole country, and to combine education with scientific research work and scientific research work with production for the purpose of developing Tianjin's national economy. Care, likewise, must be taken of cadres' and workers' education in Tianjin.

5. *Concerning city construction, it is a pity that we are heavily in debt and that city construction can only be done by giving priority to the most urgent requirements.* For the present, we must concentrate on clearing the city of houses damaged by the 1976 earthquake. The problem of sheltering the people is by far the most urgent problem to be settled, for then the problems of pollution, water supply, etc. will be solved according to well-planned and well-arranged projects so as to bring about conspicuous changes in the appearance of Tianjin. Efforts will be made to make Tianjin a highly civilized, beautiful and modernized socialist city.

83. ECONOMIC DEVELOPMENT IN TIBET AUTONOMOUS REGION

By the General Office of the People's Government,
Tibet Autonomous Region

Geographical and Historical Setting

The Tibet Autonomous Region is located on China's southwestern border. On the northwest, it is bounded by the Xinjiang Uygur Autonomous Region, with the Kunlun Mountains separating Xinjiang from Tibet. On the northeast, Tibet is connected to Qinghai Province by the Tanggula Range. On the east, it is contiguous to Sichuan Province; and on the southeast, to Yunnan Province. On the south, Tibet is bordered by Nepal, Sikkim, Bhutan, India and Burma.

The region covers an area of 1,200,000 sq. km., about one-eighth of the total area of China. With an average elevation exceeding 4,000 m. above sea level, Tibet encompasses the largest and highest plateau in the world and is known as the "roof of the world."

Tibet has a population of more than 1.8 million people. Tibetans are the main nationality, making up about 93% of the population. Other nationalities include Hui, Loba, Monba, Naxi, Nu and Han.

Tibet is an inalienable part of China's territory. Exchanges between the various nationalities in Tibet and those in other parts of the country can be traced far back in history. In the seventh century A.D., during the early years of the Tang Dynasty, these exchanges underwent significant growth.

During the decade of the 1240's, Tibet was officially incorporated into Chinese territory, and became an administrative region under the direct jurisdiction of the central government of the Yuan Dynasty.

Along with closer political relations, economic and cultural exchanges between the Han and Tibetan nationalities also grew stronger, promoting the development of Tibet's agriculture and handicrafts and a culture of its own identity. Tibetans and the other nationalities living in Tibet, such as the Monba and Loba, are fine members of the big family of the great motherland. They are industrious, honest, intelligent and courageous; they love the motherland and firmly oppose foreign aggression; and, like the people of other brotherly nationalities, they have made outstanding contributions to the creation and development of our great motherland.

Agriculture and Animal Husbandry. Tibet is rich in natural resources. It can be roughly divided into four natural zones according to its topographical features. These are: Northern Tibet Plateau, the Ngari area, Southern Tibetan Valley, and the Hengduan Mountain Ravine in eastern Tibet. Both the Northern Tibetan Plateau and the Ngari area have extensive natural pasturelands and are the chief pastoral areas in Tibet. The main animals raised here are yak, sheep, goats and horses. The Southern Tibetan Valley is an agricultural area.

The main crops are highland barley, wheat, rape, broad beans, peas and buckwheat. Highland barley, with a short growing period, is the staple grain of the Tibetan people. A small part of Nyingchi and Minling and most parts of Bomi, Medo and Zayu of the Southern Tibetan Valley have average elevations below 3,000 m. Here, there are dense forests and the warm climate and fertile soils are suitable for growing subtropical crops. The Eastern Tibetan Ravine is semi-agricultural and semipastoral, in addition to being a timber producer.

Mineral Deposits. Tibet abounds in mineral resources. According to incomplete figures, the region is known to have more than 40 kinds of minerals, including boron, chromium, copper, iron, coal, mica, natural sulphur, lead, zinc, arsenic, cobalt, molybdenum, barite and salt. Tibet ranks first in China in reserves of boron sand and chromium and third in copper.

Water Resources. An adequate rainfall and torrential rivers provide the region with inexhaustible water resources. It is estimated that potential hydroelectric power resources of the region is about 200.56 million kw., or about 29.3% of the nation's total hydroelectric power potential and ranking Tibet first in the country in this resource. The region also has abundant geothermal and solar energy resources.

Forests. Tibet is one of the important forest areas in China, with 3.1 million hectares under timber. Tibet's natural forests have a timber reserve of 610 million cu. m., ranking it fifth in the country. Surveys indicate that there are more than 4,500 species of plants, including evergreen *pinus yunnanensis*, dragon spruce and hemlock — among the most precious species in the world.

Fauna. More than 100 kinds of indigenous animals, including quite a few rare varieties, are to be found in Tibet, including bison, wild ass, Tibetan antelope, Mongolian gazelle, blue sheep, bear, wolf, tiger, leopard, roe-deer, deer, lynx, otter, snow hog, stoat, fox, lesser panda, Tibetan takin, blue-eared pheasant and golden monkey. Lesser panda, blue-eared pheasant and Tibetan takin are on the state list of rare animals for special protection.

There are about 100 varieties of medicinal herbs and other medicinal materials, such as cordiceps, fritillary bulb, rhizome of wind-weed, tuber of elevated gastrodia, Tibet calamus, angelica root, rhubar, rhizome of Chinese goldthread, aucklandia lappa, Chinese ephedra and dried peppermint herb. These native products are important items for shipment to other parts of the country and for export.

These natural resources provide favourable condition for Tibet's economic development, and their exploitation and utilization also help China's construction as a whole.

Economic Achievements Since Liberation

Under feudal serfdom, the Tibet of former days was extremely backward economically, politically and culturally. With the peaceful liberation of Tibet on May 23, 1951, imperialist forces of aggression were driven out and the Tibetan people returned to the embrace of the great motherland. After Liberation, Tibet went through democratic reform, socialist revolution and socialist construction. With the productive forces freed from their fetters, Tibet's economy made rapid headway and scored great successes. The following is a brief account of the main achievements the Tibet Autonomous Region has made in various economic sectors:

Agriculture and Animal Husbandry. Farming and animal husbandry are predominant in Tibet, with their combined output value making up more than 70% of Tibet's gross output value. However, these sectors were very backward before Liberation. At that time, the normal yield of grain crops was only 750 kg. per hectare. Animal husbandry remained at the stage of natural grazing, and maintained a very low breeding rate. Today, with changes in the social system, the region has started to place emphasis on scientific cultivation and grazing and has made rapid growth in both agricultural production and animal husbandry. Total grain output in 1980 was 505,000 tons - 3.1 times that of 1959 when the democratic reform was carried out. The region raised more than 23

million head of animals, 2.1 times that of 1958, the year before the democratic reform. The total output value of agriculture and animal husbandry in 1980 reached 451 million yuan, of which agriculture accounted for 164 million yuan, or 36.3% of the total; animal husbandry output was valued at 250 million yuan, or 55.4% of the total; sideline production came to 37 million yuan, or 8.3% of the total. Agriculture in Tibet has the following special features:

1. *The region, being extensive in area and with extremely diverse natural conditions, promises a great potential for the development of agriculture, provided crops are grown rationally and suited to local conditions.*

2. *A mixture of farming and animal husbandry is the main aspect of its economic structure. However, only some parts are suitable for farming and forestry while the region as a whole is suitable for animal husbandry. Hence, it enjoys particularly good conditions for developing animal husbandry.*

3. *Abundant wild life and plants provide good conditions for developing a diversified economy. Many native and special products, such as pilose antler, musk, cordiceps, fritillary bulbs and animal pelts, enjoy popularity on domestic and foreign markets.*

Industry. Old Tibet knew nothing of modern industry. Even its handicrafts were underdeveloped. Industry underwent large-scale development following Liberation and now makes up an important element in the economy. Its 1980 output value was 150 million yuan, accounting for 25.3% of Tibet's total output value. The region has medium-sized and small enterprises for power generation, chromium and coal mining, chemicals, building materials, machine-building, forestry, industry, woollen textiles, matches, paper, printing, tanning and food processing. It produces 52 major products. The original value of fixed assets was 153 million yuan.

Handicrafts. The handicrafts sector engaged in making traditional Tibetan goods has a long history but suffered great damage during the decade of turmoil (the "cultural revolution"). After the Third Plenum of the 11th Party Central Committee, the party's policy was implemented and traditional handicrafts were restored and developed. In 1980, there were 64 handicrafts workshops, turning out phrue (a kind of tweed), woollen cushions and mattresses, Tibetan quilts, traditional aprons, Tibetan shoes, knives, wooden bowls and

churns for making butter. Their total output value was 6 million yuan.

Transport and Communications. Highways were non-existent in Tibet in the old days. After Liberation, five trunk roads were built: the Sichuan-Tibet, Qinghai-Tibet, Xinjiang-Tibet, Yunnan-Tibet and Sino-Nepalese highways. Fundamental changes have thus taken place in communications facilities. Today, total road length is 21,000 km. More than 400 bridges, permanent and semi-permanent, have been erected, totalling 13,000 m. in length. A network of highways now radiates out from Lhasa. Lhasa is also linked with Chengdu and Xi'an by direct, scheduled air connections. The development of communications and transport facilities has promoted economic and cultural exchange between Tibet and the interior part of the motherland as well as within the region, and has helped bring prosperity and well-being to the Tibetan people.

Postal and telecommunications services have also seen significant growth. Post offices are to be found in all the counties as well as all localities with a concentration of industrial or mining enterprises. International postal services are available in Lhasa, Xigaze, Yadong and Zham.

Commerce and Foreign Trade. Commerce before Liberation was in a sorry state. But it grew quickly after Liberation, thanks to the attention by the Communist Party and the government. A socialist market has been fundamentally established, with state-owned commerce as the main element catering to the minority nationalities and incorporating multiple economic sectors. In 1980, the number of workers engaged in commerce was 12,000. The whole region was served by 2,600 shops, of which 378 were owned by the state. Since the democratic reform, purchases, sales, transfers and stocks have continually increased. In 1980, total purchases of commodities in Tibet exceeded 40 million yuan, eight times the total of 1959. Goods transferred from other parts of the country were valued at 180 million yuan, 4.8 times more than in 1959. Total retail sales reached 344 million yuan, 19.2 times more than in 1959.

In 1980, Tibet's foreign trade amounted to U.S.\$10 million. All this played an active role in promoting Tibet's farming and animal husbandry, in enlivening the market and in providing a secure life for the people.

Science, Culture, Education and Health Work. Before Liberation, there were only seven primary schools for children of nobles and one Tibetan hospital. Since Liberation, Tibet has made great advances in these fields. There were four institu-

tions of higher learning in 1980, with a combined student body of 1,400; 23 secondary technical schools, with 3,500 students; and 6,000 primary schools, with 240,000 pupils. Most gratifying is the fact that Tibet now has a contingent of more than 6,000 teachers of Tibetan and other nationalities. The people of Monba and Loba nationalities, who recorded events in the old days by tying knots, now have their own college graduates. By 1979, the region had set up a number of scientific research institutes with a combined staff of 14,000. They achieved gratifying results in research projects in animal husbandry, industry, communications, architecture, medicine and meteorology.

In 1980, the region had 800 hospitals and clinics, with 3,700 beds and 6,000 medical personnel. Tibetan medicine and pharmacology are being promoted and developed. Music, dancing, literature, drama, sculpture and painting, rich in national styles, were all revived and took on new splendour.

Living Standards. In old Tibet, the three categories of manorial lords (officials, clergy and the nobility) — who made up approximately 5% of the population — lived in extravagance and waste, while the serfs and slaves — making up more than 95% of the population — laboured all day long and yet could not get enough to eat. After Liberation, the party and the state did much work and appropriated large sums of money to help the Tibetan people develop production and solve their difficulties of livelihood. Between 1951 and 1980, the state allocated over 83 million yuan for social relief; state loans to assist the needy totalled over 97 million yuan; and the state issued 108 million yuan in funds to help cooperatives and people's communes. In the 29 years following Tibet's liberation, the state granted Tibet more than 5,000 million yuan to subsidize local finances. A total of 300,000 tons of grain were brought into Tibet during the 22 years following 1959.

In 1980, in particular, the Party Central Committee issued important directives concerning Tibet and adopted special and flexible economic policies. This speeded up local economic development and brought improvement in the people's livelihood. In 1980, each peasant or herdsman received an average of 150 yuan from his collective. At the end of 1980, total bank savings of peasants and herdsmen came close to 14 million yuan; those of the urban residents reached 60 million yuan. The wages of workers and staff employed in enterprises under ownership by the whole people averaged 673.7 yuan per person, over 90 yuan more than the 1979 rate because of wage increases and bonuses.

Population Growth. Better living standards and health facilities have resulted in a large growth in population. According to historical records, during the reign of Emperor Qianlong of the Qing Dynasty (1736-96), the Tibet region (excluding Qamdo) had a population of 2 million. In the ensuing 100 years and more, it was reduced by more than 1 million as a result of the rule of feudal serfdom. At the time of the democratic reform, the population had shrunk to 870,000 (excluding Qamdo). By 1980, the population of the Tibetan nationality in Tibet had grown by 60% compared with 30 years ago. The demographic change testifies to the reactionary nature of the old system and to the superiority of the socialist system.

Problems in Present Economic Work and Tentative Ideas for Future Development

Long years of "Left" influence created many problems in various aspects of the economy in Tibet. Problems yet awaiting solution include: serious imbalances in the relationships among industry, agriculture and animal husbandry and also within the various branches of agriculture; a long-entrenched approach to economic work which did not heed actual conditions in Tibet, and ignored economic accounting and results; and backward conditions in science, technology, culture and education.

In order to make its economic work conform to the needs of the Four Modernizations, Tibet should in the future concentrate on readjusting the economy so as to bring its damaged economic structure back to the previous condition in which a mixture of farming and animal husbandry formed the economic core, and so as to restore the traditional handicrafts industry and household sideline occupations within three to five years. The aim is to bring about a proportionate and planned development of the economy and to effect a marked improvement in people's living standards throughout the region and in their cultural and scientific level. To this end, the following aspects of work should be grasped well:

Agriculture. Tibet has an economic structure based on a combination of farming and animal husbandry. In this, animal husbandry takes up a large proportion and is closely linked with people's clothing, food, shelter, transportation and other articles for daily use. Therefore, whether in the farming, pastoral, semi-farming or semi-pastoral areas, animal husbandry should be developed. While developing animal husbandry, a real effort should be made to successfully develop grain pro-

duction, afforestation and a diversified economy, thus achieving simultaneous and harmonious progress in farming, forestry, animal husbandry, sideline occupations and fisheries.

Industry. Vigorous efforts should be made to restore and develop the traditional handicrafts industry, especially the production of light industrial products and special products for minority nationalities that use animal products as raw materials. We must carry out technical transformation of handicrafts, systematically introducing mechanization and semi-mechanization. Those enterprises which depend on the interior of China for their materials, which have not passed the grade technically, which incur big wastes, which turn out inferior products or which operated at a loss for a long time should be closed, suspended, merged or retooled for alternate production as each case merits. Existing enterprises should be put in order and should be managed well. Efforts should be made to tap their existing potential through technological innovation and transformation so as to lower production costs, raise productivity and fulfil this year's production plans.

Power Resources. Tibet suffers serious fuel and power shortages due to small coal reserves. This has seriously affected economic construction and people's livelihood. The most effective measure for solving this problem is to utilize Tibet's very rich water resources for hydroelectric power generation, chiefly through the construction of small power stations. The next step is to make full use of geothermal resources and solar energy, so as to lay a good foundation in energy for the exploitation of Tibet's rich resources in the future.

Transport and Communications. Being vast in territory, road transportation must serve as Tibet's main artery in the region's economic development. Highway and bridge construction should be strengthened and transport conditions improved. Efforts must be made to establish a thorough network of communications throughout the region during the period of the Sixth Five-Year Plan.

Traditional Trade. Local commerce should be vigorously encouraged to cater to the needs of the people of the minority nationalities. Commercial activity should lend vigorous support to production. Efforts should be made to expand purchases, strengthen the shipment of goods from the interior, encourage sales, enliven the market, withdraw currency from circulation and basically stabilize prices. At the same time, foreign trade should be actively expanded.

Livelihood. We should develop the economy and raise the level of the people's material lives, as well as their scientific and cultural levels. While adhering to socialist principles, we should adopt more flexible economic policies in Tibet so as to rapidly realize the region's wealthy potential. Capital construction must be curtailed, financial expenditures kept within the budget and state investments put to use in developing agriculture and animal husbandry and in the production of badly needed goods. We shall strive to primarily alter Tibet's poor and backward state within two or three years. Culture, education, science and technology should be adapted to suit the special conditions of

Tibet, and they should advance through readjustment.

Stress in education should be placed on the Tibetan nationality, on middle and primary education, and on public schools. More efforts should be made to collect, sort out, study and pass on Tibet's traditional cultural heritage, including fields of astronomy, Tibetan medicine, Tibetan opera, music, dancing, painting and sculpture, and to develop socialist Tibetan culture. It is necessary to step up the training of personnel, particularly from among the minority people, for the general task of developing the region into a united, prosperous and socialist new Tibet.

84. ECONOMIC DEVELOPMENT IN XINJIANG UYGUR AUTONOMOUS REGION

By the Office of Research and Investigation,
People's Government of Xinjiang Uygur Autonomous Region

Geography. The Xinjiang Uygur Autonomous Region lies on the northwest border of the country and has an area of over 1.6 million sq. km., making up one-sixth of the country's total area. Xinjiang is a vast region with rich and varied natural resources. In the fertile regions on both sides of Tianshan Mountains live 13 nationalities; the Uygurs are the main ethnic group.

Survey of Economic Development Since 1949

Before Liberation, under various reactionary rules, the economic development of this rich land was negligible. The whole region's industry consisted of only ten very small, poorly equipped factories. Even daily necessities such as nails and matches had to be transported from other parts of the country. Agriculture and animal husbandry were even more backward. A considerable part of the region was still at the primitive stage of production. Communication and transport, finance, commerce, science, culture, education and public health were very backward. The people of all nationalities were living in dire poverty.

In 1949, the heroic People's Liberation Army entered Xinjiang and from then on the people were their own masters. Under the leadership of the Party Central Committee, the army and the people of all nationalities united to undertake economic construction in various fields which started from scratch and grew rapidly. The economic situation has changed tremendously.

Major Economic Advances. For 30 years, the region's industrial and agricultural output value increased by an average annual rate of 7.7%. Agriculture and animal husbandry increased 4.3 times in value, from 490 million yuan in 1949 to 2,142 million yuan in 1979. At present, the area of cultivated land is over 48 million *mu*, or triple that in the early days after Liberation. The output of grain reached 7,780 million catties in 1979, or 4.5 times that in 1949. There was 750 million *mu* of pastures with 25.85 million head of livestock in 1979, or 2.5 times what it was 30 years earlier.

Industry, communications and transport have also undergone tremendous changes. Iron and steel, nonferrous metals, electric power, coal, petroleum, chemical, cement, automobile, trac-

tor, electronics, motor, farm machinery, cotton and wool textile, paper-making, sugar refining, cigarette, salt, and defence industries have been established. Now there are altogether 4,000 industrial enterprises, with an annual output of 3,140 million yuan as against 80 million yuan in 1949, an increase of nearly 39 times. A foundation for socialist industry has been laid. Railway mileage is over 1,100 km., and highways total more than 21,000 km., seven times that in 1949. Civil aviation has also developed considerably.

With the development in industry and agriculture, the region's revenue in 1979 was 31 times what it was at the time of Liberation. The commercial network extends throughout the region and two-thirds of it is in agricultural and pastoral areas. With the continuous rise of the people's living standard, retail sales reached 2,470 million yuan in 1979 — 11 times that of 1950 — thus satisfying the needs of and providing convenience to the people of different nationalities.

Principal Scientific and Cultural Achievements. In the past 30 years, the region's science, culture, education, public health, publishing, press, broadcasting and sports have also greatly developed. In 1951 the whole region's sole scientific organization was staffed by only 55 workers. In 1979, research organizations numbered 191, with 3,591 workers. As for education, the number of universities and colleges rose from 1 to 12; vocational schools, by 9.2 times; secondary schools, 221 times; and primary schools, 7.8 times. By 1979, the region had trained 26,000 university graduates and 91,000 vocational school graduates. The number of health organizations, hospitals, hospital beds, and medical workers has increased 51, 20, 86 and 131 times, respectively, since 1949. The shortage of doctors and medicine in the vast agricultural and pastoral areas has been tremendously alleviated.

Progress Despite Setbacks. For 30 years the achievements in Xinjiang's economic construction were gigantic. However, due to the long-term disturbance of "Left" ideology, especially that of the ten-year catastrophe caused by Lin Biao and the Gang of Four, economic construction suffered serious damage and the speed of economic development was slowed down.

After the collapse of the Gang of Four and

under the correct line and policy of the Third Plenum of the 11th Party Central Committee, our region's national economy has speedily revived and developed due to the carrying out of the national economic readjustment policy, the rectification of guiding thought in economic construction and criticism of a whole string of "Left" mistakes. With the steady rise in industrial, agricultural and livestock production, the living standard of the people has continued to improve, the national economy has been revitalized, and along the Tianshan Mountains the whole picture is a cheering and heartening one.

Economic Development in 1980

The correct implementation of the Party Central Committee's two documents concerning agriculture and the region's policies for agriculture and livestock breeding, the institution of many forms of responsibility systems and of the principle of "to each according to his work," and the reorganization of the agricultural structure have all served to arouse the peasants' and herdsmen's zeal for production, thus further developing agriculture and animal husbandry.

Agriculture. The total output value of agriculture in 1980 was 2,330 million yuan, an increase of 8.8% over that of the previous year. Despite a decrease of 1,279,000 mu of land sown to grain, the total output nevertheless reached 7,723 million catties. Even though the output was 65 million catties less than the previous year, the per-mu yield was 7 catties more, reaching a record 238 catties. In particular, the region's cash crops showed sharp increases. In comparison with the previous year, cotton, oil-bearing crops and beets increased by 49.4%, 24.3% and 29.9%, respectively — the best records since 1966. The yield of grapes, melons, other fruits and vegetables surpassed that of the previous year.

In view of the fact that in the three prefectures in southern Xinjiang — Kashi, Hotan and Kergez — production developed sluggishly for the past 10 years or so and the people there are still in difficulty, the region's party committee decided to speed up their economic development with financial aid. In 1980, they were appropriated 36.1 million yuan and granted a loan of 73.1 million yuan for agricultural use. They were also given special consideration in the allocation of merchandise. That year the Kashi and Hotan prefectures reaped a bumper harvest in agriculture and significant growth in numbers of livestock. Grain yield increased by 5.3% over the previous year, the yield of cotton and oil-bearing crops surpassed former

records and livestock achieved a net increase of 500,000 head.

All this played an active part in the acceleration of the region's agriculture and animal husbandry. In line with the policy of all-around development of agriculture, forestry, animal husbandry, sideline production and fishing also showed considerable development in 1980; 380,000 mu of trees were planted — the region's highest annual record. Some changes have also taken place within agriculture; the increased rate of output value of ture; the increase rate of the output value of livestock breeding and sideline production began to surpass that of farming itself. The collective economy and household sideline production are most active, presenting a picture of prosperity for the urban-rural economy.

What is most gratifying is the changes in the state farms, which have an important place in the region's agricultural economy. In 1980, their main products such as grain, cotton, oil-bearing crops, beets and livestock attained or surpassed their previous records. Great strides were also made in improving management and turning deficit to profit.

Livestock breeding has an important position in the region's economy. Since the party's Third Plenum, the people's governments at all levels have reinforced the leadership over animal husbandry. The tendency of paying too much attention to agriculture and too little to animal husbandry is being overcome. In accordance with the principle of raising livestock, where it is most suitable, readjustments have been made. A group of semi-agricultural, semi-pastoral counties and communes have been officially changed to full pastoral counties and communes. In the management of livestock economy, an overall policy of assigning herds to specific groups, families and herdsmen and a system of payment according to results have been advocated. The policy concerning private livestock and their unlimited number has been further stressed. With the advance of scientific research and popularization of technical skills, the construction of pastures in pastoral areas has been given major importance. In 1980, the region's investment in construction of pastoral areas totalled 13.8 million yuan. A total of 325 pump wells have been dug in the region and over 900 ponds and 7,490 permanent corrals have been built. The zeal of the herdsmen is very high. By the end of 1980, the total number of livestock reached 26.726 million head, increasing by 3.4% over the previous year — the best record since 1966. The output of meat totalled 127,000 tons, or 12,000 tons more than that of the previous year. The output of wool was 34,000 tons, surpassing that of the previous year. Commune members had a total of 7.53

million head of private livestock. On the whole, the situation in animal husbandry is most encouraging.

Industry. Industry pressed forward amid readjustment. In 1980, industrial enterprises were resolute in tapping their full potential, making innovations and transformations and increasing income and cutting down expenditure. As a result, industrial production climbed steadily. The region's total output of industrial products reached 3,489 million yuan, or 10.9% more than in 1979. The development of light industry was given special attention. Under the principle of giving priority to raw material, fuel, power, capital construction, bank loans, foreign currency and transportation, 51% of the funds for tapping potential, innovations and transformations, technological improvement loans and portions of short-term facility loans were used for light and textile industries, which resulted in a 13.1% growth in output value. This surpassed the speed of growth in heavy industry and caused a change in the proportion of light to heavy industry.

The output of main products showed increases in comparison with the previous year. Woollen piece goods, knitting wool, sugar, cigarettes, paper and cardboard, tractors, rolled steel, coal, crude oil, cement, steel and timber all set new production records. The quality of industrial products also improved. In a November 1980 survey of 47 items on the quality index of main enterprises, 31 items surpassed the previous year's level and 18 reached or surpassed the previous best levels — an increase of 4 items compared with the previous year's survey. No. 18 refrigeration motor oil and Tianshan Brand cement were awarded national silver medals. A total of 1,200 new styles, designs and varieties were added to the list of industrial products.

A mass movement of increasing industrial production and income and cutting back expenditures and material was under way. The years 1979 and 1980 saw the overfulfillment of the 150 million yuan target set by the plan for increasing production and practicing economy. In economizing on the use of energy, favourable results were achieved.

Communications and Transport. There were also new achievements in the area of communications and transportation. In 1980, railway passenger transport overfulfilled the year's plan by 45.1%, an increase of 10.6% over that of the previous year. Merchandise transportation overfulfilled the year's plan by 2.7%. Transportation belonging to enterprises directly subordinate to the region's Bureau of Communications over-

fulfilled the annual target of merchandise distribution by 10.9%. The tension resulting from problems in highway transportation was evidently relaxed.

After investigation and study by the communications departments, 96 enterprises were closed down or suspended, drastic adjustments were made to 269 other enterprises and favourable results were achieved. Through consolidation, the leadership of these enterprises was strengthened, their management improved, their economic accounting reinforced, their product quality elevated, their production increased and their technical level raised.

Capital Investment. The investment in capital construction yielded favourable results. The region's 1980 capital construction investment proportion was appropriately readjusted and the proportion for agriculture, light industry, textile industry, education and culture was raised. At the same time, funds were added for the construction of housing, public utilities and other non-productive projects. Of the region's construction projects involving at least 1 million yuan each, 102 were postponed for two years and the total investment of 710 million yuan was cut down. The quality of construction improved and more projects were completed and put into operation, adding 812 million yuan in fixed assets.

Commerce and Trade. Finance and commerce also achieved favourable results. Along with the region's development of industry, bumper harvests and improvements in animal husbandry and sideline products, many attempts were made to activate the urban-rural economy. The further development of country markets, opening up city markets for farm products and increasing merchandise distribution channels created a prosperous climate in sales. In 1980, purchases in commercial operation reached 2,650 million yuan, increasing by 25.6% over that of the previous year. Retail sales totalled 3,050 million yuan, increasing by 23.5% — the best record since the founding of the People's Republic. With the market livening up, difficulties in the supply of merchandise were overcome and some merchandise in short demand for a long time is now in ample supply. The open supply of merchandise has played an active part in reassuring the masses and increasing the withdrawal of currency from circulation.

Foreign trade was actively developed in the light of local conditions. In 1980, the region's purchases for export were valued at 176 million yuan, 5% more than the preceding year. Export commodities included 65 kinds of products, an increase of 29. Among them, special local products such as

polose antlers, deer horns, sheared and fine wool, hops, safflower seeds, allium, honeydew melons and fresh grapes all showed large increases.

Science and Culture. There were also new developments during 1980 in the fields of science and technology, education, culture, public health and sports. The status of science and technology was further reinforced. Thousands of scientific and technical personnel who had been misplaced in their jobs were returned to their own specialized fields and created over 300 items of value in scientific research, of which more than 50 reached advanced national standards.

In education, teaching order was rectified, teaching quality raised, funds and construction investment for schools added, educational courses on radio and television and sparetime university education developed. Vocational schools also were developed, their enrollment enlarged and the ratio of enrollment for national minority students increased. In 1980, the number of students studying in universities, colleges, vocational schools and middle schools increased by 25.6%, 5.38% and 8.95%, respectively. Further developments were made in press and publishing. Family planning also witnessed new developments.

Living Standards. The living standard of the people in the region was greatly raised. In 1979 and 1980, 800 million yuan were spent in increasing the people's income to improve their living conditions. In agricultural and pastoral areas, commune members have increased their income by 40% on the average in the past four years. In 1980, the average increase in income per capita was 5 yuan. The average increase in grain was 15 catties per capita, reaching 400 catties annually. Household sideline production totalled 110 million yuan; grain yield from private plots was 430 million catties; private livestock, 7.53 million head; and urban and rural savings, 1,070 million yuan, an increase of 200 million yuan over the previous year. At the same time, for production brigades with a per capita income lower than 40 yuan, primary school textbooks were provided free of charge, as was medical care given for favus of the scalp and brucellosis, thus lightening the peasants' and herdsmen's financial burden. As for workers and staff members, besides receiving raises in salary and wages according to the national rules, they were granted subsidies in food, awards and bonuses in enterprises and other considerations peculiar to local conditions, such as subsidies for heating in winter; better terms on home leave; border region health subsidies; and readjustments

on subsidies for those sent on special missions. All this thereby increased their actual incomes by quite a margin.

In 1980, the average increase in annual income was about 120 yuan, and after deducting the rise in actual expenses, the average income netted a 10.2% increase over the previous year. In 1980, newly built residential areas totalled 2,370,000 sq. m., the highest figure since the founding of the People's Republic. In cities and towns, new channels in production were opened, giving employment to 110,000 people.

Current Problems and Goals for Future Development

The year 1980 witnessed certain favourable results in the region's economic construction and the current situation, on the whole, is heartening. But there are still vestiges of disturbance left over from the "Left" line of the past. In the development of the national economy there are still serious problems and shoals. They are evidenced by the annual decreases of revenue, the increasing expenditure, the growing circulation of currency that adversely influences the stability of market prices and the people's livelihood, and capital construction scale becoming too large. The progress in closing down, suspending, merging or switching industrial enterprises is too slow and our products are too high in price and too low in quality, thus making them noncompetitive. Besides, the readjustment in industry is far from adequate for the needs of readjustment of the national economy. Financial results are poor and losses and wastage are serious. These conditions reflect the fact that our technical skills in production and management are still very much behind the times and our passive position in economics has not undergone a decisive change.

According to the Party Central Committee's policy of further readjustment of the economy and further political stability, 1981 is a crucial year in the region's economic readjustment. The main task of the region is to firmly and resolutely carry out the directives of the Party Central Committee and the State Council concerning the work in minority areas and to earnestly apply the spirit of the Third Session of the Fifth National People's Congress and the Working Conference of the Party Central Committee. The national autonomy policy, unity between peoples and further readjustment of the national economy should be strengthened. We shall continue to preserve stability, resolutely cut down the scale of capital construction, fully develop agriculture and livestock breeding, speed up the development of light and

textile industries, appropriately develop science, culture and education, strive to increase revenue and cut spending, earnestly solve the burning ques-

tion of providing more food, meat and spending money for the people — and in general push forward our region's socialist construction.

85. ECONOMIC DEVELOPMENT IN YUNNAN PROVINCE

By the General Office,
Yunnan Provincial People's Government

Geography and Resources

Yunnan Province is located on the south-western border of China and is bounded by Vietnam, Laos and Burma. Its total area is more than 390,000 sq. km. The province has a population of 31.74 million; 22 minority nationalities account for about one-third of the population.

Yunnan Province is vast in area and rich in natural resources. Its forest reserves rank fourth among China's provinces and water resources are third. Its deposits of nonferrous metals and phosphorous rank first. Yunnan's varied climate is suitable for developing forestry, animal husbandry and a diversified economy.

Survey of Economic Development Since 1949

The national economy of Yunnan Province has developed very rapidly in the past 30 years. The major achievements are summarized as follows:

Agriculture. Agriculture has embarked on the path of collectivization and has greatly developed through land reform, the cooperative movement and the people's commune system. Total grain output in 1979 doubled that in 1949 and the annual average increase was 2.35%. The output of sugarcane in 1979 was 6.6 times that of 1949; cured tobacco, 48 times; tea, 6 times; and oil-bearing crops have almost doubled. The area of rubber plantations increased to 700,000 mu. The number of pigs has increased 4.8 times; draught animals have almost doubled; and sheep have risen 3.4 times. More than 50,000 irrigation works have been built, with a total storage capacity of 5,700 million cubic metres. The effective irrigated area amounted to 13.56 million mu, which accounted for 33% of cultivated land. The number of tractors increased 21 times over that in 1962. The quantity of chemical fertilizer applied increased 26 times and consumption of electric power 33 times.

Industry. Before Liberation, Yunnan's industry was very backward. There was a small quantity of industry and handicrafts only in cities such as Kunming and Gejiu. After Liberation, the

following light and heavy industries were established in the province: ferrous metal, steel, machinery, coal, electric power, forestry, chemicals, textiles, foods, daily necessities, etc. Now Yunnan has more than 7,000 industrial enterprises and 8,000 million yuan's worth of fixed assets. Total industrial output value in 1979 was 32.3 times that in 1949, accounting for 61% of total industrial and agricultural output value, as against 16.7% before Liberation. The output of major products has increased greatly. Steel output increased 1,157 times; eight ferrous metals, 71.3 times; electricity, 108 times; coal, 57 times; timber, 133.4 times; cigarettes, 26.2 times; sugar, 7.2 times; and cloth 4.5 times. Machine-building, optics and chemical industries all have increased to a certain degree. A firm foundation was laid for electronics, textiles, paper-making, printing, pharmaceuticals, pottery and porcelain, and glassware trades.

Transportation. Before Liberation, transportation in Yunnan was very backward, especially in the mountainous and border areas where transportation mainly depended on man and horse. The railroads in the whole province were narrow-gauge rail: from Kunming to Hekou, from Kunming to Zhanyi, from Gejiu to Bisechai to Shiping. Highways aggregated only 2,700 kilometres and two-thirds of the counties had no motor traffic. After the founding of the People's Republic, traffic and transportation have greatly developed. The railroad from Kunming to Hekou (metre gauge) has been restored and railroads from Guiyang to Kunming and from Chengdu to Kunming (standard gauge) have been built, greatly strengthening Yunnan's connection with various inland provinces. By 1979, the railway mileage had increased 3.6 times over 1949. Highways had increased 9.3 times to more than 44,000 kilometres. Motor traffic was available for all counties. Civil aviation has also developed rapidly with services by many new air routes both inside and outside the province.

On the basis of the continuous growth of production in industry and agriculture, finance and trade have also developed to a great degree. Retail sales of commodities in 1979 increased 8.1 times over 1952, purchases of export commodities increased 3.1 times and financial income increased 5.6 times.

Education, Science and Culture. With the de-

velopment of economic construction, education, science, culture and public health made great progress. In 1979 there were more than 64,000 universities, middle and primary schools in the province — a 5.5-fold increase over 1950. The total number of students in schools was 5.415 million, increasing 9.3 times. There were 263,000 teachers and workers in various schools, an increase of 15.3 times. There are 1.32 million minority nationality students in school, accounting for 24% of the total number of students. In the past 30 years, the universities and colleges have trained 49,800 graduates for the country and the secondary professional schools, 140,000 graduates.

At present, there are 154 independent scientific research organizations at the county level and above. And there are 125,600 technical personnel in the natural sciences, of whom 121,700 are in state-owned units — an increase of 18 times over 1952. The province has 238 cultural halls or centres and 59 professional ensembles, 95 professional art troupes, 155 cinemas and 66 libraries with more than 10,000 volumes of books each.

Public health institutions in the whole province have increased from 96 units in 1949 to 579 today. Medical professionals have increased in number from 571 to 68,262 and hospital beds have increased from 615 to 64,623, averaging 2.06 beds per 1,000 people as against 0.04 beds before. There are now 2.18 medical professionals per 1,000 people as against 0.4 professionals per 1,000 population in 1949.

Income and Livelihood. People's lives have improved gradually. The average consumption level of the peasants increased from 44.7 yuan in 1952 to 131 yuan today, and the average consumption level of workers and staff members rose from 109.1 yuan to 411.2 yuan. During the past 30 years, a total of 1,192.38 million yuan has been invested for housing construction and in 1979 and 1980 alone the completed housing space was more than 3.74 million square metres. This helped to lessen housing pressures which had caused tensions for a long time. Savings accounts in urban and rural areas totalled 782.19 million yuan, increasing 8 times over 1957.

Review of Economic Developments in 1980

Agriculture had an all-around good harvest in 1980 and the situation in the countryside was excellent. Due to the implementation of several important documents issued by the Party Central Committee concerning agriculture and of various economic policies stipulated by the committee and provincial people's government, the enthusiasm of

cadres and commune members was fired and the development of agricultural production accelerated. Total grain output in 1980 reached 17,311 million catties, the highest level in history. Output of main cash crops increased in varying degrees: oil-bearing crops by 52.2%, spices by 50%, tea by 20.1% and sugarcane by 1.6%. Thanks to the good harvest and the practice of giving extra bonuses for excess production or profit return, in addition to price increases for some agricultural and sideline products, the commune members' annual income averaged 147.7 yuan per head — an increase of 22.5 yuan over the previous year.

Industrial Advances. Industrial readjustment made progress in 1980 as both industry and transportation marched forward steadily. Some 125 enterprises, because of poor markets, inferior product quality, higher prices and serious financial losses, were shut down, amalgamated or switched to another line of production. According to market needs, the defence and machinery industries readjusted the composition of their products and service orientation and started to produce light industrial products for daily use. Various measures were taken to speed up the development of the light and textile industries. And there was a big increase in the production of light industrial goods needed in the market. The variety, designs and styles of products increased by more than 1,600 items.

The experiment of enlarging decision-making power was carried out in 195 units in the province. Some units adopted the method of sharing out profits and being responsible for profits and losses. Adjustments in the market were made and economic integrations were organized. Therefore, industrial production was promoted and the enthusiasm of managers and producers aroused. The total industrial output value was 6,138 million yuan, an increase of 3.4% over 1979. The economic results increased to some extent. The total output value of industrial enterprises in the provincial budget increased by 1.3% over 1979, their profits increased by 5.6%; energy consumption was reduced by 9% and comparable costs decreased by 0.2%. The total loss incurred in the enterprises decreased by 12.8%. The quality of products was improved to some extent.

Capital Investment. The scale of capital construction was reduced. A number of capital construction projects were stopped or postponed. The investment for capital construction in the whole year was 1,401.2 million yuan, a reduction of 5% from 1979. At the same time, efforts were concentrated on speeding up the key projects. The number of projects wholly or partially put

into operation in 1980 made up 51% of all projects under construction. Newly added fixed assets were valued at about 1,000 million yuan. The direction of investment for capital construction was readjusted. The percentage of investment in nonproductive construction increased by 8.5% over the previous year and the absolute value increased by 39.3%.

Markets. Purchasing and selling operations in the whole province improved and the market was brisk. Retail sales amounted to 4,120 million yuan, an increase of 9.6%. Compared with 1979, the sale of pork increased by 12%; fresh eggs, 13.6%; tea, 25.8%; polyester-cotton cloth, 41%; woollen fabrics, 22%; silks and satins, 35%; TV sets, 69%; wrist-watches, 22%; bicycles, 15.6%; and semi-conductor radios, 14.1%. The village fairs flourished and registered a 35% increase in transactions over 1979. The difference of market prices was reduced by 12.1% and the general level of prices dropped by 11.2%.

Main Problems and Future Plans

The economy and culture of Yunnan Province have developed greatly during more than 30 years of socialist construction. But Yunnan Province is a border province with many nationalities and its economic development is faced with many problems for historical and geographical reasons. The main problems are as follows:

(1) *The present irrational economic structure.* The grain production level is low and the development of forestry, animal husbandry and cash crops cannot meet the needs of the market and light industry. Light industry is weak in its foundation and its pace of development has been slow. Some products are inferior in quality and high in price. The variety is less than it should be and designs and styles are simple. The whole economic structure is inclined to heavy industry. Of the total output value of industry and agriculture, industry makes up 61%, and agriculture 39%. Of the total output value of industry, heavy industry accounts for 57.9% and light industry for 42.1%. The agricultural structure is one-sided. Of the total output value of agriculture, farming accounts for 63.6%; forestry, 6.5%; animal husbandry, 16.9%; sideline production, 12.7%; and fishing, 0.2%. The ratio among different branches of the national economy is not coordinated.

(2) *The commodity economy is underdeveloped.* The regional and closed characteristics of Yunnan's economy are quite obvious. All dis-

tricts except those with better communications and an early history of development have self-supporting natural economies. In a few areas inhabited by minorities the economy is still in a primitive stage. The production rate is very low. The development of the national economy is seriously influenced by the backward mode of production of the natural economy and its habitual tendency for small-scale production.

(3) *Traffic and communications are inconvenient.* The railways open to traffic within the whole province total only 1,700 kilometres, running through 20 counties and concentrated in the northeastern corner of the province. Basically, there is no river transport. Communications and transport mainly depend on highways but they are few and average only 14.9 kilometres per square kilometre in the province. Also, the standard is low; only 56% of existing highways are all-weather roads and they are irrationally located, poorly connected, easily damaged by natural disasters, comprise indirect routes and are costly to maintain.

(4) *Culture, education, science and technology are still backward.* In the province the illiterate make up almost a quarter of the population. Primary schools are attended by only about 50% of eligible pupils. Universities and secondary technical schools are small and their training capacity is limited. The personnel engaged in science and technology are small in number; engineers and technicians account for only 2% of the total number of workers and staff members. There are only 3.9 agro-technicians per 10,000 agricultural population. Among the scientists and technicians, graduates from universities, colleges and secondary technical schools make up only 32% of the total. High and middle-ranking personnel in science and technology make up only 6.84%, which is lower than the national average. There are especially few scientists and technicians among the minority nationalities — 15 persons for every 10,000 in minority nationality areas, which is much lower than the provincial level of 49 persons for every 10,000 people.

The future plans for Yunnan's economic development are as follows:

(1), *We must readjust the irrational economic structure and advance agriculture and light industry.* We plan to speed up the development of agriculture and light industry and to raise their proportion in the national economy. We must try our best to readjust the economic structure and to make it more balanced and rational. Agriculture will continue to implement and carry out the provision of important documents and relevant policies

issued by the Party Central Committee concerning agricultural development and will try to perfect various forms of production responsibility. Forestry, animal husbandry and a diversified economy will be developed in a big way while ensuring the production of grain. The development of light industry mainly depends on regrouping and reforming existing industrial enterprises, strengthening their operational management, implementing technical innovations and improving the economic results.

(2) *We will give full play to the superiority of the local economy and develop the commodity economy in a big way.* Since the natural resources of Yunnan Province are especially rich, the successful readjustment of the national economy will actively create favourable conditions and give full play to the superiority of the resources in various places. We will develop such local products as cigarettes, tea, sugarcane, animal by-products, spices, medicinal herbs, ferrous metal products, forestry products, rubber products, phosphorous products, hardware and other local specialities. We will strive to produce many competitive first-rate products and brand-name products.

(3) *We will vigorously develop transport and communications and strengthen exchanges inside and outside the province.* In the near future we must develop highway transport and raise the capacity of existing highways. At the same time, we should pave interrupted highways and keep highways open to collection and distribution areas for agricultural and sideline products. We should give priority to the construction of mountain-area highways having economic value and post roads.

We should vigorously develop transportation run by the local people. Transport should be oriented towards heavy-duty and diesel vehicles so as to raise transport efficiency and lower costs.

(4) *We will firmly grasp education and speed up the training of qualified personnel.* We should stick to the policy of "walking on two legs" and bring the initiative of various quarters into play to undertake various forms of schooling. According to the circumstances, we will run primary schools well and make education universal. We should actively reform the secondary education structure and properly convert ordinary middle schools into various secondary technical schools while developing agricultural middle schools and part-work and part-study schools. Teachers' universities and schools should be well run in order to raise the level of teachers, as should higher education and secondary technical schools so as to provide more qualified personnel. We must pay attention to and give aid to cultural and educational undertakings by operating free lodging middle or primary schools, by vigorously training intellectuals and special professionals of minority nationalities, by developing spare-time education for adults and by running broadcasting and TV universities, night universities and correspondence universities well. We will gradually establish a spare-time educational system from the lowest level to higher education. We should do a good job of training workers and staff members and raise the scientific, technological and cultural levels of workers and staff. In the countryside especially we should make strenuous efforts to wipe out illiteracy and improve education so as to stress agricultural techniques.

86. ECONOMIC DEVELOPMENT IN ZHEJIANG PROVINCE

By Ji Wei and Zhong He

Synthesizing Office, Zhejiang Provincial Planning Commission

Population, History and Resources

Population. Zhejiang is one of China's small but densely populated provinces. It has an area of more than 100,000 sq. km. At the end of 1980, the population was 38.27 million, averaging 376 persons per sq. km. About 34.36 million people live in rural areas.

History. The province has a long history behind it. During the Spring and Autumn Period (770 B.C.—476 B.C.), it was part of the state of Yue, which had its capital at present-day Shaoxing. After the unification of China under the Qin Dynasty (221 B.C.—207 B.C.), it was divided between Huiji and Minzhong prefectures. During the Sui Dynasty (581 A.D.—618 A.D.), a canal was dug from Gongchengqiao in Hangzhou in the south to connect with the Grand Canal north of the Changjiang River. This waterway became an artery between the north and south in ancient China. Hangzhou was then the seat of a prefecture.

With the development of maritime trade in the Tang Dynasty (618—907), Mingzhou (present-day Ningbo) and Wenzhou became major sea ports. Later, during the Five Dynasties and Ten States Period (907—960), Hangzhou became the capital of the state of Wuyue. It was also the capital of the Southern Song Dynasty (1127—1279), but it was then called Lin'an and was known as the principal city in southeast China. Zhejiang became a province during the Yuan Dynasty (1271—1368).

Natural Resources. Zhejiang is known as the "home of fish, rice and silk." The Hangzhou-Jiangxing-Huzhou and Ningbo-Shaoxing plains abound in rice and natural silk. Hills and mountains cover 70% of Zhejiang, supporting the growth of timber trees, bamboo, tea and citrus fruits. The province borders a vast stretch of sea and faces the Zhoushan Islands, one of China's major fishing grounds. Along the extensive coastline there are fine harbours such as Ningbo, Wenzhou, Haimen, Dinghai and Zhapu.

The province has enormous easy-to-work reserves of non-metallic minerals such as fluor spar, alumstone, limestone, amargosite and arenaceous hyaline-quartz. Verified coal and iron ore deposits are small.

Transportation. Water transport is convenient in the lower reaches of large rivers and along a labyrinth of small rivers and canals which criss-cross the plains. Hangzhou is a railway hub from which one can reach all parts of China through the Shanghai-Hangzhou, Zhejiang-Jiangxi, Xiaoshan-Ningbo and Hangzhou-Changxing trunk lines and the branch line between Xinanjiang and Jinhua. Hangzhou is also a road transport centre from which highways branch out to all parts of the province and to adjacent provinces and Shanghai Municipality.

Economy. Zhejiang's economy is dominated by agriculture and light industry, although a foundation has been laid for heavy industry. Thanks to the fine natural conditions, the province has become a comprehensive agricultural economic zone with farming, forestry, animal husbandry, fishing, sideline occupations and various other undertakings. The silk, paper, woollen textile, linen, food and ceramics industries, as well as other light and handicraft industries, have fairly solid bases. Zhejiang's foreign trade began quite early and the province now accounts for an important share of China's exports. Zhejiang is also known for its picturesque landscape and cultural and historical relics. Hangzhou is one of China's tourist centres.

Survey of Economic Development Since 1949

Zhejiang's economy has made tremendous progress since 1949, although there have been ups and downs. Large-scale farm improvement projects have been built on the basis of agricultural collectivization. As a result, farming conditions have improved continuously and productivity has increased steadily.

Agriculture. More than 80% of the farmland is irrigated, either mechanically (three-fourths, or 17.1 million mu) or electrically. Average consumption of electricity now exceeds 60 kwh. per mu of farmland and that of chemical fertilizer about 20 kg. (counting only the effective content). With the improvement in agricultural techniques, unit yields have gone up steadily. Although farmland averages only 0.72 mu per capita, the province has been

able to meet the basic needs of its population, provide light industry with more and more raw materials and increase exports of farm and farm-related products.

Industry. In the early 1950's, Zhejiang's light industry consisted mainly of handicraft workshops. There were few modern factories. Since then, a large number of key enterprises have been built and the old enterprises have been renovated and expanded. This has greatly increased the production capacity of the silk, cotton, textile, paper, food and ceramics industries. The new industries that have sprung up make such goods as woollen fabrics, linen, chemical fibres, plastics, sewing machines, bicycles, clocks and wrist-watches to fill the gaps in the supply of consumer goods. Industry as a whole has been updated technically in a systematic fashion.

With regard to heavy industry, Zhejiang had nothing more than a few small power plants and iron works in the early post-Liberation period. Starting with the construction of the Xinanjiang Hydroelectric Power Station in the First Five-Year Plan period, a series of new heavy industrial divisions have been set up. They include the metallurgical, heavy machinery, electronic meters, building materials, basic chemicals, chemical fertilizer and insecticides industries.

Transportation and Communications. Progress has also been made in transport and communications. Compared with the early post-Liberation period, the total length of railways open to traffic has doubled, that of highways has increased 9.9-fold and that of waterways open to modern shipping rose 8.8-fold. Civil aviation, posts and telecommunications also have developed rapidly.

Economic Structure. Development of production and construction has brought about a radical change in Zhejiang's economic structure and a noticeable improvement in the people's livelihood. In 1949, Zhejiang's total industrial and agricultural output value was 2,474 million yuan. Of this sum, 1,814 million yuan came from agriculture and 660 million yuan from industry, while heavy industry accounted for only 37 million yuan of the total. In 1979, the province's total industrial and agricultural output value reached 23,145 million yuan or 9.4 times the 1949 figure, averaging an annual increase of 7.7% over 30 years. To this total, agriculture contributed 8,200 million yuan, an increase of 4.5-fold over 1949, and industry 14,940 million yuan, an increase of 22.6-fold. The output value of heavy industry in 1979 was 6,110 million yuan, 165 times the 1949 figure. Of the total 1949 output value, agriculture accounted for 73.3%,

light industry 25.2% and heavy industry 1.5%, but the figures for 1979 were 35.5%, 38.1% and 26.4% respectively. National income for the province averaged 66 yuan per capita in 1949 and it rose to 370 yuan in 1979 (at 1970 constant prices).

Since 1979, Zhejiang has carried out the principle of readjustment, restructuring, consolidation and improvement of the national economy in accordance with the principles and policies of the Third Plenary Session of the 11th Party Central Committee. In view of Zhejiang's actual conditions, emphasis was put on giving full scope to the strong points of the province's diversified rural economy, light and textile industries and tourism so as to improve the economic structure step by step. Considerable progress has been made in the course of readjustment.

Review of Economic Developments in 1980

Agricultural Development. Agricultural production in 1980 was marked by a fairly good harvest and structural improvements, though it suffered from one of the worst natural calamities in several decades. Total agricultural output value reached 8,500 million yuan, an increase of 3.6% over 1979 and 17.6% over 1978. Grain output was 14,355,000 tons, which was less than the 1979 output but about the same as the good 1978 harvest.

Output of most industrial crops increased as follows:

Crop	1980 Output	Percentage increase over 1979
Cotton	82,900 tons	19.1
Rapeseeds	272,100 tons	7.0
Jute and ambary	149,700 tons	— 3.8
Silkworm cocoons	65,000 tons	12.6
Tea	75,400 tons	15.2

Output of pork, beef and mutton in 1980 totalled 698,000 tons, or 22.7% more than in 1979. Sales of hogs were up 12% while the number in stock at the end of 1980 was down 9.4% compared with 1979.

Total output of aquatic products in 1980 was 817,000 tons, or 0.7% over 1979. Marine products made up 91.8% of the total. Fishing operations were readjusted and the total haul was limited in order to protect ocean fisheries.

Substantial financial and material aid has been given to forestry during the readjustment in the past two years. Grain purchase and sales quotas for mountainous areas have been readjusted. In 1980, trees were planted on 137,400 hectares of land, an area 10.5% larger than in the previous year. But

excessive cutting over the years has reduced the proportion of full-grown trees in forest reserves. It is therefore necessary to limit the volume of cutting.

Sideline occupations and industries run by production brigades and teams accounted for 22.4% of the total agricultural output value in 1980, as against 16.4% in 1979. Commune-run industries also made impressive progress.

Industrial Development. Zhejiang's industry has developed steadily in the course of economic readjustment. The total industrial output value in 1980 was 19,040 million yuan, 27.5% more than in 1979. Output of major industrial products was as follows:

Product	1980 Output	Percentage increase over 1979
Steel	393,500 tons	44.6
Pig iron	322,600 tons	3.9
Coal	1.43 million tons	15.2
Electricity	8,146 million kwh.	43.1
Shipped timber	581,500 cu. m.	5.9
Cement	2.28 million tons	10.0
Plate glass	1,117,000 standard cases	18.5
Chemical fertilizer (counting only the effective content)	494,300 tons	19.8
Plastics	22,700 tons	14.1
Power generating equipment	176,600 kw. (aggregate)	15.5
TV sets	74,695	191.1
Radio sets	1,715,600	182.5
Silk	8,099 tons	29.3
Silk piece goods	171 million m.	28.6
Cotton yarn	94,200 tons	13.1
Cotton cloth	476 million sq. m.	22.7
Machine-made paper and paperboard	221,200 tons	18.2
Bicycles	137,200	71.5
Sewing machines	264,900	31.9

In 1980, the volume of freight carried by all means of transport totalled 6,489 million ton-km., an 8.69% increase over 1979. Of this total, the volume of freight carried by road was 825 million ton-km., 8.4% more than in 1979; that carried by inland shipping was 3,390 million ton-km., 12% more than in 1979; and that carried by coastal shipping was 2,280 million ton-km., 4.2% more than in 1979. The Zhejiang branch of the China Ocean Shipping Corporation, set up in 1980, inaugurated freighter services from Ningbo and Wenzhou to Hong Kong and began to carry cargo to and from Korea and Japan.

Zhejiang's industrial development in 1980 had three salient features:

(1) The structure of industry was better coordinated, with light industry growing faster than heavy industry. The total output value of light industry in 1980 was 11,510 million yuan, an increase of 30.4% over 1979. Its proportion of the province's total industrial output value rose from 59.1% in 1979 to 60.5% in 1980.

(2) Collectively owned enterprises grew faster than state-owned enterprises; the total output value of the former in 1980 was 7,380 million yuan, a 39.6% increase over 1979, accounting for 38.8% of Zhejiang's total industrial output value in 1980.

(3) The system of economic management underwent preliminary reform. The management in a number of enterprises was given greater decision-making power. Market regulation was introduced under the guidance of the state plan. Various forms of joint ventures were adopted. All this stimulated the enthusiasm of the enterprises and workers for production, strengthened the system of economic responsibility and improved economic results.

For most industrial products, quality was improved, variety increased and consumption of raw materials was reduced. Locally administered state industrial enterprises reduced the costs of comparable products and turned over 14.7% more profits to the state in 1980 than in 1979. About one-fourth of the enterprises that had been losing money began to turn a profit, cutting the total losses of locally administered state industrial enterprises by 31.5% as compared with 1979.

The major problems in industrial production were that the readjustment and reorganization of industrial enterprises and the improvement of their techniques and management did not proceed fast enough, and that some products were not made in line with market demands.

Capital Construction and Investment. In capital construction, the investment structure was improved and work on key projects was accelerated. More than 820 million yuan worth of fixed assets were added through the completion of new projects in 1980. Among them were power-generating sets with an aggregate capacity of 133,000 kw., 5,000 spindles for woollen mills, 30,000 spindles for cotton mills, facilities for the dyeing and printing of 20 million metres of terylene fabrics and 10 million metres of silk fabrics, and waterworks with a daily capacity of 75,000 tons. New buildings for colleges completed in 1980 totalled

100,000 sq. m. of floor space — a record in the past 30 years. New tourist facilities were built with a total floor space of 15,000 sq. m. and 454 beds. The Zhejiang and Huangang hotels, as well as the Jingshan Hotel in Wenzhou, were completed on schedule.

Investment in capital construction was re-oriented in 1980. More money went to science and technology, education, public health, urban construction and housing than in the past. Non-productive projects accounted for 32.2% of the total investment in 1980, as against 21.7% in 1979.

The main problem in capital construction was still overextension. The scale of capital construction exceeded financial and material capabilities. As a result, the ratio of projects completed to the total number under construction dropped.

Finance and Commerce. With increased production, business was brisk in both urban and rural markets and government revenue increased. The total value of commodities purchased by the commercial departments in 1980 reached 10,590 million yuan, or 18.7% more than in 1979. Retail sales totalled 8,940 million yuan, an increase of 14.9% (after deducting the rise in prices) over 1979. Compared with 1979, sales of pork went up 19.2%; fresh eggs, 13.5%; sugar, 20.6%; cotton cloth, 14.7%; chemical fibre cloth, 29.2%; mixed polyester fabrics, 40.8%; woollen fabrics, 76.8%; silk fabrics, 49.1%; bicycles, 37.6%; sewing machines, 25.1%; wrist-watches, 40.4%; transistor radio sets, 59%; TV sets, 126.1% and electric bulbs 28.2%.

Total revenues collected by the province in 1980 reached 3,080 million yuan, an increase of 20.2% over 1979. Of this amount, local revenues accounted for 1,730 million yuan, a 26.9% increase over 1979. Local expenditures during the year totalled 1,740 million yuan, an increase of 0.9% over 1979. Spending to tap the full potential of enterprises and to renovate enterprises rose by 45.1%, while expenditures on science, education, culture and public health went up 22%. However, allocations for local capital construction projects declined by 27.5%.

Foreign Trade and Tourism. In 1980, total purchases of goods for export totalled 1,920 million yuan, an increase of 27.2% over 1979. Of this, silk and other textiles accounted for 555 million yuan, or 13.8% more than in 1979. Purchases of metals, minerals, chemicals, medicine, machinery and equipment rose by 68.9% over the previous year, and their proportion of total purchases increased from 12.8% in 1979 to 17% in 1980.

The number of visitors to Zhejiang has in-

creased enormously in recent years. They included foreign nationals, overseas Chinese and Chinese compatriots from Hong Kong and Macao who took tours, visited relatives or came for other purposes. To cope with this situation, repairs were begun on scenic spots around the West Lake in Hangzhou and other tourist centres. These included Fuchun River, Mogan Mountain, the tomb of Yu (the reputed founder of the Xia Dynasty, circa 21st–16th century B.C.) and Lanting (Orchid Pavilion) in Shaoxing; the Tiantong and Yuwang monasteries in Ningbo; Putuo Mountain in Zhoushan; the Guoqing Temple in Tiantai; and Yandang Mountain in southern Zhejiang. Tourist facilities were improved.

Science, Culture and Health. In 1980, Zhejiang had 95 independent scientific research institutes staffed by 3,789 scientists and technicians, and 67 affiliated scientific research institutes staffed by 1,155 scientists and technicians. New results were achieved in applied sciences relating to the increase of farm yields, the breeding of aquatic products, energy saving, and the improvement of quality and increase in the variety of goods produced by the silk, paper, ceramics and other light industries.

Total enrollment in the province's 22 institutions of higher learning in 1980 was more than 37,000, an increase of 16.6% over 1979. In addition, over 11,000 students were enrolled in the Television University. Enrollment in the 89 vocational secondary schools was 31,000; in regular middle schools, 1.7 million; and primary schools, 4.82 million. Nearly all school-age children were enrolled.

Progress was also made in the development of culture, public health, sports, broadcasting and publishing. In 1980, there were 69,000 hospital beds, an increase of 5.4% over 1979. The incidence of some diseases dropped.

Population and Employment. At the end of the year, Zhejiang's population exceeded 38.26 million, surpassing the 1979 figure by more than 340,000.

During the year, jobs were found for 227,000 urban inhabitants, including educated young people who returned from the countryside after the "cultural revolution." This brought the total number of newly employed persons in the period 1978-80 to 808,000. Most cities and counties in Zhejiang have basically solved the problem of unemployment left over from past years.

Income and Livelihood. The people's livelihood improved significantly in 1979 and continued to improve in 1980. Increased farm output and

state purchasing prices added 1,100 million yuan to the peasants' income from sales of farm and sideline products in 1979, compared with the preceding year, and a further increase of 330 million yuan was recorded in 1980. A commune member's income from the collective averaged 116 yuan in 1980, which was 13.3% more than the 102.4 yuan of 1978. The actual increase was even bigger, because the above-mentioned figures did not include the pay rises that commune members working in industry received directly from the enterprises run by communes and their subdivisions, nor did they include the peasants' rising income from sideline production.

Urban workers earned more in 1980 than before as a result of the November 1979 pay raise and the significant increases in bonuses and subsidies. Annual wages in state-owned enterprises averaged 772 yuan per worker in 1980. This was 19.3% more than 1979 (647 yuan) and 29.3% more than 1978 (597 yuan). In this case, too, the actual increase was larger, when the increase in employment is taken into consideration. The total floor space of new housing for workers completed in 1979 was 1.36 million sq. m.; and in 1980, 2.32 million sq. m. Construction in the two years put together exceeded one-third of the total housing constructed in the preceding 30 years.

Current Problems and Future Prospects

Under the influence of "Left" ideologies, there was for a long time an overemphasis on the development of heavy industry and disregard for the potentialities of Zhejiang's natural resources. Instead of making full use of the province's advantages in agriculture and light industry, considerable manpower, financial and material resources were devoted to the development of the coal and iron industries. This failed to produce the expected results because the resources were limited.

During the "cultural revolution" in particular, the economy became seriously imbalanced as a result of the policies of Lin Biao and the Gang of Four. The readjustment undertaken in the past two years or so has corrected the imbalance to a certain extent. However, the economic structure is still far from satisfactory.

The main problems are as follows:

(1) *Agriculture is not sufficiently strong and its internal structure still needs improvement.* Zhejiang is usually described as a province comprising "70% mountains, 10% water surface and 20% farmland." But forestry makes up only 2.6% and fishing only 3.7% of the province's total agricultural output value. Some mountain regions are

underdeveloped and the conditions of production are poor. In some places, forest resources have been wantonly destroyed, and this has had an adverse effect on the ecological balance.

(2) *The development of light industry has lagged behind market demands.* Though Zhejiang's light industry started relatively early, for many years it did not receive sufficient investment and hence did not grow fast enough. In 1950-78, its total output value averaged an annual increase of 9%, less than the national average of 11% in the same period. The rate of increase has accelerated in the past two years. However, because investments were insufficient and because not enough attention was paid to renovating old enterprises, quite a number of enterprises at present are not adequately equipped and their technological processes are rather backward and ill-coordinated. Consequently, the products of these enterprises cannot satisfy international market demands in terms of quality, variety, design or packaging, nor can they meet the growing demands of the home market.

(3) *The processing industries have developed faster than the supply of raw and semi-processed materials and of energy.* Heavy industry still consumes too much energy and some enterprises in this sector are operating below capacity. Some light industrial projects are redundant and for some branches of the industry the processing capacity has exceeded the available supply of raw and semi-processed materials. One of Zhejiang's main tasks in readjusting and developing its industry is to improve the technological level and the product mix of its industries so as to save energy and raw and semi-processed materials.

(4) *Transport and communications, electric power and water supply are not sufficiently developed, nor are some undertakings required by the development of society.* Science, technology, culture and education, all of which suffered a great deal during the 10 years of turmoil, cannot keep pace with economic construction. Urban reconstruction and the building of public utilities in Hangzhou, Shaoxing and other tourist centres have lagged behind the development of tourism. Environmental protection should be strengthened.

Economic Goals. In carrying out economic construction under the guidance of unified state planning, Zhejiang will henceforth proceed on the basis of local resources and socio-economic conditions, so as to maximize its advantages and minimize its disadvantages. It will carry on the readjustment of the economy, continue to

strengthen the agricultural and light industrial sectors, strive for better economic results, speed up the development of tourism and foreign trade and continuously raise the people's standard of living on the basis of increased production.

In agriculture, emphasis will be placed on intensive farming, cultivation of crops suited to local growing conditions, raising the land utilization rate and increasing grain output, while increasing the production of commodities that will yield not only nonstaple foods, but also raw materials for the textile and light industries. Efforts will be made to renovate existing light industrial and textile enterprises, improve the product mix, increase the intensity and accuracy of processing operations and develop labour-intensive products.

Foreign trade will be expanded through the development of such businesses as processing imported or supplied materials and various forms of compensatory trade, and production of market-oriented products will be increased to meet the demands of home and international markets.

Heavy industry will be readjusted and reorganized so that it will gear itself mainly to the needs of the technical transformation of agriculture, light industry and existing enterprises. At the same time, transport, communications, power and other basic industries will be strengthened.

Investment in science, technology and education will be increased to speed up the training of specialists and to improve the technical level and management of the economy as a whole.

A. SURVEY OF ECONOMIC DEVELOPMENT IN TAIWAN PROVINCE

By Gao Lingzhen

Geographic and Economic Setting

Taiwan, a beautiful and richly endowed island, has since ancient times formed an inalienable part of the sacred territory of our great motherland. The compatriots there are kith and kin of the big family of the Chinese nation. Making China independent, unified and prosperous is the unanimous aspiration and common responsibility of the people on the mainland and on Taiwan Island.

Lying on the edge of the continental shelf of the East China Sea, Taiwan is separated from the mainland in the west by the 100-km. broad Taiwan Strait. It borders on the Pacific Ocean in the east and faces the Philippines in the south and Japan across the sea to the north.

Taiwan province consists of 80 islands, including Taiwan Island and the Penghu Islands. The province covers an area of 36,000 sq.km., accounting for 0.4% of the total area of China. Its population stands at 17.8 million, averaging 494 persons per sq.km., making Taiwan the most densely populated province in the country.

Han and Gaoshan nationalities are the principal inhabitants of the island. With a warm climate, abundant rainfall, diversified topography and 55% forest coverage, Taiwan is richly endowed by nature. It enjoys abundant outputs of rice, sugarcane, tea and various fruits such as pineapples, bananas and tangerines, which are famous at home and abroad. Camphor is one of its special products. Cattle and pigs are raised widely. It has very rich offshore fishery resources and is one of the principal sea-salt producing areas of our country. A quantity of minerals and plenty of hydroelectric and geothermal resources are also found on Taiwan.

1980: A Difficult Year. The Gross National Product of Taiwan Province in 1980 stood at 1,449,300 million New Taiwan dollars (NT\$), the equivalent of U.S.\$40,200 million. Its annual growth rate was 6.66%, compared with 8.1% in 1979, and failed to meet the planned goal of 8%. The 1980 growth rate was the lowest since 1975. Per capita income was registered at U.S.\$2,281, a 4.6% increase over the previous year. The growth rate of industrial output value was 8.3%, of which mining was 4.3%; manufacturing 7.2% (including increases of 9.4% in heavy industry, 4.4% in light industry, and 7.5% in utilities); and housing construction 20.5%. Agricultural output value fell by

1%, of which agricultural products dropped by 1.8% and forest products by 5.9%; animal by-products rose by 0.3%, and fisheries increased by 1.2%. The total volume of foreign trade stood at U.S.\$39,400 million, of which imports accounted for U.S.\$19,733 million and exports, U.S.\$19,810 million, yielding an favourable balance of U.S.\$77.5 million — a sharp decline from the 1970 total of U.S.\$1,350 million, a peak not seen since 1974. Wholesale prices increased by 21.6% over 1979. Urban consumer prices were 19% higher. The money supply reached NT\$305,400 million, up 19.9%. Savings deposits reached NT\$649,200 million, a rise of 23%. The bank discount rate stood at 11%, while loan interest rates ranged from 13.5% to 16.2%. Total employment in 1980 was 6,547,00. The unemployment rate rose to 2.05%, up from 1.88% in 1979. The average monthly per capita wage of employed workers averaged U.S.\$210. Nominal wages could not catch up with price increases, resulting in a decline of real wages.

The direct causes of the slow-down in Taiwan's economic growth in 1980 were:

1. *The impact of the petroleum crisis.* Oil consumption in Taiwan shot up from 5.59 million tons in 1973 to 20.26 million tons in 1980, of which 20 million tons, or 99.1%, were imported at a cost of U.S.\$4,100 million, an 88.7% rise over the U.S.\$2,175 million of 1979. Oil import expenditures accounted for 21% of all import costs. Due to skyrocketing oil prices in the international market, oil prices in Taiwan rose twice between July and September 1980; including a readjustment in 1979, the accumulated increase came to 88.4%. The cost of electricity rose by 77%; railway cost increases ranged from 41% to 86%; and prices for industrial products were 20% higher. Thus, the oil impact brought about tremendous adverse effects and almost insurmountable difficulties for Taiwan's economy and for the lives of its people.

2. *Aggravated inflation.* Imports accounted for over 50% of the gross domestic product in 1980. Supplies of oil, raw materials, grain and machinery equipment required for the development of production largely depend on foreign countries. Marked price hikes for imported goods heightened production costs, in turn resulting in the skyrocketing of commodity prices. In order to stimulate the economy and deal with the oil impact, financial expenditures in 1980 were in-

creased to NT\$20,500 million, boosting the budget deficit from NT\$24,629 million to NT\$45,129 million. Due to the reckless issuance of banknotes in an attempt to make up the financial deficit, the money supply increased by nearly 20%. Rising prices and the over-issuance of banknotes forced a devaluation of the currency. The 100-dollar banknote was no longer in circulation; instead, banknotes of 500- and 1,000-dollar denominations were issued in late February, aggravating the already serious inflationary trend. Although the bank discount rate and the savings interest rate were raised and other measures taken to encourage savings, tighten the money market and curb inflation, these efforts produced no marked effect, and were in fact detrimental to investment stimulation.

3. *Productivity declined.* With prices skyrocketing, wages in term of money rose slightly; however, productivity grew to a lesser extent and even declined in some instances. Wages in the manufacturing sector in 1980 stood at 89% above the 1976 level, while productivity grew by only 41%. Therefore, labour costs had increased by 34%. The 2.5% decline in agricultural productivity pushed up the prices of export products, weakening their competitive power on the international market. The competitive power of exports could not be restored, even though the Taiwan dollar had been devalued by 5% against the U.S. dollar.

4. *Exports were stagnant.* The favourable trade balance was reduced. Taiwan's exports in 1980 grew normally by 22%, although their actual rise was only 7%, below the growth rate of the previous few years. Moreover, an unfavourable trade balance was registered for half the year.

Among the 27 major export products, 7 were below the 1979 level, 19 maintained the same level and only 11 grew slightly. Public opinion in Taiwan was of the view that "1980 was a hard year for Taiwan's economy."

Changes Over the Past Three Decades

The economy of Taiwan Province has grown considerably during the past 30 years. The GNP growth rate averaged 9.1% a year. A rate of 6.9% prevailed during the period from 1953 to 1962; 10.1% for the period 1963-72; and 8% for the period 1973-78. GNP grew most rapidly in the 1960's, and slowed in the 1970's. The grow rate varied greatly from year to year. It fell sharply from 11.9% in 1973 to 0.6% in 1974. In that year, the industrial growth rate dropped to -1.5%, the manufacturing growth rate fell to -2.7%, and the trade deficit shot up to U.S.\$1,327 million. The economy began to pick up in 1976 and climbed up to a record growth rate of 12.8% in 1978. But it went down again to 8.1% in 1979 and to 6.6% in 1980. In the 1970's, Taiwan's economy developed in a highly unstable manner with two upward and two downward surges.

Taiwan's economic structure has also changed, evolving from dominance by agriculture to dominance by industry. However, economic development in Taiwan was not based on economic independence and initiative, but relied rather on the demands of the international market. Beginning in the 1960's, the export processing industry expanded rapidly, producing imbalances between industry and agriculture and between raw materials and primary industries and the processing industry. Consequently, a lop-sided industrial structure was formed.

Changes in Taiwan's Economic Structure

Year	Agricultural Sector (farming, forestry, animal husbandry, fishery)		Industrial Sector (mining, manufacturing, construction, public utilities)		Service Sector (communications, commerce, banking, services)	
	Output Value	Employment	Output Value	Employment	Output Value	Employment
1952	35.8	51.4	17.7	20.4	46.5	28.2
1960	32.6	46.5	24.2	22.4	43.2	31.1
1970	17.7	36.7	33.8	28.3	48.5	35.0
1977	10.4	21.5	45	41.8	44.7	36.7

Industry. Under the colonial policy of "industry — Japan, agriculture — Taiwan" as practiced in Taiwan during the period of Japanese occupation, agricultural products were plundered by Japan and industrial products were dumped in Taiwan. During the Second World War, Taiwan did not suffer serious destruction as did the mainland. On the eve of the liberation of the mainland, large quantities of capital and equipment were transferred to Taiwan. Taiwan's light and textile industries developed in the 1950's with the assistance of the United States and by stimulation from the War of Aggression in Korea. The 1960's, the post-war "golden age" for economic development in the capitalist world, provided a favourable environment for the development of Taiwan's economy and industry in particular. During this period, developed capitalist countries transferred

some of their labour-intensive and seriously polluting industries to underdeveloped areas. Under these circumstances, Taiwan's export processing industry made rapid progress. In the 1970's, Taiwan began to develop such energy-intensive heavy and chemical industries as iron and steel, shipbuilding and petrochemicals.

From 1953 to 1978, the annual industrial growth rate averaged 14.8%, with industrial output value increasing from NT\$5,600 million to NT\$994,900 million. The output of principal industrial products grew rapidly.

Industry has occupied an increasingly important position in the economy of the province. The proportion of light and heavy industries within the manufacturing sector has greatly changed with light industry dropping to a share of 43% in 1980, down from 75.2% in 1952, and

Output of Taiwan's Principal Industrial Products, 1952 to 1978

Product	Unit	1952	1980
Coal	million tons	2.28	2.57
Crude oil	kilolitres	2,900	211,000
Natural gas	million cu. m.	173	1,700
Electricity	megawatt-hours	1,400	40,800
Steel	thousand tons	16	3,310
Cement	thousand tons	440	14,030
Granulated sugar	thousand tons	620	728
Cotton yarn	thousand tons	13.6	341
Cotton cloth	million metres	85.42	8,072.65
Aluminium ingots	tons	3,856	63,549
Refined oil	kilolitres	—	202,600
Petrochemicals	thousand tons	—	1,310
Chemical fibres	thousand tons	—	1,450
Plastics and rubber	thousand tons	—	450
TV sets	thousand units	—	57,435
Automobiles	single units	—	132,580
Housing units	thousand cu.m.	—	35,280

heavy industry rising to 57% from 24.8%. Taiwan's industry at present is still based on labour-intensive activities using simple techniques; highly mechanized industries only account for 24% of the total manufacturing output value.

The Role of Foreign Investment. Taiwan's economy has developed with the assistance of U.S. and Japanese monopoly capitalists. From 1951 to 1978, Taiwan received U.S.\$1,500 million in "economic aid" from the United States, U.S.\$7,478 million in loans from foreign countries, U.S.\$1,250 million in local-currency loans from branches of foreign banks in Taiwan, and U.S.\$1,329 million in private direct foreign investment. The amount of U.S. aid to Taiwan from 1952 to 1960 was equivalent to 58.8% of the composition of total fixed capital in this period. In the middle and late 1960's, huge sums of overseas capital flowed into Taiwan. The number of enterprises funded by overseas capital totalled about 2,500 in 1978; these had nearly 300,000 employees, accounting for 15% of total employment in the province in that year. Exports from these enterprises came to 29% of the total export volume of Taiwan. By 1980, overseas capital had amounted to more than U.S.\$2,700,000 million.

For a long period, the wages of Taiwan workers were very low. The average wage in the 1950's only came to about 5% of the average wage in the industrialized capitalist countries. Since the 1960's, the wage of a Taiwan worker equalled only one-fourth to one-third of that of a Japanese worker. In export processing areas, poorly paid women and child workers still comprise up to 80% of the workforce in some units. Low pay has increased the competitive power of export products, enabling foreign capital to score staggering profits. Japan extracted U.S.\$6,100 million in profits with less than U.S.\$200 million in investments during the 1965-75 period. One U.S. company raked in profits totalling 22 times its investments during a period of 3-4 years. In 1980 alone, foreign capital earned U.S.\$21,000 million in profits from export processing activities.

Most of the raw materials and energy required by Taiwan's industry relies on imports. For instance, all raw cotton needed by the textile industry was imported from the United States, while all fuel oil and raw materials needed by the power, oil refining, chemical fibres, plastics and rubber industries relied on imported petroleum. About 80% of Taiwan's manufactured goods were sold abroad. Thus, Taiwan's economy and development of industrial production cannot but be severely affected by fluctuations on international markets. The two ups and downs of Taiwan's economy and industry stemming from the two recent world

economic crises and oil shortages clearly show the vulnerability of Taiwan's economy.

The Role of Public Capital. "Public capital" occupies a dominant position in Taiwan's economy and industry. Production in the sectors such as power, petroleum, natural gas, aluminium, chemical fertilizers, salt, sugar, cigarettes, wine, and in undertakings such as railways, posts and telecommunications and water supply, were all operated by "public capital." Moreover, basic materials for the petrochemical industry, steel and shipbuilding were largely in the grip of "public capital." Thirteen out of the 16 banks in Taiwan are owned by bureaucrat-capital. The three others also have shares of bureaucrat-capital. A 1979 industrial and business survey conducted in Taiwan showed that although publicly-owned enterprises accounted for only 0.24% of all industrial and commercial enterprises, their fixed capital accounted for 45.7%, and total value of their assets accounted for 57%. "Private capital" operates mostly medium-sized or small enterprises with relatively backward equipment and techniques. Their level of productivity and the competitive power of their products are rather low. As the international economic environment gradually deteriorates, these medium and small enterprises tend either to go bankrupt or to be annexed or else they are forced to turn into joint operations. Therefore, along with the development of its economy and industry, Taiwan's socio-economic and class contradictions are also growing and deepening.

Agriculture. Of the total agricultural output value, farm products account for 50%, fishery products 20% and animal by-products 30%. The province has 816,000 hectares of farmland. Output of main products in 1980 included rice, 2.32 million tons; sugarcane, 8.91 million tons; pineapples, 225,000 tons; bananas, 195,000 tons; fish, 940,000 tons; beef, 6,175 tons; and pork, 667,000 tons. The rate of agricultural mechanization averages 60-70%. The area ploughed by tractor now approaches 90%. Rice shoots transplanted by machine account for 30% of the total; crops reaped by machine stand at 40%; and grains dried by machine amount to 36%.

In the last 30 years, Taiwan's agriculture has achieved certain progress, although its growth rate has fallen behind that of industry. The average growth rate during the period from 1953 to 1971 was 4% a year, with a 0.7% decline (with farm products dropping by 4%) registered in 1969. The growth rate from 1972 to 1979 averaged 2.8%, with a 2% decline registered in 1975 and a 1.8% drop in 1978. The year 1980 also witnessed a de-

cline. Taiwan used to be a grain exporting province of China. Now, except for rice, which has a small surplus, grain can only meet 40-60% of demand. The proportion of agricultural output value in the national economy has continuously declined, amounting to only 7.7% in 1980.

Ownership in Agriculture. According to a 1975 survey of Taiwan's agriculture, 676,000 among the 880,000 peasant households throughout the province were peasant-owned, comprising 554,000 hectares of farmland and making up 67.79% of the total area of farmland. Of the owner-peasants, 2.3% were rich peasants owning more than three hectares of land each and holding 11.8% of the total farmland; middle-income and rich peasants engaged in small-scale production made up 53.5%, working on 73% of the farmland; and small farmers with farmland below 0.5 hectares made up 44.2%, holding 15.3% of the farmland. Apart from the owner-peasants, there were 189,000 households of semi-owner peasants and tenants, holding 212,200 hectares of farmland.

Capitalist relations in agriculture have developed step by step. In 1975, there were 1,263 large capitalist farms. Some 5% of farm households participated in various forms of "joint management" in the supply, transport and sale of their agricultural products. In recent years, on the basis of joint management, they formed agricultural "specialized areas," such as Chinese olive and tea specialized areas. "Commission management" is currently in vogue in Taiwan. Those peasant households with small plots of land and those short of labour and incapable of buying machines on their own have partly or totally entrusted specialized agricultural service teams to manage their farmlands.

Productivity and Income. Agricultural pro-

ductivity in Taiwan is much lower than that of industry. In the period from 1954 to 1978, the average annual productivity growth rate was 5.12%, with industry at 8.04% and agriculture at 3.98%. Taiwan's farmers shoulder heavy taxes and levies. For instance, each peasant household pays on the average of NT\$2,607 in taxes and other levies, making up 26.13% of its annual income. Taiwan has always pursued a low grain-price policy so as to maintain low wages and low costs for industrial goods, and to promote industrial production and industrial exports. During the 1950-59 period, the price index for agricultural products was only 70% of the general price index; the price index of rice in the period of 1950-59 was 60%; in 1960, 84%; and in 1969, 71%. With the constantly increasing costs of agricultural production, the disparity between the income of peasants and that of people in other trades has increasingly widened. The average per capita income of peasant households in 1966 was NT\$4,509, while non-peasant households earned NT\$6,464. The differentials were NT\$1,955 in 1966, NT\$3,801 in 1972, and NT\$7,011 in 1975. Taiwan peasants can not make a living by merely doing farming and must engage in other work. In 1975, specialized peasant households in the province totalled 160,000, making up 18% of all peasant households. The number of specialized peasant households was reduced by 59%, or 220,000, between 1960 and 1975. During the same period, peasant households engaging in other occupations numbered 730,000, accounting for 82% of the total. This figure represented a growth of 72%, or 300,000 households, from 1960 to 1975. Of this total, 260,000 peasants left home to engage in other work — the equivalent of 1 person per 34 households; 890,000 peasants stayed at home to do other jobs concurrently, amounting to 1 person in each family. Altogether 50% of the labour force in the countryside had other occupations. One-third of part-time peasants

Product Composition of Taiwan's Foreign Trade

Year	Exports				Imports	
	Agricultural Products	Processed Agricultural Products	Manufactured Goods	Machinery Equipment	Raw Materials for Industry and Agriculture	Consumer Goods
1952	22.1%	69.8%	8.1%	16.5%	72.0%	11.5%
1969-72	8.2%	12.6%	79.2%	32.5%	62.4%	5.1%
1979	4.4%	5.2%	90.4%	24.6%	69.0%	6.4%

made a living by selling their labour. They comprised proletarians or semi-proletarians.

Foreign Trade. Foreign trade is a "pillar" of Taiwan's economy. The total combined import and export value in 1952 was U.S.\$303 million; in 1979, the amount rose to U.S.\$30,874 million. The proportion of commodity and labour imports and exports in the gross domestic product increased from 14.18% in 1953 to 56.43% in 1980. The average growth rate was 15.8%. Starting from 1971, an unfavourable balance of trade that had lasted for 18 successive years was reversed. In 1978, the total value of foreign trade surpassed the total output value of industry and agriculture. The trade surplus in 1978 was valued at U.S.\$1,700 million, a record figure in Taiwan's foreign trade. The structure of foreign trade has also changed. The proportionate value of manufactured goods increased from 8.1% in 1952 to 90.4% in 1979; the share of agricultural products and other processed goods dropped from 22.1% and 69.8% in 1952 to 4.4% and 5.2%, respectively, in 1979.

Among Taiwan's exports, textile goods ranked first in 1980, making up 21.2% of total export value. Electronics and electrical equipment accounted for 18.4% of the total. Imported fuels and raw materials amounted to 67.3% of the total. Crude oil ranked first, making up 20.8%, while machinery and metal products took up 19.2%.

Taiwan's foreign trade was mainly directed to the United States, Japan and countries of the Middle East. The volume of trade with the U.S. in 1980 was U.S.\$11,419 million, making up 28.92% of Taiwan's trade total; trade with Japan totalled U.S.\$7,411 million, accounting for 19% of the total.

The growth of foreign trade has given impetus to the development of Taiwan's economy, but has also brought about a state of grave dependency and instability.

Prospects for the Future

The state of affairs in the first four months of

1981 indicated that Taiwan was still in a very difficult situation. The general index of industrial production from January to March 1981 increased by 2.8%, with manufacturing industry up by 0.9% (heavy industry increased by 2.7%, while light industry fell by 1.5%). An unfavourable balance of payments prevailed for three months running, amounting to U.S.\$483 million. From January to April, overseas investments fell sharply: the total was U.S.\$74.6 million, dropping by 50% compared with that of the same period last year. Taiwan public opinion considers 1981 to be "an unhappy year."

Authoritative sources in Taiwan acknowledge that in the past three decades Taiwan has advanced amidst difficulties. The same pattern can be projected for Taiwan's future. In the 1980's, with the economy of the capitalist world in recession and continuing shortages of energy, oil prices will rise and competition in world markets will become fiercer. Taiwan's labour-intensive industrial structure has changed from a motivating force to an obstruction to economic development. Taiwan has to turn to the development of high-technology industry in order to raise labour productivity and to reduce pressure on energy resources and manpower. But it will also rely more on developed capitalist countries for capital, precision equipment and sophisticated technology. Deepening social and class contradictions, a lop-sided economic structure and heavy reliance on other countries are chronic maladies in Taiwan's economy. If the Taiwan authorities go against the will of the people and against historical trends and if they refuse to resume contacts with the mainland, economic conditions cannot improve fundamentally and Taiwan will be unable to rid itself of its dependence on others. In the difficult international situation, Taiwan can only drift with the tide and can never manage to be master of its own destiny. Only by returning to the embrace of the motherland at the earliest possible time and by integrating with the mainland into one unified country can Taiwan's economy look to a bright future.

B. ECONOMIC DEVELOPMENT IN HONG KONG

By Gu Nianlong and Yuan Shibang

Geographic and Economic Setting

The total area of Hong Kong Island, including nearby Tsing Chiu Island, Ap Lei Chau (Aberdeen) Island and other small offshore islands, is 75.6 sq. m. Kowloon is 11.1 sq. m. Together, the two occupy 86.7 sq. km. Hong Kong was ceded to Britain by the government of the Qing Dynasty which signed the "Treaty of Nanking" in 1842 and the "Treaty of Peking" in 1860. The New Territories, consisting of a mainland area adjoining Kowloon and 235 adjacent islands, were leased to Britain under a 99-year lease under the Second Convention of Peking in 1898. Thus, the total area under the administration of the Hong Kong British authorities is 1,046.3 sq. km.

Hong Kong is the transportation hub of Southeast Asia, possessing the region's finest natural harbour. With these favourable natural conditions, following Hong Kong's establishment as a free port, the territory gradually became a centre for entrepot trade — a port for taking in and sending out large quantities of goods for China's southern areas, and a bridge of trade with foreign countries, the Southeast Asian countries in particular. During the 100 years following its establishment as a free port, Hong Kong's economy has in general relied on entrepot trade, lacking a solid industrial base.

After the liberation of China's mainland, owing to a variety of complex factors, large amounts of capital — including foreign capital and manpower — flowed into Hong Kong to seek an outlet, thus creating favourable conditions for industrial development. During the war to resist U.S. aggression and aid Korea, Hong Kong's British authorities carried out a policy of "embargo," dealing heavy blows to the traditional entrepot trade on which Hong Kong depended for its existence. This forced Hong Kong's economy to find a new way out — the development of industry.

Economic Development Since the 1950's

Due to its lack of natural resources and its limited internal markets, objective factors gave rise to Hong Kong's development as an entrepot trade port during the initial 100 years, focusing on activities such as international communications, transportation, finance and banking, telecommunications equipment and commerce. Thus, Hong Kong's economy and industry from the very beginning was geared to the needs of exporting. Some scholars have described Hong Kong's

economy before 1955 as the period of entrepot trade; the period from 1955 to 1970 is regarded as the first industrial revolution.

During the latter period, abundant supplies of manpower and low wages favoured production for exports. A series of labour-intensive industries entered a period of rapid development; these included textiles, garments, plastics and rubber products, clocks and watches, electronics and metal-processing trades. By the end of the 1960's, Hong Kong's industry had established a foundation, and the port was transformed into an industrial city. Manufactured exports from Hong Kong began to occupy a prominent place among exports from the world's developing countries and regions. At the same time, exports of Hong Kong goods began to face fierce competition from South Korea, Singapore and China's Taiwan Province; on the other hand, owing to the needs of local economic development, Hong Kong's economy began to develop in the direction of finance and banking, and step by step the port became a regional financial and banking centre.

From the early 1950's to the beginning of the 1970's, Hong Kong's population had risen from 1 million to over 4 million. The economic growth rate surpassed that of the population. Per capita output value in 1970 was H.K.\$4,716. The total value of exports was H.K.\$15,100 million, among which the value of re-exports was H.K.\$2,800 million. The total value of imports was H.K.\$17,600 million. Textiles and garments ranked first among exports, comprising 45% of total export value. Workers engaged in these trades accounted for 40% of the total workforce of 570,000. Plastic and rubber toys ranked second among exports, amounting to 25% of the total. In 1970, Hong Kong's banking density was 1.01 banking offices for every 10,000 people. The average per capita bank deposit at the end of 1970 was H.K.\$2,650.27. The issuance value of Hong Kong currency at the end of 1970 totalled H.K.\$2,578 million. Banknotes in circulation were H.K.\$6,548 million.

Generally speaking, the 1970's were the most prosperous years in Hong Kong's history. Apart from signal progress in trade, manufacturing and tourism, the growth of real estate construction and finance and banking was all the more striking. This growth pattern both reflected the features of Hong Kong's economy and illustrated its problems.

Hong Kong's Economy in 1980

Hong Kong's population in 1980 reached

5,148,000. Average per capita output value surpassed H.K.\$15,000. The total export value was H.K.\$98,242 million, 6.5 times the total of 1970. Exports of Hong Kong-made products totalled H.K.\$68,171 million; re-exports were valued at H.K.\$30,072 million. Total value of imports was H.K.\$111,651 million, 6.6 times higher than in 1970.

Industry and Exports. In 1980, employees in textiles, clothing manufacturing, electronics equipment, plastic and rubber products, toys, and watch and clock industries made up 67% of the total Hong Kong industrial labour force of 892,100.

In that year, the total export value of textiles and garments was H.K.\$27,793 million; output of cotton yarn, 160 million kg.; output of synthetic and blended fibre yarns, 46 million kg.; and output of worsted wool yarn, 4.7 million kg. A total of 28,784 machines in the textile industry turned out 748 million sq. m. of fibre and blended fabrics in 1980. The clothing industry employed 275,000 workers, making up 31% of the labour force in Hong Kong industry. The total value of garment exports in 1980 reached H.K.\$23,258 million.

The electronics industry ranked second among Hong Kong's export industries. In 1980, 88,000 workers in 1,197 electronics factories produced H.K.\$8,306 million in electronics exports.

The 86,314 workers in 4,816 plastic and rubber products factories produced H.K.\$5,397 million worth of exports. Toys predominated among plastic and rubber products, with Hong Kong's toy exports ranking first in the world.

The clock and watch industry mainly turned to electronic products. The 40,628 workers in 1,054 factories produced a total export value of H.K.\$6,576 million.

Hong Kong's 5,148,000 people relied on imports for their consumption and raw materials, and for components and semi-finished products needed by virtually all industries. Processing activities comprised the main source of income for various industrial trades and supplied the bulk of wages for all sectors of Hong Kong's population.

Imports. In 1980, the value of imports of raw materials and semi-finished products was H.K.\$46,489 million, accounting for 42% of the total import value. The main items were synthetic fabrics, valued at H.K.\$4,430 million; plastic and rubber dies and materials, H.K.\$2,605 million; watch and clock elements, H.K.\$3,688 million; iron and steel, H.K.\$3,426 million; cotton cloth, H.K.\$2,641 million; electrical appliances, components, diodes, semiconductors and integrated circuits, H.K.\$1,927 million.

The value of imported consumer goods was

H.K.\$29,469 million, making up 26% of the total import value. Main items were: diamonds, H.K.\$4,178 million; garments and clothing accessories, H.K.\$3,461 million; radios, TV's, record players, records and tape recorders, H.K.\$2,744 million; watches, H.K.\$2,137 million; jade, gems, ivory, jewellery, gold objects, and silverware, H.K.\$1,502 million.

Imports of industrial production installations and machinery reached H.K.\$16,055 million, amounting to 14% of the total. These included electronic components, H.K.\$2,823 million; transport equipment, H.K.\$3,079 million; electric machinery, H.K.\$1,669 million; textile machinery, H.K.\$765 million; machinery for other industries, H.K.\$788 million; and office equipment, H.K.\$731 million.

The value of imported foodstuffs was H.K.\$12,065 million, making up 11% of the total. Main items were fish and fish products, H.K.\$1,750 million; fruits, H.K.\$1,614 million; meat and meat products, H.K.\$1,475 million; live pigs, H.K.\$1,170 million; and vegetables, H.K.\$1,231 million. Imports of petroleum and oil products were worth H.K.\$7,573 million.

Apart from the above-mentioned geographical and historical conditions that led to the growth of trade and manufacturing in Hong Kong in the 1970's, one cannot ignore the role of various measures taken by the Hong Kong British authorities in implementing the policy of free trade and in actively developing international trade.

Banking and Finance. In the wake of an upsurge of trade and manufacturing industry, the banking business has been developing rapidly. It has increasingly evolved into an important force in giving impetus to the growth of Hong Kong's economy inasmuch as Hong Kong has become a major centre of trade, shipping, finance, banking and investment in the Asian-Pacific region. This is one of the important characteristics of the modern Hong Kong economy that is drawing increasing public attention.

At the end of 1980, there were 113 registered banks; 1,146 bank offices; 108 branches or representatives of foreign commercial banks; and 302 companies engaged in foreign financial business. At the end of 1980, Hong Kong's deposit-taking banks and companies absorbed H.K.\$131,206 million in domestic deposits and H.K.\$167,333 million in overseas deposits. Their deposits in banks outside Hong Kong amounted to H.K.\$119,786 million, while overseas loans totalled H.K.\$59,665 million and domestic loans, H.K.\$124,287 million. In 1980, Hong Kong issued H.K.\$10,464 million in banknotes, more than four

times the amount in 1970. The M1 money supply was H.K.\$24,124 million (M1 represents the narrow definition of money, comprising the total value of banknotes and coins in circulation together with bank deposits on current account); M2 money supply was H.K.\$96,862 million (M2 represents the sum of M1 and current, demand, time and savings deposits); the M3 money supply was H.K.\$139,578 million (M3 represents M2 plus deposit holdings of all financial institutions).

Hong Kong has few restrictions on foreign capital and businessmen can move their capital in and out freely. This policy has led to rapid expansion of credit, to excessive supply of capital and to increased import prices, all of which have led to a continuous increase of prices in Hong Kong. The inflation rate in Hong Kong was 16% in 1980.

Tourism is an important source of invisible trade income in Hong Kong, providing an important means of compensation for the unfavourable trade balance and increasing opportunities for employment. In 1980, 2,300,000 tourists came to Hong Kong, producing earnings of H.K.\$6,595 million in foreign exchange.

Real Estate. Owing to its relatively scarce land and to the policy of Hong Kong authorities in maintaining high land prices, the cost of housing property in Hong Kong is very high. Hong Kong's real estate market absorbs a tremendous volume of investments. The total area of housing, buildings and factories completed in 1980 was 2,077,000 sq. m., built at a cost of H.K.\$4,674 million. Among various real estate transactions in 1980, those involving entire estates totalled H.K.\$7,288 million; purchases and sales of floors of buildings were valued at H.K.\$19,853 million; and real estate mortgages were valued at H.K.\$32,563 million, making up 23% of total bank loans. Policies promoting high land prices and speculation in real estate enable speculators to gain enormous profits,

with related sectors such as banking and the construction industry also reaping substantial gains.

The auction of land owned by the authorities has become an important income source in the financial budget of the Hong Kong British authorities. Such income not only made up for the budget deficit but also contributed much to Hong Kong's enormous financial surpluses in recent years. Ordinary industrial and commercial enterprises — the small and medium-sized ones in particular — are keenly aware of the heavy burden of unbearably high land prices and housing rentals which make it difficult for them to engage in business. The broad masses of inhabitants constantly complain about this situation, which has become a grave obstacle to the further growth of Hong Kong's economy.

Future Development. Economic recession in Western countries, the growth of world-wide protectionism and increasingly fierce competition among neighbouring countries and regions, together with restrictions from internal conditions, have made Hong Kong's industrialists and businessmen feel increasingly hard pressed in running their factories and firms. At the beginning of the 1980's, noted figures in Hong Kong's industrial, commercial and academic circles put forth the view that Hong Kong's economy was facing another structural change. Some took the view that Hong Kong was in the second stage of its industrial revolution. Apparently, the Hong Kong British authorities had premonitions of this change. In December 1979, they issued a report from a 1979 advisory committee on the multiple economy of Hong Kong which reviewed the history of Hong Kong's economic development and proposed a number of suggestions on goals and directions for further economic growth. The contents, both wide-ranging and general, have given rise to widespread comments in Hong Kong's academic circles.

C. ECONOMIC DEVELOPMENT IN MACAO

By Huang Weiliang

Geography and History

Macao, with a total area of 15.52 sq. km., is a peninsula located southwest of the mouth of the Zhujiang (Pearl) River. Its northern boundary is the Barrier Gate. It contains three main segments: Macao Peninsula, 5.42 sq. km.; Taipa Island, 3.48 sq. km.; and Coloane Island, 6.61 sq. km.

Macao has been China's territory since time immemorial. In 1535, the Portuguese entered Macao under the pretext of finding a place to dry goods in the sun. In 1557, they "leased" Macao from local Chinese officials. They occupied Taipa Island in 1851 and Coloane Island in 1864. On December 1, 1887, the Portuguese and the government of the Qing Dynasty formally signed the "54 Clauses Between China and Portugal," confirming stipulations of the "Sino-Portugal Trade Protocol" signed on March 26, 1887 to the effect that "China resolutely approves Portugal's permanent administration over Macao and its dependencies without any difference from other places under the jurisdiction of Portugal." In 1928, however, China proclaimed the abrogation of this protocol.

Economic Setting. Under rule by the Portuguese authorities, Macao is a "free port." But due to its shallow water and antiquated dock equipment, sea transportation has been subject to limitations. Thus, over the last 400 years, Macao's economy has been in a state of underdevelopment. In the past, the only industries were handicrafts such as firecrackers, matches, joss sticks and candles. Since the 1960's, the Portuguese authorities in Macao have adopted the policy of "attracting foreign capital to promote economic prosperity in Macao"; from then on, Hong Kong's Chinese capital financial groups have begun businesses in Macao, investing in gambling houses, tourism, shipping, gold trading and real estate; at the same time, foreign capital from the United States, Britain, Japan and Portugal has entered Macao in succession to invest in finance and banking, as well as in industrial and commercial enterprises. Thus, Macao's economic structure has undergone great changes in recent decades. At present, tourism, import and export trade, building and industry are the main pillars of Macao's economy.

Owing to lack of resources, Macao's economy is mainly dependent on other places. Consumer products and industrial raw materials are both

reliant on imports. Thus, Macao's industry in general focuses on processing and assembly. Macao's foreign trade relies mainly on the European Common Market, the United States, Japan and former Portuguese colonies. In addition, it serves as a transit point for goods from Hong Kong. Macao's economy has its own specific characteristics and flexible nature: its economic structure is simple, the scale of industry is not large and wage levels are low. Provided there is a small quantity of orders from abroad, production can be maintained and, in face of economic difficulties, it is usually easy to find a way out.

Macao's Economy in 1980

The current population of Macao is 500,000, of whom 97% are Chinese. Macao borders on the mainland and has good land and water transport services. Supplies of rice, non-staple foods, fresh fruits and vegetables and fresh aquatic foods all rely on imports from the mainland. The West European Common Market lists Macao as an area still awaiting exploitation, so restrictions on Macao's exports are lax, a situation beneficial to the development of Macao's economy.

Tourism. Tourism, one of the pillars of Macao's economy, experienced a boom in the 1970's, but slowed in its rate of development in 1980. Tourists from Hong Kong in 1980 totalled 3,362,000, an increase of 3.55% over 1979; the rate of increase, however, had dropped sharply. Actual expenditures of tourists were also on the decline. Tourists from Hong Kong and foreign countries spent 2,000 million patacas (the unit of currency used in Macao) in 1980, an increase of 12% over 1979. Real expenditures fell by 7% as against those of 1979 when factored with the local 20% inflation rate. The number of foreign tourists visiting China via Macao has been on the rise, totalling 36,741 in 1980. The local tourist industry viewed the vigorous development of China's tourism as a clear boost to Macao's tourism.

Improved conditions in Macao's hotel and communications sectors have to some degree reduced obstacles to the growth of Macao's tourism that have been caused by shortages in hotel space and in transport facilities connecting Macao with Hong Kong. Water craft travelling between Hong Kong and Macao now carry 9,360

passengers daily. In view of busy passenger traffic between Hong Kong and Macao, many Hong Kong and Macao enterprises have applied for permission to build docks in Macao. They have also taken positive measures to improve links between Macao and docks in China's Zhuhai City to meet growth needs for passenger transport.

Foreign Trade. Macao's export trade in the last decade grew rapidly. Since 1976, the rate of increase has increased and the structure of goods and foreign-trade markets has undergone great changes. The average annual growth rate for Macao's exports was 3.8% during the 1950's. In 1979, the value of Macao exports was 2,014 million patacas, or 14.6 times higher than the total of 138 million patacas in 1966. In the 1950's, exports consisted mainly of marine products and traditional handicrafts such as joss sticks, candles, fire-crackers and matches. Since the 1960's, the textile industry has grown rapidly. Textiles exports, making up 51.5% of total exports in 1965, increased to 87.13% of the total by 1979. Products include knitted garments, handkerchiefs, gloves and wool yarn. In addition to textiles, electronics have developed rapidly in recent years, including radios, tape recorders, transistor radios, and electronic and photo-controlled toys.

Export markets have expanded beyond the traditional destinations of Portugal, Portuguese colonies and Hong Kong that were dominant in the 1960's to the European Common Market and the United States in the 1970's. In 1979, export markets for Macao goods had spread to over 70 countries and regions. The United States took first place in Macao's export goods in 1979, followed by West Germany, France, Hong Kong and Britain. Since 1976, Macao began to reverse its long-existing pattern of foreign trade deficits. Trade surpluses reached 169 million patacas in 1976, 119 million patacas in 1977, and 196 million patacas in 1979.

Housing and Construction. In the construction field, land prices for commercial buildings and housing are comparatively lower than in Hong Kong. However, with large amounts of foreign capital filtering into Macao for real estate investment, and with the artificial driving-up of prices, the cost of real estate has skyrocketed. During the first half of 1980, activities of speculators had been restrained somewhat by high interest rates, although the price of housing did not come down.

From late May to the end of July, 1980, there were four successive drops in interest rates; the total decline was over 20%. Owing to this trend, together with the influence of rising real estate prices and stocks in Hong Kong, the real estate

market in Macao became brisk again and prices subsequently began to rise at an increased rate. By the end of 1980, prices of industrial buildings had increased by 40% over rates at the beginning of the year; low- and medium-income residential buildings had gone up by 20%; high-income residences, 30%; and commercial buildings, 40%. In November 1980, bank interest rates went up three times in a row, reaching the highest level in history, and the real estate market again fell into stagnation. In terms of building construction, 1980 was the most prosperous of recent years. The total of construction sites was 420, 10% higher than 1979; 288 blueprints were approved, an increase of 23% over the previous year; and total floor space of completed housing was 224,559 sq. m., rising by 10.93%.

Industry. In the past two decades, together with growth in the economy, Macao's processing industries developed to a new stage, now including scores of trades and several hundred products including clothing manufactured goods, weaving, woollen textiles, printing and dyeing, hats and shoes, porcelain, plastics, rubber products, silk flowers, gloves, umbrellas, handbags, electronics, toys, hardware, furniture, food and optical instruments. Most of these commodities are produced for export. By the end of 1980 there were 1,332 large and small factories under industrial licence, employing 33,600 workers. By February 1981, ten new factories entered production, including two glove factories and firms turning out sewing machine thread, feather products, leatherette suitcases and bags, rayon flowers, electric-fan parts, machine-embroidery, iron grill work and toys.

Prospects for Future Development

It is projected that despite all kinds of difficulties, Macao's economy will continue to grow to a certain extent. The main premises for this view are:

1. On the basis of continuing growth in good relations between China and Portugal, the Portuguese Macao authorities have adopted positive measures to improve Macao's economy such as simplifying procedures in foreign trade and increasing public expenditures. In 1981, the authorities planned to allocate 125 million patacas for capital construction, twice the amount of 1980. Preparations are being made to streamline entry formalities for foreign tourists and to set up new factories. All these measures will be beneficial to the development of Macao's economy.

2. *Most of Macao's factories are small and medium-sized and are easily adaptable to changing market circumstances.* For purposes of future development, they have devoted themselves to improving the quality of products and to opening new markets. Stocks of textile goods in the European countries and North America are low at present. Once the economic situation changes for the better, local businessmen in these markets will import more goods. Moreover, inasmuch as European countries and the United States have less

restrictions on imports from Macao, textile exports can look to relative stability in the future.

3. *Thanks to the growth of tourism in the Asian-Pacific region and to its geographical proximity to Zhuhai City and Zhongshan County, Macao has become a new centre for attracting tourists.* It is estimated that tourism in Macao will continue to grow. The same is true for the real estate market and for construction, which will play an important role in supporting Macao's economy.

SECTION V:

CHINESE ECONOMIC THEORY

THEORETICAL STUDIES BY CHINESE ECONOMIC CIRCLES IN RECENT YEARS: PROGRESS AND FUTURE TRENDS

By Zhao Renwei and Xiang Qiyuan

*Institute of Economics,
Chinese Academy of Social Sciences*

With the downfall of the Gang of Four, China put an end to years of turmoil and instability and entered a new period of development. Breaking through the gloomy atmosphere which had existed for many years, the Chinese economics profession also came into a period of unprecedented activity. The four years following the downfall of the Gang of Four may be described as the most fruitful period of the past three decades, a period in which Chinese economists discussed the largest number of questions and gained the greatest successes.

The first two years were largely devoted to criticizing the Gang of Four's economic theories, wiping out their vicious influence and sweeping away obstacles. In the next two years, to cope with the needs of shifting the focus of work, economists concentrated on discussing and exploring theoretical questions concerning the programme of socialist modernization and the readjustment and restructuring of the national economy. The discussion covered a very wide area and extended to many branches of economics; here, we will describe briefly only the most representative questions and mainly from the viewpoint of socialist political economy.

I. Concerning the Basic Economic Law of Socialism

There have been several occasions in the last three decades when the economic law of socialism came up for discussion in Chinese economic circles. One such occasion took place around 1955, and dealt with economic laws in the transition period. One of the central issues under discussion at that time was whether and how the basic economic law of socialism could play its leading role while various economic sectors co-existed during the transition period. Another discussion took place during the readjustment of the national economy in 1962-65. The background to that discussion was the "big leap forward," which violated both objective laws and socialist economy. People wanted to review that experience and take from it theoretical lessons that would enable them to better apply economic laws. The latest discussion occurred following the downfall of the Gang of Four. By vigorously preaching subjective idealism

and completely negating the existence of economic laws, Lin Biao and the Gang of Four created confusion in both thinking and theory. On the one hand, the discussion helped to clear up the confusion. On the other hand, the in-depth examination of erroneous "Left" ideas in socialist construction made people increasingly aware that the correct or incorrect application of economic laws would determine the success or failure of socialism. Hence, the discussion of the basic economic laws of socialism once more drew wide attention.

The Third Plenary Session of the 11th Party Central Committee was followed by an in-depth discussion of making practice the only criterion for testing truth.

Many economists pointed out that a major shortcoming in our economic work had been our relative neglect of the purposes of socialist production in our socialist construction. Some suggested that in the process of criticizing the Gang of Four we should restore the primacy of the basic economic law of socialism as elaborated by Stalin. At that time, an editorial in the *People's Daily*, entitled "Seek A Clear Understanding of the Purpose of Socialist Production," drew widespread attention.

For a time, people working in the field of economics concentrated on discussing the purpose of socialist production. Compared with previous discussions, this one integrated more closely the theory with the practice of socialist construction and showed greater emancipation of thinking. Many excellent views were put forward. It was generally agreed that the orientation of socialist economic development, the structure of the economy and the overall balance in the national economic plan hinged on our correct understanding and conscious implementation of the purpose of socialist production.

During China's First Five-Year Plan (1953-57), targets were better fulfilled, both production and construction advanced at a fairly rapid pace and the people's living standard also showed relatively fast improvement. One of the major reasons was the prudent ideology guiding our socialist construction and our conscious understanding of the purpose of socialist production. In the 20 years after 1958, we blindly followed a policy of seeking to develop at an unrealistically

"high speed" and of "production for production's sake." This led to a high rate of accumulation, imbalance in the national economy, lop-sided development of the economic structure and a huge gap between state construction and the people's well-being. In that period, the ideology guiding socialist construction deviated in a certain degree from the purpose of socialist production.

The purpose of socialist production clearly plays a decisive role in socialist production as a whole. It should become one of the major guiding principles in the readjustment of the national economy and the reform of the economic management system. In mapping out the strategy of the country's long-term economic development, we must first give consideration to improving the welfare of the people and meeting social needs. In so doing, we will enhance people's understanding of the basic economic law of socialism.

The discussion concerning the purpose of socialist production has just concluded. It has prompted economists to propose many new topics for study, such as the final products of socialist production, the economic mechanism for realizing the purpose of socialist production and the relationship between the purpose of social production and that of enterprise production. This signifies that the discussion will be on-going.

For a long time there have been different views about the basic economic law of socialism. Some views put forward in the discussion over the last few years are noteworthy.

A number of economists deny the existence of the basic economic law of socialism. One of their main arguments is that the purpose of socialist production belongs to the category of subjective will, and not to that of objective economics. Most of the people studying economic theory and doing economic work do not agree with this view. They argue that the purpose of social production is decided by the nature of the ownership of the means of production and embodies the vital material interests of the class, group or social members who own the major means of production. Various economic formations of society have different systems of ownership of the means of production and different purposes of social production. Under capitalism, production aims at increasing surplus value; under socialism, it aims at satisfying the material and cultural needs of the whole society. These aims are independent of man's will. Therefore, the purpose of social production belongs to the category of objective economics.

Among those who affirm the existence of the basic economic law of socialism, the content of that law, as set forth by Stalin, is generally accepted. However, some consider that Stalin's formula-

tion is not perfect and insufficiently specific and that it should be extended and enriched by new content drawn from empirical experience. As to the satisfaction of social needs mentioned by Stalin, apart from personal living needs, there are different views with regard to whether the needs for expanded production and for national defence and foreign aid should also be included. Some people say that the purpose of social production has its objective nature, but they doubt whether the means to achieve this purpose mentioned by Stalin reflect the essence of the socialist relations of production and share their objective nature.

One school of economists disagree with Stalin's basic economic law of socialism. They argue that the study of basic economic law should proceed from the contradiction between productive forces and the relations of production and the basic economic contradictions to which it gives rise. Others hold that the basic economic law of socialism is the concrete manifestation of the law of correspondence between the relations of production and productive forces.

II. Concerning Ownership of the Means of Production

It is known that, as early as 1956, China carried out, in the main, the socialist transformation of the ownership of the means of production, and that socialist public ownership became predominant in both town and country. Some 20 years later, the notion that the economy owned by the people as a whole is unconditionally superior to the collective economy and that individual economy engenders capitalism still prevailed among the economics profession. Therefore, as far as ownership was concerned, the remaining questions were how to bring about the rapid transition of the collective economy to an economy owned by all the people and how to eliminate the individual economy, the vestige of capitalism.

Because few people gave serious thought to the question of the ownership of the means of production in the 20 years after 1956, a series of mistakes were made in practice. There were two outstanding mistakes. One was the attempt to realize the transition to the socialist economy owned by all the people and even to the communist economy at a time when the rural collective economy was still weak. It was argued that the transition would be difficult once units of the collective economy became rich and differences between their respective living standards increased. The transition method adopted encroached upon the right of the rural basic accounting units to make their own decisions, ignored their economic

interests and essentially appropriated the peasants' interests without compensation. It led a number of units of the collective economy to kill their draught animals, fell trees and distribute all savings among their members, thereby damaging the productive forces and suppressing the peasants' incentives to produce.

The same mistake was made in dealing with the urban collective economy. Handicraft co-operatives and other collective industries in the urban areas such as the "May 7th" factories set up by family members of workers and staff were universally forced to undergo transition. Collectives at the elementary level were raised to a higher level, and collectives at the higher level were actually transformed into units owned by all the people. The urban collective economy remained only in name and this transition meant, in essence, expropriation of the handicraftsmen and other working people without compensation.

Another mistake was to eliminate the small plots for peasants' personal use and peasants' household sideline activities and wantonly reduce the number of artisans, peddlers and people in the service trades working on their own in the urban areas. In 1953, there were nine million individual workers in cities and towns, accounting for one-third of the people employed at that time. After the socialist transformation was more or less completed, there were still one million of them. During the ten ensuing years of turmoil, their number dwindled to 150,000. This measure enormously reduced the retail, service and repair shops and greatly inconvenienced the public.

In the last few years, the economics profession has thoroughly reviewed these mistakes and learned from them. They have come to understand that the basic reason for these mistakes was the violation of the law of correspondence between the relations of production and productive forces. Therefore, to improve the relations of ownership of the means of production in China we must take into account the existence of various levels of productive forces, ranging from the very backward to the modern, and preserve some non-socialist economic elements and flexible forms of management.

In order to promote the development of productive forces, it is necessary, first, to preserve and develop the individual economy to a certain degree. In both urban and rural areas there generally exist manual labour and small trading activities that are run in a decentralized fashion and are suited to management in the form of individual ownership. Particularly in the tailoring, catering and repair trades, individual management can offer consumers the advantages of flexible and better service. The individual economy plays an impor-

tant supplementary role to the socialist public economy and helps create more jobs.

Many economists also argue that the nature of the individual economy should be examined in the context of the economic system as a whole. With the socialist public economy in a dominant position, individual handicrafts and trades can be assimilated into the society's production and distribution system by allowing them to make sales, process raw materials supplied by state enterprises and get commodities from state wholesale shops. This will turn these individuals into assistants and dependents of the socialist public economy and prevent them from developing along the capitalist line. In recent years the individual economy in China's urban areas and countryside has been restored and developed and small plots for personal use of rural commune members and household sidelines activities have been encouraged.

Secondly, the collective economy has to be consolidated and expanded and made truly collective in nature. Under the influence of the above-mentioned concept and practice of "poor transition," the units of China's rural collective economy usually lack even rudimentary decision-making power. Production management, distribution of income and the members' standard of living are all decided by organs of political power at the higher level. The department in charge of the units of collective economy in an urban area usually assumes overall responsibility for the profits and losses of local units, thus turning them into its appendages.

Much of the discussion on consolidating and expanding the collective economy in recent years has focused on the question of how to respect the decision-making power of the production teams and basic accounting units, and how to let units of the urban collective economy assume responsibility for their own profits and losses so as to enhance the features and advantages of the collective economy. More than a few economists have pointed out that the urban and rural collective economy at present has great vitality and will co-exist with the economy owned by the whole people for a long time. Setting things right theoretically has heralded the adoption of flexible economic policies, and promising changes in this respect have appeared in actual economic life over the past few years.

Thirdly, the economy owned by the people as a whole also needs to undergo a process of gradual improvement. This point has been recognized by a growing number of economists. In the past, Chinese economists always identified socialist ownership by the people as a whole with state ownership. In the course of discussing the reform of the economic management system in recent

years, some economists hold that many drawbacks in the internal economic management of units owned by the people as a whole, such as bureaucracy and the use of purely administrative orders, are often connected with the form of state ownership, and that the essence of reforming the economic management system lies in changing the form of state ownership adopted by units owned by the people as a whole. Some other economists adhere to the traditional concept that ownership by the people as a whole can only adopt the form of state ownership and that the reform of the economic management system should only be carried out within this scope. However, a greater number of economists are of the opinion that state ownership is not the perfect form of the socialist ownership by the people as a whole and one differs from the other. As conditions for the elimination of state ownership do not exist at present in China, the reform of the economic management system can only be carried out within the scope of state ownership. But the majority of economists agree that efforts should be made to develop state ownership to the perfect form of ownership by the people as a whole.

III. Concerning the Use of the Market Mechanism in a Planned Socialist Economy

For a long time Chinese economists have discussed the nature of commodity production and the law of value under the socialist system. The discussion in recent years on how to make use of the market mechanism in the planned socialist economy may be taken as a continuation of the above-mentioned discussion. It may also be taken as a new development because it went much farther than previous discussions.

Take the question of the role of the market mechanism in the economy owned by the people as a whole. In the past, Chinese economists generally denied the existence of commodity relations within the economy owned by the people as a whole; they held that the economy owned by the people as a whole had to maintain the cover of commodity relations only because of its co-existence with the collective economy. In other words, costs, prices and other terms of value were only tools of calculation in the units owned by the people as a whole and were not objective economic mechanisms; among enterprises there was only the relationship of allocating goods, not that of buying and selling commodities.

There were both theoretical reasons and practical considerations for the prolonged domination of this view in the Chinese economics profession.

This view was propounded by Stalin, and it is common knowledge that Chinese economic thinkers were profoundly influenced by Stalin's socialist economic theories. Moreover, the discussions among Chinese economists concerning commodity production and the law of value, especially those held after the universal establishment of people's communes, were undertaken with the practical consideration of upholding the autonomy of units of the collective economy in their capacity as commodity producers. The major questions to be solved at that time were the relations between the two types of public ownership and the economic management system in the people's communes. Hence, emphasis was given to the analysis of the commodity-money relations between the two types of public ownership and among the various economic units under collective ownership.

The discussions in the last few years, however, focused on the role of economic management in the entire socialist economy. Since the founding of the People's Republic of China, the economic management system has been plagued by problems such as irrational, excessive concentration and rigidity in the planned management of the national economy; overall management of incomes and expenditures in financial affairs; unified allocation in the management of materials and exclusive purchases and sales in the relations between industry and commerce; unilateral emphasis on administrative means and neglect of economic means; one-sided stress on the state; overall and long-term interests with little attention given to the interests of enterprises and individuals and immediate interests. In fact, all these problems are directly related to the view that exchanges among state enterprises are not commodity exchanges and to disregard of the law of value. Practical considerations demand that we explore and explain questions of why commodity relations exist among units owned by the people as a whole and how to use the market mechanism.

Chinese economists now give different explanations for the existence of commodity relations among units owned by the people as a whole and the market mechanism. Some hold that the exchange of equal values is necessary to solve economic contradictions and conflicts of interests among individuals and between workers' collectives, even though their fundamental economic interests are identical. Some say that, owing to the immaturity of socialist ownership by the people as a whole, that is, the existence of collective ownership, exchange among state enterprises still involves a transfer of ownership in a certain sense. Others attribute the existence of commodity relations to the fact that there is still individual or partial individual ownership of labour power

today, such that labour is still not direct social labour. They generally recognize the existence, in essence, of commodity relations within the units owned by the whole people and agree with the viewpoint that the means of production circulated between enterprises owned by the people as a whole are also commodities.

This theoretical breakthrough is of great significance in recognizing enterprises as relatively independent commodity producers, enlarging their decision-making power, overcoming the use of purely administrative means and adopting more economic means, and giving value-related economic levers (prices, credit, tax and wages) a role to play. It also provides an important theoretical basis for reforming the internal economic management system of units owned by the people as a whole.

Another question concerns the role played by the law of value in the socialist economy. Chinese economists had long accepted Stalin's view that the law of value exercises only marginal influence on socialist production and does not play a regulatory role. This view has been negated by the practice of socialist construction since the founding of the People's Republic of China. After a few years of discussion, it is generally agreed that as the law of value is the fundamental law governing the commodity economy, its role cannot be excluded where commodity production and commodity exchange exist. Therefore, if we accept the general existence of commodity relations in the development of the socialist economy, we must accept the regulatory role of the law of value in the whole process of socialist production.

Other discussions focused on the relationship between the law of value and the law of planned, proportionate development of the national economy. Chinese economists hold fairly divergent views with regard to this question. One view denies the objective existence of the law of planned development of the national economy. The present socialist economy is still a commodity economy based on public ownership, so the law of value is the only regulator of socialist reproduction. Marx said a long time ago that in a commodity economy the law of value regulated the proportionate distribution of total social labour-time. Now we should give full play to the objective regulatory role of the law of value and consciously incorporate the law of value in working out the national economic plan.

Another view holds that the fundamental feature of the socialist economy is planned economy and not commodity economy. The law of planned development of the national economy is the main regulator of the socialist economy and the law of value only plays a secondary regulatory

role. In working out the national economic plan, therefore, we should take the former law as the basis but we should also take into consideration the requirements of the law of value.

A large number of economists regard the socialist economy we have at present as both a planned economy and a commodity economy, but they differ in the degree of emphasis they place on the two aspects. Economists who emphasize the commodity nature of the socialist economy call it a planned commodity economy; those who stress the planning aspects of the socialist economy call it a planned economy under the conditions of commodity economy. Both groups agree that the law of planned development and the law of value function in basically the same direction, and that their functions interweave to regulate the national economy. Therefore, the national economic plan has to be worked out simultaneously on the basis of the two laws regulating the economy.

There is still no unanimous opinion on the relationship between the law of value and the law of planned development. However, compared with the situation which existed for a long time before the downfall of the Gang of Four, the question is being discussed on a higher level and in greater depth, and we have made a step forward in understanding the role of the law of value in the socialist stage.

As to the relationship between planning and the market, the prevailing opinion in the past was that planning and the market conflicted with each other and were mutually exclusive. Wherever planning was operative, the market ceased to play its role; and vice versa. In recent years many economists have cast aside this view; they now hold that planning and the market are integrated, with the former playing the main role. As to how they are integrated, some economists deem that they are not put together like plates but by mutual infiltration. Some economists consider that integration of planning and the market must proceed from plate-like integration to the stage of mutual infiltration. Other economists have analysed the integration of planning and the market at the macro-economic and micro-economic levels. Although opinions differ on this question and deeper and specific discussions are called for, the change from the view that planning and the market are mutually exclusive to the view that they are integrated certainly represents a great advance in theory.

As to the question of competition in the socialist economy, its existence has long been denied by the Chinese economics profession. However, as a result of discussions in recent years, Chinese economists now generally accept the concept that competition is an integral part of the commodity economy and that wherever com-

modity production and exchange exist there is competition. As long as the relationship between commodity production and the market persist in the socialist economy, there will be competition. Furthermore, production, supply and marketing according to market needs, allocation of investments according to their results and recruitment of personnel according to the principle of choosing the best qualified persons are all inseparable from competition. Under the conditions of the socialist planned economy, limited competition plays a positive role in encouraging the advanced, spurring the backward, improving the quality of products and raising management efficiency.

Apart from affirming the necessity of socialist competition, Chinese economists have also studied and discussed the difference between socialist and capitalist competition and between socialist competition and socialist emulation, and the question of how to foster competition while simultaneously strengthening guidance.

IV. Concerning Economic Structure

China's present economic structure was gradually formed over the last 30 years. What are its features? What are its problems? Although economists have conducted different analyses, their basic conclusions are more or less the same. These may be roughly summed up in two main points.

1. *The economic structure is, in many respects, unbalanced or lop-sided.*

There is imbalance between agriculture, light industry and heavy industry. The last has been intensively developed while the development of the first two has been neglected. Between 1949 and 1978, agriculture increased 3.4-fold and agricultural industry 39.2-fold; but during the same years, light industry rose 20.8-fold and heavy industry 91.6-fold. In agriculture, there was undue emphasis on farming at the expense of animal husbandry, fishing and forestry. In industry the fast growth of processing industries outstripped the development of materials and energy industries.

The rate of accumulation was greater than that of consumption, and stayed high for many years starting from the Second Five-Year Plan (1958-62). In 1958, 1959 and 1960, it was respectively 33.9%, 43.8% and 39.6% of the national income. Though the accumulation rate dropped to 22.7% in the readjustment period of the early 1960's, it rose to 26.3% and 33%, respectively, during the Third Five-Year Plan (1966-70) and Fourth Five-Year Plan (1971-75). It jumped to

36.9% in 1978, then dropped to 33.6% in 1979, but it was still relatively high.

The too-rapid increase of the Chinese population, as some economists have pointed out, has caused an imbalance between material growth and population growth for a long period. It is also one of the principal causes of the imbalance in the national economy.

2. *The economic structure is of a closed type bent on self-sufficiency.*

Its closed character is expressed in the two following aspects: In China's external economic relations the closed-door tendency finds expression in the small proportion of foreign trade in the national economy, weak ability to import and export and the lack of competitive commodities on the international market. In China's internal economic relations there is the tendency towards autarchy in the various departments, regions and production units. Farm production has long been self-sufficient to a great extent and a high proportion of the heavy industry serves itself; despite unfavourable local conditions and features, many areas strive to build their own integrated economic systems; a large number of enterprises have become all-embracing and self-supporting units or societies.

To overcome the above-mentioned shortcomings and rationalize the economic structure, Chinese economists have put forward the following suggestions:

1. *It is necessary to overcome the policy of blindly seeking high speed and to strive instead for overall balance in the national economy.*

Many economists point out that seeking to develop at excessively high speed is one of the major reasons for the serious imbalance in the national economy. Practices such as setting unrealistically high targets, regarding comprehensive balance with reserves as a "negative balance," and praising plans with unbridged gaps as a "positive balance" will not spur the economy forward but will only result in serious imbalance in the national economy. Therefore, on the basis of past experience and the lessons derived from that experience, we should not seek high-speed economic growth at the price of skewing the plan and we must maintain a good overall balance especially among the four major fields of finance, credit, materials and foreign exchange.

2. *It is imperative to discontinue the one-sided development of heavy industry so as to ensure concerted growth of the various branches of the national economy.*

Although Chinese economists hold different

views with regard to the prior growth of the means of production under socialism, they are almost unanimous in their support for the view that, in the period of readjustment, the rate of growth of heavy industry must be slowed down and that of the light industry and agriculture speeded up.

The current economic readjustment is proceeding in this direction. It is noteworthy that we have vigorously developed labour-intensive industries while developing capital-intensive industries in the last few years. According to statistics, the average number of workers employed for every million yuan of fixed assets in China is 94 in heavy industry, 257 in light industry and 800 in such labour-intensive trades as arts and crafts, production of clothing, metal wares for daily use and leather goods. Vigorous development of labour-intensive industries is certainly conducive to the rationalization of China's economic structure. Moreover, it helps solve the employment problem in a populous country like ours.

3. *It is necessary to moderate the single-minded drive of raising the rate of accumulation and take into consideration the relationship between production and livelihood.*

In view of the relatively high rate of accumulation over a long period, Chinese economists have recently stressed the need to study the ratio between accumulation and consumption. Many of them point out that the rate of accumulation varies from country to country and according to the specific conditions at different periods of development and cannot be set uniformly. A 30-40% rate of accumulation is obviously high and will severely reduce consumption as China's per capita national income is very low. Under ordinary conditions, it is inadvisable to undertake production and construction by holding down the people's standard of living.

Of course, to handle better the relations between state construction and people's livelihood, it is not enough to lower the rate of accumulation; one must also examine the uses to which the accumulation fund is put. China not only has the problem of a fairly high rate of accumulation but also the problem of bad results in how the accumulation fund is used. In dealing with these problems, the latter should not be dwarfed by the former. Some economists suggest that, given better results in the use of the accumulation fund, the rate of accumulation should preferably be set around 25% under China's present conditions.

4. *The economic management system must be reformed to promote the rationalization of the economic structure.*

Many economists hold that the highly centralized economic management system is one of the causes for the imbalance among the various branches of the national economy and for the tendency towards self-sufficiency in the various departments, areas and enterprises. Therefore, the readjustment of the economic structure and the reform of the economic management system, which is a manifestation of the relationship between readjustment and reform, are inseparable.

Readjustment is the basis of reform, but the further rationalization of the economic structure needs to be promoted by the reform of the economic management system. Many reform measures, such as the use of the market mechanism, the enlargement of decision-making power of enterprises, the strengthening of horizontal links in economic life, the growth of competition and integration, advances in specialization and co-ordination, are conducive to bringing about a balance in the national economy and overcoming the tendency towards self-sufficiency.

V. Concerning Material Interests and Distribution According to Work

The question of material interests under the socialist system is one of the major theoretical principles distorted and tampered with by the Gang of Four. The Gang condemned material interests, particularly personal material interests, as being diametrically opposed to Marxism and absolutely inconsistent with the socialist economic system. Whoever stressed material interests was accused of spreading revisionism. In the process of criticizing the Gang of Four, this theoretical taboo was set aside and heated discussions were held on this question.

The consensus among Chinese economists is that economic relations between people are mainly those of material interests and that in striving for the realization of the socialist ideal, the proletariat, in the final analysis, aims at protecting the material interests of all workers. These are basic principles of Marxism. At the present stage of development, we should pay full attention to the basic material interests of the state, the collectives and individuals, but we cannot neglect the material interests of the workers as individuals and the socialist enterprises as collectives. One of the basic principles of socialist economic management is to integrate properly the interests of the state, the productive units and the workers.

Setting theoretical things right on the question of material interests helps us enormously in understanding commodity production and commodity exchange under socialism, in respecting the

legitimate rights of enterprises as relatively independent commodity producers, and in carrying out resolutely the principle of distribution according to work.

The question of distribution according to work had been discussed repeatedly by Chinese economists for a long time. However, under the influence of "Left" guiding ideas, the principle of distribution according to work had not been earnestly carried out. The Gang had frequently alleged that the principle of distribution according to work was the bourgeois standard of distribution. They cited passages about the bourgeoisie from the works of Marx and Lenin. The Gang even went so far as to portray the distribution according to work as a relation of exploitation. This caused tremendous losses to the socialist economy.

After the downfall of the Gang of Four, this question attracted widespread attention and four national discussions were devoted to it in 1977 and 1978.

These discussions first dispelled the confusion and reaffirmed the socialist nature of distribution according to work. In order to set things right and restore the honour of distribution according to work, many economists had to address the questions of whether distribution according to work is a socialist principle of distribution and whether it may become the economic basis engendering new bourgeois elements.

An outstanding feature in the discussions over the last few years was to criticize and overcome the tendency towards equalitarianism. In the past 20 years or so, the principle of distribution according to work came under frequent attack and the piece-work wage system, bonus system and eight-grade wage system were also criticized on many occasions. As a result, the rewards for the labour of workers and staff members were increasingly separated from their contributions. Equalitarian distribution led to a situation where it made little difference whether one worked more or less, whether one did a good or bad job and even whether one worked or not. The practice of equalitarian distribution seriously affected the enthusiasm of workers and staff members and discouraged production efficiency. Low production efficiency, in turn, aggravated equalitarian distribution.

In the 20 years between 1957 and 1976, there was only one relatively general wage rise, in 1963. Not only did original workers and staff members not receive higher pay corresponding to their contributions, but equalitarianism became even more strictly enforced in the wages for workers and staff members newly recruited in this period. Although these workers and staff members in their 30's or 40's were the backbone of the workforce, their wages were generally the lowest. Clearly, in

the relations between efficiency and equality, the experience of the past 20 years showed that the equalitarian tendency retarded the rise of efficiency.

Many economists have pointed out that, to overcome equalitarianism, we must overcome the situation in which differences between existing incomes do not reflect the existing contributions of labour. Of course, we must also admit that, because China is undertaking socialist construction on the basis of a fairly low level of the productive forces, there will come a stage of development in which the differences between both people's labour contributions and their resultant incomes will be enlarged. Consequently the policy of letting a section of the working people get rich first has its objective basis: in the short run it may widen the differences in incomes among the working people but it is beneficial to raising production efficiency; in the long run the policy will speed up the realization of general prosperity for all working people. Allowing differences in incomes and a time sequence for people to get rich is the inevitable road for the general prosperity of the entire workforce and conforms to the socialist principle.

In the discussions over the past few years the question of closely linking the material interests of individual workers and staff members with the management of their enterprises was put forward. In China today, where commodity-money relations generally exist, workers and staff members getting the same amount of bonus and equal income despite profits or losses of their enterprises is an expression of equalitarianism which dampens the masses' enthusiasm for socialism. Economists differ in their theoretical analyses of how the income of workers and staff members is linked with the management of their enterprises (some say it follows the law of distribution according to work; some say it follows the law of value; and others say it follows both laws), but they have all given attention to this question. During the reform of the economic management system, many enterprises experimenting with enlarged power of management have adopted measures to effect this link and obtained good results.

To link closely the rewards for labour with the fruits of labour, Chinese economists also studied and discussed various forms of rewards for labour. Among the forms of rewards proposed are integrated basic and flexible wages for workers and staff members and rewards on the basis of output in the rural people's communes.

VI. On Comparing and Choosing Different Socialist Economic Models

This is a comprehensive question which is

closely linked to the above-mentioned questions, particularly that concerning the relationship between planning and the market. However, Chinese economists are beginning to study and discuss this question as an independent one. Breaking with the narrow concept that the socialist economy can have only one model, we have come to understand that, as long as socialist public ownership holds the predominant position and there is no exploitation of man by man, the socialist economy is completely free to adopt various models. Different socialist countries may, according to their specific conditions, choose their own arrangements to link planning with the market and centralization with decentralization, and choose the best model on the basis of comparing the conditions of decision-making, information and motivation.

In the discussions, the two following points have attracted special attention:

1. *What was China's original economic model?*

The prevailing explanation is that China's original economic management system was copied from the Soviet Union in the early 1950's and conformed to the centralized model, or Stalinist model. Further analysis led some economists to point out that this model showed some variations in China. In the period after 1958, in particular, decisions became more centralized, more mobilization was used, economic relations tended to be embodied more in goods, greater stress was given to self-sufficiency and more factors of war communism appeared. According to some economists, these features were clearly related to the traditional domination of small-scale production in China and the country's relatively isolation in the international community during the 1960's. Thus, a study of China's original economic model is of significance in understanding and analysing the starting point of the reforms of the economic management system.

2. *What kind of economic model should China adopt?*

It has been generally agreed that China should not copy any of the existing models in foreign countries but should work out a model suited to its domestic conditions in light of its own features as well as the experiences of other countries. The opinion of Chinese economists in recent years is that both the highly centralized model and the highly decentralized model are inappropriate. The former did play a positive role in the past, but it has many drawbacks and must be changed.

In the relationship between centralization and decentralization, recent reforms tend to enlarge

the scope of the latter; in the relationship between planning and the market, they tend to let the latter play a more significant role; in the relationship between administrative and economic means, they tend to make greater use of the latter in managing the economy.

However, this does not mean that the more power is decentralized and the bigger the role played by the market, the better the result. Nor does it mean the complete rejection of using administrative means. The focus of recent discussions is where the line should be drawn in the various sets of relations. Centralized decision-making for macro-economic activities and decentralized decision-making for micro-economic activities seems to be the overall guideline, but many specific lines have to be studied and worked out.

As long as we follow the principle of seeking truth from the facts, we will surely work out a model of a planned socialist economy suited to our conditions, thereby providing a theoretical basis for reform of the economic management system and a strategy for economic development.

VII. Future Trends in Chinese Economic Circles

We have briefly described some theoretical questions which preoccupied Chinese economists in the past few years. From the questions discussed and the academic activities of economists, including those of economic theorists, we can discern the following noteworthy trends in Chinese economic circles.

First, the study of economic theory has become more closely integrated with economic construction. During the period when the line of the ultra-"Left" prevailed, economists were generally prohibited from expressing their empirically derived views on major economic questions. As a result, the study of economic theory often became superficial. In recent years, however, discussions of traditional questions as well as some new questions are all closely related to the lessons and experiences gained from 30 years of economic construction, to the readjustment and restructuring of the national economy and to the long-term goal of realizing the Four Modernizations. Many valuable suggestions have since been put forward.

This trend is obviously inseparable from the shift of focus of party and government work which was first raised by the Third Plenary Session of the 11th Party Central Committee in December 1978. For a long time prior to 1978, economics was somewhat esteemed only because of its service to ideological struggles and it was expected only to

explain certain phenomena of class struggle. With the shift of focus in our work economics has become highly esteemed as a science in the service of economic construction and is asked to seek scientific answers to many urgent problems in economic construction. Apart from the questions mentioned above, economists have addressed many other questions, such as the stages of development of socialism, economic results, population and vestiges of feudalism in the economy.

This new trend will certainly revitalize Chinese economic circles.

Second, the isolated state of Chinese economic studies has begun to be breached and academic exchanges with foreign countries strengthened. For a long time, in connection with the tendency towards self-sufficiency in economic construction, the closed-door tendency also existed in the Chinese economics profession. This was particularly so with regard to economists specializing in socialist economic problems who knew even less about the outside world.

Remarkable changes have taken place in this respect in the last few years. The numbers of Chinese economists going abroad and foreign economists coming to China have increased enormously and there is considerable exchange of academic views. Our previous attitude towards Western economics was one of complete negativism. In recent years an increasing number of economists hold that our attitude towards Western economics should be one of factual analysis: throwing away its dross, drawing on its essence and critically absorbing the parts which may be useful to China's economic construction and

theoretical studies of economics.

The discussions of the questions mentioned above, especially those concerning the comparison and choice of economic models, the relationship between planning and the market and the forms of ownership by the people as a whole, obviously not only drew on China's own experiences but also on certain academic achievements of foreign economists who were inspired by those experiences. This exchange, of course, is still in an early stage, but it is indicative of a healthy trend.

Third, Chinese economists have begun to integrate quantity analysis with quality analysis. For a long time, China stressed solely quality analysis and seriously neglected quantity analysis in economic studies. The lack of statistics and their inaccuracy further aggravated this one-sidedness. This situation has begun to change in the last few years. Not only is econometrics now regarded as an independent field of study, but attention has been paid to strengthening quantity analysis in the study of many theoretical and practical questions, such as calculation of investment results, determination of accumulation rates and population forecasts.

Take the accumulation rate for instance. Many economists are of the opinion that the aforementioned rate of 25%, a relatively proper one, is derived only from experience, and is not a scientific forecast reached after analysing the quantitative relations of various factors which determine the accumulation rate. Efforts to integrate quantitative analysis with qualitative analysis are clearly conducive to the development of China's economics.

SECTION VI:

CHINA'S ECONOMIC STATISTICAL DATA

1. SELECTED ECONOMIC STATISTICAL DATA

Compiled by the State Statistical Bureau of the People's Republic of China

Explanatory Notes:

1. These statistical data are provided by the State Statistical Bureau. For the data published previously, some statistics have been verified and others revised due to the changes in measuring units and statistical coverages.
2. Figures for Taiwan Province are not included, except in total surface area.
3. In order to facilitate comparison of data for different periods, 1949-57 data of state-owned and collectively owned enterprises include joint state-private enterprises, privately owned enterprises and handicraft units at that time.
4. Annual average increase rate is calculated on the basis of geometric mean method.

Distribution of Population and Natural Resources

Item	Unit	End of 1979
Population	10 thousand	97,092.00
Of which: urban	"	12,862.00
rural	"	84,230.00
Labour force employed in national economy	"	40,580.00
Of which: agriculture	"	29,934.00
industry	"	5,340.00
Total surface area	10 thousand km. ²	approx. 960.00
Cultivated land ¹	10 thousand hectares	9,950.00
Plains	"	5,473.00
Hilly and mountain areas	"	4,477.00
Of which: horizontal terraced fields	"	800.00
Forestry area ²	"	25,509.00
Of which: forest area	"	11,978.00
forest thinning area	"	1,563.00
bush area	"	2,957.00
young growth forest and young plants	"	472.00
Rate of forest-covered area	%	12.50
Forest growing stock	100 million m. ³	93.50
Prairie area	10 thousand hectares	31,908.00
Freshwater area	"	1,664.00
Hydropower resources	100 million kw.	6.76
Length of inland rivers	10 thousand km.	43.00
Marine fishing area	10 thousand square nautical miles	81.80
Coastline ³	km.	18,000.00

Notes:

1. The figure of cultivated land is under-estimated and remains to be verified.
2. The figures of forestry area and forest growing stock are from statistical data of 1973-76. The figure of fresh water area refers to 1974.
3. Coastline excludes the coastline of islands.

Population (in 10 thousands)

Year	Population (year-end figure)	By sex		By residence	
		Male	Female	Urban	Rural
1949	54,167	— —	— —	5,765	48,402
1952	57,482	— —	— —	7,163	50,319
1957	64,653	33,469	31,184	9,949	54,704
1965	72,538	37,128	35,410	10,170	62,368
1975	91,970	47,126	44,844	11,171	80,799
1979	97,092	49,754	47,338	12,862	84,230

Note: The figures for Taiwan Province, Hong Kong and Macao are not included in this table.

Main Indicators of China's National Economy (absolute figures)

- Notes: 1. 1949 and 1952 figures of gross industrial and agricultural output value are calculated at constant prices of 1952; figures of 1957 and 1965 at constant prices; and figures of 1975 and 1979 at constant prices of 1970. Other indicators in value terms are calculated at current prices.
2. National income refers to the net output value of five material production sectors including industry, agriculture, construction, communications and transport, and commerce.
3. Asterisked figures(*) denote 1950 data.
4. Retail sales of commodities include the retail sales by peasants to non-agricultural residents.

Main Indicators of China's National Economy (Rate of Increase)

Item	Index numbers (1952 = 100)			Average annual % increase rate	
	1957	1965	1979	1953-79	1950-79
1. Population	112.5	126.2	168.9	2.0	2.0
2. Labour force employed in national economy	114.7	138.3	195.8	2.5	—
Of which: staff and workers	193.5	309.7	621.8	7.0	—
3. Gross industrial and agricultural output value	167.8	268.3	845.2	8.2	9.4
Gross agricultural output value	124.8	137.1	249.4	3.4	4.5
Gross industrial output value	228.6	452.6	1,734.0	11.1	13.3
Heavy industry	183.2	344.5	1,061.0	9.1	11.0
Light industry	310.7	650.6	2,991.2	13.4	16.5
4. National income	153.0	197.5	484.9	6.0	7.3
5. Revenue	168.9	257.7	600.6	6.9	10.2*
Expenditure	172.8	264.9	723.8	7.6	10.6*
6. Investment in capital construction	317.2	392.0	1,146.8	9.5	13.9*
7. Volume of freight transport	237.5	454.2	1,429.6	10.4	13.3
8. Retail sales of commodities	171.3	242.2	650.3	7.2	8.9
9. Total value of imports and exports	161.8	183.3	705.3	7.5	8.6*
Imports	133.3	147.5	650.4	7.2	8.8*
Exports	201.1	232.8	781.2	7.9	8.1*
10. Output of major industrial and agricultural products					
Coal	198.5	351.5	962.1	8.8	10.5
Electricity	264.4	926.0	3,863.0	14.5	15.0
Crude oil	331.8	8,527.3	24,134.6	22.5	25.4
Steel	396.3	905.9	2,553.8	12.8	19.7
Cotton cloth	131.9	164.0	317.2	4.4	6.4
Sugar	191.1	324.4	555.6	6.6	8.8
Bicycles	1,008.2	2,299.5	12,629.2	19.6	24.5
Sewing machines	421.0	1,874.0	8,882.3	18.1	—
Grain	119.0	118.7	202.6	2.6	3.7
Cotton	125.8	160.9	169.2	2.0	5.5
Oil-bearing crops	100.1	86.5	153.5	1.6	3.1
Pork, beef and mutton	117.7	162.8	313.9	4.3	—
Aquatic products	186.8	178.4	258.1	3.6	7.8

Notes: 1. Increase rates of gross industrial and agricultural output value and national income are calculated at comparable prices.

2. Asterisked figures (*) refer to the average annual increase rates of 1951-79.

Average Daily Figures for Selected Main Indicators

Item	Unit	1949	1952	1957	1965	1979
1. Output of main industrial products

Wages and Employment in Collectively Owned Sectors in Cities and Towns

Item	1965	1977	1978	1979
1. Number of staff and workers at end of year (in 10 thousands)	1,226.6	1,916.4	2,048.0	2,273.5
Industry	505.4	1,142.0	1,215.0	1,327.7
Construction	93.5	157.0	174.5	219.1
Farming, forestry, animal husbandry, sideline occupations and fishing	72.3	51.4	59.2	51.6
Transport	172.6	188.9	204.3	218.6
Commerce, catering and service trades	200.3	203.1	211.3	259.4
Education, culture and health	117.8	123.0	128.4	132.9
Management bodies	6.3	14.0	14.2	17.0
Others	58.4	37.0	41.1	47.2
2. Total wage bill (100 million yuan)	—	89.0	100.2	117.2

Fixed Assets of State-Owned Enterprises (Original Value¹) (in 100 million yuan)

Item	1952	1957	1965	1975	1979
Total at end of year	240.6	522.9	1,445.8	3,414.3	4,892.5
Of which: industry	107.2	272.2	961.0	2,290.3	3,253.2
agriculture	—	—	—	90.8	146.8
construction	1.7	21.7	22.9	47.5	80.4
transport, posts and tele-communications	115.2	182.7	337.9	672.0	890.2
commerce, catering and service trades	11.5	33.9	91.1	209.6	358.7
supply and marketing of means of production	0.1	1.8	8.8	23.9	41.6
civic public utilities	4.9	10.6	24.1	37.6	59.1
science, education, culture and health	—	—	—	17.0	25.9

- Notes: 1. Original value of fixed assets refers to payments by independently accounting enterprises for the purchase and construction of various fixed assets.
2. Data in this table are classified by management systems instead of by sectors of national economy.

Use of Quota Circulating Funds by State-Owned Enterprises (in 100 million yuan)

Item	1952	1957	1965	1975	1979
Total at end of year	171.7	401.8	915.9	2,298.6	3,087.5
Of which: industry	33.0	62.9	230.4	770.8	1,026.5
agriculture	—	—	—	47.0	129.8
construction	3.7	19.5	18.0	30.8	41.0
transport, posts and tele-communications	7.1	9.5	20.7	61.9	75.8
commerce, catering and service trades	123.2	290.1	493.4	1,061.0	1,421.5
supply and marketing of means of production	4.3	19.4	152.3	299.3	354.3
civic public utilities	0.4	0.4	1.1	3.4	5.1

Note: Data in this table are classified by management systems instead of by sectors of national economy.

National Income, Consumption and Accumulation

Item	Unit	1952	1957	1965	1965	1979
National income ¹	100 million yuan	589	908	1,387	2,503	3,350
Index numbers (1952 = 100)	%	100	153.0	197.5	384.7	484.9
National income per capita	yuan/person	104	142	194	274	347
Available national income ²	100 million yuan	607	935	1,347	2,451	3,356
Consumption	"	477	702	982	1,621	2,195
Accumulation	"	130	233	365	830	1,161
Accumulation ratio	%	21.4	24.9	27.1	33.9	34.6

- Notes: 1. All indicators are calculated at current prices except the index numbers of national income, which are calculated at comparable prices.
2. Available national income is not equal to total national income because of the difference between imports and exports and of the statistical discrepancy.

People's Communes in Rural Areas

Year	People's communes	Production brigades (10,000)	Production teams (10,000)	Households joining communes (10,000)	Persons joining communes (10,000)	Average number of production brigades per commune	Average number of production teams per production brigade	Average number of persons per production team
1958	23,630	—	—	12,861	56,017	—	—	—
1966	74,755	64.8	541.2	13,527	59,112	8.7	8.3	109
1975	52,615	67.7	482.6	16,448	77,712	12.9	7.1	161
1979	53,348	69.9	515.4	17,491	80,739	13.1	7.4	157

Area of Cultivated Land

Year	Of which:			% of total cultivated land	
	Area of cultivated land (10,000 hectares)	Paddy field (10,000 hectares)	Irrigated land (10,000 hectares)	Paddy field	Irrigated land
1949	9,788	2,282	323	23.3	3.3
1952	10,792	2,585	489	24.0	4.5
1957	11,183	2,753	1,068	24.6	9.6
1965	10,359	2,496	1,011	24.1	9.8
1975	9,971	2,553	2,068	25.6	20.7
1979	9,950	2,542	2,230	25.5	22.4

Note: The figures of cultivated land are underestimated and remain to be verified.

Gross Agricultural Output Value

Year	1952 = 100	Previous year = 100	Year	1952 = 100	Previous year = 100
1949	67.3	—	1965	137.1	108.3
1950	79.2	117.8	1966	148.9	108.6
1951	86.6	109.4	1967	151.3	101.6
1952	100	115.2	1968	147.5	97.5
1953	103.1	103.1	1969	149.2	101.1
1954	106.6	103.4	1970	166.4	111.5
1955	114.8	107.6	1971	171.4	103.1
1956	120.4	105.0	1972	171.1	99.8
1957	124.8	103.6	1973	185.5	108.4
1958	127.8	102.4	1974	193.2	104.2
1959	110.4	86.4	1975	202.1	104.6
1960	96.4	87.4	1976	207.1	102.5
1961	94.0	97.6	1977	210.6	101.7
1962	100.0	106.2	1978	229.6	109.0
1963	111.6	111.6	1979	249.4	108.6
1964	126.7	113.5			

Note: Constant prices of gross agricultural output value have been changed 3 times, and the index numbers presented are calculated at comparable prices. Growth rates of the agricultural output of different years can be calculated by using these index numbers.

Gross Output Value of Farm Products, Forestry, Animal Husbandry, Sideline Occupations and Fisheries

Year	Farm products	Forestry	Animal husbandry	Sideline Occupations		Fisheries
				Total	Of which: brigade-owned enterprises	
1. Absolute figures (100 million yuan)

1979	123.7	97.8	126.1	181.8	63.3	245.8	211.9

Major Agricultural Machinery (Year-end data)

Item	Multiple	1957	1957	1965	1975	1979
Total horsepower of agricultural machinery	10,000 hp.	25	165	1,494	10,168	18,191
Large and medium-sized tractors	10,000	1,307	14,674	72,599	344,518	666,823
Hand tractors	10,000			0.4	59.9	167.1
Large and medium-sized tractor-driven agricultural tools	10,000			25.8	90.8	131.3
Combine harvesters		284	1,789	6,704	12,551	23,026
Motor-driven threshers	10,000			11.4	155.3	232.8
Power-driven drainage and irrigation machines	10,000 hp.	12.8	56.4	907.4	4,866.6	7,122.1
Rice mills, wheat mills	10,000				217.7	291.2
Cotton gins	"				30.2	26.7
Oil presses	"				16.7	21.6
Trucks			4,084	11,063	39,585	97,105
Rubber-tired animal-drawn carts	10,000			133.5	245.5	247.7
Rubber-tired hand carts	"			875.7	2,361.1	3,262.4
Motor-driven fishing boats	10,000 hp.		10.3	64.0	213.6	312.9

Agricultural Modernization

Item	Unit	1952	1957	1965	1975	1979
Actual tractor-ploughed area	10 thousand hectares	13.6	263.6	1,577.9	3,320.3	4,221.9
Tractor-ploughed land as % of total cultivated land	%	0.1	2.4	15.0	33.3	42.4
Irrigated area	10 thousand hectares	1,995.9	2,733.9	3,305.5	4,328.4	4,500.3
Irrigated area as % of total cultivated area	%	18.5	24.4	31.9	43.4	45.2
Power irrigated area	10 thousand hectares	31.7	120.2	809.3	2,288.9	2,532.1
Power irrigated area as % of total irrigated area	%	1.6	4.4	24.5	52.9	56.3
Consumption of chemical fertilizer ¹	10 thousand tons	7.8	37.3	194.2	536.9	1,086.3
Chemical fertilizer consumption per hectare of cultivated land	kg.	0.7	3.3	18.7	53.8	109.2
Small-sized hydroelectric stations in rural areas		98	544		68,158	83,224
Generating capacity	10 thousand kw.	0.8	2.0		144.4	276.3
Electricity consumed in rural areas ²	100 million kwh.	0.5	1.4	37.1	183.1	282.7
Electricity consumed per hectare of cultivated land	kwh.		1.3	35.8	183.6	284.1

Notes: 1. Consumption of chemical fertilizer is calculated on the basis of 100% effectiveness.
 2. Electricity consumed in rural areas refers to electricity consumed for production and daily use by the communes, brigades and teams in rural areas, excluding electricity consumed by state-owned units in rural areas.

Index of Gross Output Value of Heavy and Light Industry

Year	1952 = 100			Previous year = 100		
	Total	Light industry	Heavy industry	Total	Light industry	Heavy industry
1949	40.8	46.6	30.3			
1950	55.7	60.6	46.7	136.4	130.1	154.1

Wrist-watches	"	—	—	0.04	100.80	782.20	1,707.00

- Notes:
1. Timber refers to amount shipped.
 2. Chemical fertilizers for agricultural use are calculated on the basis of 100% effectiveness.
 3. Power generating equipment refers to water turbogenerators, turbogenerators and gas turbines with generating capacity of 500 kw. and over. Alternating current motors refer to those with power capacity of 0.5 kw. and over.
 4. Cotton yarn includes pure and cotton blend yarn and pure chemical fibre yarn; it excludes cotton thread, substitute fibre yarn and hand-made yarn.
 5. Cotton cloth includes pure and cotton blend cloth, pure chemical fibre cloth and canvas; it excludes substitute fibre cloth, handwoven cloth and cord fabric.
 6. Gunny bags include pure gunny and blend gunny bags and bags made of pure chemical and substitute fibres; it excludes handmade and regenerated gunny bags.
 7. Silk does not include hand-made silk.

Overall Labour Productivity of State-Owned Industrial Enterprises Using Independent Accounting

(at constant prices of 1970)

Year	Overall labour productivity (yuan/person/year)	Index numbers (1952 = 100)
1952	4,167	100
1957	6,336	152.1
1965	8,943	214.6
1975	9,994	239.8
1979	11,790	282.9

Main Financial Indicators for State-Owned Industrial Enterprises Using Independent Accounting.

Item	Unit	1952	1957	1965	1975	1979
Original value of fixed assets	100 million yuan	149.2	336.6	1,040.0	2,428.3	3,466.7
Total value of funds	"	147.1	331.8	1,037.3	2,569.0	3,487.6

2. COMMUNIQUE OF THE STATE STATISTICAL BUREAU OF THE PEOPLE'S REPUBLIC OF CHINA ON FULFILMENT OF CHINA'S 1980 NATIONAL ECONOMIC PLAN

(April 29, 1981)

Under the leadership of the Communist Party of China and the People's Government, the Chinese people of all nationalities conscientiously carried out the policy of readjusting, restructuring, consolidating and improving the national economy, and made new achievements through energetic efforts in 1980. The total annual value of industrial and agricultural output, calculated at constant prices of 1970, was 661,900 million yuan, 3.2% above the plan and 7.2% over the previous year. The preliminary figure for the national income was 363,000 million yuan, which, calculated at constant prices of 1970, was 6.9% above the previous year (the national income for 1979 was readjusted from 337,000 million yuan to 335,000 million yuan). The livelihood of the people continued to improve on the basis of increased production. The main problems were that there was another relatively large financial deficit, considerably more currency was issued, and the prices of many commodities rose.

Fulfilment of plans by the various sectors of the national economy was as follows:

1. Industry

In 1980, there was a sustained increase in industrial production, and the proportional distribution among industries gradually became more rational and appropriate. Total annual industrial output value, calculated at constant prices of 1970, was 499,200 million yuan, 3.1% above the plan and 8.7% over 1979. Output value of light industry was 234,400 million yuan, an 18.4% increase over 1979, and that of heavy industry, 264,800 million yuan, a 1.4% increase. The proportion of the output value of light industry to total industrial output value increased from 43.1% in 1979 to

46.9% in 1980. Targets were reached or surpassed for the output of 93 of 100 major products, including coal, crude oil, electricity, steel, pig iron, rolled steel, cement, plate glass, sulphuric acid, soda ash, caustic soda, chemical fertilizers, motor vehicles, locomotives, chemical fibres, paper, sugar, television sets, bicycles, sewing machines and wrist-watches. Targets for detergents and six other products were not fulfilled.

The initiative of the enterprises and their workers and staff members was brought into greater play and the management of enterprises was strengthened in 1980 as a result of continuing the experiments in expanding the power of enterprises in self-management and introducing market regulation over the production and supply of a number of products. Although energy production dropped 1.3%, industrial production continued to achieve a fairly rapid growth rate, the number of varieties and specifications of industrial products increased, the quality of products improved, and consumption of raw materials and fuels fell. State gold and silver medals were awarded to 255 industrial products for civilian use. The output value of industrial enterprises owned by the whole people was 12,031 yuan per worker, 2% higher than in the previous year.

However, the economic results of industrial enterprises as a whole were not yet satisfactory. The indices for quality and per-unit consumption for many of the products did not reach the best historical levels. About 23.3% of state-owned industrial enterprises still suffered losses to varying degrees, thus affecting the increase of state revenues. A considerable amount of rolled steel, machinery and power equipment was overstocked by the end of 1980.

Industrial Output in 1980

Item	Output	% Increase over 1979
Coal	620 million tons	- 2.4
Crude oil	105.95 million tons	- 0.2
Natural gas	14,270 million cubic metres	- 1.7
Electricity	300,600 million kwh.	6.6
Rolled steel	27.16 million tons	8.8

Continued next page

Note: Figures for Taiwan Province are not included in the communique.

Industrial Output (Cont.)

Item	1980 Output	% Increase over 1979
Pig iron	38.02 million tons	3.5
Steel	37.12 million tons	7.7
Coke (machine-made)	34.05 million tons	1.5
Timber	53.59 million cubic metres	- 1.5
Cement	79.86 million tons	8.1
Plate glass	27.71 million standard cases	18.9
Sulphuric acid	7.64 million tons	9.1
Soda ash	1,613,000 tons	8.5
Caustic soda	1,923,000 tons	5.3
Chemical fertilizers	12.32 million tons	15.7
Of which:		
Nitrogenous fertilizers	9.99 million tons	13.3
Phosphate fertilizers	2.31 million tons	26.9
Potash fertilizers	20,000 tons	25.0
Chemical insecticides	537,000 tons	0
Ethylene	490,000 tons	12.6
Plastics	898,000 tons	13.2
Pharmaceuticals (chemical)	40,100 tons	- 3.8
Calcium carbide	1.52 million tons	8.0
Rubber tyres	11.46 million	- 2.0
Mining equipment	163,000 tons	-38.3
Power generating equipment	4,193,000 kw	-32.5
Machine tools	134,000	- 4.3
Motor vehicles	222,000	19.4
Tractors	98,000	-22.2
Hand tractors	218,000	-31.4
Internal combustion engines (sold as commodities)	25.39 million hp.	-12.7
Locomotives	512	-10.6
Railway passenger coaches	1,002	17.1
Railway freight cars	10,571	-34.1
Steel ships for civilian use	818,000 tons	1.1
Television sets	2,492,000	87.5
Radio sets	30.04 million	117.5
Cameras	373,000	56.7
Chemical fibres	450,000 tons	38.0
Of which:		
Synthetic fibres	314,000 tons	46.7
Cotton yarn	2.93 million tons	11.4
Cotton cloth	13,470 million metres (or 12,800 million square metres)	10.9
Woollen piece goods	101 million metres	12.0
Silk	35,400 tons	12.2
Silk textiles	759 million metres	19.2
Gunny bags	433 million	14.5
Machine-made paper and paperboard	5.35 million tons	25.9
Sugar	2.57 million tons	8.5
Cigarettes	15.2 million cases	2.8
Beer	688,000 tons	16.7
Salt	17.28 million tons	33.3
Detergents	393,000 tons	17.0
Bicycles	13.02 million	- 1.0
Sewing machines	7.68 million	29.0
Watches	22.16 million	30.8
Light bulbs	950 million	29.8
		11.8

2. Agriculture

In 1980 many parts of the country suffered from natural calamities seldom seen in many years. However, correct policies of the party and the government were carried out, which triggered the enthusiasm of rural cadres and peasants for production so that most areas achieved fairly good harvests. A few, including Hubei and Hebei had considerable decreases in grain output. The total value of agricultural output, calculated at 1970 prices, was 162,700 million yuan, 3.3% above the plan and 2.7% more than in 1979. Except for grain, targets were met or surpassed for all seven other major agricultural products — cotton, oil-bearing crops, sugar-cane, sugar beet, jute and ambary hemp, silkworm cocoons and tea. The diversified economy of the rural communes and

their subdivisions and household sideline production grew fairly quickly.

Some 4,552,000 hectares of land in China were afforested in 1980, 1.4% more than in 1979. Output of some forest products increased sharply: that of rubber was 4.3% higher than 1979; walnuts, 31.7% higher and chestnuts, 41.8% higher. Output of raw lacquer and tea-oil seeds was below 1979. Trees were felled at random in many areas.

Output of major animal products increased in 1980. Except for hogs, animals in stock at the end of the year grew in number.

Output of aquatic products was 4,497,000 tons, up 4.5% over the previous year. Output of fresh-water products increased by 11.1%, and marine products, 2.1%.

State farms achieved all-around growth in

Agricultural Output in 1980

Item	Output	% Increase over 1979
Grain	318,220,000 tons	- 4.2
Of which:		
Paddy	139,255,000 tons	- 3.1
Wheat	54,155,000 tons	-13.7
Tubers (counted on the basis of 5 kg. of tubers equals 1 kg. of grain)	27,845,000 tons	- 2.2
Soybeans	7,880,000 tons	5.6
Cotton	2,707,000 tons	22.7
Oil-bearing crops	7,691,000 tons	19.5
Of which:		
Peanuts	3,600,000 tons	27.6
Rapeseed	2,384,000 tons	- 0.7
Sesame	259,000 tons	-37.9
Sugarcane	22,807,000 tons	6.0
Sugar beets	6,305,000 tons	103.0
Jute, ambary hemp	1,098,000 tons	0.8
Silkworm cocoons	326,000 tons	20.3
Tea	304,000 tons	9.7
Pork, beef and mutton	12,055,000 tons	13.5
Of which:		
Pork	11,341,000 tons	13.3
Beef	269,000 tons	17.0
Mutton	445,000 tons	17.1
Milk	1,141,000 tons	6.6
Sheep wool	176,000 tons	15.0
Hogs slaughtered	198,607,000 head	5.8
Hogs (end 1980)	305,431,000 head	- 4.5
Large animals (end 1980)	95,246,000 head	0.7
Sheep and goats (end 1980)	187,311,000 head	2.3

production. In 1980, grain output by state farms under the land reclamation departments was 4.7% higher than in 1979; cotton, 11.2% higher; oil-bearing crops, 4.1% higher; sugarcane and sugar beets, 28.6% higher; and milk, 8.7% higher. The total accounts of all state farms under the land reclamation departments showed a 52.7% increase in profits, but 40% of the farms still suffered losses to varying degrees.

Attention was paid during the year to the development of farm machinery suited to local conditions. By the end of the year, China had 745,000 large and medium-sized tractors, 78,000 more than in 1979; 1,874,000 small and hand tractors, 203,000 more than in 1979; power-driven drainage and irrigation equipment for rural use with an aggregate of 74,645,000 hp., an increase of 3,424,000 hp.; and 135,000 farm trucks, 38,000 more than in 1979. Tractor-ploughed farmland came to 40,991,000 hectares, accounting for 41.3% of all farmland. A total of 12,694,000 tons of chemical fertilizer were applied, averaging 127.8 kg. per hectare, a 17% increase over 1979. Total electricity used in the rural areas came to 32,100 million kwh., 13.5% more than in 1979.

By the end of 1980, China had 86,000 reservoirs of all sizes and 2.09 million diesel and electric pump wells. Improved management of water conservancy facilities helped raise resistance to drought and ability to drain off excessive water.

The meteorological departments last year improved their service, giving prompt forecasts and warnings for droughts, water-logging, typhoons and frost, thus raising the effectiveness of the struggles against these natural calamities.

3. Capital Construction

All over China, units owned by the whole people had an additional 42,700 million yuan worth of fixed assets through capital construction in 1980, a 2.2% increase over 1979. The rate of availability of such assets reached 79.2%, a 4.5% decrease compared with 1979. Total floor space of housing completed for the whole year came to 145 million square metres, an increase of 20.8% over 1979.

Annual added production capacity from capital construction in 1980 consisted mainly of facilities for producing 8.29 million tons of coal, 5.75 million tons of crude oil, 880 million cu. m. of natural gas, power-generating capacity of 2.87 million kw., 2.74 million tons of iron ore, 710,000 tons of steel, 279,000 tons of chemical fertilizer, 60,000 tons of chemical fibres, 2.88 million tons of cement and 113,000 tons of sugar. Also added were 761,000 cotton spindles. New railway lines

totalling 1,008 km. were put into service. The cargo handling capacity at newly built or expanded ports was enlarged by 8.13 million tons.

Total investment in capital construction in units owned by the whole people all over China in 1980 was 53,900 million yuan, a .78% increase over 1979. Investment covered by the national budget was 28,100 million yuan, a decrease of 24.9% compared with 1979. Of the total investment, the proportion for costs of non-productive use to meet the needs of the people's material and cultural life rose from 27% in 1979 to 33.7% in 1980, investments, in housing construction went up from 14.8% in 1979 to 20% while those in light industry increased from 6.4% in 1979 to 9.1%.

A number of projects were cancelled or suspended in 1980. The number of large and medium-sized projects under construction was 904 by the end of the year, 283 less than in 1979. However, owing to the large scale of some newly built projects, the national construction scale was not curtailed. Eighty-two large and medium-sized projects were completed and put into operation in the whole year, 46 less than in 1979. Two hundred and sixteen single-item projects attached to big and medium-sized projects were completed and put into operation, 124 less than the year before. The rate of large and medium-sized projects that went into operation to the total number under construction dropped from 9.7% in 1979 to 8.3%. Of the newly added production capacity for 34 major products listed in the state plan, the capacities of 16 products failed to meet the planned targets. The results for investment were insufficient.

New reserves of iron ore, coal, phosphorus, pyrites and 17 other major minerals which were verified in 1980 met or surpassed the state targets. Known deposits of iron ore increased by 2,140 million tons, and coal by 24,840 million tons. In addition, more reserves were also proven for 40 kinds of minerals, including niobium, tantalum, cobalt, blue asbestos, gypsum, graphite, ceramic clay and mica. Total drilling footage for geological prospecting completed in 1980 was 12.49 million metres. A number of new oil and gas fields were discovered and appraised, as were more than 100 metallic and non-metallic mineral sites. But the work of fundamental geology, general surveying of mineral resources and mining geology remains poor and the economic results of geological prospecting still needs to be improved.

4. Transport, Posts and Telecommunications

In 1980, the volume of freight carried by all

means of transport totalled 1,202,600 million ton-km., a 5.6% increase over 1979. The volume of railway freight transport was 571,700 million ton-km., a 2.1% increase over 1979. The volume of waterway cargo transported was 505,300 million ton-km., a 10.7% increase. The volume of road freight transported was 76,400 million ton-km., an increase of 2.6%. The volume of air freight shipment was 140.6 million ton-km., an increase of 13.9%. The volume of oil and gas carried through pipelines was 49,100 million ton-km., a 3.2% increase. The volume of cargo handled at major sea ports was 217.31 million tons, 2.2% more than the previous year.

The volume of passenger transport by all means of transport totalled 228,100 million passenger-km. in 1980, a 15.8% increase over 1979. The volume of railway passenger transport was 138,300 million passenger-km., an increase of 13.7%. The volume of waterway passenger transport was 12,900 million passenger-km., 13.2% higher. The volume of road passenger transport was 72,900 million passenger-km., a 20.9% increase. The volume of passenger transport by air was 4,000 million passenger-km., a 14.3% increase.

Post and telecommunication transactions for the whole country amounted to 1,334 million yuan in 1980, surpassing 1979 by 6.3%. Among this was a 7.56% increase in letters, a 29.6% increase in the distribution of newspapers and magazines, an 8.7% increase in telegrams, and a 4% increase in long-distance calls.

In 1980, fuel consumed per steam locomotive and per diesel locomotive for each 10,000 ton-km. dropped by 2.8% and 2%, respectively.

In the same year, the railway departments made new achievements in technical transformation of the existing lines. Electrification of the Baoji—Tianshui section of the Longhai Railway, the Shijiazhuang—Yangquan section of the Shijiazhuang—Taiyuan line and the Xiangfan—Ankang section of the Xiangfan—Chongqing line raised transport capacity. However, transport is still over-burdened and certain sections of trunk railways have a relatively small carrying capacity. The handling capacity at some sea ports also cannot meet the growing needs of foreign trade. And trucks show great waste in empty runs as a result of lack of coordination in management.

5. Domestic Trade

The total value of commodities purchased by commercial departments owned by the whole

people reached 226,300 million yuan in 1980, topping that of the previous year by 13.6%. This included 156,760 million yuan worth of manufactured goods, an increase of 12.8% over 1979; and 67,700 million yuan worth of farm products and sideline products, an increase of 15.4%. Purchases of most manufactured goods and farm produce surpassed those of 1979. Among them, the purchase of cotton cloth rose by 17.9% over 1979; chemical fibre cloth, 71.3%; leather shoes, 43.5%; wrist-watches, sewing machines, bicycles and television sets, 24 to 40%; radio sets and cassette recorders, 85%; cotton, 25.8%; edible vegetable oil, 26.7%; and hogs, 3%. The purchase of grain, which suffered a loss due to natural disasters, was slightly below the previous year.

The 1980 total value of retail sales was 214,000 million yuan, an 18.9% increase over 1979, or a 12.2% increase if the rise in retail prices is excluded. (The 1980 total value of retail sales included 6,900 million yuan from retail sales by peasants to the nonagricultural population. The 1979 total value of retail sales is correspondingly readjusted to 180,000 million yuan from the original 175,250 million yuan.) Retail sales of consumer goods were marked by an overall increase, and the growth of sales of durable consumer goods was even more rapid.

Compared with the 1979 retail sales of main consumer goods, the sale of edible vegetable oil went up by 20%; pork, 15.3%; sugar, 9.2%; cotton cloth, 7.6%; chemical fibre cloth, 32.5%; woollen textiles, 34.2%; silk fabrics, 25%; leather shoes, 34%; sewing machines, bicycles, radio sets and wrist-watches, from 23 to 66%; and television sets and cassette recorders, 100% and 240%, respectively.

By the end of 1980, commercial departments owned by the whole people kept 9.2% more goods in stock than in 1979.

Although there was a greater supply of market commodities in 1980, supplies still could not meet the growth in social purchasing power. Some industrial consumer goods fell short of demand. The supply of some consumer goods and building materials for rural needs was not sufficient. Some commodities in stock did not satisfy consumer demands.

The government again raised the state purchasing prices for some farm produce in 1980, including cotton, sheep and goat skins, jute and ambar hemp, timber, raw lacquer and tung oil. In addition, more farm produce was purchased at negotiated prices, and at higher prices for that part above the purchase quota. As a result, the total purchasing price index for farm produce and side-

line products went up by 7.1% over the previous year, which was 22.1% above 1979. Starting in November 1979, the state raised the retail price for principal nonstaple foodstuffs, and in 1980 many places readjusted the retail prices for a small number of manufactured goods, thus causing the annual average level of retail prices of the nation (including state listed prices, negotiated prices and prices on the rural market) to register a 6% increase over 1979. (The general level of retail prices is calculated according to the average prices of the year. It shows a 2.2% rise if December 1980 is compared with the corresponding 1979 period.) Among these was an 8.1% increase in cities and a 4.4% increase in rural areas; a 7.1% increase in consumer goods prices and a 1% increase in the price of means of production for rural use.

Among price fluctuations for consumer goods, the price of clothing remained the same; food rose by 10.5% (of which state list price of non-staple food rose by 13.8%); daily necessities, 1.2%; commodities for cultural and recreational activities, 0.7%; pharmaceuticals, 0.9%; and fuel, 0.7%.

6. Foreign Trade and Tourism

The total value of imports and exports came to 56,300 million yuan in 1980, a 23.6% increase compared with 1979. Export value totalled 27,200 million yuan, exceeding 1979 by 28.7%, and imports were valued at 29,100 million yuan, a rise of 19.2%. Import value outstripped export value by 1,900 million yuan.

The proportion of heavy industrial products and mineral products among exported commodities rose from 44% in 1979 to 51.8% in 1980. Coal, oil products, machine tools and bearings experienced relatively large export growth.

Of imported commodities, complete sets of equipment showed a 103.9% increase over 1979, accounting for 12.9% of total import value as against 7.6% in 1979. Imports of raw materials for textile and light industries, such as cotton, chemical fibres and paper pulp, shot up by 68.6% over 1979, and their proportion of the total import value rose to 24.3% as against 17.2% in the year before. The import of consumer goods, including grain, fats, vegetable oils, wrist-watches, television sets and cassette recorders, went up by 35.6% over 1979, accounting for 21.2% of the total import value as against 18.6% in 1979. Imports of chemical fertilizer and other means of production for rural use rose by 48.4% over the previous year, and their proportion of the total import value rose from 5.9% in 1979 to 7.3% in 1980. Imports of single-item equipment, rolled steel and pig iron were cut back considerably.

In 1980, the total number of foreigners, overseas Chinese and Chinese compatriots from Hong Kong and Macao coming on tours and visits and for trade, sports and scientific and cultural exchanges reached 5.7 million, 1,499,000 more than in the previous year, or a 35.6% increase. Among them, tourists from 164 countries and regions totalled 529,000, a 46% rise. Annual foreign exchange income from visitors was 920 million yuan, 32% more than 1979.

7. Science and Technology, Education, Culture

At the end of 1980, there were 5,296,000 personnel in the natural sciences and technological units owned by the whole people. Good results were achieved in more than 2,600 major scientific and technological research items in 1980. Among these were 107 innovations and inventions ratified by the state.

The number of institutions of higher learning in 1980 reached 675, or 42 more than the figure in the preceding year. The student body came to 1,144,000, an increase of 124,000 over 1979. This included 281,000 newly enrolled (including locally enlarged enrollments), 6,000 more than the previous year's figure. There were 324,000 people enrolled in TV colleges, an increase of 44,000 over the preceding year. In addition, 455,000 people were enrolled in factory-run or spare-time colleges. Secondary technical schools had an enrollment of 1,243,000, 44,000 more than in 1979. Reform in the structure of secondary education continued. There were 55,081,000 regular middle-school students, a decline of 3,734,000 compared with the previous year. There were 454,000 students in agricultural and other vocational schools at the secondary education level. Workers' training schools had a total enrollment of 680,000. There were 146.27 million primary school pupils and 11.51 million children in kindergartens. With a view to training specialists, 2,124 students were sent abroad to study by educational departments in 1980. Many departments, localities and units organized various types of courses for workers, staff members, peasants and job-waiting youths to study and improve their general knowledge or vocational skills.

Literature, drama, films, ballad-singing, music, dance and fine arts flourished in 1980. Eighty-two feature films were produced in the year, and altogether 116 new full-length films of various types were distributed. More than 1,000 theatrical productions were staged in 1980, including items on modern themes, new versions of historical themes and traditional items. There were 125,000

film-projection units, 3,553 performing arts troupes, 2,912 cultural centres, 1,732 public libraries, and 365 museums in China. The number of broadcasting stations reached 106, with 484 transmitting and relay stations. There were 38 TV centres and 246 TV transmitting and relay stations, each equipped with transmitters of 1,000 watts or more. The annual output of national and provincial newspapers was 10,040 million copies. An aggregate of 1,120 million copies of magazines and 4,500 million copies of books were published.

In science and technology, education and culture, problems remain: insufficient scientists and technicians; insufficient school buildings, and backward equipment; irrational structure of secondary education; and improper use of persons with special knowledge.

8. Health Work and Sports

Efforts continued in 1980 to readjust health departments at various levels, consolidate medical and health work organizations and strengthen scientific management. The national total of hospital beds reached 1,982,000, or 2.6% more than the previous year. There were 2,798,000 professional medical workers, representing a 5.9% increase over the preceding year. They included 262,000 doctors in traditional Chinese medicine, 447,000 senior and 444,000 junior doctors of Western medicine, and 466,000 nurses. Health departments at various levels strengthened in-service training of medical workers, launched patriotic health campaigns and conducted work to prevent and treat diseases on a wide scale.

The year 1980 saw Chinese athletes chalk up world records in seven sports: weight-lifting, shooting, model-airplane flying, parachuting and model boats, as well as equal three other world records. China won three world championships in table tennis and gymnastics. One hundred and twenty national records and 46 junior national records were broken. Some 23,000 sports meets were held at the county level and above. An additional 8.56 million people attained the standards set by the National Physical Training Programme, representing a 37% increase over the preceding year.

9. People's Livelihood

Continued improvements were made in the livelihood of most of the urban and rural population in 1980. The per capita income in rural people's communes derived from the basic ac-

counting units of the collective economy was 85.9 yuan, an increase of 2.5 yuan over 1979. Owing to a fairly rapid development of household sideline occupations, coupled with a rise in the state purchasing prices of some farm produce and other factors, the total income of members of rural people's communes increased substantially over that of the previous year.

Nine million people were provided with jobs in 1980. They included young people waiting for jobs and other people in cities and towns throughout China, and graduates of universities, colleges and secondary technical schools in 1980 who were assigned jobs under the unified state plan. The total number of workers and staff members employed in units owned by the whole people and collectively owned units came to 104.44 million at the end of 1980, 4.77 million more than a year before. They included 80.19 million in units owned by the whole people, an increase of 3.26 million over the 1979 figure; and 24.25 million in collectively owned units in cities and towns, an increase of 1.51 million over the number in 1979. In addition, more than 810,000 people operated individual businesses in cities and towns, representing an increase of 500,000 over 1979.

Owing to the increase in the number of workers and staff members, pay rises for workers and staff members, the adoption of piece work pay on a wider scale, the implementation of a reward system and subsidies for price rises in nonstaple foods, the total 1980 wage bill reached 77,300 million yuan, exceeding the previous year by 19.5%. The wage bill for workers and staff members employed in units owned by the whole people amounted to 62,800 million yuan, an increase of 18.5% over 1979. The wage bill for workers and staff members in collectively owned units in cities and towns totalled 14,500 million yuan, an increase of 23.9%.

Wages of workers and staff members throughout the country averaged 762 yuan in 1980, a 14.1% increment over the previous year, or a real increase of 6.1% after deducting the 7.5% rise in the cost of living index. The average wage of workers and staff members employed in units owned by the whole people was 803 yuan in 1980, representing a 13.9% increase over 1979, or a real gain of 6%. The average wage of workers and staff members in collectively owned units in cities and towns was 624 yuan, representing a 15.1% increase over 1979, or a real gain of 7.1%.

At the end of 1980, the savings deposits of the urban and rural population totalled 39,900 million yuan, topping the 1979 figure by 41.9%.

Some 82.3 million sq. m. of housing were built in 1980 for workers and staff members in units owned by the whole people using investment

for capital construction, a 31.6% increase over 1979.

Some problems remain in people's livelihood: Life is still rather hard for the peasants in some areas affected by natural calamities; price hikes affect the living standards of workers and staff members who receive no bonuses; jobs have yet to be given to some people in cities and towns; some units pass out bonuses and subsidies indiscriminately and in violation of state regulations;

and quite a few units raise prices at will or in disguised forms.

10. Population

At the end of 1980, China had a population of 982.55 million, an increase of 11.63 million, or 12%, over the 1979 figure of 970.92 million.

3. CHINA'S 1980 MONETARY STATISTICS

Receipts and Payments of State Credit Funds (in 100 million yuan)

Item	End of 1979	End of 1980
Deposits	1,340.04	1,658.64
Deposits by enterprises	468.91	573.09
Deposits by the treasury	148.68	162.02
Capital construction funds	131.30	171.75
Deposits by government departments and organizations	184.88	229.45
Savings deposits in cities and towns	202.56	282.49
Deposits in rural areas	203.71	239.84
Deposits by international monetary institutions		34.27
Currency in circulation	267.71	346.20
Bank working funds	427.88	477.33
Bank surplus	49.45	27.19
Others	77.52	80.63
Total credit funds	2,162.60	2,624.26
Loans	2,039.63	2,414.30
To industrial production enterprises	363.09	431.58
To industrial supply and marketing enterprises and materials supply departments	242.12	236.03

SECTION VII:

CHRONOLOGY OF MAJOR ECONOMIC EVENTS IN CHINA

CHRONOLOGY OF MAJOR ECONOMIC EVENTS IN CHINA

December 1978 – December 1980

*Prepared by the Library,
Institute of Industrial Economics, Chinese Academy of Social Sciences*

1978

December

December 10 to 20. The Ministry of Metallurgical Industry held a national meeting of outstanding units and workers on the metallurgical front in Beijing to celebrate a breakthrough in China's steel output, which topped 30 million tons.

The State Council approved and circulated the Regulations on the Trial Use of Enterprise Funds in State Enterprises laid down by the Ministry of Finance.

The Xinhua News Agency reported that the Wuhan Iron and Steel Works had basically completed construction of a 1.7-m. rolling mill. Construction began on our first large, modern iron and steel production centre – the Baoshan Iron and Steel Complex in Shanghai. The Zhicheng-Liuzhou Railway was completed and opened to traffic. It is 885 km. long and is the second major north-south railway line in China.

December 18 to 22. The Third Plenary Session of the 11th Central Committee of the Communist Party of China was held in Beijing. It was decided at the Plenary session that, beginning from 1979, the focus of the party's work should be shifted to socialist modernization. The session discussed and adopted in principle the arrangements set forth in the national economic plans for 1979 and 1980. It discussed agricultural problems in a thoroughgoing way and agreed to distribute the Decisions of the Central Committee of the Communist Party of China on Some Questions Concerning the Acceleration of Agricultural Development (Draft) and the Regulations on the Work in the Rural People's Communes (Draft for Trial Implementation) to the provinces, municipalities and autonomous regions for discussion and trial implementation.

1979

January

January 15. The State Council issued a notice on protecting forests and forbidding the un-

planned and uncontrolled felling of trees. Ten measures were put forward in the notice.

The Xinhua News Agency reported that another large modern chemical fertilizer plant in our country – the Chishui Natural Gas and Chemical Fertilizer Plant, in Guizhou Province – was completed and went into production.

February

February 4 to March 12. A national conference of heads of the administrative bureaus for industry and commerce was convened in Beijing. The conference defined the guiding principle of supporting industrial and agricultural production, promoting the interchange of commodities, enlivening markets and aiding consumers.

February 5 to 28. The People's Bank of China held a national conference of presidents of bank branches in Beijing to discuss how to bring the role of banks into greater play and thus promote the readjustment, consolidation and rapid development of the national economy.

A national conference of heads of light industry bureaus was held in Shanghai. The conference set tasks and worked out concrete plans for turning out more light industrial products of higher quality and newer design.

A national conference of heads of administrative bureaus for industry and commerce was held in Beijing. It discussed questions on encouraging open markets in large and medium-sized cities.

A national conference of heads of geological bureaus decided to reform the management system and management methods through a division of labour according to fields of specialization.

February 5 to March 1. The State Bureau of Aquatic Products held a national aquatic products working conference. The conference decided to strengthen the breeding and protection of aquatic resources, to energetically expand reproduction and to conscientiously carry out fishery policies.

February 10. The State Council promulgated the Regulations for Breeding and Protection of aquatic resources.

The 870-km. Beijing-Tongliao Railway was completed and opened to traffic. It is the second main trunk line linking up north China to the northeast.

The State Council decided to revive the operations of the Agricultural Bank of China.

February 17 to 23. The Sixth Session of the Standing Committee of the Fifth National People's Congress was held in Beijing. It adopted in principle the Forest Law of the People's Republic of China (Draft for Trial Implementation) and decided to designate March 20 as National Tree-Planting Day. The session approved the establishment of the State Agricultural Commission, the Ministry of Forestry and the Ministry of Agricultural Machinery. It also approved the renaming of the Ministry of Agriculture and Forestry as the Ministry of Agriculture and the separation of the Ministry of Water Conservancy and Power into the Ministry of Power Industry and the Ministry of Water Conservancy.

Chinese frontier troops launched a counter-attack against the Vietnamese aggressors.

The Ministry of Finance decided to further reduce taxes on the rural people's communes, brigades and production teams beginning from 1979 and specified methods for implementation.

March

March 3. The Chinese Association of Enterprise Management was set up in Beijing. Yuan Baohua is the president.

A national standardization working conference was held. The conference discussed the Regulations of the People's Republic of China on the Management of Standardization Work (Draft).

The State Capital Construction Commission convened a national working conference in Beijing to discuss capital construction. The conference suggested that the major task on the capital construction front at present is to do a good job in the readjustment, consolidation and restructuring of capital construction work.

Beginning in March, the State Council successively raised state purchase prices for 18 major farm products by an average of 24.8%.

The Xinhua News Agency reported that another railway linking up China's north and south-central region — the Taiyuan-Jiaozuo Railway — was opened to traffic. It also reported that the Gongzui Power Station, with a generating capacity of 750,000 kw., was completed and had begun generating electricity. The station is situated in Leshan County, Sichuan Province. It is at present the largest hydroelectric power station in southwest China.

April

April 1. With the approval of the State Council, the People's Bank of China raised the interest rate on time deposits in Renminbi (RMB) made by urban and rural inhabitants and by overseas Chinese.

A national conference of heads of statistical bureaus in various provinces, municipalities and autonomous regions was held. The conference suggested improving statistical work in six critical areas.

April 3 to 7. The State Agricultural Commission, the State Scientific and Technological Commission, the Ministry of Agriculture and the Chinese Academy of Sciences jointly held a national conference in Beijing to discuss investigation of natural agricultural resources and regional planning. The conference declared the formal establishment of the National Commission for Investigating Natural Agricultural Resources and Regional Planning.

March 20 to April 23. A national postal and telecommunications working conference was held in Beijing. The conference held that it must conscientiously implement the principle of readjustment, restructuring, consolidation and improvement, and transform the backwardness of postal and telecommunications work as speedily as possible.

The State General Administration of Exchange Control was set up.

May

The Ministry of Agricultural Machinery convened in Beijing a national conference of heads of agricultural machinery bureaus in various provinces, municipalities and autonomous regions. The conference called for a conscientious readjustment of the agricultural machine-building industry.

A national working conference on customs work was held in Beijing. The conference held that customs workers must "levy taxes in accordance with the law, facilitate the lawful traffic of people and goods, prohibit smuggling and illegal activities, and defend and promote the Four Modernizations."

May 16. The State Economic Commission set up a telephone conference in Beijing to mobilize the workers, cadres and technicians on the industrial and communications front throughout the country to rapidly bring about an upsurge in the

mass movement to increase production and practice economy.

The State Economic Commission issued a circular specially demanding that various areas and relevant departments give priority to textiles and other industries in supplying fuel, power and raw materials.

May 28 to June 4. In Beijing, the State Economic Commission, the State Scientific and Technological Commission, the State Agricultural Commission and the Ministry of Agriculture jointly convened a national conference of heads of offices for promoting the use of methane gas. The conference summed up the experience of recent years in rural production of methane gas and laid down concrete steps to energetically promote the use of methane gas in rural areas.

June

June 18 to July 1. The Second Session of the Fifth National People's Congress was held in Beijing. Premier Hua Guofeng delivered the report on the work of the government. The session approved the national economic plan for 1979 and the budget for 1978.

The State Agricultural Commission and the State Scientific and Technological Commission called a national forum in Wuxi County, Jiangsu Province to discuss setting up centres for scientific experiments in agricultural modernization.

The Ministry of Finance held a national taxation working conference in Chengdu. The conference stressed making full use of taxation as an economic lever.

The Ministry of Agricultural Machinery held a national forum in Yueyang, Hunan Province, on the regionalization of agricultural mechanization. The forum called for doing a good job in this field in accordance with natural and economic laws.

June 28 to July 4. The Chinese Standardization Association held its first national representative assembly in Hangzhou.

June 30. The State Council promulgated the Regulations of the People's Republic of China on Rewards for Quality Products.

The State Planning Commission, the State Economic Commission and the State Bureau of Labour jointly issued a circular requiring the various areas, departments and units throughout the country to earnestly implement the labour defence laws and regulations issued by the State Council.

The first phase in the construction of the Shanghai Petrochemical Works - a large, modern

petrochemical fibre complex - was successfully completed, examined and accepted for operation.

July

July 1. The Standing Committee of the Fifth National People's Congress convened its Ninth Session. The session decided to set up the Financial and Economic Commission under the State Council and appointed Chen Yun as a vice-premier of the State Council and concurrently as chairman of the commission. The Tenth Session, held on July 30, decided to set up the Foreign Investment Commission and the Administrative Commission on Import and Export Affairs. Vice-Premier Gu Mu was appointed chairman of both commissions.

The Financial and Economic Commission under the State Council called a conference of leading cadres of relevant financial departments under the Party Central Committee and the State Council and comrades in economic circles in order to undertake extensive investigations and research into economic problems related to national economic readjustment and to thorough economic restructuring.

The All-China Federation of Supply and Marketing Cooperatives held a national working conference in Beijing on rural catering and service trades. The conference decided to speed up the development of catering and service trades.

The Ministry of Water Conservancy held a national water conservancy conference which summed up experiences in water conservancy work over past 30 years and put forward the major tasks in this field for the three-year period of national economic readjustment.

July 3. The State Council promulgated the Regulations on Some Questions Concerning the Development of Commune- and Brigade-Run Enterprises (Draft for Trial Implementation) and urged that the various provinces, municipalities, autonomous regions and institutions under the State Council immediately discuss and implement these regulations on a trial basis.

July 6 to 11. The Central Committee of the Communist Party of China and the State Council convened a national conference in Beijing on farmland capital construction. Comrade Hua Guofeng attended the conference and made a speech calling on the country to make earnest efforts to shift the focus of work and concentrate on improving the national economy. The speech stressed that farmland capital construction should be carried out in accordance with local conditions and in a diligent manner.

In Dong'an County, Hubei Province, the Ministry of Agriculture convened a national conference of counties where experiments were being conducted in the specialization of seed production, mechanization of seed processing, standardization of seed quality and regionalization of seed varieties, and where seeds were being systematically supplied to counties which are taken as basic units.

July 8 to 26. The Ministry of Commerce held a national forum of heads of commercial bureaus in Beijing. In line with the tasks of national economic readjustment, the conference made further arrangements for work in the field of commerce.

July 10 to 23. The State Council convened a national working conference in Chengdu on increasing production and practicing economy in industry and communications.

A national conference of heads of supply bureaus was also held in Chengdu. The conference decided that the present task was to maintain a balance between supplies and needs, to practice economy resolutely, to clear out warehouse stocks to make room for new goods and to enliven supply work.

The Ministry of Agriculture convened a national on-the-spot meeting on development of the grasslands in livestock-raising areas in the Bairin Right Banner of Iu Uc League, Inner Mongolia Autonomous Region. The meeting summed up the popularized advanced experiences in grassland development.

July 13. The State Council officially issued the following five documents: Some Regulations on Enlarging the Management and Administrative Decision-Making Powers of State-Owned Industrial Enterprises, Regulations on the Retention of a Portion of Profits by the State Enterprises, Provisional Regulations on Increasing the Depreciation Rate of Fixed Assets and Improvement of Depreciation Provisions of State-Owned Industrial Enterprises, Provincial Regulations on Imposing Fixed Assets Taxes on State-Owned Industrial Enterprises, and Provincial Regulations on Instituting Complete Reliance on Bank Credit for Working Capital in State-Owned Industrial Enterprises. The State Council also issued a circular requiring various areas and relevant departments under the State Council to select a number of enterprises under the industrial and communications departments as experimental units.

July 31. The Regulations of the People's Republic of China on Standardization Management were promulgated.

August

A national working conference to discuss problems concerning provision of complete sets of equipment was held in Beijing. The conference required that proper arrangements be made regarding complete sets of equipment immediately required for key projects undertaken by the state.

August 8 to 16. The Ministry of Light Industry convened in Beijing a national assembly of representatives of artists and designers in the industrial arts and crafts.

The Ministry of Agriculture, the Ministry of Light Industry and the Ministry of Commerce jointly called a national conference in Linhai County, Zhejiang Province, of counties that are milk-goat centres. The conference summed up experiences and put forward relevant measures to speed up the breeding and raising of milk goats.

The State Economic Commission held a national assembly of representatives of quality control groups in Beijing. The conference decided to invoke mass supervision of product quality.

The State Council approved a report suggesting that investment in capital construction should take the form of loans instead of allocation of funds and also approved and circulated the Draft Regulations on Capital Construction Loans laid down by the State Planning Commission, the State Capital Construction Commission and the Ministry of Finance. It demanded that the various areas and departments conscientiously organize experimental units.

August 22 to September 12. A national conference of heads of supply and marketing co-operatives from various provinces, municipalities and autonomous regions was held in Beijing. The conference decided to promote the purchase and sale of rural products so as to bring about faster agricultural economic expansion.

August 25. The State Council approved promulgation by the Ministry of Communications of the Regulations of the People's Republic of China on Control of Foreign Ships.

The Xinhua News Agency reported that another large chemical fertilizer plant using imported equipment — the Dongting Nitrogen Fertilizer Plant — had been basically completed. It also reported that track-laying for the Southern Xinjiang Railway (the Turpan-Korla line) had been completed.

September

September 1 to 19. A national working con-

ference on tourism was held in Beidaihe. The conference put forward the plan of receiving 3,500,000 tourists by 1985.

The Xinhua News Agency reported that more than 140 kinds of minerals had been found in our country, making China one of the few countries in the world known to possess a relatively comprehensive assortment of minerals. The Nanyang oil field, another new high- and stable-yield oilfield in China, was constructed and went into operation.

Construction of the new passenger terminal and ancillary buildings of the Beijing International Airport was successfully completed. It is the largest modern airport in China.

A huge meeting in celebration of the second Quality Month was held in Beijing on September 8 and broadcast live through the nationwide broadcasting and television network. The State Council presented 51 gold medals and 121 silver medals for products of outstanding quality.

The State Planning Commission, the State Economic Commission and the State Bureau of Supplies jointly held a second national meeting on reducing oil consumption and economizing on oil.

The Ministry of Commerce held a national forum on catering and service work. The conference called for further development of catering and service networks and centres and for efforts to restore good management and traditional varieties.

September 11 to 13. The Standing Committee of the Fifth National People's Congress convened its 11th session. The session adopted in principle The Environmental Protection Law of the People's Republic of China (for Trial Implementation).

September 25 to 28. The Fourth Plenary Session of the 11th Central Committee of the Communist Party of China was held in Beijing. The session adopted The Decision of the Central Committee of the Communist Party of China on Some Questions Concerning the Acceleration of Agricultural Development.

September 27 to October 17. A national meeting of presidents of branches of the Agricultural Bank was held in Beijing. The meeting resolved to develop credit in the rural areas, to promote the rapid development of agriculture and to realize the modernization of agriculture.

September 28. The State Council held a grand prize award ceremony in Beijing to honour advanced enterprises and model workers on the industrial, communications and capital construction fronts. Representatives of 118 advanced enterprises and 222 model workers accepted the highest awards conferred by the state.

September 29. The Central Committee of the Communist Party of China, the Standing Committee of the National People's Congress and the State Council held a grand rally in celebration of the 30th anniversary of the founding of the People's Republic of China. Comrade Ye Jianying made an important speech at the rally.

October

October 4. The Board of Directors of the China International Trust and Investment Corporation was formally established. Rong Yiren was appointed chairman of the board and president of the corporation.

October 6 to 14. The Ministry of Finance conducted a national working conference in Beijing on agricultural finance. The conference discussed and studied how to raise more funds for the acceleration of agricultural development and how to make better use of funds allocated to agriculture.

The General Administration for Industry and Commerce held a national working conference in Hangzhou to discuss trademarks. The conference decided to do better in the unified registration of trademarks and in strengthening trademark control.

A national sales exhibition of light industrial products was held in Beijing. During the exhibition, the Ministry of Light Industry called a national forum on work in light industry, at which a study was made of ways to do a good job in designing and turning out new light industrial products.

The Central Committee of the Communist Party of China and the State Council issued a circular announcing their decision to raise the prices of eight major non-staple foods, i.e., pork, beef, mutton, poultry, eggs, vegetables, aquatic products and milk, beginning from November 1 and, at the same time, to grant workers and staff members a subsidy for purchasing non-staple foods. The circular also announced the decision to give job promotions to 40% of China's workers and staff members and to increase their wages starting from November 1979.

The National Broadcasting and Television Station broadcast live a meeting held in Beijing marking "Energy-Saving Month." The meeting urged the various areas, trades and professions to mobilize immediately to reduce energy consumption and to conserve energy.

November

November 5. The State Council issued a

circular demanding that various areas carry out a well-publicized, extensive survey of market prices.

The Ministry of Agriculture convened a national meeting in Chengbu Miao Autonomous County, Hunan Province, to discuss animal husbandry in the rural areas, the utilization and development of grass-covered mountains and the breeding and raising of herbivorous livestock.

The National Defence Industries Office held a working conference in Beijing at which it was decided that military industry enterprises should turn out products for both military and civilian use.

November 19 to 27. A national insurance meeting was held in Beijing. The meeting made practicable arrangements for the domestic insurance business, which the State Council had agreed to resume in 1980.

The State Planning Commission, the State Economic Commission and the State Bureau of Supplies jointly held a national working conference on questions relating to timber to promote the experience of the Hangzhou Timber Corporation in making multiple use of timber and in improving utilization rates.

The Ministry of Agricultural Reclamation and State Farms held a national meeting in Wuhan on state farm administration and management. The meeting declared that agricultural reclamation enterprises throughout the country were no longer operating at a deficit as they had been over the last 13 years. The meeting also formulated the Regulations on Some Questions Concerning the Better Administration and Management of State Farms (Draft for Trial Implementation).

The State Council held a national grain meeting in Beijing. The meeting emphasized that, to solve the grain problem, it was necessary to implement resolutely the principle of "basing ourselves on domestic supply, being self-reliant, promoting production and practicing strict economy" as put forward by the Party Central Committee and the State Council.

The People's Construction Bank of China held a working conference in Beijing. The meeting decided to implement on a trial basis in 1980 the Draft Regulations on Capital Construction Loans, as approved by the State Council, with application to textiles and light industries and to tourism in Beijing, Shanghai and Guangdong Province.

The Ministry of Agricultural Machinery held a national working conference at which it was decided to make readjustments in the farm machine-building industry. Ten measures in that regard were put forward at the conference.

December

The State Council held its second awards ceremony in Beijing to honour the nation's advanced units and model workers in the fields of agriculture, finance, commerce, education, public health and scientific research.

Beginning in December, China began trial implementation of the Standards for Farmland Irrigation Water and the Standards for Fishing Waters that were jointly approved and promulgated as national standards by the Environment Protection Leading Group under the State Council, the State Planning Commission, the State Economic Commission, the Ministry of Agriculture and the State Bureau of Aquatic Resources.

December 2 to 9. The State Capital Construction Commission and other units jointly held a national working conference in Qingdao on rural housing. The conference urged various areas to treat rural housing construction as a priority.

The Ministry of Agriculture and three other units jointly called a national meeting in Beijing to discuss silkworm cocoon production. The meeting summed up the situation in silkworm cocoon production during the past few years.

The Ministry of Water Conservancy, the Ministry of Finance and the State Bureau of Aquatic Resources jointly held a meeting in Dongguan County, Guangdong Province, to exchange experiences in fish breeding in reservoirs and in the use of reservoirs for other purposes. The meeting urged water conservancy project departments to promote fish breeding and to utilize reservoirs for other productive activities.

December 5 to January 8. A national forum on the work of trade unions at grassroots levels was held in Beijing. The forum pointed out that trade unions should do a good job of ideological and political work among workers and staff while focusing on economic readjustment.

December 15 to 20. A national conference of heads of family-planning offices in various provinces, municipalities, autonomous regions, and in the army was held in Chengdu. The conference drew up detailed population plans for 1980-81 in line with the 1980 national economic plan.

The State Scientific and Technological Commission and the Ministry of Building-Materials Industry held a meeting in Suzhou to exchange experiences in manufacturing new types of building materials and in experimental construction techniques.

December 15 to 21. The State Council held a national meeting on cotton production in Beijing. The meeting stated that the central task of cotton producing centres for the coming two years is to promote cotton production.

The Xinhua News Agency reported that the Sichuan Vinlon Plant, the largest in China, was virtually completed. Since 1979, 24 large and medium-sized light industrial projects were completed and put into operation, while eight large and medium-sized projects in the textile industry entered service.

1980

January

January 1. The National Committee of the People's Political Consultative Conference held a New Year's Tea Party. Chairman Deng Xiaoping pointed out in his speech at the party that the 1980's are crucial to the realization of the Four Modernizations, that the most important task, domestically, is to do a good job in economic construction and that leadership by the Communist Party is the cardinal rule of the four basic principles.

Renmin Ribao (People's Daily) published an editorial "Usher in a New Period of Great Achievements."

The State Council approved of a trial method whereby the People's Bank of China would grant medium- or short-term special loans to light industries and textiles. According to the principle of "six priorities," the bank would issue 2,000 million yuan of medium- or short-term special credits and U.S.\$300 million in foreign-exchange credits to buyers so as to extend the productive capacity of light industries and textiles.

The First Ministry of Machine-Building instituted floating prices for 16 types of mechanical and electrical engineering products.

Beginning from 1980, cultural, educational and scientific research institutions and administrative establishments were tentatively made responsible for their own budgets.

The first set of amino-hexaphosphate manufacturing equipment in China was put into production at the Jiande Organic Chemical Plant, Zhejiang Province. The first bank gangue-burning power station was built in Jixi, Heilongjiang Province. It was reported that at the end of 1979, the first installation for alkene production was designed, built and outfitted by China and a sand cracking stove was put into production by the Lanzhou Chemical Industrial Corporation.

January 2. *Renmin Ribao* published a commentary entitled "Carrying Out the Spirit of Plain Living and Hard Struggle," which pointed out that the goal of socialist production is to ensure that the increasing material and cultural demands of the whole society are met to the maximum.

January 3. The State Council approved and circulated a report of the Ministry of Agricultural Machinery on the vigorous development of wheat harvesting machinery and pointed out that appreciation of the importance of wheat harvesting mechanization is an important step in realizing overall agricultural mechanization.

The State Bureau of Metrology held a national working conference in Beijing, summing up experiences and drawing up work plans.

January 4 to 18. A national conference of heads of geological bureaus was held in Beijing. The conference decided to readjust plans for mineral exploration so as to meet the needs of the Four Modernizations.

January 4 to 23. A national meeting to discuss commodity prices was held in Beijing. The meeting laid down principles and tasks for 1980: proceeding from the desire for stability and unity, to keep prices relatively stable, to make earnest efforts to strengthen price controls and to continue to monitor prices.

January 5. The All-China Federation of Trade Unions held a working conference of women workers and staff members in Beijing. The conference discussed current tasks and called for the mobilization of women workers and staff members to make greater contributions to the Four Modernizations.

January 5 to 12. A national symposium on economic theories of collective ownership in cities and towns was held in Shenyang.

January 6. The Chinese Financial Society and the Chinese Society of Accountants were officially founded at a meeting in Foshan, Guangdong Province.

January 7. The state decided to institute the principle of "six priorities" in light industries and textiles to guarantee rapid development of light industry, textiles and handicrafts.

The Ministry of Agriculture held a forum in Changsha on administration and management of commune- and brigade-run enterprises. The forum

proposed to strengthen work in this field in five respects.

January 7 to 23. A national working conference on metallurgy was held in Beijing. The conference decided that, in view of the overall situation and practical considerations, the departments of the metallurgical industry should adhere to the principle of making way for other industries, while going all out to increase production, thus promoting comprehensive development.

January 11. The People's Insurance Company of China offered two new types of insurance — business liability insurance (insurance against contractual breaches) and insurance against political risk.

The Xinhua News Agency reported that since 1977, three high-yield petroleum and natural gas wells had been drilled in the Tarim Basin in the southern part of the Xinjiang-Uygur Autonomous Region.

January 12. The Ministry of Coal Industry held a national coal mining telephone conference to call for a movement of "100 days safe production without accidents."

January 13. The first 500,000-volt power transformer in China was successfully trial-manufactured by the Shenyang Transformer Plant. This marked a new level in the transformer manufacturing industry of our country.

January 14 to 31. A national meeting of heads of chemical industry bureaus was held in Beijing. The meeting called for competition that was broader in range and more extensive in content. The meeting required the leading cadres of the chemical industry bureaus and enterprises in various provinces, municipalities and autonomous regions to become personally familiar with sales work, to allow scope for the regulatory role of the market and to promote chemical industrial production.

The State Economic Commission, the State Agricultural Commission and the General Administration for Industry and Commerce jointly issued a circular which demanded the immediate investigation and registration of industrial enterprises.

January 15. The Xinhua News Agency reported that a huge coal field — the Yunlian Coal Field — was discovered in Sichuan Province. Proven coal deposits were over 2,400 million tons.

January 17. The Ministry of Water Conservancy and other units jointly held a national on-the-spot meeting in Chengdu regarding small hydroelectric power stations to address the problem of how to strengthen the "construction, management, supply and utilization" of small hydroelectric stations.

January 19. The first high-dam hydroelectric power station in China — the Wujiangdu Power Station, in Guizhou Province — began generating electricity.

A basic protocol for Sino-Japanese cooperation in developing the Sanjiang wasteland in Heilongjiang Province was signed in Beijing.

January 20. The Jining-Heze Railway was opened to traffic. It is 108 km. long.

January 21. The National Defence Industries Office of the State Council held a meeting in Beijing to discuss the livelihood of workers and staff members in national defence industries. The meeting emphasized the necessity of plain living and hard struggle and of proper management of collective welfare.

The State Council issued an emergency circular to prohibit the distribution of year-end bonuses during this year's Spring Festival.

January 22. The State Council approved and circulated the Trial Policy of Allowing the State-Owned Industrial Enterprises to Keep a Portion of Their Profits, as laid down by the State Economic Commission and the Ministry of Finance; and it informed those enterprises conducting experimental restructuring that they should begin implementation of the new policy in 1980.

Shaanxi Province ascertained that coal reserves of the Binxian County Coal Field exceed 4,000 million tons and that the area of the coal field is 1,170 sq. km.

January 22 to February 6. A national working conference on electric power supplies was held in Beijing. At the conference it was decided — on the basis of fulfilling state plans in an all-around way — to strive to generate an extra 10,000 million kw. of electricity and to install power generators with an extra capacity of 1 million kw. above the targets set in the plans for 1980.

January 23 to February 2. A national meeting of heads of textile industry bureaus was held in Beijing. The meeting decided that the focal point of work for the year was to carry out internal readjustment and to go all out to promote chemical fibre production. The meeting declared

that it was necessary to tap potential and make progress in regard to the quality and variety of products.

January 24. The Central Committee of the Communist Party of China and the State Council issued a circular demanding that the various areas and units throughout the country strictly reduce nonproductive spending and combat waste.

The State Economic Commission called a special meeting to draw up energy-saving plans for 1980. The meeting urged various departments to adopt effective measures to significantly cut down energy consumption.

January 26. It was reported that the State Council recently approved the Bank of China's Report on Protecting the Renminbi (RMB), Centralizing Markets and Prohibiting the Circulation of Foreign Currencies in Internal Markets and demanded its implementation by the various localities and departments.

January 28. Another large oil and natural gas field in our country, the Liaohai oil field, was reported to have begun production. It was reported that at present, the annual output of crude oil is 5 million tons and that of natural gas, 1,700 million cu.m.

January 28 to February 8. A national conference of leading cadres of the electronics industry was held in Beijing. The conference emphasized studying questions concerning readjustment and consolidation in the electronics industry and drew up plans for work in 1980. The conference proposed that a change should be made in the present situation in which there are too many factories and strength is scattered; thus, readjustment should be carried out well and the role of local electronics industries should be brought into full play.

January 29. A working conference of financial supervisors was held in Beijing. The conference demanded that the financial supervisory departments in various places combat activities that violate financial and economic regulations.

January 30 to February 8. A meeting of heads of machine-building industry departments and bureaus of various provinces, municipalities and autonomous regions was held in Beijing. The meeting resolved that during the present period of readjustment the machine-building industry should tap new sources to achieve development.

February

February 1. The State Council promulgated the Provisional Regulations on Instituting a Division of Revenues and Expenditures Between Central and Local Authorities, While Holding the Latter Responsible for Their Own Surpluses and Deficits.

With the approval of the State Council, the Chinese Modern Building Materials Corporation was founded in Beijing.

The Ministry of Foreign Affairs of the People's Republic of China and the Embassy of the United States in China exchanged notes in Beijing, whereupon the agreement on Sino-U.S. trade relations came into force.

February 4. The *People's Daily* published a commentary entitled "Tapping New Sources of Production," stating that this was an important measure in readjusting the national economy and in implementing the principle of promoting production and practicing economy; it said that this was a major issue in economic work for 1980.

February 11. A new industrial zone went under construction in the Shekou area of Shenzhen, Guangdong Province, to facilitate investment and factory building in China by firms from Hong Kong, Macao and foreign countries.

February 12. The 13th Session of the Standing Committee of the Fifth National People's Congress was held in Beijing. Yuan Baohua, Vice-Chairman of the State Economic Commission, gave a report on the situation in industry and communications in 1979 and on planned tasks for 1980. He set forth five tasks and ten projects for 1980 which would receive special attention. In order to consolidate unified leadership in the machine-building industry, the session decided to establish a machine-building industrial commission under the State Council. Vice-Premier Bo Yibo is concurrently chairman of the commission.

February 13. The State Council issued the "Circular on Drawing Up Long-Term Plans," which enunciated the decision to begin drawing up a ten-year programme (1981-90) for national economic development.

February 15. The State Council decided to set up the General Administration of Customs of the People's Republic of China.

February 19. The Ministry of Agriculture held a national conference of heads of bureaus (departments) of agriculture and animal husbandry in Beijing; it stressed an overall increase in agricultural production in 1980.

The State Economic Commission put forward three proposals for doing a good job in trying to enhance the decision-making powers of enterprises. Over 3,000 industrial enterprises — or 7% of all major state-run industrial enterprises, accounting for more than 30% of gross output value — were experimenting with added decision-making powers.

February 21. The State Economic Commission decided to stress work in five fields in 1980 and to successfully carry out enterprise readjustments according to the requirements of modernization.

A large coal field was discovered in the Inner Mongolia Autonomous Region. It has proven coal reserves of 14,600 million tons, with estimated reserves exceeding 36 billion tons.

February 22. The State Council approved and distributed a report on strengthening energy-saving efforts submitted by the State Economic Commission and the State Planning Commission. It pointed out that in order to realize the Four Modernizations the energy question should be handled well.

February 23 to 29. The Fifth Plenary Session of the 11th Central Committee of the Communist Party of China was convened in Beijing. A Secretariat of the Central Committee was established; Comrade Hu Yaobang was elected General Secretary of the Secretariat.

February 25. The Xinhua News Agency reported that by the end of 1979, China's proven coal deposits exceeded 600 billion tons.

February 25 to March 10. A national working conference on coal mining was held in Beijing. The conference decided to take readjustment as the central task in drawing up work plans for 1980. It also decided that the coal industry should successfully carry out readjustment while promoting production and practicing economy.

February 27. The State Economic Commission held a production control meeting which decided to close the Production Control Bureau under the State Economic Commission and issued the Circular on Bringing into Play the Role of Production Control by Various Departments and Localities.

The State Administration of Urban Construction issued a circular on going all out to plant trees in cities.

February 28 to March 9. The Chinese Enter-

prise Management Society held its first annual meeting in Beijing.

The State Planning Committee and four other units jointly held the third national forum on controlling group purchases in Beijing. The forum urged that, in 1980, close attention be paid to controlling purchases by social groups and that this work be done well.

March

March 1. The Environmental Protection Leading Group under the State Council inaugurated a National Environmental Protection Propaganda Month, for March.

March 1 to 14. A national conference of heads of light industry departments and bureaus was held in Beijing. The conference summed up and exchanged experiences in speeding up the development of light industry and demanded that party committees at all levels consolidate and improve leadership in light industry. To this end, the *People's Daily* published an editorial entitled *The Whole Party Attaches Importance to Light Industry*.

March 3. It was reported that China's proven iron ore deposits stood at 44,000 million tons.

March 5. The Central Committee of the Communist Party of China and the State Council issued a directive on going all out to plant trees and pointed out that planting trees was a major strategic task.

March 8. The All-China Federation of Trade Unions promulgated the Regulations Concerning Selection of Model Workers.

March 11 to 18. The national working conference of the building materials industry was held in Beijing. The conference decided to increase production in the building materials industry in 1980 and, during the readjustment, to bring the role of existing enterprises into full play and make the building materials industry a truly leading industry.

The State Economic Commission promulgated the Tentative Rules for Exercising Total Quality Control in Industrial Enterprises.

March 13. The Ministry of Agricultural Machinery held a national working conference on agricultural machinery management. The conference put forward the task of raising the level of agricultural machinery management to a new stage in 1980 and worked out six concrete measures in this regard.

A wind-driven electric power generator with an 18-kw. capacity, the largest of this type in China, began generating electricity on Sijiao Island, Zhejiang Province.

March 15. Annex I to the Protocol Between the Chinese and U.S. Governments on Cooperation in Hydroelectric Power, Generation and Related Use of Water Resources was signed in Beijing.

March 15 to 23. The second national congress of the Chinese Scientific and Technical Association was held in Beijing.

March 16. It was announced that a national working conference on housing property and construction was held recently. It agreed to strive for the construction of more housing in 1980 than 1979.

March 19. The China Construction Machinery Corporation, the Schindler Holding Ag (a Swiss firm) and the Jardine Schindler (Far East) Holdings, S.A., (a Hong Kong firm), signed an agreement in Beijing for establishment of a joint-venture elevator company in China.

In order to strengthen foreign-exchange controls, the State Council authorized the Bank of China to issue foreign-exchange certificates beginning April 1.

March 21. A contract to establish a joint-venture company for joint management of shipping business was signed in Beijing between the China National Ship-Building Industry Corporation, the China National Ship-Chartering Corporation, the Hong Kong Shipping Group and World International Finance Limited.

March 21 to April 14. A national working conference to discuss capital construction was held in Beijing. The conference held discussions on continuing the policy of readjustment, curtailing capital construction and reforming the managerial system. It held that the most important task in capital construction readjustment was to curtail and limit the scope of capital construction.

March 22. The State Council approved and distributed the Report on Speeding Up the Development of Animal Husbandry made by the Ministry of Agriculture and pointed out that animal husbandry was a very weak link in China's agriculture and that it was important to speed up the development of animal husbandry, to increase the proportion of livestock breeding in agriculture, and to increase the proportion of pork, egg and dairy products in the national diet.

March 24 to 30. A national working conference was held on exporting electronic industrial products.

A large coal field was discovered in Huating County, Gansu Province. Its proven area is over 100 sq. km. with known coal reserves of 3,300 million tons.

March 25. A national forum of heads of commercial bureaus was held in Beijing. The forum put forward eight measures to ensure the basic stability of market prices in 1980.

March 26. A national working conference to discuss economic relations with foreign countries was held in Beijing. The tasks put forward by the conference were to work earnestly for good economic relations with foreign countries and to strengthen international economic and technical cooperation.

March 29. The Xinhua News Agency reported that in 1979 the crude oil output of the Renqiu Oilfield in north China exceeded 10 million tons, comprising over 10% of the national output of crude oil.

March 31. The national conference of heads of administrative bureaus for industry and commerce held its closing session. The conference decided that the main tasks for 1980 were to support production, promote distribution, increase co-ordination, enhance the welfare of the masses, protect legal operations and prohibit illegal activities.

April

April 1. The State Planning Commission, the State Economic Commission and the State Bureau of Labour jointly issued a circular calling for the trial implementation of the Provisional Rules Concerning the Piece-Work System in State Enterprises (Draft).

Beginning today, with the approval of the State Council, the People's Bank of China again increased the interest rates on urban and rural savings deposits of individuals, as well as on deposits in Renminbi (RMB) made by overseas Chinese.

Foreign Minister Huang Hua and Vice Foreign Minister Han Nianlong sent telegrams to the International Monetary Fund and World Bank, respectively, demanding restoration of China's legitimate seats in those two international financial organizations.

April 2. The spokesman for our General Administration of Customs discussed problems concerning customs formalities and tax collection in trade between Taiwan and the mainland and made it clear that trade between Taiwan and the mainland is an exchange of goods between localities.

The State Economic Commission, the State Scientific and Technological Commission and the State Planning Commission jointly held a forum on developing new products and adopting new techniques. The meeting called for the application to production of new ideas gained from scientific research and new technologies developed at home and abroad, so as to change the backwardness of our industrial products and production technology as quickly as possible and to meet the demands of international and domestic markets.

April 3. The State Council approved and distributed the report of the Agricultural Bank of China on the meeting of the heads of its branch banks and pointed out that resumption of the operations of the bank was an important measure for accelerating the development of agriculture and that funds for agricultural loans should be well managed and used so as to derive their maximum returns.

April 4. The *People's Daily* issued an editorial, entitled "The Guiding Ideology of Doing Things Within the Limits of Our Capability Is Very Important." On June 9, 12, 16 and 26, the newspaper carried four editorials in succession, entitled "It Is An Important Principle to Do Things Within the Limits of Our Capabilities in Capital Construction," "More Haste, Less Speed," "Leaving No Loopholes Is a Very Important Principle in Planning Work" and "What to Uphold and What to Oppose in Our Economic Work." All four editorials expounded on the guiding ideology of doing things within the limits of China's capabilities.

April 4 to 15. A national working conference on transport and communications was held in Beijing. The meeting called for strengthening weak links, adjusting ratios and making great efforts to improve transportation and communications.

The People's Bank of China issued Renminbi currency coinage in four new denominations: 10 cents, 20 cents, 50 cents and 1 yuan.

April 5. The State Capital Construction Commission, the All-China Federation of Trade Unions and three other units jointly held a meeting to commend and present awards to capital construction enterprises in Beijing, Tianjin and

Tangshan in the drive for high-quality work.

The meeting of the heads of the branch banks of the People's Bank of China was held in Beijing. The meeting stated that work should continue to be done in accordance with economic laws so as to revitalize bank work.

April 6 to 21. A national meeting of the heads of material supply bureaus was held in Nanjing, at which it was decided to further implement the principle of combining regulation through planning with regulation through the market and to make the distribution of means of production more flexible.

April 7. The State Council approved and circulated the Report on Strengthening Education in the Legal System in Industrial and Communications Enterprises and Adhering Strictly to the Law in Dealing with Worker and Staff Injuries and Deaths. The report was submitted by the State Economic Commission, the State Bureau of Labour and the All-China Federation of Trade Unions. It pointed out that those who neglected their duties, acted irresponsibly, disregarded safety regulations, broke operational rules, resorted to coercion and commandism and issued arbitrary orders and, as a result, were responsible for major injuries and deaths, should be punished.

The Ministry of Textile Industry and the State Bureau of Labour jointly issued a circular enunciating their decision to introduce the system of "four groups with three at work and one at rest" in 54 woolen textile and 24 linen textile enterprises.

April 8. Li Renjun, the vice-minister in charge of the State Planning Commission, gave a report on the implementation of the 1979 National Economic Plan and on arrangements for the national economic plan for 1980 to the 14th Session of the Standing Committee of the Fifth National People's Congress.

The Central Committee of the Communist Party of China and the State Council issued a circular concerning strengthening price controls and strictly forbidding arbitrary price increases or concealed measures of inflation. They required all localities and units to strengthen price controls and to basically ensure stable market prices.

A national meeting of the heads of China's customs houses ended. The meeting pointed out that the central task in customs work is the exercise of its supervision and control functions.

April 9 to 19. The State Council held a national working conference in Nanjing on increasing production, practicing economy, boosting

revenues and cutting down expenditures in industry and communications. At the conference, five major policies concerning enterprise management were discussed.

April 10. The Xinhua News Agency reported that up to now, 3,358 industrial enterprises, or 8% of all enterprises under the state budget, had experimented with added decision-making powers. Their output value accounted for one-third of the total output value of all industrial enterprises and their profits accounted for 40% of total profits.

April 10 to 14. A meeting to make commendations and issue awards in the geological field was held in Beijing. Units and individuals with outstanding achievements in geological and mineral exploration over the past 30 years were commended and rewarded.

April 14. The State Council approved the setting up of a "Safety Month" programme for stepping up our efforts in labour safety protection in industrial and mining enterprises. The State Economic Commission and nine other units jointly issued a circular instituting "Safety Months."

April 14 to 18. The China Technical Economy Research Society and China Management Modernization Research Society jointly held a symposium on economic reforms in Beijing.

April 17. The International Monetary Fund and the Executive Board of the World Bank, respectively adopted resolutions on the restoration of China's legitimate seats in the two organizations.

April 20. A national conference to discuss recomputation of enterprise assets, making up deficits, increasing surpluses, and economic accounting ended in Nanjing. The conference called on all enterprises to do what they could to discover additional sources of revenue, to increase revenues, and to strictly control and economize on expenditures.

April 21 to 28. The China World Economic Society held its inaugural meeting in Shanghai.

April 22. The Central Committee of the Communist Party of China and the State Council jointly issued a circular announcing the decision to combine the National Conference of Model Workers and the National Conference of Model Agricultural Workers into one conference, namely, the National Conference of Model Workers, and to postpone its first session until around May 1, 1981.

April 30. The State Statistical Bureau issued a communique on the fulfilment of China's 1979 national economic plan. According to the communique, total industrial and agricultural output value in 1979 was 617,500 million yuan, an 8.5% increase over 1978. National income totalled 337,000 million yuan.

May

May 1. The second major trunk railway from Beijing to Northeast China — the Beijing-Tongliao Railway — was opened to traffic. It is 806 km. long.

The Xinhua News Agency reported that the output of the Daqing oil field reached 50 million tons for four years running.

May 2. The All-China Federation of Trade Unions held the fourth (enlarged) session of its Ninth Standing Committee. A resolution was adopted to mobilize workers and staff to make contributions to the Four Modernizations and to thoroughly implement the policy of increasing production and practicing economy.

May 3. A national conference of leading cadres in charge of railway services was held in Beijing. It was decided at the conference to speed up the work of renovating old railway lines and to further strengthen weak links in transportation and communications.

May 4. The State Capital Construction Commission and four other units jointly issued the Provisional Rules Concerning Expansion of Managerial and Administrative Decision-Making Powers in State-Owned Construction Enterprises.

May 5 to 17. A national conference of heads of architectural engineering bureaus was held in Beijing. The conference urged that construction quality be improved, that the time required to complete a project be reduced and that a positive attitude be taken in promoting building products as commodities.

May 6. The Secretariat of the Central Committee of the Communist Party of China issued four suggestions regarding the work of the Beijing Municipal Government.

May 8. The State Council approved promulgation of Provisional Rules Concerning Professional Titles for Agro-Technicians as worked out by the State Agricultural Commission, the

Ministry of Agriculture, the Ministry of Agricultural Reclamation and State Farms and the Bureau of Scientific and Technical Personnel under the State Council.

The State Council circulated a Summary of the Meeting of Leading Groups in Charge of Building Shelterbelts in the Northwest, the Northern Part of North China and the Western Part of the Northeast, calling on provinces and autonomous regions in these parts of China and relevant departments to strengthen leadership, combine efforts and build a good shelterbelt system.

May 9. A national working conference to discuss product quality supervision and examination was held in Wuhan. It urged that efforts be stepped up to establish a network for supervision and examination of product quality.

May 11. A national working conference dealing with inventions was held in Beijing, at which some of the details involved in the implementing of the Regulations Concerning Awards for Inventions were discussed.

May 11 to 19. A national conference on purchases of summer grain and oil by the state was held in Beijing.

May 12. With the approval of the State Council, the Ministry of Geology and seven other ministries jointly issued the Measures for Rewarding People Who Report Mineral Deposit Discoveries.

May 13. A ceremony to celebrate the 20th anniversary of Daqing's great battle for oil and the march towards modernization on the national oil front was held in Daqing. Medals were awarded to those who had made great contributions to opening up the building of the Daqing oil field. Souvenir badges were presented to all workers and staff.

The Xinhua News Agency reported that in the 20 years since the Daqing oil field was opened, it has produced 490 million tons of crude oil and turned over 50,000 million yuan in profits and taxes to the state, an amount 17.8 times the total state investment in the oil field.

May 16. The State Council approved distribution of the Provisional Rules Concerning Professional Titles for Statisticians drawn up by the State Statistical Bureau.

The Jiangxia Experimental Tidal Power Station began generating electricity. It is the first two-way tidal-power generating station in China.

May 21 to June 4. A national meeting of

heads of medicine and drug administrations was held in Beijing. The meeting called for the consolidation and development of a unified system controlling the production, sale and use of medicines and drugs.

May 22. Entrusted by the Party's Central Committee, Hu Yaobang, General Secretary of the Central Committee of the Communist Party of China and Wan Li, member of the Secretariat of the Party and Vice-Premier of the State Council, made an inspection tour of Tibet. They discussed with local cadres and masses vital questions concerning the improvement of the material and cultural well-being of the Tibetan people as quickly as possible and proposed six major programmes in this regard.

The Xinhua News Agency reported that China's first 500-kv. transformer and transmission line was erected in northeast China. It was designed by Chinese personnel and built with domestically manufactured equipment.

May 23. The Ministry of Power Industry announced that China's hydroelectric resources have a total potential capacity of 680 million kw., nearly 100 million kw. more than the total from a survey during the 1950's. Of the current total, 370 million kw. is suitable for exploitation.

The Committee for Management of Worker and Staff Education was set up in Beijing, with Yuan Baohua as its director and personnel from the All-China Federation of Trade Unions, the Ministry of Education and 12 other units making up its membership.

The *People's Daily* carried a commentary calling for integration of enterprises in the further development of light industry.

May 26. The Central Committee of the Communist Party of China circulated the Summary of the Forum on Our Work in Tibet. The Central Committee set forth the central task in building Tibet, its goals and eight specific policies in that regard.

The Ministry of Commerce, the Ministry of Finance and the State Administration of Commodity Prices jointly issued a circular which required that the purchase price of pigs remain stabilized and that policies conducive to pig-raising be unchanged.

May 28. The government named the President of the People's Bank of China, Li Baohua, and the Minister of Finance, Wu Bo (later replaced by Wang Bingqian), as the directors representing China in the International Monetary Fund and World Bank; Vice-President of the Bank of China, Wang Weicai, and Vice-Minister of the Ministry of

Finance, Li Peng were appointed as vice-directors in these two organizations.

May 29. The China Petroleum Company and two French oil companies signed a contract to carry out joint exploration and exploitation of oil in portions of the Bohai Gulf.

China and Japan signed their first long-term contract to carry out joint exploration and exploitation of oil.

May 31. On November 23, 1979, owing to orders given contrary to regulations, a gas explosion occurred in the No. 2 coal pit of the Songshuzhen Coal Mines under the Tonghua Coal Mining Administration in Jilin Province. It was an accident involving serious criminal liability. The People's Court of Hunjiang municipality sentenced the persons responsible for the accident according to the law.

June

June 2. Comrade Hua Guofeng inspected the Baoshan Iron and Steel Complex, encouraging the workers to do a good job of building this large modern iron and steel enterprise.

June 3. A meeting held by the Third Ministry of Machine Building to discuss production of goods for civilian use ruled that the aviation industry should also turn out products for civilian use.

The State Administrative Commission on Import and Export Affairs and the Ministry of Foreign Trade issued the Provisional Measures Concerning Export Permits so as to strengthen control over exports and to facilitate a uniform approach in international trade.

June 13. A forum was held by persons in economic circles, during which it was pointed out that considerations for economic results should take priority in all economic work and that the idea of seeking quick results should be discarded.

The China National Electric Devices Industrial Corporation was set up in Beijing. This is the first entrepreneurial industrial corporation operated by China's electronics industry; the corporation was set up on a trial basis.

June 15. Shaanxi Province decided to suspend a project to divert water from the west to the east in Xiyang County. The *People's Daily* published a relevant editorial, entitled "Let's Have No More of This Kind of Folly."

June 18. The State Economic Commission,

the State Bureau of Supplies and two other units jointly issued the Measures for Reducing the Stockpile of Rolled Steel, requiring that 4 million tons of overstocked rolled steel be put on nearby markets.

June 19. The third national trade union conference on labour protection ended in Beijing. The meeting called on trade unions at all levels to improve labour protection and to ensure production safety.

June 20. The People's Government of the Tibet Autonomous Region issued a notice announcing a series of new economic policies to speed up economic development and to overcome the current backwardness in Tibet as quickly as possible.

The *People's Daily* carried an editorial, entitled "In Developing Heavy Industry, Emphasis Should Be Put on Tapping the Potential of Existing Enterprises." The editorial pointed out that China had had some problems in understanding and putting into effect the slogan "Give priority to the development of heavy industry" and that, henceforth, the emphasis of most industrial departments would be placed on tapping the potential of existing enterprises and renovating and transforming them.

June 21. The State Council approved and circulated the Temporary Measures for Strengthening the Work of Tapping the Potential of Existing Enterprises and of Renovating and Transforming Them in Industry and Communications. These measures were formulated by the State Economic Commission, the State Planning Commission and the Ministry of Finance.

The State Economic Commission, the State Scientific and Technological Commission and the State Bureau of Metrology jointly published the Measures for Implementing Control of Weights and Measures in Factories, Mines and Other Enterprises.

June 25. Li Chaobo, head of the Environmental Protection Office under the State Council, announced in Geneva that China had decided to join the International Federation for the Protection of Nature and Natural Resources and the International Endangered Wildlife and Plant Species Trade Accord.

June 28. The State Bureau of Labour announced that in the past three years nearly 20 million people had been given jobs by the state.

The State Economic Commission issued a circular calling for the start of the second "Energy-Saving Month."

June 30. The People's Daily issued an editorial entitled "Giving Full Play to Advantages." It pointed out that taking actual conditions into full account, making the best possible use of favourable conditions and avoiding unfavourable ones and giving full play to advantages while avoiding shortcomings should be primary considerations in our drive for Chinese-style modernization, upon which the success or failure of our modernization drive hinges.

The State Commodity Inspection Bureau was set up.

The State Council issued a circular on earnest implementation of the policy on unified state purchasing and marketing of cotton yarn, cloth and knitted and cotton goods.

July

July 1. A meeting of the Standing Committee of the State Council adopted the Provisional Regulations Concerning the Promotion of Economic Integration. It was pointed out in the regulations that the pursuit of integration and the development of various forms of economic integration was necessary for readjustment of our national economy and for further restructuring of the economic managerial system, and also that this was the inexorable trend of China's economic development.

The Standing Committee of the Party Committee of the Inner Mongolian Autonomous Region held a forum during which the Party Central Committee's instruction on work in Tibet were studied. It was held that good work should be done with respect to five aspects, that more flexible policies should be introduced in the economic sphere, and that the production policy of "taking livestock raising as the key link" should be resolutely put into effect.

A postal code system was instituted in China.

The Chongqing-Changjiang River Bridge, the first large highway bridge spanning the Changjiang River on its upper reaches, was opened to traffic.

July 2. The State Council approved and distributed Several Provisions Concerning Supervision of Financial Affairs and issued a circular calling on all financial supervisory organs to exercise their functions and to struggle against acts in violation of the financial system.

July 3. The Ministry of Finance sponsored a national working conference in Kaifeng, Henan Province, to discuss agricultural tax questions. The meeting required all localities to use the money

from the reduction and remission of agricultural taxes for the benefit of the communes, production brigades and production teams in impoverished areas.

July 4. The Party Committee of the Ningxia Hui Autonomous Region held a meeting of secretaries of prefectures, municipalities and counties, at which they studied the instructions given by the Party Central Committee concerning work in Tibet and the important suggestions of the Secretariat of the Party Central Committee concerning work in Ningxia, and made five decisions regarding relaxation of economic policies.

July 6. The Xinhua News Agency reported that the former leader of Xiyang County, Shaanxi Province had resorted to deception and had falsely exaggerated county grain output by 270 million catties during the period from 1973 to 1977.

July 7. The members of the Standing Committee of the Party Committee of the Guangxi Zhuang Autonomous Region and the secretaries of the region's counties and prefectures studied the instructions given by the Party Central Committee concerning work in Tibet and held a working conference in Nanning attended by comrades from eight minority nationality autonomous counties. The conference held that it was imperative to relax economic policies in rural areas and to give play to the advantages of each autonomous county so as to quicken the pace of economic construction.

July 8. A project to divert water from the west to the east in Xiyang County was completely halted.

July 12. The Nanjing Radio Company was set up. It is the first entrepreneurial company in our electronics industry to be formed jointly by enterprises under ministries and local enterprises.

July 14. The State Council decided to devote major efforts to developing farm mechanization in northeast China and to speed up the construction of centres for the production of commodity grain and soybeans.

In accordance with instructions given by the Party Central Committee, and the State Council, the Ministry of Coal Industry decided to gradually introduce a "four-shift, six-hour day" system for underground workers in coal mines under its direct administration.

July 15 to 26. A national forum to discuss the question of carrying out ideological and political work among workers and staff was held by the

All-China Federation of Trade Unions in Dalian.

The State Council approved and circulated a summary of a meeting on reforming the managerial system in the railway bureaus of Beijing and Taiyuan where experiments in managerial reform had been conducted.

July 18. The 18th national working conference on postal and telecommunications work was held in Beijing. The conference called for integration of enterprises so as to speed up the growth of postal and telecommunications services.

July 21. The Xinhua News Agency reported that the number of state-owned industrial enterprises given greater decision-making powers had increased to 6,600 by the end of June. They now constitute 16% of the total number of state-owned industrial enterprises and their output value and profits account for about 60% and 70%, respectively, of the total. In most cases, both revenues and production have increased.

July 21 to 28. The Ministry of Finance held a national conference in Beijing to exchange experiences in rural financial management. The conference discussed how to better manage funds for agriculture, put them to better use and achieve better results.

In accordance with the instructions of the State Council, the Ministry of Light Industry decided to vigorously develop labour-intensive products.

July 23. The Research Association for Studying Capital Construction Economics in China was established in Beijing.

July 23 to 30. The second national meeting on the investigation of natural resources and regional planning was held in Beijing. The meeting put stress on good performance in resource surveys so as to provide scientific data for making adjustments both in the internal structure of agriculture and over-all regionalization of crops.

July 24. The State Council approved and circulated a summary of the forum on the problem of Hainan Island, deciding to take measures to develop it step by step into a production centre for tropical cash crops and valuable woods.

In his speech on energy policy delivered at the national coal industry conference held at Benxi, Vice-Premier Yu Qiuli declared that the energy policy decided upon by the Party Central Committee and the State Council had placed equal stress on exploiting energy and economizing on energy consumption but that, for the present,

priority would be given to saving energy and making every endeavour to carry out technical transformation and structural reform.

The Xinhua News Agency reported that the average annual per capita income in 1,622 production brigades of rural people's communes exceeded 300 yuan in 1979, with some topping 1,000 yuan.

The State Council and the Central Military Commission approved and distributed a report by the Administrative Bureau for Industry and Commerce and other departments on strengthening controls in regard to goods brought into China by overseas Chinese, compatriots in Taiwan, Hong Kong and Macao, and on the struggle against smuggling, speculation and profiteering. They called for earnest implementation of the demands raised in the report.

July 25 to 31. The Ministry of Commerce convened a forum on trust trade attended by comrades from eight cities including Beijing and Shanghai. It was maintained that trust trade offers an important channel for the distribution of commodities in socialist countries and is also an important way to encourage market regulation and commodity distribution.

The State Council published the Measures for Registration and Control of Joint Ventures with Chinese and Foreign Investment and the Rules Concerning Labour Management in Joint Ventures with Chinese and Foreign Investment.

July 27. It was announced that the State Council had recently issued a circular calling for the earnest examination of the problem of enterprises which had suffered losses over a long period and for the suspension of those enterprises which have been turning out high-cost, low-quality products, have long been operating at a loss and where management was in a state of confusion, so that they can undergo readjustment.

August

August 2 to 7. The Party Central Committee held a national conference on employment in Beijing. The conference pointed out that the way to solve the problem of employment was to emancipate thinking, adopt more flexible policies, promote production, open up new avenues of employment and combine employment on the recommendation of state labour departments with employment through mutual-help teams and self-help.

August 3 to 13. The second national symposium on economic theory in animal hus-

bandry was held in Xining. It probed into questions concerning readjustment of the economic structure in animal husbandry, ownership, the system of responsibility in production and commodity distribution.

August 8. The Defence Industries Office under the State Council held an on-the-spot meeting in Shenyang, at which it was stressed that defence industry enterprises should switch quickly from turning out products only for military use to turning out products for both civilian and military use.

August 9. The Central Discipline Inspection Commission issued a notice concerning deterioration of goods as a result of the serious overstocking in a Shanghai wool and jute company and silk company. The notice emphasized that it was imperative to strengthen party discipline and inspection in economic matters. Bureaucrats who act irresponsibly and neglect their duties shall be held responsible and be dealt with strictly.

August 11 to 30. A national mechanical and electrical engineering products trade fair was held in Changsha. The volume of business was 2,000 million yuan.

August 19. The State Economic Commission issued a circular calling on all provinces, municipalities and autonomous regions to select one or two state-owned industrial enterprises for experimentation in economic management reform. The chosen enterprises were to carry out independent accounting, pay taxes to the state, and assume responsibility for their own profits and losses.

August 25. The State Council made a decision on the "Bohai No. 2" drilling rig accident. The Minister of Petroleum Industry, Song Zhenming, was relieved of his post and Vice-Premier Kang Shien, who was in charge of the petroleum industry, was issued a demerit of the first degree.

August 25 to 27. An emergency meeting of leading cadres of all oil enterprises was held by the petroleum industry in Beijing. The meeting concentrated on summing up the lessons from the capsizing of the "Bohai No. 2" oil rig.

August 26. The 15th Session of the Standing Committee of the Fifth National People's Congress approved the Regulations Concerning the Guangdong Province Special Economic Zones and decided to establish the State Energy Commission with Vice-Premier Yu Qiuli as its director.

In order to lighten the burden on the

peasants, to support agricultural production and to change conditions of impoverishment in poor areas, the State Council approved and distributed the Report on the Implementation of the Policy of Setting a Level Below Which Agricultural Tax Is to Be Remitted, issued by the Ministry of Finance; the council called for implementation of the policy of stabilizing agricultural taxes and increasing production without increasing taxes.

August 28. It was reported that a national meeting on the work of former seed reproduction farms had been convened in Beijing. The meeting called for a good job to be done in reproducing and popularizing improved varieties and regarded this work as an important measure for the modernization of agriculture.

August 29. The second national meeting of the representatives of the group for quality control cited 70 groups which have done excellent work in total quality control.

August 30. The State Council approved and distributed the Bank of China Measures Concerning Short-Term Foreign Exchange Loans and the report submitted by the Bank of China for instructions on these measures. The State Council required governments at all levels to give full play to the functioning of the Bank of China.

The Ministry of Coal Industry held a national coal mining telephone conference in Beijing, mobilizing cadres at all levels to carry out the decision made by the State Council on the capsizing of the "Bohai No. 2" oil rig to draw lessons from it, and to pay attention to safety in production. The Minister of Coal Industry, Gao Yangwen, criticized himself for responsibility in the gas explosion in the Songshuzhen Coal Mine and other major accidents.

August 30 to September 10. The Third Session of the Fifth National People's Congress was held in Beijing. The session heard an important report delivered by Comrade Hua Guofeng; appointed Zhao Ziyang Premier of the State Council; adopted resolutions on Arrangements for the National Economic Plans for 1980 and 1981, the Final State Accounts for 1979, the Draft State Budget for 1980 and Financial Estimates for 1981, the Income Tax Law of the People's Republic of China Concerning Joint Ventures with Chinese and Foreign Investment, and the Individual Income Tax Law of the People's Republic of China. The delegates raised questions concerning the construction of the Baoshan Iron and Steel Complex and the overstocking of certain goods.

September

September 1. The third national "quality month" meeting was held in Beijing and was broadcast and televised live throughout the country. The State Council awarded gold and silver medals for 293 high-quality products.

September 2. The State Council approved and distributed the Report on Experimentation with Added Decision-Making Powers in Enterprises and Opinions for Future Work submitted by the State Economic Commission. The State Council approved expansion of decision-making powers in all state-owned enterprises.

The Economic Tribunal of the Tianjin Intermediate People's Court publicly tried those who were directly responsible for the "Bohai No. 2" oil rig accident and sentenced them according to law.

September 4. The China Supply and Marketing Corporation for Enterprises Run by the People's Communes was set up.

September 5. The State Economic Commission, the State Bureau of Labour and the All-China Federation of Trade Unions jointly held a meeting on production safety. The meeting set forth four measures for improving safety in production to be implemented by all factories, mines and bureaus of transport and communications.

September 9. The double-track electrified section of the Shijiazhuang-Taiyuan Railway, from Shijiazhuang to Yangguan, was opened to traffic. This is China's first double-track electrified line.

September 16 to 22. The first national conference on regional planning of natural environmental protection zones was held in Chengdu. Protection zones would increase from 72 to 300.

September 17 to 22. Sponsored by the Ministry of Finance, a national working conference on financial management in cultural and educational departments and administrative establishments was held in Beijing. The conference emphasized that comprehensive extension of the system under which cultural and educational departments and administrative establishments take responsibility for their own budget surpluses and deficits is a key reform in financial management.

September 18. It was reported that the China Society for the Study of Forestry Economics had been established in Beijing.

September 20. The China Production Cost Research Society was set up in Beijing.

September 29. A Chinese delegation attended the joint annual meeting of the International Monetary Fund and the World Bank held in Washington. It was the first occasion that a delegation from China had attended this meeting.

October

October 1. The branch bank of the People's Bank of China in the Tibet Autonomous Region decided to implement a policy of offering interest-free loans for agriculture, animal husbandry, and handicrafts industries for a period of three years starting from October 1.

October 5. The first national exhibition of goods produced by state-run integrated agricultural-industrial-commercial complexes opened in Beijing.

A meeting of heads of water conservancy bureaus was held recently in Beijing. The meeting earnestly summed up the experience and lessons of the past 30 years and set forth the principles for water conservancy work during period of readjustment.

October 5 to 15. Sponsored by the State Capital Construction Commission, a national conference on urban planning was held in Beijing. The conference stressed that it was imperative to eradicate the pernicious influence of ultra-"Left" ideology and to work out a feasible urban planning programme.

October 8 to 22. A national conference of heads of farm machinery bureaus was held in Beijing. The meeting made concrete suggestions for reforming the managerial system in farm machinery production and marketing.

October 10 to 24. An inter-regional symposium on cement-making techniques sponsored by the U.N. Industrial Development Organization and China was held in Beijing.

The State Planning Commission, the State Agricultural Commission, the Ministry of Agriculture and the State Statistical Bureau jointly issued a circular pointing out that "the number of animals in stock at the end of the year" and "the per-mu yield of grain on cultivated land" were no longer targets to be used in assessment of achievements in agricultural production.

October 11. With the approval of the State Council, the Ministry of Finance decided to take measures to reduce the income tax on cooperative trades and individual economy.

October 11 to 21. A meeting of state-run integrated agricultural-industrial-commercial complexes was held in Beijing. The meeting urged all state farms to move as quickly as possible towards becoming integrated agricultural-industrial-commercial complexes.

October 15 to 21. A national meeting to exchange experiences in economizing on market coal was held in Beijing. The meeting set forth seven measures and called for trying to conserve 4 million tons of coal this year.

October 17. A meeting of the Standing Committee of the State Council adopted temporary regulations on expanding and protecting socialist competition and expressed hope that it would be carried out earnestly in all localities and departments according to actual conditions.

October 17 to 27. The Ministry of Finance sponsored a national forum attended by heads of financial departments and bureaus in Beijing. It was decided at the forum to make vigorous efforts to promote production, increase revenues, control expenditures and reduce deficits.

October 20. The State Council approved and distributed the Report on Foods for Infants and children submitted by the Ministry of Light Industry, the Ministry of Commerce, and the Ministry of Food, calling for study and implementation of suggestions in the report.

October 20 to 24. A meeting sponsored by the U.N. Industrial Development Organization and the Chinese government to exchange experience and to promote cooperation in expanding the farm machinery industry in developing countries was held in Beijing.

October 20 to 28. The first phase of meetings of the second international symposium on the application and development of hydroelectric techniques for small-scale projects was held in Hangzhou.

October 23 to November 9. The State General Supply and Marketing Cooperative held a meeting of heads of supply and marketing cooperatives of the provinces, municipalities and autonomous regions in Beijing. The meeting discussed and laid down plans for readjustment and restructuring in supply and marketing cooperatives and affiliated organizations.

October 27. The State Council issued instructions on cutting down the use of all kinds of

oil-burning boilers and industrial kilns and furnaces, calling for strict implementation of the plan for utilizing oil and of a check-up and approval system.

October 27 to November 20. A working conference of the People's Construction Bank of China was held in Beijing. The conference decided that the task at present was to control and reduce the scope of capital construction according to the state plan.

October 29 to November 3. A national meeting to exchange experience in energy-saving was held in Beijing. The meeting demanded that technical innovations and structural reforms focusing on energy-saving be carried out to ensure that the energy equivalent of 20 million tons of standard coal can be saved each year during the period of the Sixth Five-Year Plan.

October 30. The State Council published the Provisional Regulations for the Administration of Foreign Enterprises Agencies in China.

October 31. The first national sales exhibition of goods turned out by commune- and brigade-run enterprises ended in Chengdu.

November

November 1. The State Planning Commission, the State Capital Construction Commission, the State Economic Commission and the Environmental Protection Leading Group under the State Council jointly issued a circular on strictly implementing the policy of simultaneous planning, construction, and operation of environmental protection facilities within new capital construction and technological projects.

The Xinhua News Agency reported that 4,300 sites containing non-metallic ore deposits had been discovered and that reserves of 8,000 non-metallic ore deposits had been proven. Among these, reserves of iron sulphide, gypsum, magnesite, boron, phosphorus, arsenic, asbestos, fluorite, alunite and rock salt stood in the front ranks of the world.

November 4. The State Council issued the Circular on Paying Close Attention to Revenues and Expenditures in the Last Two Months of the Year and on Controlling Financial Deficits and Increases in the Money Supply.

November 7. The first session of the commercial cooperation conference of five provinces and autonomous regions in northwest China was

held in Xi'an. The session decided, through consultation, to break down provincial barriers and to organize the distribution of goods according to economic zones and traditional practices.

The Zhujiang River Water Conservancy Commission under the Ministry of Water Conservancy held its first meeting in Foshan on planning and cooperation among five provinces and one autonomous region in the Zhujiang River basin. It was decided at the meeting to unify planning for comprehensive control and exploitation of the Zhujiang River basin.

November 11. It was reported that the State Scientific and Technological Commission, the State Planning Commission and the State Energy Commission recently held a forum on nuclear energy in Beijing. The forum suggested that the state regard vigorous development of nuclear energy as a long-range policy and first build nuclear power stations in east China and in Guangdong and Liaoning provinces.

The Ministry of Finance sponsored a national working conference of accountants and an annual meeting of the Accountants Society in Beijing.

November 13. A conference to exchange experience in rice production in south China was held in Jiaying County, Zhejiang Province. At the conference, the Ministry of Agriculture proposed to give full play to favourable conditions in the south for producing rice, so as to increase paddy output.

November 14. The State Bureau of Aquatic Products held a national meeting in Wujin County, Jiangsu Province, for the exchange of experiences in fish-rearing on the part of communes and brigades.

November 17. Early this month, the Ministry of Forestry held a national conference in Xianning Prefecture, Hubei Province to exchange experiences in growing tree seedlings.

November 18. The State Council approved and distributed a Report on Providing Loans Instead of Allocating Funds for Capital Construction, jointly submitted by the State Planning Commission, the State Capital Construction Commission, the Ministry of Finance and the People's Construction Bank of China; and a Circular on the Decision to Provide Loans Instead of Allocating Funds to Enterprises Practicing Independent Business Accounting and Having the Ability to Repay Loans, Beginning from 1981.

November 21. The State Economic Com-

mission, the Ministry of Finance and the People's Construction Bank of China announced that as of 1981 the funds for tapping potential (in production) through innovation and transformation arranged by the State Economic Commission and the Ministry of Finance will be provided in the form of loans from the People's Construction Bank of China, instead of in the form of allocations by the state.

The Chinese Research Association of Water Conservancy Economics was founded in Jiangkou, Hubei Province.

November 25. A contract between the China International Trust and Investment Corporation, the Beijing Machinery and Electrical Equipment Corporation and the Oriental Leasing Company, Ltd. (of Japan) on establishing the China Oriental Leasing Company was signed in Beijing. This was the first joint venture leasing company in New China.

November 29. The Xinhua News Agency reported that over 1,000 large production centres for local products and by-products were established in China. Some 60% of local products and by-products purchased by the state come from these centres.

November 30. In 1980, over 100 million sq. m. of urban housing was under construction. By the end of November, total floor space of over 40 million sq.m. had been completed. The living conditions of urban dwellers has thus been improved to some extent.

December

December 2. The *People's Daily* carried an editorial entitled, "Completely and Resolutely Implement the Policy of Readjustment."

The China Coal Mining Equipment Service Corporation was set up in Beijing.

December 3. It was reported that a national working conference on the export of mechanical and electrical products was held in Beijing. The meeting called for tapping potential in the machine-building industry and increasing the export of mechanical and electrical products.

A national meeting for the examination and approval of food hygiene standards and for exchanging experiences ended. The meeting examined and adopted China's first set of food hygiene standards.

December 4 to 10. A symposium on the purpose of socialist production was held in Beijing.

It was declared that a clear understanding of the purpose of socialist production was of vital importance to the readjustment of the national economy and to the reform of economic management; that in guiding our production we must conform to the demands of the essential nature of socialism; that we should make new arrangements for production in accordance with the needs of the market; and that we should formulate a complete set of policies and principles for guiding production and serving the interests of the people on the basis of Marxist political economy.

December 5. The State Council issued an urgent circular to all localities and departments resolutely forbidding the reckless felling of trees.

An integrated electrical equipment company formed by six large electrical equipment producing factories was set up in Beijing.

December 7. The State Council issued a circular entitled Strictly Control Prices and Consolidate Negotiated Prices to all provinces, municipalities, autonomous regions, the ministries and commissions under them and organs directly under the State Council.

December 7 to 23. A national conference on prices was held in Beijing. The conference decided that the central task for the present was to implement suggestions made in the circular entitled Strictly Control Prices and Consolidate Negotiated Prices issued by the State Council so as to keep prices stable.

December 8. The General Administration for Industry and Commerce issued a circular on the registration of agencies of foreign enterprises in China.

A national meeting to exchange experience in highway passenger transportation was held in Changsha, at which the experience of Suzhou and other places in joint highway passenger transportation services was popularized.

The State Bureau of Prices, the Ministry of Commerce, the All-China Federation of Supply and Marketing Cooperatives, the Ministry of Food, the General Administration for Industry and Commerce, the Ministry of Light Industry, the State Bureau of Metrology and the State Bureau of Aquatic Products issued a circular to various places and relevant departments at all levels on December 8, 9, 10, 12 and 13, respectively, calling for the study and implementation of the circular entitled Strictly Control Prices and Consolidate Negotiated Prices.

December 10. The State Council officially

approved the establishment of the Xiamen Special Economic Zone.

December 14. With the approval of the State Council on December 10, the Ministry of Finance promulgated the Detailed Regulations for the Implementation of the Income Tax Law of the People's Republic of China Concerning Joint Ventures with Chinese and Foreign Investment and the Detailed Regulations for the Implementation of the Individual Income Tax Law of the People's Republic of China.

A national meeting to exchange experience in synthetic fibre production ended in Shanghai. The meeting called for further promoting synthetic fibre production so as to solve the problem of clothing for China's 1,000 million people.

December 18. The State Council published the Provisional Regulations of the People's Republic of China on the Control of Foreign Exchange.

December 19. A national customs conference on supervision and control of freight transport was held in Beijing, calling for still better supervision and control of imported and exported goods.

A national meeting of the heads of aquatic products departments and bureaus ended in Beijing. The meeting concentrated on the study of policies concerning readjustment in the production of aquatic products.

December 20. A meeting of heads of bureaus in charge of the inspection of commodities ended in Beijing. It called for improvements in the inspection and control of import and export commodities.

December 27. With the approval of the State Council, the State Economic Commission and three other units promulgated the Regulations Concerning Science and Technology Archives.

December 29. A national working conference on imports and exports closed in Beijing. The conference discussed how import and export work could serve the readjustment of the national economy well, along with relevant policies and measures.

December 30. The Xinhua News Agency reported that the State Statistical Bureau had made a survey of the living conditions of over 80,000 families in 44 cities. The investigation found that the number of families of workers and staff members with an average monthly income exceeding 25 yuan per person had risen to 76.5%.

Address: Erligou, Xijiao, Beijing**Cables:** INSTRIMPEX BEIJING**Telex:** 22304 CHEC CN**Telephone:** 890931**China National Technical Import Corporation**

The China National Technical Import Corporation specializes in the import of complete plants

and, according to state plans, government trade agreements, loan agreements and market needs, importing new techniques (including technological processes, equipment manufacture and the transfer of technology); purchasing all kinds of complete plants, production lines, main equipment, parts and supplies, as well as machine tools, instruments and meters, experimental installations, electronic computers, and raw materials and accessories for imported projects; contracting with foreign businesses for engineering design, technical consultation and plant transformation; undertaking Chinese and foreign compensatory trade, co-production and joint ventures; engaging foreign technicians for imported projects and sending training personnel abroad. The corporation also assists in the export of Chinese scientific techniques.

This corporation undertakes the above import and export activities under the commission of all departments and companies at home, and also acts as agent for foreign enterprises in China.

Address: Erligou, Xijiao, Beijing**Cables:** TECHIMPORT BEIJING**Telex:** 22244 CNTIC CN**Telephone:** 890931**China National Foreign Trade Transportation Corporation**

The National Foreign Trade Transportation Corporation (CNFTTC) is a state-owned enterprise under the Ministry of Foreign Trade. It shares the work of the China National Foreign Trade Import and Export Corporations and also deals with orders from them. It undertakes the transport of China's imports and exports. CNFTTC has branch offices at ports and border stations throughout the country. These branches oversee the delivery of import cargo to end-users and export cargo to the receivers abroad.

Its scope of business is:

To organize the transportation of imports and exports by sea, land, air and mail;

To charter vessels and bulk space;

To arrange the handing over or taking delivery of cargo and documents at China's ports and border stations;

To accept orders from principals in China for storage and to dispatch to end-users cargo imported by sea;

To accept or deliver, distribute or dispatch imports and exports by air, except perishable goods;

To arrange international through transportation of imports and exports in transit via China;

To arrange the work for trucks exclusively carrying foreign-trade cargo;

To make arrangements for transportation within China of foreign exhibits to be shown in China.

China National Chartering Corporation

The China National Chartering Corporation is a state-owned enterprise which handles the chartering of vessels and booking of shipping space. It is entrusted by the China National Foreign Trade Transportation Corporation to charter vessels on the international market, and operate and sublet them on behalf of the charterers.

The China National Chartering Corporation also negotiates the booking of shipping space on behalf of the China National Foreign Trade Transportation Corporation. It has therefore entered into agreements with many shipping companies to dispatch vessels regularly to our ports or foreign ports to carry China's import and export cargo.

This corporation also acts as agent for foreign charterers wishing to charter vessels or book shipping space.

China National Packaging Import and Export Corporation

This corporation's original name was "China National Export Commodities Packaging Corporation." It was changed to the present name in August 1980 and is under the Ministry of Foreign Trade.

It mainly handles the import and export of packaging materials, containers, machinery and tools.

Packaging Materials: Corrugated medium, kraft paper, white board with grey back, white board with white back, sack kraft paper, white card-board, stencil steel board, aluminium-foil laminated paper, decorative paper for packaging;

all kinds of plastic film, metallized film, laminated material; ink, coating, adhesives, bronze powder and jute cloth.

Packaging Containers: paper, plastic and metal containers.

Packaging Machines and Tools: Corrugators, die cutting machines, paper-bag makers, crate nailing machine, can makers, metal drum makers, glass bottle manufacturing machines, closure and cap makers, moulds; printing machines, plate making equipment; blow moulding machines, injection moulding machines, plastic foaming machines, blow and cast extruders, laminating machines, plastic bag makers; vacuum packers, shrink wrap, blister pack, forming, filling, sealing, casing, cartoning, strapping, labelling, marking and weighing machines; testing instruments and equipment for packaging materials and containers.

The corporation also undertakes agency business as entrusted by foreign clients, and contracts for the processing and converting of packaging machines and materials with raw materials supplied by foreign clients and by joint ventures with foreign interests to produce packaging machines and materials.

China National Machinery and Equipment Import and Export Corporation

The China National Machinery and Equipment Import and Export Corporation is a state foreign trade enterprise under the First Ministry of Machine Building.

Major Export and Import Items:

Complete plants;

Machine tools, forging and casting equipment;

Heavy-duty machinery, mining machinery;

Power-generating machinery;

Electricity generating sets, electric motors, welding machines, electric appliances, cables, porcelain insulators, switches, electric instruments and meters;

Motor vehicles and parts;

Pumps, pneumatic tools, air compressors, valves;
 Printing machinery, refrigerating equipment, wood-working machinery;
 Laboratory instruments, surveying instruments, optical instruments, educational apparatus, industrial electric furnaces, photographic and cinematographic equipment;
 Bearings, cutting tools, measuring tools, grinding tools, electric tools.

China National Aero-Technology Import and Export Corporation

The China National Aero-Technology Import

and Export Corporation is under the Third Ministry of Machine Building; it is a state enterprise which handles import and export business in aviation technology and products.

Its business scope is:

Managing the export of aero-products of various companies, including aircraft, aero-engines, meters and instruments, accessories, electrical devices as well as other machinery, meters and instruments;

Handling investment in joint ventures, co-production, processing and assembling with materials and parts supplied, and accepting orders according to customers' samples and designs;

Contracting to design and construct complete aircraft factories, repairing bases, air fields, aviation testing facilities and civil buildings, offering services of engineering and technical personnel and the manual labour of skilled and qualified workers;

Undertaking the translation of technical materials, books, periodicals on aero-products;

Introducing to China advanced aviation technology and complete sets of equipment and importing aviation electronic devices, precision parts and components and test instruments from abroad.

China Precision Machinery Import and Export Corporation

The China Precision Machinery Import and Export Corporation has been set up under the China Precision Machinery Corporation, which is a state-owned enterprise handling complete sets of precision machinery for aerospace, aircraft-building, ship-building industries, as well as general-purpose machinery. Its scope of business includes:

- The import and export of precision and general-purpose machinery;

- The import and export of related technologies;
- Joint ventures and co-production with foreign firms;

- Compensatory trade, processing and assembling with materials and parts supplied;

- Services on commission.

Main Exports:

- Autopilots, control instruments, radar equipment, telemetering equipment, navigation equipment, fusing devices, as well as various testing equipment, instruments and meters;

- Infrared, laser and optical machinery and parts, 800,000x electron-microscopes;

- Mini-motors, current converters, charges, relays, signal sources, switches, plugs and sockets;

- Electronic computers, facsimile equipment, television relay vans, wire broadcasting equipment, stereo recorders;

- Chemical batteries (silver-zinc batteries, acid batteries, thermo-electric batteries and watch batteries), Freon, synthetic ammonia, and various gases for industrial use;

- General-purpose machinery, engineering machinery, transport machinery, light industrial machinery, agricultural machinery, medical appliances and tools, standard fasteners, and compound fixtures.

Address: 2 Yuetan Beixiaojie, Beijing

Cables: CPMIEC BEIJING

Telephone: 895012

North China Industrial Corporation

The North China Industrial Corporation is a comprehensive enterprise for industrial production and foreign trade. It handles business of processing and assembling with materials and parts supplied, compensatory trade, joint ventures, and contracting engineering designs at home and abroad. Its imports and exports include:

- Diesel engines, presses, hydraulic presses, engineering machines;

- Light and heavy vehicles;

- Precision machines, tools;

- Optical glass, optical instruments, photographic and cinematographic equipment, testing instruments;

- Chemicals, high polymer materials, paints and coatings, chemical industrial equipment;

- Detonating equipment, protectors;

- Special technical equipment.

China Great Wall Industrial Corporation

The China Great Wall Industrial Corporation is a comprehensive enterprise engaged in research, design and manufacture of various special-purpose precision machinery, electronic instruments, as well as vacuum, cryogenic and automatic control techniques. With several research institutions and factories attached to it, the corporation handles direct export business of its own products; deals in joint ventures with foreign firms, compensatory

trade, processing and assembling with materials and parts supplied by customers; undertakes maintenance services for imported goods on commission basis; contracts for technical and civil engineering designs for overseas projects; and provides technical services.

Main Exports:

Precision machinery, such as gyroscopes, servo-actuators, hydraulic motors, pumps, valves, actuating cylinders;

Special-purpose machines, cutting tools, moulds, fuelling lorries, lane excavators, semi-trailers, truck-mounted cranes, ultra-sonic precision gas-cutting machines, high-pressure air flasks, metal hoses, corrugated tubes, stainless steel welding rods;

Electronic computers and peripherals, analog computers, radar equipment, satellite navigation equipment, telemetry and remote-control equipment, electrostatic printers, magnetic recorders, screen display and terminals.

Integrated circuits, transducers, amplifiers, accelerometers, strain gauges, crystals, relays and sockets;

Testing instruments and meters;

Medical appliances;

Vacuum and cryogenic devices;

Magnetic tapes, heads, discs and equipment for the manufacture of magnetic tapes;

Automatic candy packers, automatic-count tablet packers, duplicators, etc.

The Chinese Export Commodities Fair

GENERAL INTRODUCTION

The Chinese Export Commodities Fair is held biannually in Guangzhou during spring (April 15 – May 15) and autumn (October 15 – November 15).

The Chinese Export Commodities Fair focuses on exports. Combining trade negotiations with sample showing, the Fair is but one of China's trade activities. The Fair helps business people from all over the world make selections against samples during on-the-spot talks. Meanwhile, import negotiations for China's needed goods are carried out between Chinese importers and their foreign counterparts.

ORGANIZATION AND BUSINESS NEGOTIATION METHOD

The Fair is directed by a leading committee, consisting of a chairman and several vice-chairmen, a secretary-general and several deputy secretaries-general, and a number of committee members.

At the Fair, China's foreign trade corporations are represented by ten trade delegations dealing respectively in cereals, oils and foodstuffs; native produce and animal by-products; textiles; light industrial products; arts and crafts; metals and minerals; chemicals; instruments; machinery; and

machinery and equipment. These ten trade delegations work under the leading committee.

There is a head, several deputy heads, a secretary-general and several deputy secretaries-general for each trade delegation. Commodity divisions and groups are set up to be in charge of business talks with clients at the Fair.

Contracts signed at the Fair are executed afterwards by the Chinese foreign trade corporation concerned. In case of problems arising in implementation of the contract, the pertinent Chinese foreign trade corporation will consult with the clients for clarification.

PROCEDURES FOR ATTENDING THE FAIR

Invitations are issued by the Fair or by the commercial counsellors' offices of the embassies of the People's Republic of China a month or two prior to the opening of the spring and autumn fairs to businessmen of the world to attend and negotiate import and export business.

Businessmen who wish to attend the Fair are requested to write to the relevant Chinese foreign trade corporation and specify clearly their respective firms, addresses, names of the executive members of their firms, lines of business and credit information. In case the Chinese foreign trade corporation concerned finds it necessary to conduct on-the-spot business talks, invitations to the Fair are extended.

Representatives sent by the firms invited to the Fair should apply for entry visas to Guangzhou at the Embassy or Consulate of the People's Republic of China in the country where the invited firm is located, by producing the invitation extended by the Fair and the invited firm's Letter of Recommendation certifying the representatives' status. If the applicant, for personal reasons, is unable to apply for an entry visa at the Chinese embassy or consulate in his own country, he is requested to inform in good time the Chinese embassy or consulate there of the reasons and designate the place where he wishes to have the visa to be issued, so that the Chinese embassy or consulate will be able to relay the request to the embassy or consulate concerned.

In case the People's Republic of China is not yet represented in the country or region where the invited firm is located, the applicant may apply for a visa to Guangzhou at the diplomatic representative's office in a neighbouring country by presenting the invitation extended by the Fair and his firm's letter of recommendation, or may write to China Travel Service (H.K.) Ltd. for help.

FACILITIES AT THE FAIR

At the Fair, there is an information booth handling inquiries about the Fair.

Facilities for customers' entry, banking, insurance, transportation, post and telecommunications, as well as typing and copying services, are provided.

Restaurants, retail stores and a bookstore are also available in the Fair building.

China International Trust and Investment Corporation

The China International Trust and Investment Corporation is a state-owned socialist enterprise operating under the direct leadership of the State Council of the People's Republic of China.

The function of the corporation is to introduce, absorb and apply foreign investment and advanced technology, to import advanced equipment and to bring in advanced technology for purposes of China's national construction and promoting the socialist modernization of our country pursuant to the provisions of the Law of the People's Republic of China on Joint Ventures Using Chinese and Foreign Investment and other relevant laws and regulations.

The scope of business: joint ventures using Chinese and foreign investment; compensatory trade; technical cooperation; international trust deposits and investments; real estate business; undertaking commission and acting as agents; leasing business and consulting business.

China Foreign Turnkey Contract Corporations

In order to meet the need of international economic cooperation, many foreign turnkey contract corporations have been set up in China.

China National Complete Plant Export Corporation

The China National Complete Plant Export Corporation undertakes turnkey jobs on complete industrial and agricultural plants in foreign countries as well as providing guidance in production techniques; this corporation also deals

in the export of single items of equipment, the supply of spare parts and the training of administrative personnel. Technicians and skilled workers will be also provided for projects undertaken by this corporation.

Address: Andingmenwai, Beijing
Cables: COMPLAINT BEIJING
Telephone: 445678 or 440325

There are five special branches under the China National Complete Plant Export Corporation. They are:

Electricity Branch: Undertakes turnkey jobs on hydro-power stations, thermo-power stations, transmission lines, transforming lines, transformer sub-stations, tube and pump stations; provides guidance in production techniques; exports complete power plants; processes and assembles with materials and parts supplied; operates joint ventures and compensatory trade; provides other technical services and labour.

Address: Baiguang Road, Beijing
Cables: 7193 BEIJING
Telex: 22466 CHMEP CN
Telephone: 338601

Building Materials Industry Branch: Undertakes turnkey contracts for building materials industry; provides guidance in production techniques; exports building equipment and building materials; undertakes joint investment and compensatory trade; provides other technical services and labour.

Address: Baiwanzhuang, Beijing
Cables: CPECB BEIJING
Telephone: 8992942

Coal Branch: Undertakes turnkey jobs on coal mining projects and engineering and provides guidance in production techniques; handles export of complete mining equipment, single-item equipment, materials and parts; maintenance and servicing and the training of administrative personnel, technicians and skilled workers will also be provided; undertakes technical services and labour.

Address: Hepingli, Beijing
Cables: CNCDC BEIJING
Telex: 22494 CNCDC CN
Telephone: 463759

Chemical Branch: Undertakes turnkey contracts for the chemical industry; provides guidance in production techniques; handles ex-

ports of complete chemical industry equipment and single equipment; provides technical services, labour and technology transfers.

Address: Hepingli, Beijing
Cables: CNCIC BEIJING
Telex: 22492 CNCCC CN
Telephone: 462923

Textile Branch: Undertakes turnkey jobs for textile printing and dyeing projects; provides guidance in five production techniques; handles export of complete textile equipment, single-equipment, and parts; supplies trained administrative personnel, technicians and skilled workers; provides technical services and labour.

Address: 12 Changan Street E., Beijing
Cables: 4791 BEIJING
Telephone: 550702

China Construction Engineering Corporation

The China Construction Engineering Corporation is a state-run enterprise. It contracts for all kinds of civil and public construction projects and provides technical services and labour.

Address: Baiwanzhuang, Beijing
Cables: 22477 CCEC CN
Telephone: 8992046 or 8992445, 8992249

China Road and Bridge Engineering Company

The China Road and Bridge Engineering Company undertakes turnkey contracts on highways and bridges, provides technical services and labour.

Address: 10 Fuxing Road, Beijing
Cables: CRBECO BEIJING
Telex: 22462 COMCT CN
Telephone: 8643464 or 8643514

China Civil Engineering Construction Corporation

The China Civil Engineering Construction Corporation contracts for all kinds of railway projects and other civil engineering projects; it provides technical services and labour.

Address: 10 Fuxing Road, Beijing

Cables: CHICICON BEIJING
Telephone: 8642714 or 8643034

China Marine Industry Corporation

The China Marine Industry Corporation undertakes:

To build and repair various transport ships, dredgers, work ships, salvage vessels, tugs, harbour vessels and other auxiliary vessels;

To build fibreglass yachts;

To manufacture and supply marine diesel engines and spare parts;

To manufacture and supply anchor chains, deck machinery, pumps and other machinery for ship's use;

To provide technical and labour services.

Address: 10 Fuxing Road, Beijing
Cables: CHINAHEC BEIJING
Telex: 22462 COMCT
Telephone: 864367

China National Hydraulic Engineering Corporation

The China National Hydraulic Engineering Corporation undertakes survey and design work and installations for projects utilizing water resources; drainage planning; hydraulic and hydro-power engineering; and exports complete small hydro-power stations. Technical services and labour can also be supplied.

Address: Baiguang Road, Beijing
Cables: 3068 BEIJING
Telex: 22485 WATER CN
Telephone: 363314

China National Oil Engineering Construction Corporation

The China National Oil Engineering Construction Corporation is ready to contract projects in oil-field construction, petroleum pipelines, oil refineries, petro-chemical plants and oil depots. The corporation also provides technical and labour services.

Address: P.O. Box 766, Beijing
Cables: 3112 BEIJING
Telex: 22312 PCPRC CN
Telephone: 461854

China National Machinery Foreign Economic Technical Co-operation

The corporation undertakes turnkey contracts and engineering designs related to the products made by the First Ministry of Machinery-Building; it handles joint investment, co-production, compensation trade, technical exports and provides technical and labour services.

Address: Sanlihe Road, Beijing
Cables: MACHINTERCORP BEIJING
Telex: 22341 CMIC CN
Telephone: 867524 or 867890

China National Light Industry Foreign Engineering Corporation

The corporation undertakes turnkey contracts in light industry; provides guidance in production techniques; undertakes technical cooperation in light industry production; exchanges complete plants and single-item equipment with foreign countries and joins them in providing complete plants to third countries; jointly develops and exchanges parts, and provides technical and labour services.

Address: 12 Changan Street E., Beijing
Cables: LIGHTING BEIJING
Telephone: 554718 or 551246

Sichuan International Economic and Technical Co-operation Corporation

The corporation undertakes turnkey contracts on civil and industrial construction; highway, bridge and municipal engineering; handles exports of complete plants and parts; undertakes processing with materials supplied.

Address: 243 Shengli Road W., Chengdu
Cables: 2266 CHENGDU
Telephone: 6765 or 6760

Jiangsu International Economic and Technical Co-operation of China

The corporation undertakes turnkey contracts in industry, communications, public buildings, agriculture and forestry, water conservancy, gardens, culture and education, sports and health, commercial services; handles exports of technical equipment, and provides technical and labour services.

Address: 70 Beijing Road W., Nanjing
Cables: CJJETCC
Telephone: 32354

8. ARTICLES OF ASSOCIATION OF THE BANK OF CHINA

Including International Branches of the People's Insurance Company
(Approved by the State Council on September 22, 1980)

Chapter I: General Provisions

Article 1. The Bank of China is a state-owned socialist enterprise and is the specialized foreign exchange bank of the People's Republic of China.

Article 2. The functions of the Bank of China are: to raise, utilize, accumulate and manage foreign-exchange funds, to engage in all kinds of foreign-exchange business, and to participate in international financial activities for the purpose of rendering service to the modernization of China's socialist construction.

Article 3. The Head Office of the Bank of China shall be established in Beijing. To meet the needs of business, the Bank may set up branches, sub-branches and representative offices at places of commercial and financial importance both in China and abroad.

Chapter II: Capital

Article 4. The authorized capital of the Bank of China shall be Renminbi 1,000 million yuan.

Chapter III: Business

Article 5. The Bank of China shall engage in and handle, when entrusted, the following kinds of business:

- a) International settlements in connection with foreign trade and non-trade transactions.
- b) International interbank deposits and loans.
- c) Overseas Chinese remittances and other international remittances.
- d) Deposits and loans in foreign currencies; and, with the approval of the People's Bank of China, deposits and loans in Renminbi which relate to foreign-exchange business.
- e) Buying and selling of foreign exchange (including foreign currencies).
- f) Buying and selling of gold in international markets.
- g) Organizing and participating in international syndicated loans.
- h) Investing singly by itself or jointly with others in banking businesses, finance companies and other enterprises in foreign countries and in

the Hong Kong and Macao regions.

- i) Issuing bonds and securities in foreign currencies with the authorization of the state.
- j) Providing trust and advisory services.
- k) Engaging in other kinds of banking business approved or entrusted by the state.

Article 6. The Bank of China shall participate in international financial meetings with the authorization of the state.

Article 7. Branches and offices of the Bank of China set up in foreign countries and in the Hong Kong and Macao regions may engage in all kinds of banking business which are permitted by local laws and regulations.

Chapter IV: Organization

Article 8. The Bank of China shall have a Board of Directors consisting of an honorary chairman, a chairman, and a number of vice-chairmen, managing directors and directors, all to be appointed by the State Council.

Article 9. The functions of the Board of Directors of the Bank of China are as follows:

- a) To examine and determine the business policies and plans of the Bank.
- b) To receive and examine the president's reports on the work of the Bank.
- c) To examine and approve the Bank's annual financial statements and proposals for the distribution of profits.
- d) To appoint and remove high officials of the Bank.
- e) To consider and determine the setting up and closing down of branches, sub-branches and offices of the Bank in China and abroad.
- f) To consider and examine other important matters relating to the Bank.

Article 10. The Bank of China shall have a Board of Supervisors consisting of a chief supervisor and a number of supervisors all to be appointed by the State Council.

Article 11. The functions of the Board of Supervisors are as follows:

- a) To supervise the Bank's implementation

of the policies, laws, and orders of the state as well as the Bank's business policies.

b) To examine the annual financial statements of the Bank.

c) To investigate matters of a serious nature and submit opinions on ways of dealing with them.

Article 12. The Bank of China shall have a president and a number of vice-presidents to be nominated by the chairman of the Board of Directors who shall, with the approval of the Board of Directors, submit his nominations to the State Council for appointment.

Article 13. The president of the Bank of China shall be responsible for the overall operation and administration of the Bank and shall submit to the Board of Directors periodic reports on the work of the Bank. The vice-presidents shall assist the president in his work.

Chapter V: Meetings

Article 14. A meeting of the Board of Directors shall be held once a year and is to be convened by the chairman. A meeting of the Board of Supervisors shall be held once a year and is to be convened by the chief supervisor. If necessary, the convocation of the aforesaid meetings may take place in advance or be postponed; and the chairman of the Board of Directors may also convene joint meetings of the directors and supervisors.

Article 15. Meetings of the Board of Directors, meetings of the Board of Supervisors, and joint meetings of the directors and supervisors shall all require a quorum of more than two-thirds of their respective members (including proxies). All resolutions, to be effective, must be passed by more than one-half of the persons attending the meetings.

Chapter VI: Addendum

Article 16. The present Articles of Association shall come into force upon the approval of the State Council. The same applies to amendments.

ALMANAC OF CHINA'S ECONOMY
1982

With Comprehensive Economic Survey and Statistics for 1981
SELECTED CONTENTS

Introductory Documents

1. Invitation to Members of the State Planning Commission for Discussion on Strengthening Economic Planning by Comrade Chen Yun.
2. Report on the Draft Plan for Economic and Social Development in 1982, Delivered at the 23rd Session of the Standing Committee of the Fifth National People's Congress (April 28, 1982)
By Yao Yilin, Vice Premier, State Council; Chairman, State Planning Commission
3. Report on the Draft State Budget for 1982, Delivered at the 23rd Session of the Standing Committee of the Fifth National People's Congress (April 29, 1982).
By Wang Bingqian, Minister of Finance
4. Resolution by the Standing Committee of the Fifth National People's Congress on Implementing the Plan for Reform of Organs of the State Council (Passed at the 23rd Session of the Standing Committee of the Fifth National People's Congress, May 4, 1982)

Section I: General Survey of China

1. Distribution of China's Minority Nationalities
2. China's Mineral Resources
3. China's Agro-Economic Geography
4. Administrative Divisions of Provinces, Autonomous Regions, Municipalities and Counties of the People's Republic of China (1982)

Section II: Economic Documents, Policies, Laws and Decrees

Major Reports

1. The Present Economic System and the Direction of Future Economic Construction
By Zhao Ziyang
2. Report on Reform of Organs of the State Council
by Zhao Ziyang

3. On Certain Questions Concerning Our Current Economic Work

By Zhao Ziyang

4. Report on the Readjustment of Economic Planning in 1981 and National Revenues and Expenditures

By Yao Yilin

5. Report on the Final State Accounts for 1980 and the Estimated Budget for 1981

By Wang Bingqian

Agriculture

6. On Certain Questions Regarding the Strengthening and Perfecting of the Agricultural Responsibility System
7. Decisions by the Central Committee and State Council on the Question of Protecting Forests and Developing Forestry
8. Notification by the Central Committee and State Council of the Promulgation of the State Agricultural Commission's "Report on Actively Promoting a Diversified Economy in the Countryside"
9. The State Agricultural Commission's "Report on Actively Promoting a Diversified Economy in the Countryside"
10. State Council Regulations on the Implementation of Economic Readjustment by Commune- and Brigade-run Enterprises

Industry

11. State Council Regulations on Strengthening Planning and Controlling the Scale of Capital Construction
12. Supplementary Regulations on Implementing "Regulations of the People's Republic of China on Giving Awards for Top-Quality Products"
13. Regulations of the National Commission of Machinery Industry on Improving Standardization
14. Notification by the Central Committee and State Council of the Promulgation of "Provisional Regulations on Trade Union Congresses in State-Owned Industrial Enterprises"
15. Provisional Regulations on Trade Union

- Congresses in State-Owned Industrial Enterprises
16. The State Economic Commission's Views on Improving the Leadership's Grasp of Consolidation of Enterprises
 17. Views of the State Economic Commission and the Reform Committee of the State Council on Implementing the Economic Responsibility System in Industrial Production
 18. Provisional Regulations on Implementing the Responsibility System in Industrial Production
 19. Methods of Carrying Out Standardization in Industrial Enterprises (*For Trial Implementation*)
 20. Local Contracts in the People's Republic of China
 21. Regulations on the Practice of the Economic Responsibility System by Construction Enterprises
 22. Provisional Regulations on the Work of Directors of State-Owned Factories
 23. Financial Taxation
 24. Notification by the Ministry of Finance on Individual Taxation of Foreign Workers in China
 25. Decisions by the State Council on Balancing Financial Income and Rigidly Enforcing Financial Management
 26. Provisional Regulations of the Ministry of Finance on Reducing Management Expenses in State-Owned Enterprises
 27. Regulations by the State Council on Readjusting the Industrial and Commercial Tax Burden on Commune- and Brigade-Run Enterprises
 28. Banking Regulations
 29. State Council Decisions on Strengthening Credit Management and Controlling Loans
 30. Report by the People's Bank of China on Readjusting Interest Rates on Deposits and Loans
 31. Regulations on Workers' Wages
 32. Decisions by the Central Committee and State Council on Improving the Education of Staff and Workers
 33. Decisions by the Party Central Committee and State Council on Enlivening the Economy and Solving the Urban Unemployment Problem
 34. Regulations on Energy Resources
 35. State Council Directive on Economizing on Electricity
 36. State Council Directive on Economizing on Oil

37. Industrial and Commercial Management Regulations
38. State Council (Policy) Regulations on Non-Agricultural Individual Economy in Urban Areas
39. Regulations on Special Economic Zones
40. Provisional Regulations on Registration of Enterprises in the Special Economic Zones of Guangdong Province
41. Provisional Regulations on Land Management in the Shenzhen Special Economic Zone
42. Regulations on Environmental Protection

Section III: Monographic Studies

1. Complete the Task of Readjustment and Strive for a Basic Improvement in the National Economy
2. Heavy Industry Must Advance Amidst Readjustment
3. Stressing the Development of the Consumer Goods Industry Is an Important Component of China's Economic Construction
4. China's Communications and Transport: The Present Situation and Prospects for Future Development
5. Focussing on Methods of Creating, Collecting and Using Funds and Accelerating the Socialist Four Modernizations
6. The Scientific and Technological Reform of Existing Enterprises Is of Strategic Importance in China's Economic Development
7. Resolutely Carry Out the Reform of the Economic System

Section IV: Survey of China's Economy

1. China's Economy in 1981

Agriculture, Forestry and Fishing

2. China's Agriculture in 1981
3. China's Grain Cultivation
4. China's Industrial Crop Cultivation
5. Sideline Occupations of Commune Members in China's Countryside
6. China's Land Reclamation in 1981
7. The New Look of Xinjiang's Reclaimed Areas

12. China's Meteorology

Industry

13. China's Industry in 1981

Light Industry

14. China's Light Industry in 1981
15. China's Paper Industry
16. China's Sewing Machine Industry
17. China's Bicycle Industry
18. China's Clock Industry
19. China's Wine Industry
20. China's Confectionery Industry
21. China's Tobacco Industry
22. China's Salt Industry
23. China's Handicrafts Industry
24. China's Leather Industry
25. China's Garments Industry
26. China's Cosmetics Industry
27. Shanghai's Household Chemical Products Industry
28. China's Textile Industry
29. China's Commune- and Brigade-Run Industries

Energy and Power

30. Survey of China's Energy Resources Industry
31. China's Petroleum Industry
32. China's Coal Mining Industry
33. China's Electric Power Industry

Heavy Industry

34. China's Machinery Industry
35. China's Heavy Machinery Industry
36. China's Instrument and Meter Industry
37. China's Electrical Machinery Industry
38. China's Automobile Industry
39. China's Bearings Industry
40. China's Machine Tool Industry
41. China's Tool Industry
42. China's Shipbuilding Industry
43. China's Agricultural Machinery Industry and New Developments in Agricultural Mechanization
44. China's Electronics Industry in 1981
45. China's Electronics Calculator Industry
46. China's Broadcasting Industry
47. China's Aviation Industry
48. China's Chemical Industry in 1981
49. China's Iron and Steel Industry in 1981
50. China's Non-Ferrous Metals Industry

51. China's Building Materials Industry in 1981
52. China's Cement Industry
53. China's Plate-Glass Industry
54. China's Construction Engineering in 1981
55. China's Urban Construction
56. China's Pharmaceuticals Industry
57. China's Production of Traditional Medicine

Transport and Communications

58. China's Communications and Transport in 1981
59. China's Railway Transportation
60. China's Newly Constructed Railways
61. China's Highway Traffic
62. China's Water Transport
63. China's Ocean Shipping
64. China's Civil Aviation
65. China's Posts and Telecommunication in 1981

Domestic Commerce

66. Distribution of Commodities in 1981
67. State-Owned Commerce in 1981
68. China's Large State-Owned Department Stores
69. Grain Distribution and Management in China
